
Draft Risk Evaluation for Formaldehyde

Systematic Review Supplemental File:

Data Quality Evaluation and Data Extraction Information for
Environmental Release and Occupational Exposure

CASRN: 50-00-0

March 2024

This supplemental file contains information regarding the data extraction and quality evaluation results for data sources that were considered for the *Draft Risk Evaluation for Formaldehyde* and that underwent systematic review. EPA conducted data extraction, and quality evaluation based on author-reported descriptions and results; additional analyses (e.g., statistical analyses) potentially conducted by EPA are not contained in this supplemental file. EPA used the TSCA systematic review process described in the *Draft Systematic Review Protocol Supporting TSCA Risk Evaluations for Chemical Substances* (also referred to as the '2021 Draft Systematic Review Protocol').

Data that met the RESO screening criteria during the full-text screening was extracted by three data types, general facility, occupational exposure, and environmental release, as explained in Section 6.2 of the 2021 Draft Systematic Review Protocol. Five different data quality evaluation forms were used depending on the data type and condition of use (COU), as explained in Appendix M of the 2021 Draft Systematic Review Protocol. All references with data points containing monitoring data (e.g., measured occupational exposures) underwent data quality evaluation as described in Section M.6.1, using the monitoring data quality metrics. All references with data points containing environmental release data (e.g., measured or calculated quantities of chemical release across facility fence line) underwent data quality evaluation as described in Section M.6.2, using the environmental release data quality metrics. All references with data points containing published models for environmental release or occupational exposure (e.g., published models used to calculate occupational exposure or environmental releases) underwent data quality evaluation as described in Section M.6.3, using the published models for environmental release or occupational exposure quality metrics. All references with data points containing completed exposure or risk assessments (e.g., completed exposure or risk assessments containing a broad range of data types) underwent data quality evaluation as described in Section M.6.4, using the completed exposure or risk assessments quality metrics. All references with data points containing reports for data or information other than exposure or release data (e.g., process description) underwent data quality evaluation as described in Section M.6.5, using the reports for data or information other than exposure or release data quality metrics. The extracted data and their data quality evaluation are available in the tables below.

Additionally, each data type and condition of use is evaluated independently within a given study; therefore, each reference may have more than one overall quality determination (OQD) to reflect the quality of each outcome and the exposures and releases more appropriately as described by the study authors. No OQD is determined for each reference, as a whole, if it contains data from more than one evidence stream.

Study Citation:	[Redacted] (1986). [Redacted] Report on nasal cancer among XXX employees.			
HERO ID:	10605380			
Conditions of Use:	Unknown			
EXTRACTION				
Parameter	Data			
Area sampling data:	<0.05 ppm 8 hour TWA, 0.1-0.05 ppm TWA, 2-3 ppm ceiling			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Uninformative	Sampling or analytical methodology is not specified and EPA is unclear if exposures were estimated or measured.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	Country of origin is unspecified	
	Metric 3: Applicability	Uninformative	Occupational scenario is unknown.	
	Metric 4: Temporal Representativeness	Low	The data are more than 30 years old. Operations, equipment and worker activities are unlikely to represent current operations.	
	Metric 5: Sample Size	Low	characterized by no statistics.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (e.g., area) but no other metadata.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinantsof exposure for the sampled site or sector. Uncertainty not addressed.	
Overall Quality Determination		Uninformative

Parameter	Data			
Area sampling data:	Attachment 2 (starting pg 7) has table in ppm, lowest is 0.001 and highest is 1.4 ppm			
Personal protective equipment:	respirators (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	It is not clear from where the data is from.
	Metric 3:	Applicability	Low	COU/OES not specified (possibly redacted) but it is an occupational scenario within a processing plant.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Sample type provided but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination			Low	

Study Citation:	AECOM, (2019). [Redacted] Industrial hygiene air sampling XXX, formaldehyde, XXX.		
HERO ID:	10602491		
Conditions of Use:	Processing: Reactant		
EXTRACTION			
Parameter	Data		
Worker activity description:	Task 1: Opening a 55 gallon drum of formalin... monitored for formaldehyde exposure over a 15-minute period as he opened a55 gallon drum containing formalin in the Detergent Process area. The passive badge was positioned within the sphere of his breathing zone. The task requires removal of the stinger from the old drum and placement in the new drum (p. 7)Task 2: Employee ___, a lab technician, was monitored for formaldehyde exposure as he performed a product finalization lab test. Activities performed during the sampling included titration and testing for pH, color and viscosity.(p. 8)		
Exposure route:	inhalation (p. 7)		
Physical form:	liquid, vapor (p. 7)		
Personal sampling data:	Task 1: The workers sampled wore a combination of passive assay monitors as well as filter cassettes and tubes attached to air sampling pumps. (p. 7)Task 2: Two passive badges were positioned within the sphereof his breathing zone to collect a 15-minute STEL and work task sample. (p. 8)		
Exposure duration:	The task... only takes about 3 minutes, but the employee was requested to wear the monitor for 15 minutes while in the general vicinity of the drums to characterize a 15-minute exposurewhich is then compared to a 15-minute regulatory limit. The 15-minute STEL sample was obtained to determine if there was any exposure while performing this task. (p. 7)		
Exposure frequency:	Task 2: The task he performed is performed infrequently, and the potential for formaldehyde exposure only occurs when performing the lab test. (p. 8)		
Personal protective equipment:	Task 1: The employee wore Ansell II gloves, safety glasses and a face shield in addition to his normal work uniform. (p. 7)Task 2: Safety glasses and a lab coat were worn as PPE. (p. 8)		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source (mod. OSHA 1007).
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evalu-ated.
	Metric 3: Applicability	Medium	As site identification is not provided[redacted] nor additional process information, the COU of site is unclear. However with the worker activity, the information may be used for multiple COU.
	Metric 4: Temporal Representativeness	High	The assessment captures operations, equipment, and worker activities expected to be representative of current conditions. EPA has no reason to believe exposures have changed. The completed exposure or risk assessment is less than 5 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, worker activities and exposure type, but lacks additional metadata, such as exposure durations, exposure frequency, and/or operating conditions.
Domain 4: Variability and Uncertainty

Metric 7: Metadata Completeness		Medium	The monitoring study provides only limited discussion of the variability and uncertainty in the determinants of exposure for the sampled site.
Overall Quality Determination		High	

Formaldehyde

Occupational Exposure

HERO ID: 5160116 Table: 1 of 1

Study Citation:	Agency for Toxic Substances and Disease Registry (ATSDR) (2010). Addendum to the toxicological profile for formaldehyde.			
HERO ID:	5160116			
Conditions of Use:	Multiple COUs			
EXTRACTION				
Parameter	Data			
Worker activity description:	Students and anatomy lab employees.			
Exposure route:	inhalation			
Physical form:	vapor/gas			
Personal sampling data:	10 laboratory technicians were exposed to estimated average formaldehyde concentrations ranging from 0.106±0.02 to 0.269±0.05 ppm. 34 students exposed for 2-3-hour periods to an estimated time-weighted average (TWA) concentration of 1.24±0.61 ppm (range 0.07-2.94 ppm) in a gross anatomy laboratory. Estimates of breathing zone formaldehyde concentrations in the anatomy laboratory ranged from 0.3 to 4.45 ppm, with a mean of 1.88±0.96 ppm.			
Area sampling data:	38 anatomy students (9 men and 29 women, mean age 24.9 years) exposed to 1.1+0.56 ppm formaldehyde for 2.5 hours/week for 14 weeks. The highest short-term exposure level was 10.91 ppm for a 12-minute interval.			
Exposure duration:	2-3 hour periods (see PBZ extraction above)			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is ATSDR so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US.
	Metric 3:	Applicability	High	Data is applicable to student and anatomy labs as lab chemicals.
	Metric 4:	Temporal Representativeness	Low	Exposure data is over 20 years old.
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes exposure type, sampling duration and frequency, activities, exposure route and physical form.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Address variability by citing multiple different exposure studies. Does not address uncertainty.
Overall Quality Determination			Medium	

Study Citation:	Aglan, M. A., Mansour, G. N. (2018). Hair straightening products and the risk of occupational formaldehyde exposure in hairstylists. Drug and Chemical Toxicology :1-8.			
HERO ID:	6196781			
Conditions of Use:	Personal care products (nail salons)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Blow drying phase of hair straightening (pg 3)			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	PBZ; STEL (15 min TWA) (pg 3): Group 1 (29 stylists involved in hair straightening for <5 years): 1.68+/-0.27 ppm; Group 2 (31 stylists involved in hair straightening for >5 years): 1.83+/-0.16 ppm (pg 4) pg 5-6 have data from other studies on FA exposure to salon workers, limited metadata however			
Exposure duration:	8 h shift (pg 3). Analytic method: HPLC with UV detection (pg 3)			
Number of workers:	60 in study (pg 3)			
Comments:	8 h shift (pg 3). Analytic method: HPLC with UV detection (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from Egypt, a non-OECD country.
	Metric 3:	Applicability	High	Data are for personal care products (nail salons), an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, standard deviation) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by comparing results to other data in literature, but uncertainty is not addressed.

EXTRACTION			
Parameter	Data		
Area sampling data:	0.0014-0.0028 ppm		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	The data are from a non-OECD country, and locality-specific factors (e.g., potentially greater differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S., or the country of origin is not specified.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	The operations, equipment, and worker activities associated with the data are expected to be representative of current operations, equipment, and activities. The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter. If no PEL is established, the data are no more than 10 years old. Metadata on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination		High

Overall Quality Determination		High		

Study Citation:	Ahmed, H.O. (2011). Preliminary study: Formaldehyde exposure in laboratories of Sharjah university in UAE. Indian Journal of Occupational and Environmental Medicine 15(1):33-37.			
HERO ID:	4325272			
Conditions of Use:	Anatomy laboratory at a university			
EXTRACTION				
Parameter	Data			
Worker activity description:	In medical colleges, cadavers for gross anatomy laboratories are usually prepared by using formaldehyde as embalming fluid. In the presence of cadavers and during the process of dissection, formaldehyde vapors are emitted from the cadavers, resulting in the exposure of medical students and their instructors to elevated levels of formaldehyde in the laboratory.			
Personal sampling data:	average personal exposure levels were 0.80, 0.45, and 0.51 ppm for instructors and 1.02, 1.08, and 0.89 ppm for students for the three sessions			
Area sampling data:	0.003-0.004 ppm 8-hr TWA (in the absence of a cadaver); 0.024-0.024 ppm 8-hr TWA (in presence of a cadaver); 0.07 to 2.94 ppm during dissecting operations; airborne concentrations of formaldehyde in the gross anatomy varying between 0.59 and 1.72 ppm with a mean of 0.97; immediately after removing the cadavers' plastic covering, formaldehyde concentrations in the dissection room increased sharply and reached a peak point of 0.62 ppm after 10 min of starting of the class, After 30 min of achieving the peak, the formaldehyde level started decreasing gradually to a level of 0.11 ppm; room averages of formaldehyde concentrations were 0.45, 0.38, and 0.68 ppm

EXTRACTION	
Parameter	Data
Worker activity description:	Loads of currency are brought into the mechanical examination areas. Two stacks of 10,000-32 subject sheets, are opened by the bookbinder, separated on a vibrating table, and shingled out onto the currency feeder as needed to maintain a continuous flow of the sheets through the mechanical examining unit and past the examiners. The examining units have four examiners who examine the face (front) and backs of the currency sheets.
Exposure route:	Inhalation
Physical form:	vapor
Personal sampling data:	Regular Currency Production:8/19 Machine 972 A3 Face examiner N.D. A1 Face examiner N.D. A3 Back examiner Trace A1 Back examiner Trace Book binder N.D.8/20 Machine 972 A3 Face examiner Trace A1 Face examiner N.D. A3 Back examiner N.D. A1 Back examiner N.D. Book binder N.D. 8/19 Machine 978 A1 Face examiner N.D. A3 Back examiner N.D. A1 Back examiner N.D. Book binder N.D. Stacker N.D. 8/20 Machine 978 A3 Face examiner N.D. A1 Face examiner N.D. A3 Back examiner N.D. A1 Back examiner N.D. Book binder N.D. Test Currency Production:8/19 Machine 976 A3 Face examiner N.D. A1 Face examiner N.D. Book binder N.D. Regular Currency Production:8/19 Machine 972 A3 Face examining station 0.25 mg/m38/20 Machine 972 A3 Face examining station 0.20 mg/m38/19 Machine 978 A3 Back examining station 0.17 mg/m38/20 Machine 978 A3 Face examining station 0.13 mg/m3Test Currency Production:(3)8/19 Machine 976 A3 Face examining station 0.17 mg/m3 Above A3 Back feed line 0.18 mg/m38/20 Machine 976 A3 Face examining station 0.18 mg/m3 Above A3 Back feed line 0.16 mg/m3
Engineering control:	Lower exhaust takeoffs closer to the floor. Increase hold times and storage condition of freshly printed currency prior to inspection.
Comments:	The source of the formaldehyde is most likely due to the presence of a melamine-formaldehyde resin used in the currency paper. The work conducted by the bureau concerning aldehyde levels associated with the various test currency samples demonstrated little variation in formaldehyde concentrations among regular production currency, test currency printed with the test inks, blind embossed currency paper (no ink but run through the press), and unprocessed blank currency paper.

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability				
	Metric 1:	Sampling and Analytical Methodology	Medium	NIOSH study - but used a method developed by the Technical Services Division of the Department of Treasury which was similar to but not as accurate and Method 3500.
Domain 2: Representativeness				
	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (printing operation) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1987 - prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed and my not have been consider in the Department of Treasury's methodology.

		Rating	Comments
Domain 3: Accessibility/ Clarity			
Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty			
Metric 7:	Metadata Completeness	Medium	Results from individual sampling events were provided which could be used to evaluate variability between locations and jobs. Uncertainty was not discussed, and may not have been included in the Treasury Department’s methodology.
Overall Quality Determination		Medium	

Study Citation:	Ahrenholz, S. H. (1987). Health Hazard Evaluation Report HETA-86-0125-1853 Empire-Detroit Steel Division, Mansfield, Ohio. :24.			
HERO ID:	8197551			
Conditions of Use:	Processing aids, not otherwise listed			
EXTRACTION				
Parameter	Data			
Worker activity description:	Job titles on the tandem mill were assistant roller, entry operator, first sticker, second sticker, recorder, utility man, #14 crane operator, stocker, tractor operator, and motor room operator. Job titles on the reversing mill were roller, assistant roller, utility man, helper(bander), #13 crane operator, and stocker. (4/24)			
Exposure route:	inhalation (5/24)			
Physical form:	mist (1/24)			
Area sampling data:	Area formaldehyde concentrations ranged from 0.003 up to 0.06 mg/m3. (9/24)			
Number of workers:	40 workers (4/24)			
Personal protective equipment:	Personal protective equipment required in the cold rolling mill area included hard hats, safety glasses, and sound leather shoes. Respiratory protection was not required except for some clean-up operations. (4/24)			
Engineering control:	Side exhaust take-off hoods are present between the tandem mills on the side opposite the work stations. An exhaust hood is also located on the uptake side of the number five mill on the tandem mill operation above the winding reel. Exhaust hoods are located on the reversing mill to remove vapors and mists. (4/24)

Physical form:	vapor			
Area sampling data:	"Average concentration levels for formaldehyde during pre, post-, and summer as previously shown in Table 9 were 14.76 ppb, 10.83 ppb, 40.60 ppb, respectively (pg 7) Table 9 presents the same data as above plus F and sig, Table 12 presents data for door open vs. door closed (pg 9)"			
Engineering control:	Ventilation mode of the selected offices is maintained by a hybrid system; that is a combination of a central air conditioning (AC) and a split unit system. The central AC system has provisioned for a fixed fractional (10%) air exchange rate; while the split unit system cools the recirculating room air and provides no means of fresh air (100% recirculation, with the evaporator located indoor and the condenser located outdoor). Indoor air for three pollutant concentrations (VOCs, formaldehyde, NO2) was examined when doors were either open or closed, and the AC was either switched on or off during midweek and weekends. Temperature settings during the AC on-mode were fixed at either 17 °C or 26 °C during three periods (pre-, post, summer) (pg 3)			
Comments:	Method: GC/FID; passive sampling during the same period of VOC sampling. Diffusion samplers were used as recommended by the manufacturer (IVL Swedish Environmental Research Institute) (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from Kuwait, a non-OECD country
	Metric 3:	Applicability	High	Data are for building and construction materials, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure/sampling duration and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling for multiple seasons.

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability				
	Metric 1:	Sampling and Analytical Methodology	High	All laboratory analyses and equipment (Summa Canisters, Sorbent Tubes, and air pumps) were provided by ALS Laboratory Group (Murray, UT). ALS Laboratory is an American Industrial Hygiene Association accredited laboratory for these particular analyses.
Domain 2: Representativeness				
	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Study was conducted in 2010
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity				
	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	High	Study took into account such information including ambient conditions, customer volume, presence of ventilation, etc. Also provide are all discrete data as well as mean, standard deviation, and variance.
Overall Quality Determination			High

Worker activity description:	fitting, grinding, filling, coating, packing and maintenance activities			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	0.40 mg/m3 daily mean (range 0.12-2.60 mg/m3) mean Peak 0.70 mg/m3)			
Exposure duration:	8 hour work days			
Number of workers:	38 exposed individuals			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling and analysis methods was not specifically documented, but samples were made using 2,4-dinitrophenylhydrazine (2,4-DNF) followed by desorption using di-ethyl ether and determined quantitatively with fluid chromatography.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Sweden - OECD Member
	Metric 3:	Applicability	High	The data are for surface coating using acid hardening lacquer which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 2010, after the most recent PEL (1992) but 20 years old.
	Metric 5:	Sample Size	High	The data are disaggregated by worker activity and includes number of samples daily average and range and average peak exposure and range.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations and worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides range by worker activity which can be used to assess variability. The study did not provide a discussion of uncertainty.

EXTRACTION				
Parameter	Data			
Worker activity description:	Display boards for sales promotions are assembled. Metal channeling is cut to size and metal slivers are cleaned from the surface with 1,1,1-trichloroethane while wearing protective gloves. Adhesive is purchased in 55 gallon drums and dispensed into paint roller pans as needed. The adhesive is applied to the cardboard backing using paint rollers.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	Personal samples showed airborne concentrations of formaldehyde ranging from 0.23 ppm to 0.28 ppm for five It should be noted that because of a power outage normal work activities were discontinued and all samples collected were for a period of less than one and one-half hours. It is believedthat the nondetectable levels on 6/16/1987 were due to the short sampling period and the fact that part of the sampling period was during the power outage when no work could be accomplished. All samples had ND, workers included framer, gluer, and contact paper.6/22/1987Gluer 0.28 ppmGluer 0.24 ppmGluer 0.26 ppmGluer 0.23 ppmTransparencies 0.28 ppm			
Area sampling data:	Two area samples collected near the glue cabinet, above the drying rack and at the production supervisor’s desk showed airborne concentrations of formaldehyde of 3.3 ppm, 0.68 ppm and 0.23 ppm, respectively.Area - glue cabinet 3.3 ppm (6/16/1987)Area - drying rack ND (6/16/1987)Area - prod. supervisor’s desk ND (6/16/1987)It should be noted that because of a power outage normal work activities were discontinued and all samples collected were for a period of less than one and one-half hours. It is believedthat the nondetectable levels on 6/16/1987 were due to the short sampling period and the fact that part of the sampling period was during the power outage when no work could be accomplished.Area - drying rack 0.68 (6/22/1987)Area - prod. supervisor’s desk 0.23 (6/22/1987)			
Number of workers:	4			
Personal protective equipment:	Gloves			
Engineering control:	Substitute adhesive with low formaldehyde content ahesiveDrying rack should be isolated.Glue cabinet should be ventilated to the outside air			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	NIOSH study - Method 2502, NIOSH website indicates that this method is withdrawn and no longer used, information states the 2541 method has better sample stability and ease of personal sampling.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evalu-ated.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario (adhesive) within the scope of the risk eval-uation but the report under recommendations make reference that the formaldehyde function is a biocide, which would be non-TSCA. The scenario is still similar to use of adhesive within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1987 - prior to the PEL (1992) and more than 20 years.
	Metric 5:	Sample Size	Medium	results from individual sampling events were provided, summary statistics can be devel-oped using these data. Low sample size
Domain 3: Accessibility/ Clarity

Formaldehyde

Occupational Exposure

HERO ID: 1316871 Table: 1 of 1

...continued from previous page

Study Citation:	Almaguer, D. (1988). Health Hazard Evaluation Report HETA 87-307-1917, Downing Displays, Inc., Cincinnati, Ohio, August 1988.			
HERO ID:	1316871			
Conditions of Use:	Multiple			
Domain		Metric	EVALUATION Rating	Comments
	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, worker activities.
Domain 4: Variability and Uncertainty		Metric 7: Metadata Completeness	Medium	Variability was limited, but results for each sampling event were included, which is useful in evaluating variability between jobs and locations. Report indicates some dependence of exposure on batch of adhesive used but most estimates are for two batches. As this study used a NIOSH methodology it was assumed that uncertainty was considered in the method.
Overall Quality Determination			Medium	

Study Citation:	Almaguer, D. (1986). Health Hazard Evaluation Report HETA-85-48-49-1658 Lausen Engine Division, New Holstein, Wisconsin.			
HERO ID:	8684552			
Conditions of Use:	Adhesives and sealant chemicals in wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Assembling brake pads. (4/16)			
Exposure route:	inhalation (8/16)			
Physical form:	gas (8/16)			
Personal sampling data:	Personal samples for formaldehyde were below the LOD of 2ug/sample. (8/16)			
Number of workers:	200 administrative workers, 1200 production workers, and 50 maintenance workers (4/16)			
Engineering control:	Local exhaust ventilation was provided at the Sub-assembly Brake Pad area. The adhesive was applied to the brake pads within a local exhaust ventilation hood and was cured in a sealed oven which was local exhaust ventilated. Assembly of the brake pad and bracket was conducted at the sub-assembly machine which was equipped with local exhaust ventilation.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for brake pad assembly, which is similar to the in-scope occupational scenario adhesives and sealants in wood product manufacturing.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker activity provided, but missing exposure duration, frequency, and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Almaguer, D., Alterman, T., Blade, L. M., Hurrell, J. J. (1995). Health hazard evaluation report HETA 93-0154-2527, Truman State Office Building, Jefferson City, Missouri.			
HERO ID:	81269

Conditions of Use:	Other: Fumigant (Non-TSCA)

EXTRACTION

Parameter	Data
Worker activity description:	Employees at Cosmetology Clinic- use of paraformaldehyde fumigant products that offgas formaldehyde
Exposure route:	inhalation
Physical form:	off-gas
Area sampling data:	Table I- General-area air samples for airborne concentrations of formaldehyde (pdf pg. 12)Ranges from <LOQ to 15.2 ppm
Engineering control:	is served by 15 separate heating, ventilation, and air-conditioning (HVAC) system

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Three different sampling surveys were done using different sampling and analytical methods, but all were NIOSH approved.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Uninformative	The data are from an occupational scenario that does not apply to any occupational scenario within the scope of the risk evaluation (non-TSCA-Pesticide Use).
	Metric 4: Temporal Representativeness	Low	The data were collected before the most recent PEL establishment.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site. The monitoring study addresses uncertainty in the exposure estimates and uncertainty can be determined from the sampling and analytical method.

Overall Quality Determination**Uninformative**

Exposure duration:	up to 10 hours per day
Exposure frequency:	40 hours per week
Number of workers:	13 to 15 students plus an instructor (full capacity is 20 students plus an equal number of patrons)
Engineering control:	The air supply and exhaust systems for the Bathroom and Dispensary should be designed so that these areas remain under negative pressure relative to all other spaces served by this AHU. Additionally, the system should be designed so that all spaces served by the Cosmetology AHU are under negative pressure relative to the remainder of the building.The exhaust air-flow from the Dispensary should be 10% greater than the supply-air flow rate into this room (i.e., through the ceiling diffusers). Similarly, this requirement applies to the Bathroom exhaust.The combined exhaust air-flow from the Bathroom and the Dispensary exhaust systems should always be 10% greater than the outside-air-intake flowrate to the AHU. The design-specification exhaust air flow capacity of the Bathroom and the Dispensary exhaust systems should be selected to be a total of 1475 cfm, which is 10% greater than the outside-air flowrate of 1340 cfm required for the space under the greatest-expected occupancy projected (as discussed previously in this section). The design specification intake-air flow capacity of the AHU must be at least 1340 cfm. VENTILATION CONTROL SYSTEMSSeveral methods can be used to control the required amount of outside air provided to the Cosmetology Laboratory, Reception Room, Dispensary, and Classroom. A constant amount of outside air may be supplied to these areas based on the maximum number of occupants (students, instructors and patrons) or a control system may be installed to provide varying amounts of outside air depending on the number of occupants present in these areas at any given time. The choice of which type of control system to install will depend on the amount of money the school is willing to budget for this project.1. The least expensive system is a constant volume system which opens the outside air damper to a preset position when the AHU is turned on. This preset level should be based on the maximum number of occupants and should provide enough outside air to meet the ASHRAE recommendations. Although this type of system is the least expensive to install, it is the most expensive to operate because the outside air provided needs to be tempered and generally, the system would provide more outside air than needed to meet the ASHRAE recommendations.2. The next level of control has two preset levels. The outside air damper opens to the first preset level when the AHU is turned on and a timer circuit opens the damper to a second preset level during the hours when the Cosmetology Classroom is occupied. The first preset level should be based on the maximum number of occupants (including patrons) expected in the Cosmetology Laboratory, Reception Room and Dispensary. The second preset level should be based on the maximum number of occupants expected when both the Cosmetology Laboratory areas and the Cosmetology Classroom are occupied. While this control system is more energy efficient than the system described above (item 1), energy is still wasted tempering air for patrons who may not be in the space.3. The highest level of control requires the outside air damper to be opened to a preset level determined by the maximum number of students and instructors present in the Cosmetology, Dispensary and Reception areas. This control system is equipped with a timer control system to increase the amount of outside air provided when the Cosmetology Classroom is occupied. The amount of outside air supplied to the Cosmetology Laboratory areas is increased by the use of a manual switch located in the Cosmetology Laboratory. The switch allows the outside air damper to open wider and can be either an incremental or on-off switch. The instructor should be the person responsible for determining if more outside air is needed due to increased numbers of patrons, odors, etc. Since this is a manual switch, a warning device should be used to remind the instructor to reset the switch to the original position or reset the warning device if more time is needed.

Area sampling data:	Chemical resin plant: range from 0.10 to 0.95 ppm			
Exposure duration:	8 hour shifts 4 hours in the control room away from sources.			
Number of workers:	38			
Personal protective equipment:	hard hats and safety glassesFull face organic vapor respiratorRubber glovesFull protective suit, boots and air-supplied respirator for storage tank entry.			
Engineering control:	emergency eye wash			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH sponsored study so it was assumed that the consultant would use NIOSH methods (though the specific method is not mentioned)
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (formaldehyde manufacture) is within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Site visit was in 1981 prior to the PEL (1992)
	Metric 5:	Sample Size	Medium	The distribution of samples is characterized by a range of values for personal sampling. The results from the 6 sampling events were provided for each event. No discussion of uncertainty was included
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study provides individual sampling results for area sampling and range data for personal sampling, both of these can use used to appreciate the variance in the data. Because this is a NIOSH study and it is assumed that NIOSH methods were used, it is assumed that uncertainty is addressed in the methodology.

Study Citation:	Anonymous (1982). Preliminary Plant Visit, Industrial Hygiene Report, Formaldehyde Production Facilities, Tenneco Chemicals, Inc., Fords, New Jersey, Report No. CT-114-21a. Dayton(CT-114-21a):114-121.			
HERO ID:	1316695			
Conditions of Use:	Manufacture			
EXTRACTION				
Parameter	Data			
Worker activity description:	operator responsibilities include controlling the process, reporting maintenance problems, and transferring formaldehyde to storage. Operators may also be used to change catalyst beds. The loading operators are responsible for loading the tank trucks used to ship the formaldehyde, sampling the blended solution and general maintenance. Drivers are responsible for uploading Methanol. The plant also have maintenance workers (40) but report states that none are directly assigned to the formaldehyde units.Report highlights that workers in the silver catalyst process near the bottom of the absorber where a sample point is located and also near the interior storage tanks experience signs of exposure.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Area sampling was done by company IH in formaldehyde loading area, truck loading area, operator control room, the areas above and below the loading platform, the truck hatch area during loading, and the silver catalyst unit control area. Individuals results are not provided though it is noted that no sample was above 1 ppm TWA.			
Exposure duration:	4 shifts per day over 24 hour period, sample analysis is conducted once every two hours.			
Exposure frequency:	Plant operates 24 hours per day/7 days per week; Sampling is done once every two hours			
Number of workers:	15 - one operator per shift per production unit supervised by a foreman for each shift. Additionally there are two truck loading operator and one maintenance operator.			
Personal protective equipment:	- splash proof goggles and rubber gloves for sampling.- disposable tyvec suit, supplied air respirators and gloves for catalyst replacement.-full-face gas mask, rubber coat and gloves for tank cleaning - splash proof goggles for tank truck loading			
Engineering control:	scrubbers are used to control storage tank emissions of formaldehyde.Operator monitors the process from a control board that records operating conditions and alerts the operator to problems. For the formox control area, is in a separate adjacent building. For the silver catalyst unit, the control area is between the methanol vaporizer and the absorption and distillation columns.Product samples are analyzed in a lab hood that is vented to the roof (measured inward facing velocity of 150-200 ft/min)During truck loading, to protect the the truck loading operator, a flexible vacuum tube is also placed just inside the hatch to draw formaldehyde vapors out of the tank and vent them through the roof. As an added precaution, a pedestal fan is also provided.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Although a joint EPA and NIOSH study, the cited monitoring data was reported to be done by the plant manager using an unspecified sampling/analytical methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the US
	Metric 3:	Applicability	High	The data are for an occupational scenario (formaldehyde manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Plant was visited in 1981 prior to PEL (1992)
	Metric 5:	Sample Size	Low	Approximate value is provided but characterized by no statistics.
Domain 3: Accessibility/ Clarity

Occupational Exposure

HERO ID: 5956338 Table: 1 of 1

Study Citation: Anonymous, (1985). Benzene, formaldehyde - workplace exposure limits proposed. Chemical & Engineering News 63(49):4.
HERO ID: 5956338
Conditions of Use: All

EXTRACTION

Parameter	Data
Area sampling data:	fewer than half of workers are exposed to levels above 0.5 ppm and even fewer to levels above 1.0 ppm
Number of workers:	1.3 million

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5: Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Monitoring data do not include any needed metadata to understand what the data represent and are not usable in the risk evaluation.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Overall Quality Determination **Uninformative**

Area sampling data:	likely area sampling Plywood manufacture, particle board production, and laquering 500ug/m3			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Finland - an OECD member	
	Metric 3: Applicability	High	The data are for an occupational scenario (commercial use of building/construction materials – wood and engineered wood) within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Low	The data were published in 1980-85, before the most recent PEL (1992) and more than 20 years old.	
	Metric 5: Sample Size	Low	one value was provided for a wide range of applications	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	No meta data were provided for formaldehyde	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination		Low		

Study Citation:	Apol, A. (1973). Health hazard evaluation/toxicity determination: Western Foundry Company, Tigard, Oregon.			
HERO ID:	6033389			
Conditions of Use:	Chemical substances in metal products			
EXTRACTION				
Parameter	Data			
Personal sampling data:	The formaldehyde concentrations measured were 0.07 ppm during normal conditions over a complete core production cycle; 0.08 ppm during a complete cycle when the sand was warm and 0.33 ppm during the core preparation only when the sand was hot.			
Exposure duration:	0.07 ppm - 50 minutes, 0.08 ppm - 15 minutes, 0.33 ppm - 15 minutes			
Personal protective equipment:	Due to the possible skin and eye contact with the liquid substances used in the process, it is strongly recommended that protective clothing (non-permeable aprons and gloves) and safety glasses be used by the workers.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	methodology well described	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	data are from the United States	
	Metric 3: Applicability	High	data are for an occupational scenario within the scope of the risk evaluation	
	Metric 4: Temporal Representativeness	Low	more than 20 years old	
	Metric 5: Sample Size	Low	characterized by no statistics	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Conditions of Use:	Incorporation into a formulation, mixture, or reaction product			
EXTRACTION				
Parameter	Data			
Worker activity description:	There are nine to eleven employees working in this area per shift, for the first and second shifts. Each operation has a man assigned to it and his exposure will be mainly to the materials that are added at that point. In addition, the felt ribbon may sustain a break which requires rethreading of the felt through the saturator and removal of the broken felt. In order to accomplish this, the doors of the saturator are opened and one or more employees enter the saturator to do the rethreading. This may result in an exposure to higher concentrations of asphalt fume inside the saturator. In addition to the operations described, there are two employees that are involved in handling the slate granules. Also, talc and sand are hand dumped from bags into a ventilated hopper. In addition to the standard shingle manufacture, there is a "Hallmark" operation, where small strips of cut shingle are glued to the top of the standard shingle with hot asphalt. Visible fumes arise from the point where the asphalt is dripped on the shingle. The eight employees in this operation rotate through the jobs on a regular basis throughout the day, so the exposure to the asphalt is not continuous.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	During Splice 5 ppm			
Area sampling data:	on platform where fiberglass rolls are spliced and unrolled 0.11 ppmNorth end of accumulator loops 7 ft.above floor 0.09 ppmAbove the area where the slate is added just after the coater 0.01 ppm6" above splice - total time of splice is approximately 15 seconds - 3 ppmchange rolls every 6 - 10 minutes-2.5 ppmIn coater enclosure 4 ppmIn coater enclosure 3 ppmIn coater during repair of break 10 minutes into shutdown < 0. 5 ppmInside of fiberglass roll 4 ppm			
Number of workers:	20 (9-11 employees per shift for the area; 2 shifts); In addition to the operations described, there are two employees that are involved in handling the slate granules. Also, talc and sand arehand dumped from bags into a ventilated hopper.			
Personal protective equipment:	respiratory protection			
Engineering control:	increase intake air Seal Saturator and Coater doorsReplace gas forklift with electric			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is provided but does not cite an approved NIOSH method. However, it does provide the methodology which appears similar to NIOSH 3500 and 2016.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (asphalt roof manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1976-77: Prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, and worker activities, but lacks additional metadata, such as exposure durations, and exposure frequency,

EXTRACTION				
Parameter	Data			
Worker activity description:	adhesive manufacturing, foundry, latex processing, metalworking, plywood manufacturing, ricemills, rubbertire manufacturing, sawmill, shoemaking, textile manufacturing			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Mean 8 h concentrations of formaldehyde ranged from 0.16 mg/m3 in metalworking to 0.53 mg/m3 in adhesive manufacturing. 42 sites in 10 industrial sectors were studied. 465 measurements were collected. Percent of measurements below detection limit ranged from 8 (adhesive manufacturing) to 70 (ricemill). Mean concentration for all the industrial sectors combined was 0.25 mg/m3. Formaldehyde levels exceeded the American Conference of Governmental Industrial Hygienists (ACGIH) threshold limit value (TLV-Ceiling) of 0.37 mg/m3 in only the adhesives industry but all others had mean 8 h concentrations between 0.16 and 0.35 mg/m3.			
Exposure duration:	8hr/day			
Number of workers:	There were 42 sites and at each site, during one normal working day, six workers each wore one monitor close to their breathing zone.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling method well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	non-OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	the data are more than 10 years but generally, no more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	does not address uncertainty in the exposure estimates

Study Citation:	Aydın, S., Canpınar, H., Undeğer, U., Güç, D., Colakoğlu, M., Kars, A., Başaran, N. (2013). Assessment of immunotoxicity and genotoxicity in workers exposed to low concentrations of formaldehyde. Archives of Toxicology 87(1):145-153.		
HERO ID:	1313374		
Conditions of Use:	Compressed Wood Product Manufacturing		
EXTRACTION			
Parameter	Data		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	personal and area sampling was implemented but the results were aggregated, so it is not possible to differentiate.		
Area sampling data:	Overall MDF production: Momentary 0.21+/-0.07 ppm (range 0.09-0.35); TWA 0.20+/-0.06 ppm (range 0.10-0.33) separate concentrations are provided to 13 different operations at two MDF facilities.		
Number of workers:	46		
Personal protective equipment:	It was noted which operations used PPE in the detailed concentration tables.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method 3500.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Turkey - OECD member
	Metric 3: Applicability	High	The data are for medium density fiberboard production plants, an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	The report was published in 2012 after the PEL (1992) and less than 10 years old. Meta-data on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.
	Metric 5: Sample Size	High	Mean concentration and TWA values are provided for combined data as well as 13 different operations at two plants.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, sample durations, and worker activities, but lacks additional metadata, such as exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the two sites and 13 different operations. NIOSH method 3500 considers uncertainty in the methodology.
Overall Quality Determination		High	

Study Citation:	Azari, M.R., Asadi, P., Jafari, M.J., Soori, H., Hosseini, V. (2012). Occupational exposure of a medical school staff to formaldehyde in tehran. Tanaffos 11(3):36-41.		
HERO ID:	2993436		
Conditions of Use:	Laboratory Use		
EXTRACTION			
Parameter	Data		
Worker activity description:	Instructors, students, and lab technicians in a gross anatomy lab with cadavers preserved with formaldehyde.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	Instructors, exhaust and supply ventilation: 329+-80 ppb Students, exhaust and supply ventilation: 317+-35 ppb Technicians, exhaust and supply ventilation: 220+-21 ppb; Instructors, supply ventilation only: 334+-60 ppb Students, supply ventilation only: 329+-33 ppb Technicians, supply ventilation only: 236+-8 ppb Instructors, no ventilation: 754+-65 ppb Students, no ventilation: 723+-38 ppb Technicians, no ventilation: 493+-8 ppb		
Area sampling data:	Indoor Laboratory, exhaust and supply ventilation: 256 ppb Indoor Lab, supply ventilation only: 270 ppb Indoor Lab, no ventilation: 572 ppb; Corridor, exhaust and supply ventilation: 221 ppb Corridor, supply ventilation only: 241 ppb Corridor, no ventilation: 443 ppb; Moulage, exhaust and supply ventilation: 232 ppb Moulage, supply ventilation only: 253 ppb Moulage, no ventilation: 463 ppb; Classroom, exhaust and supply ventilation: 206 ppb Classroom, supply ventilation only: 228 ppb Classroom, no ventilation: 315 ppb;		
Number of workers:	20		
Engineering control:	Six ceiling diffusers arranged in two rows are attached to the central air conditioning system and four exhausts provide general ventilation for the laboratory. Cadavers are wrapped in cotton cloth and kept in a vinyl bag while not in use. In addition, alternative compounds such as Shellac (32), glutaraldehyde, fixing solutions with low concentrations of formaldehyde and formaldehyde to water ratio 1:3 (33), ammonium carbonate(34) and salt-containing solutions can also be used (35)		
Comments:	Khanzadeh et al. reported the range of concentration of formaldehyde in gross anatomy laboratory of a Medical College in Ohio,United States as 70-2940ppb (15). Kurose et al. reported formaldehyde concentrations in the range of 250-550ppb in a gross anatomy laboratory (16). In addition, the range of formaldehyde concentration in the indoor air of adissection room in Australia was 59-219 ppb (17).		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method (NIOSH no. 2016).
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	Data are from Iran, a non-OECD country.
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4: Temporal Representativeness	High	Monitoring data are no more than 10 years old.
	Metric 5: Sample Size	Medium	Sample distribution characterized by limited statistics (means, standard deviations, ranges) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty

Domain		Metric	EVALUATION	
			Rating	Comments
Metric 7:		Metadata Completeness	High	Uncertainty is addressed by comparing with other published studies. Variability is addressed by sampling 3 times during the year during different conditions.
Overall Quality Determination			High	

Formaldehyde

Occupational Exposure

HERO ID: 4165387 Table: 1 of 1

Study Citation:	Azuma, K., Ikeda, K., Kagi, N., Yanagi, U., Osawa, H. (2017). Physicochemical risk factors for building-related symptoms in air-conditioned office buildings: Ambient particles and combined exposure to indoor air pollutants. Science of the Total Environment 616-617:1649-1655.			
HERO ID:	4165387			
Conditions of Use:	commercial use			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Area sampling data:	The study investigated 11 offices during winter and 13 offices during summer in 17 buildings with air-conditioning systems in Tokyo, Osaka, and Fukuoka. Indoor air concentrations of formaldehyde did not exceed the values set by IAQGs in all the offices during both winter and summer. Measured indoor formaldehyde concentrations (ug/m3) were 3.4 (minimum), 21.2 (maximum), and 9.6 (mean) during winter. Measured indoor formaldehyde concentrations (ug/m3) were 12.1 (minimum), 45.2 (maximum), and 25.7 (mean) during summer. Indoor air quality guidelines (IAQGs) for formaldehyde is 100 ug/m3.			
Number of workers:	107 office workers during winter and 207 office workers during summer			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology is well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	data are from an OECD country other than the U.S
	Metric 3:	Applicability	Medium	data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, in terms of the type of industry, operations, and work activities.
	Metric 4:	Temporal Representativeness	High	data no more than 10 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	monitoring data include only the most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	monitoring study does address variability but not uncertainty
Overall Quality Determination		High

Conditions of Use:	Textile finishing			
EXTRACTION				
Parameter	Data			
Area sampling data:	Maximum workplace concentration values well below 0.5 ppm at the curing machine and in the mixing department have been obtained using crosslinkers that are stable to hydrolysis			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	The data are from a non-OECD country, and locality-specific factors (e.g., potentially greater differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S., or the country of origin is not specified.	
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Medium	Operations, equipment, and worker activities are expected to be reasonably representative of current conditions. The monitoring data were collected after the most recent PEL establishment or update but are generally more than 10 years old. If no PEL is established, the data are more than 10 years but generally, no more than 20 years old.	
	Metric 5: Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Monitoring data do not include any needed metadatato understand what the data represent and are not usable in the risk evaluation.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination		Uninformative		

Study Citation:	Bakke, B., Ulvestad, B., Stewart, P., Lund, M.B., Eduard, W. (2001). Effects of blasting fumes on exposure and short-term lung function changes in tunnel construction workers. Scandinavian Journal of Work, Environment and Health 27(4):250-257.			
HERO ID:	1313955			
Conditions of Use:	Installation/Demolition of Building Materials			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Blasting agent: ammonium nitrate fuel oil (ANFO): 0.02 ppm Mean, 0.015 ppm geometric mean, GSD 1.9			
Exposure frequency:	workers work 2 weeks consecutively and are then off the 3rd week			
Number of workers:	48			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified, though it was noted that formaldehyde was collected on a filter impregnated with 2,4-dinitrophenylhydrazine in a polypropylene housing. Formaldehyde was analyzed by high-performance liquid chromatography with an ultraviolet detector.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Norway - and OECD member
	Metric 3:	Applicability	High	The data are for tunnel construction workers which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The study was based on data from 1996-1997. prior to the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Arithmetic and geometric means were provided along with GSD.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, exposure frequency, but lacks additional metadata, such as sample durations, exposure durations, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided geometric standard deviation data that can be used to evaluate variability. Information about uncertainty was not provided.
Overall Quality Determination		Medium

HERO ID:	1628108			
Conditions of Use:	Plastic Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers involved in the manufacturing of thermoset microwave cookware and other molded plastic products			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Formaldehyde concentrations for nine press operators in the Press Department ranged from 0.52 to 1.75 parts per million (ppm) with a mean of 1.10 ppm.			
Area sampling data:	Area airborne formaldehyde samples collected at 15 locations inthe Press Department ranged from 0.23 to 1.98 ppm with a mean of 1.15 ppm. Two area samples collected in the Bipel booth yielded airborne formaldehyde concentrations of 0.08 and 0.32 ppm.			
Number of workers:	175 people are employed, of whom 150 work in production areas.			
Personal protective equipment:	respiratory protection till engineering controls are installed			
Engineering control:	NIOSH recommends that engineering controls, including local exhaust ventilation systems should be installed at all of the presses and pre-heat ovens in the Press Department to removeairborne formaldehyde at the source, and minimize worker exposures.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is approved by NIOSH
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata but lacks additional metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Conditions of Use: Plastic Manufacturing

EXTRACTION

Parameter	Data
Worker activity description:	workers involved in manufacturing thermoset (irreversibly hardened) plastic cookware products
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	Formaldehyde levels in the Compounding room were 0.2 (personal sample) ppm.
Area sampling data:	Seven area samples collected in the Pressroom for formaldehyde ranged from 0.5 to 1.0 ppm, and averaged 0.6 ppm. Formaldehyde levels in the Compounding room were 0.1 (area sample) ppm.
Number of workers:	The office area (adjacent to production) is used by about 25 employees for administrative and research purposes. 150 work in production areas, manufacturing thermoset (irreversibly hardened) plastic cookware products.
Personal protective equipment:	A protective suit and respirator were provided for this press operator.
Engineering control:	NIOSH recommended that existing local exhaust systems at the presses and pre-heat ovens should be evaluated by a ventilation contractor experienced with these types of systems for proper design and operation. In the Compounding Department, the batch mixer should be covered when it is not in operation.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Methodology is approved by NIOSH
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Uninformative	The report is for an occupational scenario, however formaldehyde is formed from melamine tablets when heated, not a COU of the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include include most critical metadata but lacks additional metadata.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site. The uncertainty can be determined from the sampling and analytical method.

Overall Quality Determination **Uninformative**

(2016). Comparison of hematological alterations and markers of B-cell activation in workers exposed to benzene, formaldehyde and trichloroethylene. Carcinogenesis 37(7):692-700.			
HERO ID:	3420801			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Worker activity description:	The formaldehyde exposure study was conducted in Guangdong, China, and included 43 exposed workers in two factories that used or manufactured melamine.			
Exposure route:	Inhalation			
Personal sampling data:	The median (10th, 90th percentiles) air exposure levels of formaldehyde in exposed workers were 1.3 ppm (0.6, 2.5).			
Exposure frequency:	For a full work shift for about three workdays over a 3-week period.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data is from a non-OECD country.
	Metric 3:	Applicability	High	Data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	Data are no more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study provides only limited discussion of the variability in the determinants of exposure and no discussion on uncertainty.

EXTRACTION

Parameter	Data
Worker activity description:	Pg 2:The work performed by BAE operators in B151 involves several discrete tasks working with Hexamine in super sacks. The tasks include 1) using a forklift to unload super sacks from the delivery truck and move them to the storage area, 2) conditioning the super sacks – use of a machine to loosen up the Hexamine particulate within the super sacks, and 3) transporting the super sacks to the 2nd floor and emptying the contents into the dissolver – i.e., charging. These three tasks typically take from 2 – 3 hours of the 12-hour shift. The operators perform other various tasks the remainder of the shift that do not include working with Hexamine (i.e., not thought to have potential exposure to formaldehyde).The personal sampling using ORBO tubes conducted during this sampling event only included the task of unloading super sacks from the delivery truck and moving them to the storage area. This task took approximately 37 minutes to perform.
Exposure route:	inhalation
Personal sampling data:	The ToxiRAE data log calculated TWA results for the Production and Forklift Operators indicated exposures of 0.06 ppm and 0.04 ppm, respectively. (pg 2)The timeframe that the ToxiRAE monitors were worn included the same time that the ORBO tube task sample of “unloading the truck” was collected, which was 9:16 a.m. to 9:53 a.m. The ToxiRAE minute-by-minute download data corresponding to this 37-minute period indicated significantly higher results from the ToxiRAE compared to the ORBO tube sample results. Specifically, the Forklift Operator’s ToxiRAE calculated “average” for the 37-minute period was 0.088 ppm compared to the ORBO tube result of 0.023 ppm. The Production Operator’s calculated ToxiRAE result for the 37-minute period was 0.081 ppm. Because the laboratory damaged the Production Operator’s ORBO tube, his ToxiRAE result could not be compared directly to the his personal ORBO tube result. However, his ToxiRAE calculated average during the same 37-minute period of 0.081 ppm was significantly higher than the Forklift Operator’s ORBO tube result of 0.023 ppm (pg 3)Based on the minute-by-minute chart, it appears that the Production Operator’s highest exposure was near the end of the super sack charging task, while the Forklift Operator’s highest exposure was during the task of unloading super sacks from the truck. (pg 4, table 3)The highest STEL for the Production and Forklift Operators were 0.23 ppm and 0.22 ppm (pg 4)Pg 8-22 restate same dataPg 23-end display minute-by-minute data from ToxiRAE
Area sampling data:	One area task sample using an ORBO tube was also collected during the truck unloading task. The sample was collected on the loading dock while super sacks were unloaded from the tractor trailer. The pump and media were positioned on the dock at the opening to back of trailer containing supersacks. The result of 0.005 ppm was well below the ACGIH STEL of 0.3 ppm. (pg 3)A second area sample using an ORBO tube was collected inside the control room. The sample was positioned approximately 3-4 feet above the floor and started prior to the truck unloading task and concluded after the super sacks had been charged into the dissolver. The sample duration was 175 minutes. This area sample result of 0.084 ppm exceeded the 12-hour adjusted ACGIH TLV of 0.05 ppm. (pg 3)Pg 8-22 restate same data
Exposure duration:	Pg 2:These three tasks typically take from 2 – 3 hours of the 12-hour shift. The operators perform other various tasks the remainder of the shift that do not include working with Hexamine (i.e., not thought to have potential exposure to formaldehyde).The personal sampling using ORBO tubes conducted during this sampling event only included the task of unloading super sacks from the delivery truck and moving them to the storage area. This task took approximately 37 minutes to perform.Pg 4 (Table 3): The ToxiRAE sample durations were only approximately 230 minutes.Pg 5 (Table 4): The control room area sample duration wasapproximately 175 minutes.
Number of workers:	2 operators sampled
Personal protective equipment:	Full face respirator, coveralls/hat, gloves, safety toe shoes, safety glasses (pg 8)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data are from the U.S.
	Metric 3: Applicability	Medium	Data are for hexamine handling, which may relate to an in-scope COU.

Conditions of Use:	Office Environment		
EXTRACTION			
Parameter	Data		
Exposure route:	inhalation		
Physical form:	vapor		
Area sampling data:	San Francisco Nay National Wildlife Refuge Visitor Center: 0 -0.03 ppm		
Exposure duration:	8 hrs		
Exposure frequency:	5 days/week		
Number of workers:	16		
Engineering control:	It is recommended that the formalin solution used by the biologists for preserving the wildlife samples be well controlled to prevent vapors from penetrating the general office areas. If the solution is to be used frequently, than -consideration should be given to using the chemical under a laboratory hood. Also the formalin solution along with other chemicals used in the laboratory should be stored in a proper storage cabinet to contain chemical odors. Consideration might be given to storing the preserved specimens in a ventilated cabinet to control the formaldehyde vapors.		
Comments:	Emission sources being considered include off-gassing from the plastic furniture, wood paneling, and synthetic carpet, these may be subject to other regulations. But the study suggested that the most significant source is likely to be the biologist use Formalin on site to preserve wildlife samples.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High
			NIOSH study - Area air samples were collected using a sampling train {calibrated vacuum pump} and a one percent sodium bisulfite impinger solution through which a known volume of air was passed. A second method was used in an attempt to characterize the long term formaldehyde air concentrations. This method utilized a passive dosimeter (filter)! which was hung a specified height from the ceiling and exposed to the ambient air for seven days. It should be noted that the second method is not a valid NIOSH sampling method due to sampling efficiency of the filter when the filter becomes -dry, thus this data should be carefully scrutinized. The impinger solution and filters were each analyzed by NIOSH Physical and Chemical Analytical method (P&CAM) number 125 (1).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High
	Metric 3:	Applicability	High
	Metric 4:	Temporal Representativeness	Low
	Metric 5:	Sample Size	High
			Results for 7 samples were provided for different locations: Secretary’s desk, biologist’s office, Open office, project leaders office, and library.
Domain 3: Accessibility/ Clarity

			Rating	Comments
Metric 6:		Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, exposure durations, and exposure frequency, but lacks additional metadata on worker activities.
Domain 4: Variability and Uncertainty				
Metric 7:		Metadata Completeness	High	The study provided individual results for different locations that can be used to evaluate variability. The NIOSH methods include assessment of uncertainty.
Overall Quality Determination			High	

Study Citation:	Belanger, P. L., Coye, M. J. (1981). Health hazard evaluation report no. HHE 80-185-842, Department of Munipal Railway Woods Division, San Francisco, California.			
HERO ID:	3970531			
Conditions of Use:	commercial and industrial use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Storekeepers and mechanics working at the Department of Municipal Railway (Woods Division), which operates a maintenance and servicing terminal.			
Exposure route:	inhalation			
Physical form:	gas			
Area sampling data:	No formaldehyde was detected on any of the detector tubes.			
Exposure duration:	8-hour day and 40-hour work week			
Number of workers:	11 in the storekeeping area			
Engineering control:	It is recommended that the use of respirators needs to be started for workers changing wheels for drum grinding. A local exhaust duct which is compatible to the three types of bus exhaust ducts should be designed and utilized when buses are operated indoors. Steps should be taken to assure that air exhausted on the third floor is not permitted to cross contaminate the make-up air units located nearby. Buses which are serviced with fuel should be returned to the parking lot immediately as opposed to idling the buses outside of the light maintenance area to prevent diesel-fume contamination of the horizontal make-up air ducts.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evalu- ated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	High	Distribution of samples or sample size are characterized by no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study addresses some variability in the determinants of exposure for the samplesite or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.

Conditions of Use:		Processing as a reactant		
Domain		Metric	EVALUATION	
			Rating	Comments
Metric 7:		Metadata Completeness	Medium	Data from individual sampling runs were provided which can be used to assess variability between sampling days, locations and equipment. Uncertainty is not addressed.
Overall Quality Determination			High	

Study Citation:	Bellisario, V., Mengozzi, G., Grignani, E., Bugiani, M., Sapino, A., Bussolati, G., Bono, R. (2016). Towards a formalin-free hospital. Levels of 15-F2t-isoprostane and malondialdehyde to monitor exposure to formaldehyde in nurses from operating theatres. Toxicology Research 5(4):1122-1129.
HERO ID:	3420612
Conditions of Use:	Laboratory Use

EXTRACTION	
Parameter	Data
Worker activity description:	preserving surgical samples/biopsies (pg 2-3)
Exposure route:	inhalation
Physical form:	vapor (volatilized from formalin)
Personal sampling data:	”20.7 +/- 23.3 $\mu\text{g}/\text{m}^3$ (entire population); 33.7 +/- 37.9 $\mu\text{g}/\text{m}^3$ (using FA); 14.6 +/- 4.6 $\mu\text{g}/\text{m}^3$ (not using FA) (pg 5) Additional breakdown (UVS vs. no UVS, prefilled vs liquid FA etc.) provided ”
Exposure duration:	8 hr/day
Number of workers:	94 female nurses in Piedmont region of Italy involved in study (pg 2); 30 reported using FA on sampling day, 12 using prefilled FA vials and 18 handling liquid FA (pg 4)
Engineering control:	Under-Vacuum Sealing - alternative preserving method to use of formalin
Comments:	94 total samples, 64 using FA during sampling day, 30 not (pg 4). 8 hr sampling (assumed TWA) (pg 3).

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Italy, an OECD country.
	Metric 3:	Applicability	High	Data are for lab chemical (medical samples), an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, SD) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling workers using/not using differing amounts/forms of formaldehyde, but uncertainty is not addressed.

Overall Quality Determination

High

Study Citation:	Belloc-Santaliestra, M., Haar, v.d., R., Molinero-Ruiz, E. (2015). Occupational exposure assessment of highway toll station workers to vehicle engine exhaust. Journal of Occupational and Environmental Hygiene 12(1):51-61.			
HERO ID:	2533686			
Conditions of Use:	Automobile Exhaust			
EXTRACTION				
Parameter	Data			
Worker activity description:	Toll station workers for two highway toll stations in semi-urban areas			
Exposure route:	Inhalation			
Personal sampling data:	For Tollway Station A, formaldehyde concentrations (ug/m3) for 8 attendants over 2 days ranged from 4.68 for Attendant #7 (automatic truck lane attendant) on Day 1 to 19.33 for Attendant #2 on Day 1. For Tollway Station B, formaldehyde concentrations (ug/m3) for 7 attendants ranged from 0.06 for Attendant #3 (manual car lane attendant) to 16.21 for Attendant #1 (manual truck lane attendant).See Table VI (pg. 9/12)			
Area sampling data:	For Tollway Station A, ambient background formaldehyde concentration was 1.64 ug/m3. For Tollway Station B, ambient background formaldehyde concentration was 1.19 ug/m3.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data is from Spain, an OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Data presented is less than 10 years old
	Metric 5:	Sample Size	Low	No statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

HERO ID:	6113331		
Conditions of Use:	Closed Pre-school Building		
EXTRACTION			
Parameter	Data		
Area sampling data:	Analyzed values of concentration in exposure hood for formaldehyde in 2 different studies: 573 and 691 ug/m3. The ratio of estimated and empirical values for formaldehyde 0.94.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country other than the U.S.
	Metric 3: Applicability	Low	Data is for consumer use in pre-school but may be useful for commercial use in Toys, playground, and sporting equipment.
	Metric 4: Temporal Representativeness	Low	Report is more than 20 years old.
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low	

Study Citation:	Berke, J.H. (1987). Cytologic examination of the nasal mucosa in formaldehyde-exposed workers. Journal of Occupational and Environmental Medicine 29(8):681-684.			
HERO ID:	3325			
Conditions of Use:	Paper Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Phenol-formaldehyde impregnating process. Passing a single thickness of paper on a continuous roll through a phenol-formaldehyde bath. The paper then enters a dryer in which it is heated to cure the phenol-formaldehyde resin and evaporate excess water and formaldehyde. The majority of formaldehyde exposure occurs in the bathing and drying steps.			
Exposure route:	Liquid contact, Vapor. Dermal, Inhalation			
Personal sampling data:	0.02 - 1.3 ppm (PBZ at the "former plant"); 0.5 - 2.0 ppm (PBZ at the "latter plant")			
Area sampling data:	15 ppm (short-term at both locations); 9 ppm (excursions near drying ovens when ventilation system disruptions occurred)			
Number of workers:	80 (3 locations)			
Comments:	4 groups 3 with occupational exposure and 1 control. (The extracted area sample measurement maybe a personal sample)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for paper manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Data collected before the most recent PEL (1992). PBZ data for groups 1 and 2 plants date back to the mid 1970s. Published in 1987.
	Metric 5:	Sample Size	Low	Sample distribution is characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Sample type provided but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Low		

Study Citation:	Bernardini, P., Carelli, G., Rimatori, V., Contegiacomo, P. (1983). Health hazard for hospital workers from exposure to formaldehyde. La Medicina del Lavoro 74(2):106-110.			
HERO ID:	6110213			
Conditions of Use:	Use in cleaning products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Cleaning operations in a hospital; bathrooms, service floors, ward floors, corridors, and nurses’ rooms			
Physical form:	Lysoform cleaner mixed in 1:9 ratio with water; lysoform is 6-8% formaldehyde			
Personal sampling data:	samples ranged between 0.180-0.260 mg/m3 (with durations for each sample)			
Area sampling data:	samples ranged between 0.020-0.254 mg/m3 (with durations for each sample)			
Exposure duration:	morning washing operation took from 60-120minutes and afternoon operation took from 30-60minutes			
Exposure frequency:	14 days (once a day) every five weeks based on cleaning shift rotation			
Number of workers:	NIOSH estimated in 1972-1973 that one third of total 1.5million workers exposed to formaldehyde were employed in medical services			
Personal protective equipment:	rubber gloves worn on the job			
Engineering control:	Windows typically opened in rooms to increase airflow			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Italy, an OECD country.
	Metric 3:	Applicability	High	Data are for use in cleaning products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by changing conditions of whether window is opened during one sample, but uncertainty is not addressed.

Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from Germany, an OECD country.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5: Sample Size	Medium	Sample distribution characterized by limited statistics (means) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Low	

Study Citation:	Blade, L. M. (1996). James River Corporation, Packaging Business Greensburg, Indiana HETA 93–0670–2557 January 1996.			
HERO ID:	8048989			
Conditions of Use:	Plastic and resin manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Packers, operators, and adjusters in the bag department. Extruder operators and helpers in the extrusion department. Plate makers in the printing department. (30/37)			
Exposure route:	inhalation, dermal (8/37)			
Physical form:	gas (8/37)			
Personal sampling data:	No formaldehyde was detected in personal samples. (10/37)			
Area sampling data:	Area samples near the bag machines ranged from 0.021-0.061 ppm. (35/37)			
Exposure duration:	8-12 hours/day (4/37)			
Number of workers:	Over 10 employees work in the Extrusion Department during each of two 12-hr shifts. Approximately four employees work in the Maintenance Department die shop. Approximately 13 employees work in the Printing Department pre–press area. The Bag Department employs approximately 54 people during each of three 8–hr shifts. (4/37)			
Engineering control:	All four print mold making machines are equipped with local exhaust ventilation. During the initial NIOSH survey, only a few of the bag machines were equipped with local exhaust ventilation. In early 1994, between the initial survey and the first follow–up visit, the remaining machines were equipped with local–exhaust enclosures constructed of transparent plastic plates fastened together. (4/37)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for plastic material and resin manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL but greater than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure frequency and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. The monitoring study addresses variability in the determinants of exposure for the sampled site .
Overall Quality Determination		High		

Study Citation:	Blair, A., Stewart, P.A., Hoover, R.N. (1990). Mortality from lung cancer among workers employed in formaldehyde industries. American Journal of Industrial Medicine 17(6):683-699.			
HERO ID:	32197			
Conditions of Use:	Processing as a reactant			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	duration of exposure was estimated for concentration bins of (0 ppm; <0.1 ppm,0.1-<0.5 ppm; 0.5-<2.0 ppm; >2.0 ppm (Table III)			
Exposure duration:	Cumulative exposure durations were estimated for different levels of exposure (Table III); too complicated to represent in a spreadsheet - image provided in supplemental tab , the study also provides a matrix of cumulative exposure (ppm-yr) for each site (Table IV) also included in the supplemental tab			
Number of workers:	Cohort of 26,561-described in detail elsewhere [Blair et al., 1986; Stewart et al., 1986			
Comments:	methods described in detail elsewhere [Blair et al., 1986; Stewart et al., 1986

Study Citation:	Bolstad-Johnson, D.M., Burgess, J.L., Crutchfield, C.D., Stormont, S., Gerkin, R., Wilson, J.R. (2000). Characterization of firefighter exposures during fire overhaul. American Industrial Hygiene Association Journal 61(5):636-641.			
HERO ID:	16335			
Conditions of Use:	Firefighting			
EXTRACTION				
Parameter	Data			
Worker activity description:	Fire overhaul, which is the search by firemen for hidden fires inside attics, ceilings and walls after they suppress fires.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Average sample concentration 0.25 ppm; STD Dev 0.252 ppm; Min 0.016 ppm; Max1.18 ppm			
Area sampling data:	Firefighters were monitored during 25 structure fires (25 houses, 6 apartments, and 5 commercial buildings.			
Exposure duration:	The overhaul phase of a fire lasts an average of 30 min. (PDF pg. 1/6) Sampling times were 20 minutes for each event			
Exposure frequency:	Firefighters from a single station responded to 26 fires from June 13 - Sep. 25 of 1998. (PDF pg. 2/6)			
Number of workers:	The number of firefighters who conduct overhaul during firefighting is not stated. However, an estimate of this number is the number of firefighters who conducted the monitoring during this study which is 4 individuals per fire event			
Personal protective equipment:	Masks tend to be removed during this phase of the fire fighting operation, researchers recommended using SCUBA units, but as they are bulky full face APRs were also suggested			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH sampling and analytical methods used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data pertains to U.S.
	Metric 3:	Applicability	High	Exposure of firefighters is an exposure scenario that is associated with a COU.
	Metric 4:	Temporal Representativeness	Medium	The data are slightly older than 20 years but time probably is not a factor regarding the pertinence of the data.
	Metric 5:	Sample Size	High	Statistical distribution is characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Meta data included.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Monitoring occurred at different types of structures. Method sensitivity is given.
Overall Quality Determination		High

Study Citation:	Bono, R., Munnia, A., Romanazzi, V., Bellisario, V., Cellai, F., Peluso, M.E. (2016). Formaldehyde-induced toxicity in the nasal epithelia of workers of a plastic laminate plant. Toxicology Research 5(3):752-760.		
HERO ID:	3420607		
Conditions of Use:	Plastic Manufacturing		
EXTRACTION			
Parameter	Data		
Worker activity description:	Plastic laminate plant workers		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	Table 1 shows indoor formaldehyde exposure levels: Controls workers - 35.2 +/- 3.4 ug/m^3; Plastic laminate plant workers - 211.4 +/- 14.8 ug/m^3		
Exposure duration:	working shift (8 hours) with a typical 40 hour work week		
Number of workers:	95 workers studied with 50 being FA workers and 45 office personnel		
Personal protective equipment:	Extractor hoods were regularly active in the plastic laminate plant, whereas personal protective equipment were provided and available as well (e.g. mask), but they were not regularly used by all the workers		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Source is peer reviewed so likely contains high quality data.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data is for Italy, an OECD country.
	Metric 3: Applicability	High	Data is directly applicable for use of formaldehyde in producing plastic products
	Metric 4: Temporal Representativeness	High	Data is less than 10 years old (2016).
	Metric 5: Sample Size	Medium	Characterized by range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Provides worker activity, exposure route, physical form, personal sampling data, PPE, exposure duration and frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	Does not address variability or uncertainty.
Overall Quality Determination		High

Exposure route:	Inhalation			
Physical form:	Air-borne formaldehyde			
Area sampling data:	0.49 ppm, 0.49 ppm, 0.10 ppm, 0.17 ppm			
Comments:	Formaldehyde levels were measured in the cottage associated with patients 1 and 2, 16 months after it was built. In the adjoining apartment of patient 2, 16 months after it was built. In the mobile (manufactured) home of patient 4, 5 years after it was bought.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for home occupants, which is similar to the in-scope occupational scenario chemical substances in building/construction materials.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL (1992) and greater than 10 years old. Published in 1994.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Medium		

Study Citation:	Bruno, E., Somma, G., Russo, C., Porozaj, D., Pietroiusti, A., Alessandrini, M., Magrini, A. (2018). Nasal cytology as a screening tool in formaldehyde-exposed workers. Occupational Medicine 68(5):307-313.			
HERO ID:	4471271			
Conditions of Use:	pathology and anatomy laboratories			
EXTRACTION				
Parameter	Data			
Exposure route:	mainly by inhalation because of formaldehyde emission from aqueous solution (embalming fluids)			
Area sampling data:	The mean formaldehyde concentrations ranged from <0.04 to 0.15 parts per million (ppm). The maximum levels of formaldehyde concentrations ranged from 0.2 to 0.67 ppm. Table 2 contains a summary of mean, median, and range of air concentrations during different seasons.			
Engineering control:	The laboratory is equipped with combined general and fume hood exhaust system. The general ventilation system consists of two circular anemostats for primary air intake and two rectangular ceiling extractors. Local exhaust consists of three hoods (one Grosslab Senior and two Grosslab Junior) that use a recirculating exhaust system to filter (using formaldehyde neutralizing filters) and recirculate the air.			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country, other than the U.S., and locality-specific factors (e.g., potential differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The operations, equipment, and worker activities associated with the data are expected to be representative of current operations, equipment, and activities. The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter. If no PEL is established, the data are no more than 10 years old. Metadata on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.

Study Citation:	Burgess, J. L., Gerkin, R., Hysong, T. A., Lantz, R., Nanson, C. J., Witten, M. L. (2002). Rapid decline in sputum IL-10 concentration following occupational smoke exposure. Inhalation Toxicology 14(2):133.			
HERO ID:	6029821			
Conditions of Use:	Industrial Use (Non-incorporative activities)			
EXTRACTION				
Parameter	Data			
Worker activity description:	A particular phase of firefighting, called overhaul, follows extinguishment of visible flames and involves searching for and putting out hidden sources of combustion. During this phase, firefighters often do not wear respiratory protection due to the lack of visible smoke, but elevated concentrations of a number of products of combustion may still be present.			
Exposure route:	inhalation			
Personal sampling data:	Mean: 0.25 ± 0.26 ppm			
Exposure duration:	Over-haul was conducted for a minimum of 25 min in all incidents.			
Number of workers:	12 firefighters			
Comments:	Sorbent tube samples were collected for aldehydes (acetalde-hyde, acrolein, benzaldehyde, formaldehyde, glutaraldehyde, isovaleraldehyde), benzene, hydrochloric acid, hydrogen cyanide, and sulfuric acid.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S. Phoenix Fire Department firefighters.
	Metric 3:	Applicability	High	Data are for non-incorporative activities (fires, fuel combustion), an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Sample type provided but no other metadata (only firefighter demographics, lung function, sputum conc.).
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Medium		

Study Citation:	Burgess, J. L., Nanson, C. J., Bolstad-Johnson, D. M., Gerkin, R., Hysong, T. A., Lantz, R. C., Sherrill, D. L., Crutchfield, C. D., Quan, S. F., Bernard, A. M., Witten, M. L. (2001). Adverse respiratory effects following overhaul in firefighters. Journal of Occupational and Environmental Medicine 43(5):467-473.			
HERO ID:	3050028			
Conditions of Use:	Firefighting			
EXTRACTION				
Parameter	Data			
Worker activity description:	firefighters; Overhaul- is the stage in which firefighters search for and extinguish possible sources of re-ignition			
Exposure route:	inhalation			
Area sampling data:	Combustion products exposure during overhaul: in Tuscon – 0.109 +/- 0.182 ppm; in Phoenix – 0.257 +/- 0.249 ppm			
Number of workers:	51 firefighters cited in this article			
Personal protective equipment:	cartridge respirators			
Comments:	”It is common practice not to wear respiratory protection during overhaul. ”(p.1) The time interval between cessation of extinguishment and the start of overhaul was similar in Tucson (n=4, mean 20.3 +/- 9.2 minutes) and Phoenix (n=7, mean 21.7 +/- 10.0 minutes).			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology is well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	data are from the United States
	Metric 3:	Applicability	Low	Data notes source as combustion byproduct, which is not a condition of use, however, exposures also could include off-gassing from building products and other products in the vicinity when overhauling.
	Metric 4:	Temporal Representativeness	Low	more than 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Provides only limited discussion of the variability in the determinants of exposure but no discussion of the uncertainty in the exposure estimates.
Overall Quality Determination		Medium

HERO ID:	1989341			
Conditions of Use:	Use of electrical and electronic products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Greatest potential for generating airborne contaminants: wave soldering, using automatic (belt-fed) vapor degreaser, and numerous manual solder touch-ups; Formaldehyde specifically is expected to be generated as pyrolysis product of soldering. Report also indicated that these exposure measurements may have contributions from wood paneling on the walls of the SEM areas, these were subsequently removed before NIOSH measurements.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Private IH results: Total aldehydes measured 0.17-0.27 mg/m3, which is reported to be near the LOD for the analytical method.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Methodology used a NIOSH method (No. 2502), which has since been withdrawn.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old prior to recent PEL.
	Metric 5:	Sample Size	Medium	Unknown number samples, range is provided with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data is unclear if sample is personal or area measurement and lacks other metadata (sample durations, exposure durations, and frequency).
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Due to lack of clarity on monitoring study, it is uncertain how variability was addressed. Assumes the monitoring study addresses uncertainty in the exposure estimates can be determined from the sampling and analytical method.

HERO ID:	1989341			
Conditions of Use:	Use of electrical and electronic products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Greatest potential for generating airborne contaminants: wave soldering, using automatic (belt-fed) vapor degreaser, and numerous manual solder touch-ups; Formaldehyde specifically is expected to be generated as pyrolysis product of soldering. Measured Workers: wave-solder machine operator, a touch-up solderer, and a quality assurance inspector			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	All formaldehyde samples were below the limit of detection (LOD) of 2 micrograms (ug) per sample.			
Number of workers:	The 23 workers interviewed represented 51% of the 45 persons either presently working in SEM, performing SEM-related activities at work stations that were moved to another area of the plant since November 1986, or were employed in the SEM area as of January 1986 but have transferred to other jobs.			
Personal protective equipment:	NIOSH recommended gloves which offer a higher degree of protection.			
Engineering control:	The SEM areas are supplied by 20 separate air conditioning units mounted on the roof of the plant. These units, several of which supply the front offices and fiber optic areas in the building, have dedicated returns. The units vary in capacity from 4.5 to 25 tons, and steam coils, located in supply ducts, supplement ceiling-mounted space heaters in providing heat. NIOSH recommended 4 flexible exhaust hoses, located at the SEM final inspection area, should be lengthened to permit the exhaust opening to reach within 1 to 2 inches of the point of work. Recirculation of exhaust air from the SEM areas is not recommended considering the agents presently being used; Local ventilation used near wave solder and degreasers machine (estimated flow of 3000 ft3/min).			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Methodology used a NIOSH method (No. 2502), which has since been withdrawn.

HERO ID:	3970553			
Conditions of Use:	Unknown- School			
EXTRACTION				
Parameter	Data			
Worker activity description:	Teachers			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Oct 28-Nov 9,1992 - Formaldehyde concentrations ranged from 0.017 to 0.058 ppm, expressed as time-weighted averages. The highest formaldehyde concentrations were measured in C113, one of the group of first floor/central pod classrooms which had CO2 levels ranging up to 4,000 ppm. For comparison, formaldehyde levels measured outside the school ranged from 0.004 and 0.006 ppm (levels between the minimum detectable and minimum quantifiable concentrations for this sampling and analytical method).During the follow-up survey conducted on February 25, 1993. Formaldehyde concentrations ranged from 0.011 - 0.023 ppm. On average, formaldehyde levels measured in February 1993 wereapproximately 50% lower than those measured at TCN in October 1992.			
Number of workers:	75 teachers and administrators, 10 cafeteria workers, and 8 custodial employees.			
Engineering control:	Increasing the amount of relief ventilation for the school, improving access to ventilation system components, and using more efficient filter media.The height of exhaust vents on the roof should be raised to reduce the chance of recirculation into nearby outside air intakes.

HERO ID:	1320875
Conditions of Use:	Use of Adhesives and Sealants

EXTRACTION	
Parameter	Data
Worker activity description:	The furnace operators spent the majority of their time in a climate-controlled control booth.For the metal pouring operation, two crane operators worked in open cabs. For some of the large molds, the pourer was required to climb a ladder to assist the crane operator with positioning the ladle before and while pouring. In the small core room, employees made oil-based cores which were baked in a gas-fired oven. In the large coremaking area, cores and molds were made of a phenolic-formaldehyde binder mixed with silica sand in an automatic mixer. Compressed air was used to remove excess sand in the coremaking and molding departments.The metal castings were shaken out of the molds while still hot (referred to as "shakeout") on second and third shifts. For certain castings, workers used compressed air to remove excess sand from internal cavities. Sledge hammers were also used to manually remove sand from the castings. Two Bobcat@ front-end loaders were used to load the sand reclamation system and shake out some of the castings. Brooms were used to clean up excess dry sand throughout the facility.
Exposure route:	Inhalation
Physical form:	vapor
Area sampling data:	There may be an issue with the presented data.The text claims: "The results for the five area air samples in the coremaking, molding, and pouring areas are given in Table 6. The results ranged from 0.012 to 0.026 ppm.Table 6.TWALarge Core making Department 1,170.026 ppmSmall Pouring Line 1,210.012 ppmSmall Molding Line 1,190.013 ppmLarge Molding Area 1,310.012 ppmSmall Pouring Line 1,260.021 ppm_____
Number of workers:	44 production workers on day shift, 3 on the afternoon shift and 8 on the night shift.
Personal protective equipment:	Safety shoes, hard hats, and safety glasses were required throughout the facility. NIOSH/Mine Safety And Health Administration (MSHA) approved half-mask respirators with dust/fume/mist cartridges were available upon request. Hearing protection devices (disposable plugs) were required in the shakeout area. Flame retardant clothing was worn by the pourers. Recommend organic vapor cartridge in conjunction with an air-purifying respirator with a high-efficiency particulate filter.
Engineering control:	General ventilation was supplied by propeller fans: two wall fans and two ceiling fans. At the time of the survey, the two ceiling fans over the large mold pouring area were in operation. Heat was provided by direct-fired gas space heaters. Additional general ventilation was supplied by open doors and windows during the warmer months.Recommended:- The shaker table should be enclosed with movable sides to enable ease of movement for large castings. The enclosure should be ventilated to help contain emissions.- The compressed air hoses should be eliminated and replaced with a central vacuum system. As an interim measure, the existing air lines should be regulated to reduce air to less than 30 pounds per square inch (psi) to lessen dust levels currently being generated.3- Make-up air system should be installed to supply fresh air and heat, therefore, replacing the existing direct-fired gas space heaters.- The molds should be poured on a conveyor that then enters an enclosed and ventilated tunnel. The tunnel could lead to a smokehouse where the molds can off-gas safely until ready for the shakeout operation.

Conditions of Use:	Use of Adhesives and Sealants			
EXTRACTION				
Parameter	Data			
Worker activity description:	The shell core employees load bags of resin-coated sand into a sand hopper which feeds sand into the machine. When the machine opens, an employee pulls out the core and sets it on a table, checks it for flaws, and applies a water-based graphite core wash. Two employees work with the Pepset process, a hand-controlled crane is used to move molds to an adjacent open pouring area. To produce the core nine employees are needed for the no-bake coremaking/molding process. An employee fills the box with pre-heated resin-coated sand at the beginning of the conveyor system. Another employee applies a white Zircon™ wash. The box is turned over and goes through an infrared (IR) heater. Two employees put Pepset cores into the bottom (drag), then add the top (cope) and close. Excess sand is removed using compressed air. Another employee lines up the molds to be poured.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Eight area air samples were collected for formaldehyde: The five formaldehyde samples concentrations collected in the Pepset and No-Bake areas ranged from 0.02 to 0.08 ppm. Three formaldehyde sample concentrations collected in the green sand and shell core areas ranged from 0.03 to 0.17 ppm.			
Exposure duration:	Assumed up to 10 hours per day and 40 hours per week.			
Number of workers:	475 production workers and 100 management staff			
Personal protective equipment:	Recommended that gloves should be worn.			
Engineering control:	Improve ventilation systems

Study Citation:	Burton, N. C., Monestersky, J. (1996). Health hazard evaluation report 96–0135–2612 Eagle Knitting Mills, Inc. Shawano, Wisconsin December 1996.			
HERO ID:	1320760			
Conditions of Use:	Use of fabric, textile and leather products			
EXTRACTION				
Parameter	Data			
Worker activity description:	There are ten employees in the cutting department who use either automatic spreading machines or tables on which the fabric is hand-laid to match stripes, glued, and cut using a band saw or straight knives. The cut pieces are sorted into buckets and transported to the sewing area.The sewing department employs about 50 individuals, who work in teams to make the clothing. The completed garments are taken to the finishing department, which has ten employees. Four employees inspect the garments for things such as stitching, loose threads, matching stripes, spots, and stains. There are two spotting stations, used to remove stains from the garments, located adjacent to the sewing department. A heat press is used for fusible fabric. After inspection, the garments are folded and packed to ship to the customer.The maintenance department is staffed by two persons who do awide variety of activities including machine repair and maintaining the ventilation systems. (Page 11-12 of 32)			
Exposure route:	Inhalation and Dermal: When a garment manufacturing facility receives pre-cured, finished fabric from textile-finishing plants, these treated fabrics contain some residual formaldehyde and off-gassing may occur during the cutting and assembly process. Besides off-gassing of free formaldehyde from the already cured resin-treated fabric, there may be exposure to formaldehyde bound or adsorbed on particulates. Upper airway and pulmonary complaints may arise by the inhalation route, and skin complaints may develop from dermal exposure (Page 13 of 32)			
Physical form:	Vapor (Page 11 of 32)			
Personal sampling data:	See Table 1 on page 22 of 32 for results, also listed below. See page 15 of 32 for discussion. Sewer Trace (0.03 ppm)Sewer/Dodge City Trace (0.03 ppm)Supervisor/Cutting Room Trace (0.04 ppm)Sewer/Musical Chairs Trace (0.04 ppm)Bundler Trace (0.06 ppm)Inspector Trace (0.05 ppm)Sewer/Looney Tunes Trace (0.03 ppm)Cutter Trace (0.05 ppm)Sewer/Looney Tunes Trace (0.04 ppm)			
Area sampling data:	See Table 1 on page 22 of 32 for results, also listed below. See page 15 of 32 for discussion. Sewing - Adjacent to Cleaning Trace (0.04 ppm)For formaldehyde released from fabric See Table 2 on page 23 of 32 for results. See page 15 of 32 for discussion.			
Particle size characterization:	See Table 3 on page 24 of 32 for Formaldehyde content of inhalable particles, results also listed below:Sewer/Musical Chairs 0.17 mg/m3Sewer/Mash 0.1 mg/m3Sewer/Little Haiti 0.06 mg/m3Sewer/Looney Tunes 0.08 mg/m3Sewer 0.19 mg/m3			
Exposure duration:	At the time of the site visit, the facility was operating six days (53 hours) per week. (Page 10 of 32)			
Number of workers:	85 employees including management, all full-time (page 10 of 32)			
Personal protective equipment:	Some employees who work at the heat press use Johnson & Johnson Germ filter masks as protection from organic vapors and dust. (Page 11 of 32)			
Engineering control:	The company is housed in a single-story building and has nine ceiling exhaust fans which are used in the summer. (page 10 of 32)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study - Methods 2541 and 5700
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (Garment fabrication) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	1996 - after the PEL (1992) but more than 20 years old
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in NIOSH methods 2541 and 5700.

Comments:	Human Health Risk Assessment- (6 hours/day in this study), EF—exposurefrequency (350 days/year in this study)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Poland, an OECD country.
	Metric 3:	Applicability	High	Data are for WWTPs, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by collecting samples over multiple weeks/years at the same location.
Overall Quality Determination		High		

Study Citation:	C-A, Nilsson, Lindahl, R., Norstrom, A. (1987). Occupational exposure to chain saw exhausts in logging operations. American Industrial Hygiene Association Journal 48(2):99-105.			
HERO ID:	2948482			
Conditions of Use:	Installation/Demolition of Building Materials			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers are in the logging and wood cutting industry: Felling, limbing, bucking and skidding.			
Exposure route:	inhalation			
Physical form:	vapor, dust			
Personal sampling data:	Table 1 provides exhaust emissions during a simulated run cycle: mean - 120 mg/m^3 with 16% SD. Table 2 provides exhaust composition at various fuel-air ratios for one make of chain saw: Lean - 200 mg/m^3; Fuel-air ratio normal - 120 mg/m^3; Rich - 110 mg/m^3. Table 3 provides exposure to chain saw exhaust during logging under snow-free conditions: TWA - 0.08 mg/m^3; Range - 0.04-0.2 mg/m^3. Table 4 provides exposure to chain saw exhaust during logging in the winter with snow on the ground: TWA - 0.08 mg/m^3; range - 0.02-0.1 mg/m^3. Table 5 is a comparison of exposure to chain saw exhaust for loggers engaged solely in felling and those performing ordinary logging (felling, Limbing, Bucking and manual skidding): Felling: TWA - 0.09; range - 0.07-0.1; Ordinary Logging: TWA - 0.07 mg/m^3; range - 0.03-0.09 mg/m^3.			
Exposure duration:	Exposure during working hours of logging divided into 3 periods during the day, each period ranging from 1.5 hr to 2.5 hr. Total working time varies between 6.5 to 7 hr. Exposure measured from time chain saw started until it is switched off. Chain saw operated 65-90% of the time during a work period.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is for Sweden, an OECD country.
	Metric 3:	Applicability	High	Data is for occupational exposure using chainsaws in the wood cutting industry
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old (1987)
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by looking at different mixes of fuel on chainsaws and sampling multiple days for different weeks of the year. Does not address uncertainty.
Overall Quality Determination		Medium		

Study Citation:	California Office of Environmental Health Hazard Assessment (OEHHA) (2014). Appendix D: Individual acute, 8-hour, and chronic reference exposure level summaries.			
HERO ID:	5155603			
Conditions of Use:	Wood processing plant			
EXTRACTION				
Parameter	Data			
Worker activity description:	Wood processing plant employees.			
Exposure route:	inhalation			
Physical form:	gas/vapor			
Area sampling data:	Ambient formaldehyde measurements in these three composite wood processing plants between 1975 and 1983 gave a time-weighted average (TWA) of 0.1-1.1 mg/m3 (0.08-0.89 ppm) with peaks of up to 5 mg/m3 (4 ppm). 1975 study reported that estimated formaldehyde exposures of 0.25-1.39 ppm evoked numerous complaints of upper respiratory tract and eye irritation among seven embalmers at six different funeral homes. Exposure measurements taken from a group of West Virginia embalmers were used as exposure estimates for the embalming process, ranging from 0.3-0.9 ppm (average 1-hour exposure) and 0.4-2.1 ppm (peak 30-minute exposure). 1987 study reported dose-dependent increase in health complaints (eye and throat irritation, and headaches) in 2000 residents living in 397 mobile and 494 conventional homes. Complaints of symptoms of irritation were noted at concentrations of 0.1 ppm formaldehyde or above. dose-dependent increase in health complaints (eye and throat irritation, and headaches) in 2000 residents living in 397 mobile and 494 conventional homes. Complaints of symptoms of irritation were noted at concentrations of 0.1 ppm formaldehyde or above. Occupants of houses insulated with urea-formaldehyde foam insulation (UFFI) (1726 subjects) were compared with control subjects (720 subjects) for subjective measures of irritation, measures of pulmonary function (FVC, FEV1, FEF25-75, FEF50), nasal airway resistance, odor threshold for pyridine, nasal cytology, and hypersensitivity skin-patch testing (Broder et al., 1988). The mean length of time of exposure to UFFI was 4.6 years. The mean concentration of formaldehyde in the UFFI-exposed group was 0.043 ppm, compared with 0.035 ppm for the controls. 1989 study found FA levels in 34 wood workers exposed to FA had levels from 0.4 to 0.5 ppm. sub chronic epidemiological study of 38 anatomy class students who, on average, were exposed to a geometric mean of 0.70 ± 2.13 ppm formaldehyde for two hours per week over fourteen weeks. effects of formaldehyde exposure in plywood workers (93 exposed, 93 controls) exposed for 26.6 years, on average, to 1.13 ppm (range = 0.28 -3.48 ppm). Chemical plant workers (70 subjects) were exposed to a mean of 0.17 ppm (0.26 mg/m3) formaldehyde for an unspecified duration. irritant symptoms and pulmonary function of 47 carpentry workers exposed to a mean concentration of formaldehyde of 0.36 ppm (range = 0.04 -1.25 ppm) with 20 unexposed controls.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Report is from California office of environmental health so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US.
	Metric 3:	Applicability	High	Data is applicable to multiple COUs, primarily manufacturing, processing, and industrial uses.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old.
	Metric 5:	Sample Size	Medium	Most data is characterized by statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Does not provide much information about sampling data and information is not formatted in a way that makes it readable/easily presentable

Personal protective equipment:	Protective equipment should include rubber gloves, protective aprons, and eye and face protection.			
Engineering control:	Hoses connecting free-standing modular components of hemodialysis systems to drain lines should be air tight to prevent formaldehyde vapors from escaping into treatment rooms.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Report is more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by testing at multiple facilities but uncertainty is not addressed.
Overall Quality Determination		Medium		

Study Citation:	CDC, (1983). Formaldehyde exposures in a gross anatomy laboratory–Colorado. MMWR. Morbidity and Mortality Weekly Report 31(52):698-700.			
HERO ID:	6230077			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Medical and dental students dissecting cadavers.			
Exposure route:	inhalation			
Area sampling data:	Results of the environmental sampling showed formaldehyde levels ranging from less than 0.02 ppm to 2.7 ppm.			
Number of workers:	25			
Personal protective equipment:	Persons handling formalin or preparing dilute formalin solutions should wear protective equipment, including rubber gloves, protective aprons, and eye and face protection.			
Engineering control:	Ventilation should provide a minimum of five air changes per hour to help lower formaldehyde concentrations.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Ceballos, D., Boradwater, K. (2015). Evaluation of occupational exposures at a drycleaning shop using SolvonK4.			
HERO ID:	8684521			
Conditions of Use:	Dry cleaning solvent			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers at a dry-cleaning shop using SolvonK4. (5/22)			
Exposure route:	inhalation (10/22)			
Physical form:	solvent vapors (10/22)			
Personal sampling data:	Formaldehyde was not detected in full-shift personal air samples or area samples, and the LOD was 0.007-0.01 ppm. (10/22)			
Area sampling data:	Formaldehyde was not detected in full-shift personal air samples or area samples, and the LOD was 0.007-0.01 ppm. (10/22)			
Exposure duration:	The business operated 7 a.m. to 7 p.m. Monday through Saturday, but dry-cleaning activities usually started earlier, depending on the forecasted temperature and anticipated workload. The pressers worked from 6 a.m. until they completed pressing for the day. Each presser worked at one of the six pressing stations for the entire shift. The tailors worked from 12 p.m. to approximately 6 p.m. (7/22)			
Number of workers:	The shop was staffed by 10 full-time employees and two owners. (7/22)			
Personal protective equipment:	According to the safety data sheet (SDS) for SolvonK4, employees should wear eye protection and polyvinyl chloride or polyethylene gloves when spraying this product. For loading and unloading clothes, the operator wore a latex-free Kimberly-Clark Tecnol Procedure mask that was reused throughout the day. During the day the operator hung the mask on the dry-cleaning machine between loading and unloading tasks. The owner explained that the mask was worn for protection from dust released when unloading clothes. (12/22)			
Engineering control:	Recommendations for engineering controls are to install an emergency eyewash station and to brush the pre-spotting mixture onto the fabric instead of spraying it. (13/22)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved OSHA method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Uninformative	Data are for dry-cleaning solvents, which isn't included in the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling multiple locations and different job operations.

HERO ID:	8684527			
Conditions of Use:	Adhesives and sealants			
EXTRACTION				
Parameter	Data			
Worker activity description:	Office workers			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	In office: 0.02 (ppm)In adjacent businesses: 0.03 (ppm)			
Exposure duration:	1.5-9 hours per day with an average of 4.2 hours per day.			
Exposure frequency:	2-5 days per week with an average of 4 days per week.			
Number of workers:	Eight employees work out of the office.			
Engineering control:	An HVAC system was used in the office. NIOSH recommended to set the HVAC to run in continuous mode and to ensure that the bathroom and locker room ventilation runs under negative pressure.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The monitoring data were collected after the most recentPEL establishment or update but are generally more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty can be determined from the sampling and analytical method. The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site.
Overall Quality Determination		High		

Study Citation:	Ceballos, D., Roberts, J., Whittaker, S., Lee, E. G., Gong, W. (2015). Evaluation of occupational exposures at drycleaning shops using SolvonK4 and DF 2000.
HERO ID:	8684520
Conditions of Use:	Laundry and dishwashing products

EXTRACTION	
Parameter	Data
Worker activity description:	Pressing fabrics and loading/unloading fabrics from drycleaning machine; pressing shirts; cleaning still.
Exposure route:	Dermal and inhalation.
Physical form:	Liquid. Mist during spray for spot cleaning.
Personal sampling data:	Pressing fabrics and unloading and loading fabrics from drycleaning machine: Day 1 - nondetect; Day 2 - 0.0087+ (ppm) (pg.14) For these samples, the minimum detectable concentration (MDC) was 0.008 ppm of formaldehyde+This concentration was above the MDC but below the minimum quantifiable concentration (MQC). This means that there is more uncertainty associated with this value.
Area sampling data:	Work shift area samplesFront desk: Day 1 - 0.0084+ (ppm); Day 2 - not detectedNext to press machine: Day 1 - not detected; Day 2 - 0.012+ (ppm)Next to drycleaning machine: not detected+This concentration was above the MDC but below the MQC. This means that there is more uncertainty associated with this value.*For these samples, the MDC was 0.008 ppm of formaldehydeShort-term area samples1st unloading, 2nd loading: not detected2nd unloading 3rd loading: not detected3rd unloading, 4th loading: not detectedCleaning still: not detectedLoading, wash cycle, and unloading: 0.043+ (ppm)+This concentration was above the MDC but below the MQC. This means that there is more uncertainty associated with this value*For these air samples, the MDC was in the range of 0.04 to 0.2 ppm of formaldehyde.
Dermal exposure data:	Dermal exposure data
Exposure duration:	12 hours/day
Exposure frequency:	The shop was in operation 6 days/week.
Number of workers:	Two full-time employees and an owner/operator.
Personal protective equipment:	NIOSH recommends to wear gloves and eye protection and to wear a long-sleeve shirt and PVC or polyethylene gloves when using spot cleaners. NIOSH recommends the use of chemical protective gloves and eye protection when cleaning the still bottoms, specifically neoprene or butyl rubber gloves.
Engineering control:	NIOSH recommends installing an eye wash station, using a brush to apply prespotting mix onto fabrics rather than a spray bottle, and improving the mechanical ventilation system used at the building.
Comments:	Dermal sampling performed for Solvon4K measured presence of butylal not specifically formaldehyde but both are contained within the formulation.

Conditions of Use:	Use of laundry and dishwashing products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Loading and unloading of dry cleaning machines and operating equipment for pressed dry cleaned fabrics.			
Exposure route:	inhalation, dermal			
Physical form:	gas			
Personal sampling data:	One sample found conc. of FA at 0.0087 pm all other personal samples were ND			
Area sampling data:	All area samples are below the LOD (0.008 ppm)			
Exposure duration:	Full shift (8-10 hr/day)			
Personal protective equipment:	When operating DF-2000 machine and cleaning: surgical mask, prescription glasses (not safety glasses or splash goggles), and nitrile gloves.			
Engineering control:	Ventilation systems used in two different shops: Natural ventilation (HVAC not operation) and one have Natural and HVAC.			
Comments:	Formaldehyde samples measured using OSHA Method 52. Sample times are provided for each sample in Tables 3, 5, and 7.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Report is peer reviewed so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US
	Metric 3:	Applicability	High	Data is applicable to commercial use of solvents containing FA in dry cleaning.
	Metric 4:	Temporal Representativeness	High	Data is less than 10 years old (2016).
	Metric 5:	Sample Size	High	Provides individual sample data
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Provides worker activity, process description, engineering controls, PPE, exposure duration/frequency, sampling duration, personal and area sampling data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Addresses variability by looking at different locations in dry cleaning shops and doing both area and personal sampling. Addresses uncertainty in providing sampling method and LOD and LOQ.
Overall Quality Determination			High	

Study Citation: Celanese Chem Co Inc, (1983). Industrial hygiene monitoring data summary-rock hill terminal.
HERO ID: 5914740
Conditions of Use: Exposure in terminal

EXTRACTION

Parameter	Data
Worker activity description:	M.O. operators or loaders employed at Rock Hill Terminal of Celanese Chemical Co. Inc.
Exposure route:	inhalation
Physical form:	gaseous
Personal sampling data:	In general, the individual short-term samples indicate that an exposure problem does not exist for either the M.O. operator or the loaders. It does appear that short term problems can exist during filter cleaning. Many of the high short term levels were associated with the collection and analysis of samples. The 0.68 ppm geometric mean indicates that 50% of the time (shifts) the formaldehyde exposure levels of the M. O. operator were less than 0.68 ppm. The 1.19 ppm tolerance level means that 90% of the time the formaldehyde exposure levels of the M.O. operator was less than 1.19 ppm. These levels indicate that formaldehyde exposure is considerably below the OSHA values and in compliance with the Celanese internal exposure levels. The exposure levels of the loaders appear to be well below 1 ppm.
Personal protective equipment:	Appropriate respirators should be worn during the filter cleaning process and during major upset conditions.
Comments:	Tables I and II are not included with the text. These are the table that have the actual formaldehyde data.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.

EXTRACTION				
Parameter	Data			
Area sampling data:	Geometric mean concentration of 0.15 ppm measured from the 1980s. Average concentrations of formaldehyde at eight garment factories in 1966 (range of average concentrations 0.3– 2.7 ppm). Concentrations in cutting rooms reported to be as high as 10 ppm in 1968, and subsequently reduced to 2 ppm in 1973.			
Comments:	Not primary source of data			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are mostly from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates.

Conditions of Use:	Building and construction materials (office building)			
EXTRACTION				
Parameter	Data			
Number of sites:	1 office evaluated, which is 40% of a two-story building; other 60% is for workshops, i.e. demonstration areas for spray painting/electro-plating (may impact pollutant concentrations in office) (pg 1)			
Worker activity description:	"This contaminant is emitted mainly from particle board and various insulation materials" (pg 5)			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	0.1 ppm average (pg 4)			
Engineering control:	Mechanical ventilation; AC (details such as air exchange rate on pgs 1-4)			
Comments:	Mechanical ventilation; AC (details such as air exchange rate on pgs 1-4)Method: MIRAN portable ambient air analyser. The accuracy of this analyser is estimated as ± 15%. (pg 4)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from Singapore, a non-OECD country
	Metric 3:	Applicability	High	Data are for building and construction materials, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (average) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Sample type provided but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Low		

Study Citation:	Chia, S.E., Ong, C.N., Foo, S.C., Lee, H.P. (1992). Medical students’ exposure to formaldehyde in a gross anatomy dissection laboratory. Journal of American College Health 41(3):115-119.			
HERO ID:	1314340			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	medical students exposed to formaldehyde during the dissection of cadavers in a gross anatomy laboratory			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	0.74 +/- 0.18 ppm mean (range 0.41- 1.20 ppm)			
Area sampling data:	0.50 ppm mean, 0.08 ppm SD (range 0.40-0.60 ppm)			
Exposure duration:	2.5 hours			
Exposure frequency:	2 days per week;			
Number of workers:	150 first year students			
Personal protective equipment:	Recommended use of googles and respirators			
Engineering control:	The use of an effective ventilation system would make it possible to lower the concentration of formaldehyde in the gross anatomy laboratory. Exposure can be reduce by changing the composition of the embalming fluid. IT has been reported that by using an embalming fluid consisting of 86.5% ethanol, 8.1% formalin, 2.7% glycerol, and storing the bodies for at least 3 months in 70% ethanol, it is possible to keep the formaldehyde concentration in his dissection room to below 0.20 ppm.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH method was used that require drawing a known volume of air through a midget impinger containing 10 mL of distilled water. Aliquots of 2 mL of the collected sample solutions were treated with chromotropic acid-sulfuric acid to form a purple monoca-tionic chromogen. The concentration of the formaldehyde was measured by colorimetric method, using a Shimadzu UV-visible spectrophotometer at 580 nm. A standard curve was calibrated to determine the unknown samples.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Singapore - not a member of OECD
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	The study was published in 1992, around the time of fhe most recent PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized with mean values, standard deviation and range data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data includes the critical metadata, such as sample type, exposure type, exposure durations, exposure frequency, and worker activities.

...continued from previous page

Study Citation:	Chia, S.E., Ong, C.N., Foo, S.C., Lee, H.P. (1992). Medical students’ exposure to formaldehyde in a gross anatomy dissection laboratory. Journal of American College Health 41(3):115-119.		
HERO ID:	1314340		
Conditions of Use:	Laboratory Use		
Domain	Metric	EVALUATION Rating	Comments
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The study provided standard deviation and range data that can be used to evaluate variability. Information about uncertainty was not provided.
Overall Quality Determination		Medium	

Study Citation:	Chrostek, W. J. (1985). Health hazard evaluation report: HETA-84-392-1597 - Syntex Dental Products, Inc., Audubon, Pennsylvania.			
HERO ID:	1317246			
Conditions of Use:	Use of Paper Products			
EXTRACTION				
Parameter	Data			
Worker activity description:	light manufacturing of dental equipment and supplies and packaging; Formaldehyde was measured in carbonless paper used at site, which is why formaldehyde was measured at the site.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Three air samples were collected for formaldehyde (2 in accounting, 1 in executive office). All samples were less than the lower limit of detection. (2 micrograms per sample)			
Comments:	It states that personal pumps were used for formaldehyde sampling, but presented per location therefore EPA assumes these are area samples.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is a NIOSH Study - Method P&CAM 354(1). Uncertain which current terminology matches with this method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (use of carbonless paper) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1984 - 85 - prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	Low	Discrete values (n=3) provided but all samples were below the lower limit of detection.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (i.e, area) but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Concentrations were below the lower limit of detection and it was assumed that uncertainty was considered in Method P&CAM 354.
Overall Quality Determination		Medium		

Study Citation:	Chrostek, W. J. (1984). Health hazard evaluation report: HETA-83-261-1448. Rolling Hill Hospital, Elkins Park, Pennsylvania. 83-261-1448:1-12.			
HERO ID:	5096596			
Conditions of Use:	Laboratory Chemicals			
EXTRACTION				
Parameter	Data			
Worker activity description:	Gross pathology laboratory employees preserve tissue in a formalin solution before visual examination of the samples. (4/12)			
Exposure route:	inhalation, dermal, ingestion (6/12)			
Physical form:	gas (6/12)			
Personal sampling data:	The two personal breathing samples were 0.04 and 0.51 mg/m3. (10/12)			
Area sampling data:	Three area samples were ND, 0.10, and 0.25 mg/m3. (10/12)			
Exposure duration:	8-10 hours (5/12)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for the use of laboratory chemicals, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and duration provided, but missing exposure frequency, number of workers, engineering controls, and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at two different labs in the hospital.
Overall Quality Determination			High	

Study Citation:	Chrostek, W. J. (1985). Health hazard evaluation report: HETA-85-0067-1614 - Hospital of the University of Pennsylvania, Philadelphia, Pennsylvania.			
HERO ID:	8632769			
Conditions of Use:	Plastic and rubber products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Rigid foam mixing, pouring, and grinding operations.			
Exposure route:	Dermal and inhalation.			
Physical form:	Vapor			
Area sampling data:	Two samples collected for formaldehyde were below the laboratory limit of detection, 0.2 ug/sample.			
Personal protective equipment:	NIOSH recommends a Type C supplied-air respirator with full facepiece operated in pressure-demand or other positive pressure mode or with full facepiece, helmet, or mode operated in continuous-flow mode.			
Engineering control:	General and local exhaust ventilation.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Report is more than 20 years old.
	Metric 5:	Sample Size	N/A	No sample data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

EXTRACTION

Parameter	Data
Worker activity description:	Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011, the following information is available for worker activities: for France the highest contributing sector is human health activities at 21%, followed by manufacture of wood, furniture and related at 13% and manufacture of rubber and plastic products at 12%; for Germany the highest contributing sector is manufacture of wood, furniture and related at 18.1%, followed by manufacture of basic metals at 15.7% and human health activities at 12.9%. See Table 3 for more info and smaller percentage uses
Exposure route:	inhalation
Personal sampling data:	From Table 4: Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011, the following information is available for personal samples: for France GM is 0.09 mg/m ³ , median is 0.09 mg/m ³ , 75th percentile is 0.26 mg/m ³ , 90th percentile is 0.55 mg/m ³ , 95th percentile is 0.9 mg/m ³ from 2743 measurements; for Germany GM is 0.06 mg/m ³ , median is 0.06 mg/m ³ , 75th percentile is 0.19 mg/m ³ , 90th percentile is 0.52 mg/m ³ , 95th percentile is 0.8 mg/m ³ from 2796 measurements. These data are for sampling duration ≥ 30 minutes and ≤ 240 minutes. Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011 for human health activities, the following information is available for personal samples: for France GM is 0.16 mg/m ³ , median is 0.18 mg/m ³ , 75th percentile is 0.41 mg/m ³ , 90th percentile is 1.07 mg/m ³ , 95th percentile is 1.74 mg/m ³ from 583 measurements; for Germany GM is 0.23 mg/m ³ , median is 0.30 mg/m ³ , 75th percentile is 0.56 mg/m ³ , 90th percentile is 0.94 mg/m ³ , 95th percentile is 1.6 mg/m ³ from 254 measurements. Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011 for manufacture of wood and furniture sector, the following information is available for personal samples: for France GM is 0.12 mg/m ³ , median is 0.13 mg/m ³ , 75th percentile is 0.24 mg/m ³ , 90th percentile is 0.41 mg/m ³ , 95th percentile is 0.50 mg/m ³ from 466 measurements; for Germany GM is 0.07 mg/m ³ , median is 0.07 mg/m ³ , 75th percentile is 0.17 mg/m ³ , 90th percentile is 0.47 mg/m ³ , 95th percentile is 0.7 mg/m ³ from 1063 measurements.
Area sampling data:	Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011, the following information is available for area samples: for France GM is 0.07 mg/m ³ , median is 0.06 mg/m ³ , 75th percentile is 0.21 mg/m ³ , 90th percentile is 0.62 mg/m ³ , 95th percentile is 1.2 mg/m ³ from 4041 measurements; for Germany GM is 0.03 mg/m ³ , median is 0.02 mg/m ³ , 75th percentile is 0.09 mg/m ³ , 90th percentile is 0.3 mg/m ³ , 95th percentile is 0.58 mg/m ³ from 3663 measurements. These data are for sampling duration ≥ 30 minutes and ≤ 240 minutes. Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011 for human health activities, the following information is available for area samples: for France GM is 0.07 mg/m ³ , median is 0.08 mg/m ³ , 75th percentile is 0.20 mg/m ³ , 90th percentile is 0.48 mg/m ³ , 95th percentile is 0.87 mg/m ³ from 574 measurements; for Germany GM is 0.09 mg/m ³ , median is 0.12 mg/m ³ , 75th percentile is 0.29 mg/m ³ , 90th percentile is 0.73 mg/m ³ , 95th percentile is 1.2 mg/m ³ from 228 measurements. Based on data available in two databases (MEGA from Germany and COLCHIC from France) for the period from 2002 to 2011 for manufacture of wood and furniture sector, the following information is available for area samples: for France GM is 0.07 mg/m ³ , median is 0.08 mg/m ³ , 75th percentile is 0.20 mg/m ³ , 90th percentile is 0.48 mg/m ³ , 95th percentile is 0.87 mg/m ³ from 574 measurements; for Germany GM is 0.09 mg/m ³ , median is 0.12 mg/m ³ , 75th percentile is 0.29 mg/m ³ , 90th percentile is 0.73 mg/m ³ , 95th percentile is 1.2 mg/m ³ from 228 measurements.
Exposure duration:	Samples are said to be between 30 and 240 minutes
Comments:	Tables 5 - 9 contain info specific to various sectors

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	methodology is well described
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	data are from Germany and France, OECD countries.
	Metric 3: Applicability	High	Data are for occupational scenarios within the scope of the risk evaluation

Study Citation:	Clerc, F., Steinhausen, M., Bertrand, N., Vincent, R., Gabriel, S., Gelder, R.V. (2015). Comparison of formaldehyde exposure measurements stored in French and German databases. Gefahrstoffe, Reinhaltung der Luft / Air Quality Control 75(4):119-126.				
HERO ID:	5947094				
Conditions of Use:	commercial uses				
Domain		Metric	EVALUATION		
			Rating	Comments	
	Metric 4:	Temporal Representativeness	Medium	Data is between 10 and 20 years old	
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.	
Domain 3: Accessibility/ Clarity					
	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata	
Domain 4: Variability and Uncertainty					
	Metric 7:	Metadata Completeness	Medium	does not discuss uncertainties	
Overall Quality Determination			High		

Study Citation:	Cocalis, J. C., Rao, C. Y., Kestenber, K. A., Martin, J. E. (2001). Health Hazard Evaluation Report 2000-0098-2862, Robinson Run Mine, Shinnston, West Virginia, July 2001.		
HERO ID:	8016652		
Conditions of Use:	Other- Byproduct of Biocide in MWF		

EXTRACTION				
Parameter	Data			
Worker activity description:	During a production shift, typical jobs on the longwall include:• stage loader operator (headgate area),• shieldman (positioned along the face, i.e., headgate to tailgate),• shieldman helper (positioned along the face)• two shearer operators (positioned along the face),• two electrician/mechanic (one usually at face),• two timbermen (sometimes relieve shearer operator), and• scoop operator (mainly in the headgate area).			
Exposure route:	inhalation - Concerns were raised that triazine biocide used to control microbial growth in the emulsion would adsorb onto or absorb into the rockdust, become aerosolized with rockdust, and convert to formaldehyde, a known irritant and carcinogen, afterdepositing in the upper respiratory system.dermal			
Area sampling data:	Formaldehyde concentrations ranging up to 0.006 ppm were detected in outdoor air on June 13-14, 2000. Formaldehyde concentrations ranging up to 0.006 ppm were detected in the headgate area on June 13- 14, 2000. Formaldehyde concentrations ranging up to 0.027 ppm were detected in the mid-panline area on June 13-14, 2000. Formaldehyde concentrations ranging up to 0.016 ppm were detected in the tailgate area on June 13-14, 2000. Formaldehyde concentrations in air up to 0.02 ppm were measured at the teardown area. The measured formaldehyde concentrations in air at the setup area ranged to 0.009 ppm.Area sampling for formaldehyde measured concentrations up to 0.027 ppm over the two sampling trips with the highest levels measured at the tailgate.			
Exposure duration:	There are two production shifts per day, seven days per week, with maintenance performed on the swing shift. Any of the 250 miners may be positioned on the longwall during teardowns and setups (longwall moves) which occur over a 3-6 day period 2-3 timesper year.			
Number of workers:	Approximately 250 miners work at the RobinsonRun mine			
Engineering control:	If substitution is not feasible, engineering and administrative controls such as improved maintenance to control leaks and recycling of the emulsion during longwall moves should be implemented.			

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved OSHA or NIOSH method 2016 and 5700.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evalu- ated.
	Metric 3:	Applicability	Uninformative	The data are for an occupational scenario that is similar to an occupational scenario withthe scope of the risk evaluation, in terms of the type of industry, operations, and work activities. Rated unacceptable because source of the formaldehyde is stated as a biocide, so non-TSCA.
	Metric 4:	Temporal Representativeness	Low	more than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty

Study Citation:	Cocalis, J. C., Rao, C. Y., Kestenberg, K. A., Martin, J. E. (2001). Health Hazard Evaluation Report 2000-0098-2862, Robinson Run Mine, Shinnston, West Virginia, July 2001.
HERO ID:	8016652
Conditions of Use:	Other- Byproduct of Biocide in MWF

		EVALUATION	
Domain	Metric	Rating	Comments
	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.

Overall Quality Determination **Uninformative**

Study Citation:	Coggon, D., Ntani, G., Harris, E.C., Palmer, K.T. (2014). Upper Airway Cancer, Myeloid Leukemia, and Other Cancers in a Cohort of British Chemical Workers Exposed to Formaldehyde. American Journal of Epidemiology 179(11):1301-1311.				
HERO ID:	2337789				
Conditions of Use:	Multiple				
EXTRACTION					
Parameter	Data				
Exposure route:	inhalation				
Personal sampling data:	It was estimated that background exposure corresponded to time-weighted concentrations of <0.1 ppm, low exposure to 0.1–0.5 ppm, moderate exposure to 0.6–2.0 ppm, and high exposure to >2.0 ppm. Table 1 provides number of workers from each study with high exposure.				
EVALUATION					
Domain	Metric	Rating	Comments		
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.	
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	OECD country - Britain	
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4:	Temporal Representativeness	Low	Data greater than 20 years old.	
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.	
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.	
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study addresses variability in different studies but does not address uncertainty.	
Overall Quality Determination			Low		

Study Citation:	Cohen, S., Sparer, J. (1984). Health hazard evaluation report: HETA-82-107-1444 - Torrington Company, Torrington, Connecticut.			
HERO ID:	8637901			
Conditions of Use:	Processing aids, not otherwise listed			
EXTRACTION				
Parameter	Data			
Worker activity description:	There are several discrete work areas for the plant, including cutting and shaping processes, grinding operations, tumbling, and inspection and packaging. (4/29)			
Exposure route:	dermal (3/29)			
Physical form:	fluid (3/29)			
Dermal exposure data:	Dermal exposure data			
Number of workers:	49 workers (4/29)			
Personal protective equipment:	Workers were provided with gloves, sleeves, and aprons, but compliance with the program was minimal. (8/29)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for metalworking fluids, which is similar to the in-scope occupational scenario processing aids not otherwise listed.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Low	Sample distribution is described qualitatively.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure duration, frequency, and engineering controls.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Medium		

Study Citation:	Coldiron, V. R., Ward, J. B., Trieff, N. M., Janssen, H. E., Smith, J. H. (1983). Occupational exposure to formaldehyde in a medical-center autopsy service. Journal of Occupational and Environmental Medicine 25(7):544-548.			
HERO ID:	1980824			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Cooler cleaning/work, prosecting, tissue sectioning, gross SO/gross conference, changing solutions (19% formaldehyde), general autopsy duties.			
Exposure route:	Inhalation			
Personal sampling data:	0.39-3.28 (ppm) [Table 2,3 and 5]; Table 5 contains TWA by occupation: resident 0.8; pathologist 1.25; and technician 0.82			
Area sampling data:	<0.10-13.57 (ppm) [Table 4]			
Exposure duration:	Exposure duration is tied to activity[hrs/week]: Technicians- cooler cleaning 1-3.5 hrs, -Gross SO/gross conference 1-2 hrs, -changing solutions 1-3.5 hrs, -general autopsy duties 15.5 -30 hrs, -minimal exposure, -nonexposure 7.5-8.5 hrs ; Residents- cooler cleaning/work 0-0.8 hrs, prosecting 3-9.5hrs, tissue sectioning 2.5-10.8 hrs, gross SO/gross conference 2.25-4.5, changing solutions 0-1.5 hrs, general autopsy duties 1-3.5 hrs, minimal exposure 7-27.5 hrs, nonexposure 5.5-16 hrs... [Also includes hours for faculty].			
Number of workers:	>500,000			
Comments:	Study measured both area and personal, authors provide an estimated TWA which appears to use both personal and area sampling with recorded activity logs to generate TWA [Table 1]			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States(TX) and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	Data are for laboratory chemicals, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	The data were collected before the most recent PEL update and are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations per sample, exposure durations, exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple areas and job functions but uncertainty is not addressed.

Formaldehyde

Occupational Exposure

HERO ID: 3256955 Table: 1 of 2

Study Citation:	Cometto-Muniz, J.E., Abraham, M.H. (2015). Compilation and analysis of types and concentrations of airborne chemicals measured in various indoor and outdoor human environments. Chemosphere 127:70-86.
HERO ID:	3256955
Conditions of Use:	Consumer Use- Residential Home

Parameter	Data
Area sampling data:	Formaldehyde concentrations (ug/m3)measured in indoor home/school environments are as follows: minimum – 12.7; maximum – 134; range (max/min) – 11; mean – 60.5; median – 53.4; std. deviation – 34.8; variance – 1208.4; std. error – 8.89. Ratio of formaldehyde in home/school environment compared to commercial environments is 3.6.

Domain	Metric	EVALUATION Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	No measuring of concentration was done by authors, only a review of other published studies that performed monitoring studies. No specified sampling or analytical methodology included and also expected to vary.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	data from various countries including US has been used
	Metric 3: Applicability	Uninformative	The data are from an non-occupationalscenario that does not applyto any occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	report is generally no more than 10 years old
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	report clearly documents its data sources
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Report address variability in its review of several different studies, but not uncertainty in exposure results.

Overall Quality Determination **Uninformative**

Study Citation:	Costa, S., Brandao, F., Coelho, M., Costa, C., Coelho, P., Silva, S., Porto, B., Teixeira, J.P. (2013). Micronucleus frequencies in lymphocytes and buccal cells in formaldehyde exposed workers. 16:83-94.			
HERO ID:	5422263			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Pathology and anatomy workers: In total, 80 women were involved in the study, 38 working for at least one year in pathology and anatomy laboratories located in Portugal, and 42 non-exposed control females, working in administrative offices in the same area and without occupational exposure history to formaldehyde.			
Exposure route:	Inhalation			
Personal sampling data:	The mean level of worker’s exposure to formaldehyde was 0.35 ± 0.03 ppm (range 0.18–0.69 ppm).			
Number of workers:	80 women were involved in the study, 38 working for at least one year in pathology and anatomy laboratories located in Portugal, and 42 non-exposed control females, working in administrative offices in the same area and without occupational exposure history to formaldehyde.			
Engineering control:	Implementation of security and hygiene measures, such as periodic air sampling, efficient air extraction, temperature control, as well as good practice campaigns, were recommended to decrease formaldehyde exposure in this workplace. Recommendations include development of training programs and medical surveillance programs.			
Comments:	Results found in the present study substantiate an association between DNA damage at chromosomal level and occupational exposure to formaldehyde.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Air sampling and formaldehyde analysis were performed according to the NIOSH method no. 3500
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data from an OECD country other than the U.S
	Metric 3:	Applicability	High	Data is for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	Data no more than 10 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most associated metadata, but not sample durations and worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Costa, S., Carvalho, S., Costa, C., Coelho, P., Silva, S., Santos, L.S., Gaspar, J.F., Porto, B., Laffon, B., Teixeira, J.P. (2015). Increased levels of chromosomal aberrations and DNA damage in a group of workers exposed to formaldehyde. Mutagenesis 30(4):463-473.			
HERO ID:	2823656			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	0.38+/-0.03 ppm 8 hr TWA (range 0.08-1.39 ppm); Peak exposure occurred during macroscopic examination of formaldehyde-preserved specimens (range 0.3–3.2 ppm) and disposal of specimens and waste solutions (range 0.3–2.8 ppm).			
Number of workers:	84			
Personal protective equipment:	In most FA-related tasks, workers were only using masks for biological hazard, not appropriate to protect from FA vapors. The primary reason given by workers for not using goggles and appropriate masks (if available) was interference in efficiency of activities performed, namely taking notes and handling material, and communication difficulties.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Used NIOSH Method 3500
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Portugal - an OECD member
	Metric 3:	Applicability	High	The data are for anatomy pathology laboratory workers which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The study was published in 2015, after the most recent PEL (1992) and less than 10 years old.
	Metric 5:	Sample Size	High	TWA and standard error provided along with quantification of peak occurrences.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, butlacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The study provided standard error and range data that can be used to evaluate variability. NIOSH method 3500 includes uncertainty analysis.

Worker activity description:	Students and teachers in school laboratories where biological specimens are used			
Personal sampling data:	A previous study reported air levels of formaldehyde in a biology laboratory at New York University where students were dissecting preserved cats. Formaldehyde levels were 14.1 ppm in the students’ breathing zone. Measurements in an anatomy laboratory of a German university showed levels of formaldehyde ranging from 0.4 ppm to 6 ppm. The Field Offices and Laboratories measured formaldehyde vapor levels in 25 high school and college teaching laboratories, where preserved biological specimens were being dissected. Air sampling was conducted in the breathing zones of students. The results showed: levels of formaldehyde in the breathing zone of students dissecting a specimen were significantly higher than the background levels found elsewhere in the school or outdoors; in several classrooms, where formalin-packed specimens were in use, the levels of formaldehyde in the breathing zones of students were well within the levels that can cause adverse health effects.			
Area sampling data:	A previous study reported air levels of formaldehyde in a biology laboratory at New York University where students where students were dissecting preserved cats. Formaldehyde levels were 2.8 ppm in classroom air. Measurements in an anatomy laboratory of a German university showed levels of formaldehyde ranging from 0.4 ppm to 6 ppm. The Field Offices and Laboratories measured formaldehyde vapor levels in 25 high school and college teaching laboratories, where preserved biological specimens were being dissected. Air sampling showed that the levels of formaldehyde in the classroom were significantly higher than the background levels found elsewhere in the school or outdoors; in several classrooms, where formalin-packed specimens were in use, the levels of formaldehyde in the classroom, were well within the levels that can cause adverse health effects.			
Exposure duration:	For seniors in high school in advanced biology and physiology classes, students are exposed for 6-8 months of the 10-month school year.			
Number of workers:	24% of the total junior and senior high school are exposed. 10% of the total college level enrollment was exposed to preserved specimens for dissection.			
Engineering control:	Ventilation, in the form of open windows and other active ventilation can lower formaldehyde concentrations in air

HERO ID:	6574136			
Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Students and teachers in school laboratories where biological specimens are used			
Exposure route:	Inhalation			
Physical form:	In pure form, formaldehyde is a colorless, flammable gas with a pungent, irritating odor.			
Personal sampling data:	In the school samples, the highest formaldehyde levels were found in the breathing zones of students engaged in dissections. In 4 of the 27 laboratories monitored, the breathing zone levels were between 1 and 1.5 ppm (average was 0.73 ppm). When treated formalin-fixed animal specimens were used, formaldehyde concentration in breathing zone was 0.13 ppm (average).			
Area sampling data:	Room air levels, where formalin-fixed specimens were used, were below 0.5 ppm, and 16 of 27 measurements were below 0.1 ppm (average was 0.22 ppm). When treated formalin-fixed animal specimens were used, formaldehyde concentration in class room air was 0.06 ppm (average).			
Number of workers:	As per the survey presented, number of students exposed to formaldehyde were: elementary schools – 50 out 10,319; junior high school – 328 out of 6,728; senior high school – 4,902 out of 37,148; college – 9,624 out of 100,534. In the same schools, the number of teachers exposed to formaldehyde were: elementary schools – 2; junior high school – 8; senior high school – 62; and college – 126.			
Engineering control:	Increased ventilation of classrooms, using exhaust fans, where specimens are handled may reduce the potential inhalation of formaldehyde gas. It is doubtful, however, that opening laboratory doors and windows would provide sufficient ventilation. Indeed, opening doors may allow fumes to spread elsewhere in the school, increasing the number of students exposed.

EXTRACTION				
Parameter	Data			
Worker activity description:	Sewing machine operator, sheet folder, sheet cutter, inspector, stenciler, sheet puller.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	Mean concentrations given in ppmSewing machine operator: 1.10Sheet folder: 1.03Sheet cutter: 1.15Inspector: 1.04Stenciler: 0.82Sheet Puller: 1.25Overall average: 1.07			
Area sampling data:	Area exposure data in ppm (sorbent tube)North end new addition: 1.12Between cutting tables: 1.24Central old building: 1.33Fabric bolt stack: 1.43Overall average: 1.28Short-term area data in ppm (impinger)East end: 0.56-1.26Central: 0.95-1.22West end: 1.30			
Number of workers:	80			
Engineering control:	Ventilation: Airing of fabrics, prior to used, is recommended. One treatment method would involve aerating the fabric in a ventilated chamber, while at the same time adding heat to drive the formaldehyde out of the cloth. This would mean unrolling the bolt of cloth at one end of the process, and rolling it back at the other end in order to use your current pattern cutting technology. Proper temperature, humidity, and airing time would need to be determined (perhaps in an empirical fashion).			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Assessment uses high quality data/techniques/methods from frequently-used sources.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for manufacture of Textiles, Apparel, and Leather (including fabric/textile finishing), which is an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Assessment is based on data greater than 20 years old and industry conditions that are expected to be outdated.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed by sampling methods. Variability addressed by sampling multiple areas and personal breathing samples of multiple workers.
Overall Quality Determination		High

EXTRACTION				
Parameter	Data			
Worker activity description:	A majority of the workers were sewing machine operators (80 workers). Other jobs were fabric cutting, folding, pressing, and inspection. (4/17)			
Exposure route:	dermal, inhalation (6/17)			
Physical form:	vapor (6/17)			
Personal sampling data:	Personal formaldehyde exposure concentrations ranged from 0.5 to 1.5 ppm, and averaged 1.0 ppm for 14 samples. By job category, exposure concentrations averaged 1.1 ppm for the small parts area sewing machine operators, and 1.2 ppm for the fabric spreaders in the pattern shop. One sewing machine operator in the automatics areawas exposed to 0.9 ppm of formaldehyde. (8/17)			
Area sampling data:	The full-shift area samples from throughout the plant showed formaldehyde concentrations ranging from 0.8 ppm in the assembly and pressing areas to 1.4 ppm in the automatics area. (8/17)			
Number of workers:	The company employed approximately 100 hourly workers at the time of the NIOSH survey. (4/17)			
EVALUATION

HERO ID:	834715			
Conditions of Use:	Firefighting			
EXTRACTION				
Parameter	Data			
Worker activity description:	Structural firefighters involved in overhaul operations and wildland firefighters			
Exposure route:	Inhalation			
Personal protective equipment:	This study evaluated the performance of three chemical, biological, radiological, and nuclear (CBRN) canisters (MSA, 3M, and Scott) and one multi-gas canister similar in appearance to CBRN canisters but without CBRN certification. For all tests, the APR canister reduced the overall irritant index to levels below unity, indicating that these canisters would provide protection for firefighters working in overhaul environments. Formaldehyde was present in the challenge air at concentrations that exceeded the occupational exposure limits (OELs) (peak challenge concentration for formaldehyde was 1.6 ppm and more than 5 times the OEL). However, in each test conducted, the CBRN canisters were found to reduce the formaldehyde concentrations to less than 1% of the OEL for formaldehyde. Penetration was calculated at <2% for formaldehyde.

EXTRACTION

Parameter	Data
Worker activity description:	A robot applies the wax to molds on the B-line. On the A-line wax is applied manually. Workers in the A-line demold station rotate through the wax application booth in 60-minute intervals. The waxdispersion is applied to the bowl of the mold using an air atomization spray gun. Workers in the insert area are responsible for inserting components such as metal frames/wires and velcro patches, into the bowl of the mold before it reaches the pourhead. Typically, fiveemployees work at each of the insert stations. One of the five insert workers is rotated off the line, in turn, into what is termed a supply job, which entails bringing needed materials to theother workers at the insert station. This rotation occurs at 60-minute intervals.The pourhead is the point where the TDI and polyol components come together and the mixture is dispensed by a robot into the bowl of an open mold. Each of the pourheads is fully automated,and a worker is not required to be in the immediate vicinity. Persons in the demold area are responsible for removing the foam cushion from the mold and cleaning the mold in preparation for the next cycle. The demold work station is subdivided into pullers, tossers, and mold cleaners. Pullers loosen the foam cushions from the bowls of molds. The tosser removes the foam cushion from the mold and places it on a conveyor belt. Mold cleaners pull tape and residual foam flash out of the mold. After the foam cushions are removed from the molds, employees in the offline area trim, sort,inspect, and repair the finished foam product. (p.9)
Exposure route:	inhalation
Physical form:	vapor/gas
Personal sampling data:	Typical operationsLine B Demold 0.055 ppmLine A Demold 0.061 ppmLine B Insert 0.057 ppmLine A Demold 0.07 ppmLin A Insert 0.07 ppmCold BlastMold cleaner 0.021 ppmMold Cleaner 0.056 ppmMold Cleaner 0.017 ppmMold Cleaner 0.014 ppm

Number of workers:	At the time of the first site visit in November 1998, the Woodbridge Brodhead plant employed 240 hourly workers, distributed equally across three shifts. Sixty-eight hourly workers per shift work directly on the production line, 34 on each line. Of these 68 employees, 16 work directly on the foam production line (i.e., insert or demold), and the remainder work in the offline area. Other hourly employees work in the warehouse area (where baskets of cushions are stacked), or as tooling or maintenance specialists. (p. 9)
Personal protective equipment:	supplied air hood during ice blasting (p.14)gloves
Comments:	Noted that the source of formaldehyde is within the plant, but actual sources could not be identified.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method (NIOSH Study Method 2016)
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Low	The data are for an occupational scenario but the source of formaldehyde exposure is unknown. "no previous industrial hygiene data or rationale could be cited to indicate thatformaldehyde should be evolving frompolyurethane foam production processes. Thesource of the formaldehyde at the Brodhead plantis unknown at this time."(p. 30) Therefore data cannot be matched with a COU within the scope of the risk evaluation, however it may be suitable for commercial use of building materials

	Metric 4:	Temporal Representativeness	Medium	Sampling implemented in 1999, after the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was considered in Method 2016.
Domain 3: Accessibility/ Clarity				
	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	High	Results from individual sampling events were provided which could be used to evaluate variability between locations and jobs. As this is a NIOSH study, it is assumed that uncertainty was considered in Method 2016.
Overall Quality Determination			High	

Study Citation:	Dahlgren, J.G., Talbott, P.J. (2018). Asthma from hair straightening treatment containing formaldehyde: Two cases and a review of the literature. Toxicology and Industrial Health 34(4):262-269.			
HERO ID:	4455144			
Conditions of Use:	Commerical Use-Hair Straigthening Products (FDA Use)			
EXTRACTION				
Parameter	Data			
Worker activity description:	The process involves applying the product solution, blow drying, and applying a hot iron. Stylists first apply the solution, blowdry the hair, and then flat iron (heat-treats at about 400F) the hair. A follow-up conditioner, rinse, and blow dry is sometimes used.			
Exposure route:	This process created fumes that caused immediate irritating symptoms in the eyes, nose, and throat.			
Area sampling data:	0.059 to 1.88 ppm during application of hair straightening treatments; 1.3 ppm during application; 0.9 ppm during blow drying; 3.59 ppm during peak exposure in the blow-drying process; environmental formaldehyde levels ranged from 0.09 to 0.16 ppm in four salons that used products versus 0.02 and 0.04 ppm in salons that did not use them; the mean concentration for Zone 1 measured in the immediate area of the stylist was 1.17 ppm and in zone 4, the mean concentration was 0.52 ppm. Combining Zones 2 and 3 gives a concentration of about 0.705 ppm; The air levels during blow-drying operations were air concentration of 3.47 and 1.05 ppm in the area where the hair stylist worked.			
Comments:	Study also includes a summary of studies on formaldehyde-related asthma, with exposures levels that induced a response.; Data provided from multiple studies.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Uninformative	The data are for a FDA use, which is outside the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The operations, equipment, and worker activities associated with the data are expected to be representative of current operations, equipment, and activities. The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter. If no PEL is established, the data are no more than 10 years old. Metadata on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study did not addresses uncertainty in the exposure estimates.

Study Citation:	Daniels, W. J. (1989). Health Hazard Evaluation Report HETA 89-007-1983, St. Thomas More Hospital, Canyon City, Colorado, September 1989.			
HERO ID:	1628028			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	workers dealing with anesthetic gases and vapors in a hospital (primarily morgue); During the preparation of tissues, various organic solvents are used. Approximately once per month, tissuespecimens which are stored in a formaldehyde solution are required to be dumped in the morgue area. No localexhaust ventilation is used during this procedure.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Formaldehyde was found at a TWA concentration of 4.8 ppm in a 63 minute PBZ sample.			
Area sampling data:	A TWA concentration of 1.8 ppm was found in both general area samples collected in the room			
Exposure frequency:	once per month			
Number of workers:	2 employees work in the specific area.			
Engineering control:	Local exhaust ventilation should be installed at the operation where the formaldehyde is dumped to help reduce exposure to this substance to the lowest feasible level. The particular type of ventilation used would depend on the location where the operation is to be placed. However, the system should enclose the process as much as possible and maintain sufficient capture velocity to keep the formaldehyde from entering the work atmosphere.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is approved by NIOSH (1400 and 1501)
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old prior to the most recent PEL
	Metric 5:	Sample Size	Medium	Discrete values provided, however, only 2 area samples and 1 personal sample was measured.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include sample type, sample duration, frequency, location and worker activity. It is assumed that sample duration was equivalent to the exposure duration based on the calculation of the 8-hr TWA.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study does not address variability in exposure determinant (e.g., different location or time). It is assumed that uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination			High	

Study Citation:	Daniels, W., Almaguer, D., Kramkowski, R. (1987). Health Hazard Evaluation Report HETA-86-0343-1822 Sheller-Glose (Allen Industries, Inc.), Herrin, Illinois. :23.

Conditions of Use:	Processing-Reactant-Intermediate in-Plastic materials and resin manufacturing

EXTRACTION

Parameter	Data
Worker activity description:	Old Compound Room - resin powder mixing; Airlay Dept - The cotton material is first taken from the bales and placed into feed blend boxes. It is then formed into a continuous sheet material on a conveyor line. Next it is transported to one of the three Airlay lines. At the Airlay lines, one of the two resin materials prepared in the Old Compound Room is dispensed onto the cotton material as it passes along the conveyor system. The material then enters a curing oven (450° - 500° F), and is pressed and cut as it leaves the oven; Hot Oil Department - partially cured blankets from the Airlay department are taken from pallets and placed in the hotoil presses for curing and forming to the desired shape under heat (300° - 450° F) and pressure...One employee works on either side of each press placing new blankets in the press and removing them at the end of the press cycle. A third employee is sometimes present to trim the molded product. In some cases, one group of employees may work two presses.
Exposure route:	inhalation
Personal sampling data:	Hot oil Operator - Press # 1002-1003 - <LOQ, Press # 1009 - <LODOven Operator - Line 3 - <LOQ
Area sampling data:	Exit from Oven - Line 3 - <LOQOn Pump Frame - <LOD
Exposure duration:	8 hr/day
Number of workers:	520 employees, including 2 in the Old Compound Room, up to 15 in the Airlay Department, and the Hot Oil Department, with 114 employees over 3 shifts.
Engineering control:	Hot Oil Dept. has general ventilation and air moving fans.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty

Domain		Metric		EVALUATION	
				Rating	Comments
	Metric 7:	Metadata Completeness		High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination				High	

Study Citation:	Daniels, W., Kramkowski, R. (1986). Health Hazard Evaluation Report HETA 1985-0083-1705 Summit Finishing Company, Inc., Mooresville, Indiana.			
HERO ID:	8684543			
Conditions of Use:	Plating agents and surface treating agents in all other chemical product and preparation manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Employees are located at the head end of the production line to load the stock, and at the tail end of the lines to check the finished products and ensure proper winding of the material onto spools. The employees also periodically enter the tank area to check the operating conditions of the tanks and maintain the solutions. On occasion, the individual lines are "rebuild" to accomidate new products and plating solutions, a process which often requires the employees to work in the proximity of operational plating lines. Also, employees working at the remaining plating lines are responsible for moving the hangers or racks containing the parts through a series of tanks containing the pretreatment and plating solutions. The nature of these operations brings the operators into close proximity to the plating tanks. Additionally, the reflow operator places batches of plated parts into a container of heated oil, following this the parts were dipped into a tank of perchloroethylene to remove the residual oil. (6/25)			
Exposure route:	inhalation, dermal (24/25)			
Physical form:	vapors (24/25)			
Area sampling data:	Two area samples were less than the LOD of 2 ug/sample. (21/25)			
Number of workers:	67 employees, 26 of them in production operations. (4/25)			
Personal protective equipment:	PPE included safety shoes, safety glasses, and cloth work gloves, with goggles, face shields, aprons, rubber gloves, and boots available for specific activities. Respirators were also available. (6/25)			
Engineering control:	The majority of the metal pretreatment and electroplating tanks are supplied with local exhaust ventilation and covers that could be open or closed. (6/25)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for plating agents, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).

EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for fuels and related products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data are greater than 10 years old but no more than 20 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (median, mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing exposure frequency, exposure duration, engineering controls.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple locations at multiple sites, but uncertainty is not addressed.
Overall Quality Determination			Medium	

Study Citation:	Dehghani, M., Hashemi, H., Khodabakhshi, A., Rastgoo, E., Taghizadeh, M. M. (2016). Modelling of formaldehyde dispersion in the industrial park air using GIS. International Journal of Environment and Waste Management 16(4):293-304.			
HERO ID:	6155459			
Conditions of Use:	Processing: Melamine powder production			
EXTRACTION				
Parameter	Data			
Area sampling data:	38.1 ug/m3 near the chemical industry. The source includes additional air monitoring locations in residential areas and near highways, with formaldehyde concentrations ranging from 2.2 to 3.6 ug/m3. Includes measured and modeled values.			
Comments:	Study includes measured and modeled formaldehyde concentrations at an industrial park and residential areas surrounding it.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	The data are from a non-OECD country, and locality-specific factors (e.g., potentially greater differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S., or the country of origin is not specified.
	Metric 3:	Applicability	Low	The data are for a non-occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, such as a consumer DIY scenario that is similar to a worker scenario (air concentration was conducted near the chemical industry, not in the occupational areas where workers and ONUs are present).
	Metric 4:	Temporal Representativeness	High	The operations, equipment, and worker activities associated with the data are expected to be representative of current operations, equipment, and activities. The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter. If no PEL is established, the data are no more than 10 years old. Metadata on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.

Overall Quality Determination		Low	

Study Citation:	Dement, J. M., Smith, N. D., Hickey, S., J.L., Williams, T. M. (1984). An evaluation of formaldehyde sources, exposures and possible remedial actions in two office environments. 3:99-104.			
HERO ID:	22861			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	office work			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Modular offices: Unoccupied without any mechanical ventilation 0.33-0.78 ppm averages (peak 0.80); occupied before improvements 0.06-0.23ppm averages (peak 0.29 ppm); occupied after new air conditioning unit <0.05-0.08 ppm (peak 0.08). New Office: Initial 0.15 ppm average (peak 0.34 ppm); Interim 0.10 ppm average (peak 0.40 ppm); Most recent 0.08 ppm average (peak 0.11 ppm).			
Engineering control:	Ammonia fumigation at 1000 ppm for 24 hrs reduced formaldehyde concentrations by 70% and increased dilutin ventilation reduced concentration below 0.1 ppm			
Comments:	Average concentration refers to the range of average values obtained in the 12 units sampled. Unoccupied office temperature was 83 to 93F			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology noted that Impingers/chromotropic acid and pararosaniline procedures were used, but more specifics are not included. No indication of flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL and is older than 20 years - 1984 but the test data are from 1981-1983
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - average and peak values are provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only discussion of the variability due to relative humidity, ventilation, and new vs. older buildings. The monitoring study provides only limited discussion of theuncertainty in the exposure estimates.
Overall Quality Determination			Medium	

Study Citation:	Dement, J. M., Zumwalde, R. D., Parnes, W. (1972). Fibrous Glass Dust and Industrial Hygiene Survey at Pittsburgh Plate Glass Industries, Shelbyville, Indiana.			
HERO ID:	1320952			
Conditions of Use:	Incorporation into a formulation, mixture, or reaction product			
EXTRACTION				
Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	Formaldehyde concentrations ranged from 0.01 to 0.08 ppm.At Forming Station Superfine #203 0.02 ppmAt Control Panel Superfine #203 0.01 ppmAt Control Panel of Uncured Mat Line 0.02 ppmAt Curing Oven in Molded Pipe 0.08 ppm			
Number of workers:	600			
Personal protective equipment:	Safety glasses and respiratory protection devices were provided.			
Engineering control:	Curing ovens for the superfine and rotary process leak badlyand emit dense smoke into the work areas. Ventilation improvements for these ovens are badly needed. One obvious improvement would be to increase the stack air flow and provide better hooding at the oven entrances.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study - but methods used were not from NIOSH.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (fiberglass manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1972 - prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in the method that NIOSH used.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure types, and sample durations, but lacks additional metadata, such as exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Results from individual sampling events were provided which could be used to evaluate variability between different locations/operations. Uncertainty was not discussed but assumed that it was addressed in the method that NIOSH used.
Overall Quality Determination			High	

Study Citation:	Dharmawardene, L. I. (1991). Finger clubbing in match factory workers in Fiji. Ceylon Medical Journal 36(2):73-76.			
HERO ID:	1514439			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Match factory workers in Fiji - first worker was a chemist and the second worker was a lab technician.			
Exposure route:	Dermal			
Number of workers:	2			
Personal protective equipment:	First worker used dust respirator and goggles when handling chemicals and wore gloves only when handing phosphorus, urea, formalin and antimony. The second worker used a dust respirator and goggles, but never used gloves when handling chemicals in the first 6 years. He started using gloves in the last 3 years.			
Comments:	This article reports two cases of clubbing of fingers.

Overall Quality Determination		Medium		

Study Citation:	Dimenstein, I.B. (2009). A Pragmatic Approach to Formalin Safety in Anatomical Pathology. Laboratory Medicine 40(12):740-746.			
HERO ID:	1986504			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	workers in histology laboratory			
Personal sampling data:	Personal samples at 2 grossing stations collected on the same day near each other came back with different readings. One was 10 ppm while another showed 0.055 ppm. No one on this day reported any odors that would be consistent with high formaldehyde exposures.			
Personal protective equipment:	Recommended PPE are disposable gown, gloves, and safety glasses. Vented goggles are preferable while cleaning up. Additionally, a wet mask (preferably a Kimberly-Clark Face Shield type) should be worn. The wet mask is ideal because the evaporating formaldehyde goes through the multi layers of a dry mask, but a wet mask partially absorbs formaldehyde due to its high solubility in water. Both types of laboratory gloves, nitrile and latex, used in anatomical pathology laboratories are eventually formalin permeable. Nitrile gloves seem more resistant to mechanical damage. Double gloves are highly recommended.			
Engineering control:	The engineering controls for histology, pathology, and anatomy laboratories are mandated by OSHA at the level of local exhaust ventilation. A histology laboratory uses hoods, for example, at grossing workstations. The optimal choice is a back-vented station. Laboratory hoods have face velocities (the flow rate at the front of the hoods) in the 60–100 fpm range.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	report uses high quality data and/or techniques
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.

Study Citation:	Dingle, P., Tapsell, P., Hu, S. (2000). Reducing formaldehyde exposure in office environments using plants. Bulletin of Environmental Contamination and Toxicology 64(2):302-308.			
HERO ID:	1986339			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	office workers			
Area sampling data:	Monitoring was conducted in 18 conventional office buildings and 20 portable buildings used as offices in Perth, Western Australia. Average levels of formaldehyde in office buildings ranged from background levels of 10 ppb to 2110 ppb. Concentrations in the 18 conventional office buildings ranged from 10 ppb in an established office building to 78 ppb in a new four storey office building. Formaldehyde concentrations in 20 portable buildings ranged from 420 ppb to 2110 ppb. The highest levels of formaldehyde found were in newly constructed portable buildings. All these levels exceeded the recommended indoor guideline of 100 ppb and frequently exceeded the occupational standard of 1000 ppb. With plants, no change in formaldehyde concentrations with the addition of 5 or 10 plants in the rooms and only an 11% reduction in formaldehyde concentrations with 20 plants in the room.			
Engineering control:	Different plants were used as air purifiers. Plants include spider plant, fig tree, cast-iron plant, dumb-cane, and arum ivy. Up to 20 plants were used.

EXTRACTION				
Parameter	Data			
Worker activity description:	The following job classes were monitored: Anion Operators, SR Operators, Tech Advisor, and Logistic workers; Anion operators- performed the task of Unhooking Paraformaldehyde Car; performed the task of Sampling T55 overheads and bottoms; task of Line and equipment opening (LEO) on silo, replacing radar on top of silo; removing 2 Pop Valves on blower; Tech Advisor- Star Valve LEO and valve cleanout			
Personal sampling data:	Pg 3:General full shift work (Anion Operator)Two General 8 hour Time Weighted Average (TWA) samples were collected during routine shifts. During the shift, operators performed several tasks including unhooking a Paraformaldehyde car and sampling T55 overheads and bottoms. The results were 0.025 ppm and 0.0085 ppm respectively as an 8 hour Time Weighted Average. LEO on silo, replace radar on top of silo(Anion Operator)- One STEL sample was collected for this task. The results were 0.056 ppm. Removed two Pop Valves on blower (Anion Operator)- One STEL sample was collected for this task. The results were 0.0065 ppm. Star Valve LEO and Valve Cleanout (Anion Operator)- One STEL sample was collected for this task. The results were 3.0 ppm. Operator had supplied air on while conducting this task. Samples will need to continue to be collected for this task.Star Valve LEO and Valve Cleanout (Tech Advisor)- Two STEL samples were collected for this task on different days. The results were 2.9 ppm and 3.1 ppm respectively, for an average of 3.0 ppm. Operator had supplied air on while conducting this task. Samples will need to continue to be collected for this task.			
Exposure duration:	340 min, 350 min, 23 min, 15 min, 26 min, 42 min, and 19 min sampling times			
Personal protective equipment:	supplied air (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for an ion exchange facility, which is in-scope for FA under paint and coating MFG
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, worker activities and exposure type, but lacks additional metadata, such as exposure durations, exposure frequency..
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty can be determined from the sampling and analytical method but variability are not addressed.

EXTRACTION			
Parameter	Data		
Worker activity description:	Formaldehyde was unloaded and handled in solid form in the adjacent Anion plant; Formaldehyde was also a bi-product sent to a THROX unit located just east from the Cation control room and was a decomposition product (p. 3)		
Physical form:	solid (p. 3)		
Area sampling data:	Formaldehyde was detectable on area samples within the Cation control room across the dates sampled. Results ranged from 0.0018 ppm to 0.0048 ppm. (p. 3)		
Engineering control:	Formaldehyde was also a bi-product sent to a THROX unit located just east from the Cation control room (p. 3)		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source (NIOSH 2016/EPA IP-6) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates.
Overall Quality Determination		High	

Study Citation:	Dow Chemical, (2017). [Redacted] 2017 Personal exposure monitoring for XXX formaldehyde, XXX at the Elk Grove Site, Elk Grove Village, Illinois, USA.

Overall Quality Determination			High	

Study Citation:	Dow Chemical, (2019). [Redacted] 2017: Monitoring for formaldehyde, XXX Dow Water Solutions, Ion Exchange - Anion/SR Facility, 963 Building, Midland MI.			
HERO ID:	10602394			
Conditions of Use:	Adhesive MFG; paint and coating MFG (ion exchange)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Anion Operators: filter change 1H3 Filter, changing PVRV and pop valves, line and equipment opening, , general 8h exposureTech Advisor: star valve line and equipment opening and valve cleanoutUnloader: change 1F4 filter, draining para de-mister, unhook and hook up rail car (pg 2)			
Personal sampling data:	One full-shift formaldehyde sample was collected while the Anion Operator performed routine tasks including: unloading paraformaldehyde. The result was 0.0057 ppm,which was below the ACGIH Ceiling and OSHA TWA. This result was consistent with two full shift samples collected in 2016. The Student’s T Best Estimate of the 95thpercentile was 0.099 ppm. This was just under the ACGIH TWA but below the Ceiling and the OSHA TWA.One short term sample was collected while Anion Operators changed pop valves. The result was 0.012 ppm and was below the ACGIH Ceiling and OSHA STEL. Thiswas consistent for pop valve changes from past years which were not event driven.One short term task sample was collected while an Anion Operator changed the PVRV on the Para Silo. The result was 0.048 ppm and was below the ACGIH Ceilingand OSHA STEL. Additional samples will be needed to conduct statistical analysis.Two short term task samples were collected while an Tech Advisor performed a filter change on 1H3. The results were 0.46 ppm and non-detectable (ND) with adetection limit of 0.001 ppm. The first sample was above the ACGIH Ceiling but below the OSHA STEL. Additional samples will be needed to conduct statistical analysis.One short term task sample was collected while Anion Operators performed general line breaks in paraformaldehyde service. The result was 0.17 ppm and was belowthe ACGIH Ceiling and OSHA STEL. The 95th percentile of the distr bution was not in compliance with the ACGIH Ceiling.One short term task sample was collected while Anion Operators unplugged the star valve in the paraformaldehyde service. The result was 0.018 ppm and was belowthe ACGIH Ceiling and OSHA STEL. This was significantly different than past year’s data, which indicated both were exceeded. The difference in exposure potential maybe due to the installation of a de-mister unit in the system. Additional samples should be collected for statistical analysis.Seven short term task samples were collected while Unloaders drained the de-mister. This collection was to get a baseline understanding of exposure potential since thede-mister was installed this year. Results ranged from 3.1 ppm to ND with a detection limit of 0.003 ppm. The 95th percentile of the distribution was not in compliancewith the ACGIH Ceiling or OSHA STEL but was a good reduction in concentrations that resulted from previously having to unplug the star valve. The installation of the demisterwas an effort to eliminate the plugging issues. One result far exceeded the exposure limit at 3.1 ppm, but this instance was event driven and involved additionalline openings.One sample was collected while an Unloader changed filter 1F4. The result was 0.22 ppm and was below the ACGIH Ceiling and OSHA STEL. Additional samples willbe needed to perform statistical analysis.One short term sample was collected while the Unloader unhooked paraformaldehyde railcars. The result was 0.2 ppm which was below the ACGIH Ceiling and OSHASTEEL. (pg 3)			
Personal protective equipment:	supplied air (pg 8)			
Comments:	NIOSH 2016

Overall Quality Determination		High	

Study Citation:	Dow Chemical, (2019). [Redacted] 2018: Personal monitoring for formaldehyde, XXX at the Anion/SR Plant in Ion Exchange Midland, MI USA.			
HERO ID:	10602415			
Conditions of Use:	processing into a formulation			
EXTRACTION				
Parameter	Data			
Worker activity description:	The following job classes were monitored: Anion Operators, Special Resins (SR) Operators, and Unloaders. Anion Operators performed line and equipment openings, maintenance activities, changing PVRV and pop valves, and filter changes on 1H3. Unloaders performed draining para de-mister, hookup and unhook railcars and tank trucks, 1F4 filter change (pg 2 of 15)			
Personal sampling data:	One short term sample was collected for Anion Operators during changing of pop valves. The result was 0.15 ppm. This is consistent for pop valve changes from past years when not event driven. The performance of statistical analysis which included previous monitoring concluded that the 95th percentile of the distribution was not in compliance with the ACGIH STEL or the OSHA STEL. All samples were below the OSHA STEL. One short term sample was collected for Unloaders while unhooking the paraformaldehyde railcars. The result was 0.035 ppm. The performance of statistical analysis which included previous monitoring concluded that the 95th percentile of the distribution was not in compliance with the ACGIH STEL. All samples were below the OSHA STEL. One short term sample was collected for Unloaders while hooking up and sampling of paraformaldehyde railcars. The result was 0.079 ppm. Additional samples are needed to perform statistical analysis. This sample was below the OSHA STEL. The above results were all below the ACGIH and OSHA STEL. One short term sample was collected for Anion Operator while performing a filter change on 1H3. The result was 0.32 ppm. This was above the ACGIH STEL but below the OSHA STEL. Additional samples are needed to perform statistical analysis. The following tasks were above both the ACGIH and OSHA STEL: One short term sample was collected for Anion Operators while performing general line breaks in paraformaldehyde service (Star Valve Cleanout). The result was 2.6 ppm. The 95th percentile of the distribution was not in compliance with the ACGIH STEL. One sample was collected while an Unloader changed filter 1F4. The result was 3.7 ppm. Additional samples are needed to perform statistical analysis. Four short term samples were collected while Unloaders drained the de-mister. The results ranged from 0.017 to 2.8 ppm. There is still potential to exceed the OELs but this was a good reduction to the previous concentrations that resulted from unplugging the Star Valve. The installation of the de-mister was an effort to eliminate plugging issues. The sample that resulted in level of 2.8 ppm was event driven and involved additional line openings than normal. The 95th percentile of the distribution is not in compliance with the ACGIH STEL. (pg 3 of 15)			
Exposure duration:	8 hr/day (pg 3 of 15)			
Personal protective equipment:	PPR used is referred as "basic plus"; however, there is no elaboration

EXTRACTION				
Parameter	Data			
Worker activity description:	Students in animal health technology during a weekly biology lab. (2/5)			
Exposure route:	inhalation (2/5)			
Physical form:	vapor (2/5)			
Personal sampling data:	The students in TC 1 were exposed to formaldehyde levels ranging from less than 0.11 to 0.76 mg/m3 with an average at 0.25 mg/m3 during the 3-hour biology laboratory. The students in TC 2 were exposed to higher concentrations of formaldehyde ranging from 0.26 to 1.2 mg/m3 with an average at 0.632 mg/ m3. (2/5)			
Exposure duration:	3 hours			
Number of workers:	36 (2/5)			
Personal protective equipment:	"Appropriate gloves, such as butyl rubber, nitrile rubber, or viton are recommended.(12) An approved respirator for use with formaldehyde, as described in the literature,(13) also would help. Also, anyone who uses a respirator must be fit tested and trained on the use of the respirator." (4/5)			
Engineering control:	"Local exhaust ventilation in the laboratory would be the ideal solution.... An alternative for cat dissection could be the use of videos on cat dissection. training centers could maximize the use of interactive videodiscs or multimedia computer techniques and minimize the number of animals used in labs." (4/5)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Canada, an OECD country.
	Metric 3:	Applicability	High	Data are for the use of laboratory chemicals, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at two student training centers.
Overall Quality Determination			High

HERO ID:	5972538
Conditions of Use:	Manufacturing

EXTRACTION				
Parameter	Data			
Worker activity description:	”Pumps used to recirculate the solution are generally single mechanical-seal centrifugal pumps from a variety of manufacturers. Some seal types are more effective than others in controlling leaks. However, during our walkthroughs, most seals showed signs of leakage as evidenced by the formation of solid paraformaldehyde in and around the pump housing... Although operators spend a minimum amount of time in the absorber area, the leakage at the pump seals represents the highest potential for worker exposure to formaldehyde... Single mechanical-seal pumps transfer the solution from the absorber to the distillation column. Because this pump is moving a high formaldehyde concentration, it has leakage and vapor problems similar to the recirculating pumps on the absorber... Formaldehyde loading is a top-fill operation using a dip tube into the tank truck... The formaldehyde operator is generally isolated from the tank truck during loading, often in a nearby building to prevent excess worker exposure. Automatic loading devices are in common use” (pg 3)			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	PBZ data (in ppm):Chief operator: 0.01-0.13Operator: 0.12-2.4Loader: 0.02-2.4Shipper: 0.01-0.06Maintenance worker: 0.24 Corresponding $\mu\text{g}/\text{m}^3$ values can be found in Table 2, pg 3.			
Number of workers:	8 to 141 workers (Table 1, pg 1)			
Personal protective equipment:	Hard Hat, Safety Goggles, Rubber Gloves, Protective Suit, Cartridge Respirator, Dust Mask, Supplied Air Respirator			
Engineering control:	”Formaldehyde loading is a top-fill operation using a dip tube into the tank truck. Personal protective equipment are normally used by the operators as a substitute for engineering controls. Some of the newer or more progressive plants use ventilation to control the vapors and scrubbers to capture the formaldehyde. The formaldehyde operator is generally isolated from the tank truck during loading, often in a nearby building to prevent excess worker exposure. Automatic loading devices are in common use” (pg 3)			
Comments:	Table 2 specifies operator and loader sampling is short-term, assumed full shift TWA for other workers sampled

Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple locations along with personal breathing zone samples, but uncertainty is not addressed.
Overall Quality Determination		Medium		

Study Citation: Durgam, S., Page, E. (2011). Formaldehyde exposures during Brazilian blowout hair smoothing treatment at a hair salon – Ohio.
HERO ID: 8684525
Conditions of Use: Personal care products

EXTRACTION

Parameter	Data
Worker activity description:	A hairstylist washes hair, applies a smoothing solution, blow dries and flat irons the hair, applies a masque, then washes and styles it. (10/28)
Exposure route:	inhalation (10/28)
Physical form:	liquid (10/28)
Personal sampling data:	The formaldehyde concentrations for the task-based air samples ranged from 0.018–1.1 ppm. The short-term sample concentrations ranged from 0.018–1.3 ppm. (12/28)
Area sampling data:	When no treatment was performed, the GA air concentrations of formaldehyde ranged from 0.0044–0.025 ppm. The highest formaldehyde concentration (0.025 ppm) was measured in the dispensary and may be the result of pouring the Brazilian Blowout Acai Professional Smoothing Solution – Formaldehyde Free Smoothing Formula from the manufacturer’s bottle into a small dish before starting the treatment. When the Brazilian Blowout treatment was performed, the GA air concentrations of formaldehyde ranged from 0.057–0.11 ppm, with the highest formaldehyde concentration measured in the hair treatment room. (13/28)
Personal protective equipment:	The hairstylist wore disposable latex gloves while applying the smoothing solution to the hair. (10/28)
Engineering control:	The hair salon had a thermostatically-controlled residential HVAC system in the basement. The HVAC system used 1-inch thick pleated fiberglass air filters, and the supply air was delivered through floor vents. (10/28)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data are from the U.S.
	Metric 3: Applicability	Uninformative	Data are for commercial use of personal care products, outside of the scope occupational scenario.
	Metric 4: Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Exposure type, worker info, and sampling data provided, but missing exposure duration, frequency, and number of workers.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at different parts of the salon during different operations.

EXTRACTION			
Parameter	Data		
Worker activity description:	cutting, fusing, assembling, bundling, sewing, spot cleaning, inspecting, and shipping.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	Eight PBZ samples for formaldehyde were collected for employees sewing linings, cutting cloth, and bundling cloth. Eight-hour time-weighted average (TWA) PBZ concentrations of formaldehyde ranged from 0.14 to 0.17 ppm. The results of eight PBZ samples for formaldehyde on inhalable dust collected on the same employees ranged from less than the limit of detection to 29 µg/mg. [Job Title, Formaldehyde Conc., TWA conc.] Sewer, 0.22 ppm, 0.16 ppm (TWA) Sewer, 0.22 ppm, 0.16 ppm (TWA) Sewer, 0.23 ppm, 0.17 ppm (TWA) Sewer, 0.23 ppm, 0.16 ppm (TWA) Cutter, 0.18 ppm, 0.14 ppm (TWA) Cutter, 0.20 ppm, 0.15 ppm (TWA) Bundler, 0.20 ppm, 0.15 ppm (TWA) Bundler, 0.21 ppm, 0.16 ppm (TWA) Formaldehyde on inhalable dust Sewer 29 ug/mg inhalable particulate 0.14 mg/m3 Sewer 11 ug/mg inhalable particulate 0.31 mg/m3 Sewer (1.9) ug/mg inhalable particulate 0.38 mg/m3 Sewer (8.1) ug/mg inhalable particulate 0.23 mg/m3 Cutter 3.8 ug/mg inhalable particulate 1.2 mg/m3 Bundler (1.5) ug/mg inhalable particulate 0.99 mg/m3 Bundler 3.5 ug/mg inhalable particulate 0.92 mg/m3"()'' indicate between LOD and LOQ		
Area sampling data:	Eleven GA samples for formaldehyde and total particulate were collected in various locations in the facility. Formaldehyde concentrations measured in GA samples ranged from 0.16 to 0.25 ppm, 8-hour TWA. Total particulate concentrations in GA samples ranged from 0.02 to 0.15 mg/m3 (8-hour TWA). Formaldehyde General Area Samples Table 2 cutting pockets, sewing center backs 0.27 ppm 0.24 ppm (TWA) sewing pockets 0.26 ppm 0.22 ppm (TWA) liners 0.29 ppm 0.25 ppm (TWA) sleeves 0.29 ppm 0.25 ppm (TWA) final press 0.23 ppm 0.20 ppm (TWA) sewing liners 0.30 ppm 0.25 ppm (TWA) spreading and cutting area table 0.25 ppm 0.20 ppm (TWA) Receiving bulk fabric storage 0.17 ppm 0.16 ppm (TWA) Fuser, exit side 0.24 ppm 0.21 ppm (TWA) Shelf near spreading table 0.29 ppm 0.25 ppm (TWA) Collar sewing 0.28 ppm 0.25 ppm (TWA)		
Dermal exposure data:	nan		
Personal protective equipment:	- gloves, - long sleeve shirts		
Engineering control:	- Increase intake air with HVAC,		
Comments:	Samples were also taking outside but not extracted as not related to engineering assessment.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH Methods 2541 and 3500 or equivalent methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States.
	Metric 3: Applicability	High	The data are for an occupational scenario (textile work) is within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Study was implemented in 1993 after the PEL ((1992), but more than 20 years old.
	Metric 5: Sample Size	Medium	Results from sampling events are provided including TWA so statistic can be decided.
Domain 3: Accessibility/ Clarity

Particle size characterization:	Wood dust at the two particle board plants 0.6 - 1.1 mg/m3			
Number of workers:	75 exposed men out of 104 invited			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Sweden - OECD member
	Metric 3:	Applicability	High	The data are processing particle board and laminae, an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1988, before the most recent PEL (1992) and is more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range and maximum values, uncertain statistics not provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	No metadata were provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided data range values that could be used to assess variability. The study did not provide any discussion of theuncertainty.
Overall Quality Determination		Low

All the charcoal tube results reported using this method in plants 1 and 3 should, therefore, be regarded as minimum values.			
Exposure duration:	8 hrs/day			
Number of workers:	Plant 1 had approximately 1000 workers operating on a two shift basis, plant 2 had approximately 500 workers operating on a two shift basis, and plant 3 had approximately 600 workers on a single shift basis.			
Engineering control:	- Local exhaust ventilation hoods should be installed over fused lining machines to capture heat and formaldehyde vapors from this process operation. Areas of a plant should be evaluated for proper dilution ventilation in an attempt to further reduce exposure to formaldehyde.-The heating, ventilation, and air conditioning (HVAC) system should not be set up on a fully (100~) recirculated system as is the case during the summer and coldest parts of the winter. Fresh outside air should be introduced to the HVAC system to improve the dilution ventilation of the plant. The higher energy consumption that this would require could be partially offset by the installation of air-to-air heat exchangers which would pre-COOL (or pre-heat) incoming air with exhausting air. Such an improvement in dilution ventilation of a plant could reduce the formaldehyde exposure levels in the plant.- Local exhaust ventilation should be installed and utilized during the spot cleaning operation and when cleaning stamping devices with organic cleaning solvents.

Parameter	Data

Worker activity description:

Job classifications have been identified which have a potential for chemical or physical agent exposure during the application of polyurethane foam insulation and the activities associated with it. These job classifications have been divided into two general categories on the basis of the type of duties that are performed: Foam Applicators apply the foam to the surface and oversee the application process. Application Assistants prepare the surface for application, set up the application equipment, and perform other duties as required. A description of the duties within these job classifications is presented below by job category:

Foam Applicators

Foam Mechanic (Applicator A) The Foam Mechanic has the major responsibility for providing a satisfactory insulation job. His duties include: determining the method and strategy for opening the structure, application equipment cleaning and assembly, proper conditioning of resin and foaming agent, assuring adequate foam quality, foam application, assisting in opening and, on occasion, closing the structure, cleanup, measuring and sketching the building being insulated, and application equipment maintenance. The Foam Mechanic also serves as the crew chief. Application equipment cleaning and assembly usually takes less than an hour. Resin and foaming agent circulation usually begins about 1 hour before foam application starts. Density testing consists of weighing foam that is shaped into a cube of pre-determined volume. The cube is formed on a bench top in the back of the van. Foam quality testing consists of applying foam onto a plastic sheet. The test is conducted out-of-doors and usually takes a few minutes. For the 5 days of the study during which exterior application was conducted, foam application time varied from 1-3/4 to 3 hours. The Foam Mechanic assists in opening, closing, and cleanup when time permits. The house can be measured and sketched in about an hour.

Applicator (Applicator B) The Applicator has the major responsibility for applying the insulation satisfactorily. His duties include: determining the method and strategy for opening the structure, cleaning and assembling application equipment, proper conditioning of resin and foaming agent, assuring adequate foam quality, foam application, assisting in opening and closing the structure, cleanup, and light maintenance of equipment. The Applicator spends about 1 hour cleaning and assembling the foam application equipment. The foam quality check usually takes less than 10 minutes but may take longer, depending upon conditions. The actual time spent applying foam varies daily; for example, on some days foam is not applied. Conditioning resin and foaming agent involves starting the circulating pump and, if necessary, placing a band heater around the drums or circulating the components through a line heater to raise temperatures. The time spent opening varies; the amount of time spent closing is also variable and will depend on the progress that the Assistant has made in closing the house during the application process. Cleanup operations usually take less than 1 hour. Equipment maintenance is performed as needed.

Application Assistants

Laborer (Applicator A) The Laborers' duties include: opening, washing excess foam from the walls, monitoring for structural stress during foam application, closing, cleanup, scraping foam (open-bay procedure), hanging polyethylene film (open-bay procedure), and performing other duties as required. The Laborers spend most of their time opening and closing during exterior retrofit operations. On occasion, a Laborer will be stationed in the house to monitor for structural stress. Wiping excess foam from an opening can be accomplished in a matter of seconds. Cleanup operations usually last about an hour. Foam-scraping operations can proceed faster than the application process.

Assistant (Applicator B) The Assistant's duties include: opening, closing, cleaning excess foam from the wall after application, cleanup, and light maintenance of equipment. The Assistant may spend a workday or longer performing opening operations. The closing operation usually ends a short time after foam application has been completed; an exception to this is when wood must be filled, sanded, and painted. In many cases, the closing operation is less time-consuming than is foam application. The Assistant spends about the same amount of time performing cleanup and equipment maintenance operations as does the Applicator.

Warehouseman (Applicator B) The warehouseman usually works from 4 p.m. until 7 p.m. He is responsible for cleaning trash from the vans and stocking them for the next jobs. His duties include: removing trash from the vans and placing it into a dumpster outside the warehouse, consolidation of resin and foaming agent where more than one drum of each is present on a van, and preparing fresh foaming agent by diluting the 2.5 gallons of concentrate with 52.5 gallons of water. In all, three vans are serviced.

Foam Application Applicator (Applicator C) The Applicator, who is also the vice president of this company, has the responsibility for applying the polyurethane insulation. His duties include: maintenance, cleaning and assembly of the application equipment, assuring foam quality, foam application, and general cleanup. On days when foam is not applied, he may be involved in preparation and cleaning of the surface/area to be foamed, applying a weatherproof sealant to a foamed surface, or applying another type of thermal insulation material. The Applicator spends about 1 hour inside the truck each day cleaning, assembling, and performing maintenance on the application equipment. The actual time spent performing maintenance may vary; during the survey, there were delays due to equipment malfunction. End-of-day cleanup generally takes less than 1 hour.

Mechanic (Applicator D) The Mechanic's duties include: applying the foam, assuring foam quality, and cleaning and maintenance of the application equipment. The mechanic spends about 1 hour each day cleaning, assembling and performing maintenance on the application equipment. The actual time spent performing maintenance varies; during the survey, there were delays due to equipment malfunction.

Application Assistant Helper (Applicator C) The Helper's duties include: setting up equipment, moving the hoses from the path as the Applicator sprays the foam; making adjustments to the proportioning pump; changing

Exposure duration:	Operations at both applicators ran one shift, 8-10 hours per day,		
Exposure frequency:	Both Applicator A and B work Monday through Saturday when work is available. 5-7 days per week.		
Number of workers:	There are 20 individuals involved with the application of ureaformaldehyde foam insulation at Applicator A and two (occasionally three) individuals at Applicator B. Applicator C There are 12 employees, 3 of whom are generally involved in polyurethane application. Applicator D The insulation division of this company, which has 10 employees, is involved in the full-time application of polyurethane foam insulation.		
Personal protective equipment:	NIOSH recommends Type C supplied-air respirators with full-facepiece, operated in the positive-pressure mode.Applicator A - Personal protective equipment consists of respirators, goggles, and gloves. 3M 8500 disposable respirators are used, at times, when insulating with cotton fiber and when drilling masonry. This respirator is not NIOSH certified. Tight-fitting, soft plastic goggles are sometimes used when drilling masonry. Rubber gloves are frequently used by the FoamMechanic to prevent contamination of his hands with urea formaldehyde foam. Other than the gloves worn by the Foam Mechanic, no other personal protective equipment was observed in use during the course of the study. Applicator B-Rubber gloves are used during foaming operations and subsequent wall-surface cleaning to prevent contamination of the hands. Respiratory protective devices are not used during the urea formaldehyde foam application process. A wind-driven propeller fan provides ventilation for the van. There is no mechanical ventilation used in association with the application process.Applicator C - Personal protective equipment consisted of respirators and gloves. The respirators (Norton half-mask respirator, NIOSH Approval No. TC-23C-74, approved for pesticides) were used when foam was applied under the overhang of the steeple. Rubber gloves were used by the Applicator while spraying foam. Applicator D - supplies respirators (Willson Model No. 1221 with R-21 organic vapor cartridges, NIOSH certification No. TC-23C-50) fer employees. Company policy requires the use of respirators; however, some workers were observed not wearing respirators while spraying polyurethane foam. The Mechanic used the respirator while spraying foam from the floor level. While on the scaffold, the respirator was generally not used because the spray was directed mostly downward. (The helper stands near the base of the scaffold, but clear of the overspray.) Spraying from thefloor level involved directing the spray upwards, and the resulting overspray settled on the employee. There is no mechanical ventilation associated with the foam application process, and the natural ventilation was limited in the indoor application.

Parameter	Data

Worker activity description:

Job classifications have been identified which have a potential for chemical exposure during the manufacturing process of the polyurethane foam insulation system. The activities assigned to each job classification vary within each category with some overlap between categories. Consequently, a precise comparison of exposure by job categories between the two manufacturing plants cannot be performed. The Urea- Formaldehyde Foam Insulation System Resin Batchmakers 1 Cook (Manufacturer A) The Cook has the major responsibility for the production of a satisfactory batch of urea formaldehyde resin. His duties include: adding raw materials to the reactor, monitoring the reaction, and collecting samples. The Cook also performs quality control tests such as pH, temperature, degree of condensation, and viscosity determinations. Normally there are two Cooks; each makes one batch of resin during the day. While not making a batch of resin, the Cook performs other duties such as operating the forklift, assisting in filling containers with foaming agent, and washing drums. Research and Development Chemist (Manufacturer B) The Research and Development Chemist is primarily responsible for production of the resin component of the foam system. His duties include: making additions to the reaction mixture, monitoring the progress of the reaction, collecting samples and performing tests to determine the end point of the reaction, and terminating the reaction. During the survey period, the Chemist typically spent approximately 2 hours per day in the vicinity of the reaction vessel. The Chemist also has overall responsibility for the formulation of the foaming agent, although the foaming agent production is generally performed by the Laborer. The Chemist performs a variety of other functions in the company, including research and development on foam insulation systems. Production Assistants Floorworkers (Manufacturer A) The Floorworkers at Manufacturer A were broken down into three distinct job classifications as follows: Cook's Assistant- The employee's duties include: collecting drummed and bagged raw material for resin manufacturing; assisting in adding raw materials to the addition tank; setting up empty resin drums for filling; labeling resin drums and lids; and filling the resin drums. There are two Cook's Assistants; each normally performs the duties described during the production of one batch only. Other duties performed include: forklift operation, assisting the drum filler by placing lids on the drums, filling orders for application equipment, and repairing application and production equipment. Foaming Agent Blender- There is one Foaming Agent Blender. This individual is responsible for blending and drumming the foaming agent. The raw foaming agent is pumped from plastic drums into a blending tank. The Blender then adds small amounts of hardeners and a catalyst. When blending is complete, the Blender fills containers with the foaming agent. The foaming agent is blended about once a week. When not blending or drumming the foaming agent, this employee may operate the forklift, scrape labels off lids, or perform other duties as required. Drum Washer- The plastic resin drum is a reusable item that is returned to the plant for cleaning. There is one full-time Drum Washer. There is also a part-time Drum Washer who works from 1:00 p.m. to 6:00 p.m. The Drum Washer removes the lids from the returned drums and dumps the small amount of resin that remains into a trench. The washer then sprays the drums with high-pressure hot water. The water is heated in a kerosene-fired, portable steam and hot water generator. The used plastic lids are placed in a kettle of warm water which is located near the reactor. After soaking for a period of time, the Drum Washer removes the lids and scrapes the labels off with a knife. The Drum Washer spends about 10 minutes per day removing labels. Laborer (Manufacturer B) The Laborer's duties include metering ingredients into the reaction vessel, making certain additions to the reaction mixture, drumming the finished resin, mixing and drumming the foaming agent, and performing general cleanup activities. Plant Foreman (Manufacturer B) The Plant Foreman is primarily involved in shipping and receiving, and in general mechanical work in the plant. He assists in the production of the foaming agent, and operates the forklift to move finished drums of resin and catalyst to the shipping area. With the exception of shipping and receiving, this employee does not supervise foam manufacturing activities. Resin Manufacture Compounder (Manufacturer C) The Compounder is responsible for the compounding of polyurethane products including the compounding of drum-sized batches of TDI prepolymers. Work activities are similar for the production of both thermal and other polyurethane products. Specifically, the Compounder adds raw materials to the compounding vessels by following a product formulation sheet. The Compounder weighs each drum of raw material and pours the contents into the top opening of the vessel using an electric drum lifter. He then reweighs each drum. (Due to the high viscosity of many of the raw materials, residue may be left in the drum after pouring.) Certain raw materials, such as the catalysts which are used in small quantities, are first poured into smaller containers for more precise weighing, and then poured by hand into the compounding vessels. After the materials have been compounded, the Compounder collects a sample for quality control by dipping a paper container into the top opening of the vessel; he then takes the sample to the laboratory for a quality control check. adjustments to the resin may be made depending upon the laboratory results. If the sample is acceptable, the Compounder transfers the finished resin into drums. This is performed by lining up the drums on the compounding area floor, making a hose connection to the vessel, and filling the drums one at a time. Exposures may occur when ingredients are poured into the vessels, during the drum loading, and when a sample is collected. The Compounders spend more than 90 percent of their time in the compounding room. Blender (Manufacturer C) The Blender maintains the levels of raw materials in the supply tanks, monitors the flow of finished resin during drum filling, takes periodic samples for laboratory tests, and performs required maintenance and cleaning on

Area sampling data:	Operations at the two manufacturing sites ran 1 shift (8 hours) per day,Manufacturer A&BOperations at both manufacturing facilities were limited to the dayshift. Work days were Monday through Friday; however, Manufacturer B's facility may not produce foam on all 5 days. Manufacturer BIn order to produce two batches of resin in a day at Manufacturer A'sfacility, an operating period of about 11 hours is necessary. A Cookarrives about 6:15 a.m. to start the first batch. About 7:00 a.m., oneAssistant arrives. The other production workers, with the exception of a part-time Drum Washer, arrive at 8:00 a.m. The workday ends at 5:00 p.m. for those arriving at 8:00 a.m. The early Cook and Assistant do not necessarily leave after 9 hours. They may stay until drums have been filled with the second batch of resin, which could be as late as 5:00 p.m. The only formal break is lunch, which lasts for about 45 minutes. Other breaks are informal and do not necessarily involve leaving the work area. Under production conditions when one batch of resin is produced per day at Manufacturer B's facility, the Laborer arrives about 6:00 a.m. to begin the day 1s production run. The Plant Foreman also arrives early in the morning and may be involved in the preparations of resin and foaming agent production. The Research and Development Chemist arrives about 8:00 a.m. and takes charge of the resin production run. Typically, the production of a batch of resin and foaming agent is completed by about 3:00 p.m. There are no formal breaks during the workday, with the exception of lunchwhich the workers usually eat in the office area of the plant. Due to the small number of workers involved in the production process, the work schedule is very flexible and the employees generally identify and perform tasks which need to be done with a minimum of supervision.		
Exposure duration:	5 days per week.		
Exposure frequency:	The number of employees involved in production was small--seven employees were involved in production at Manufacturer A while three were involved in production at Manufacturer B. These numbers of employees are representative of the industry.Manufacturer CThere are approximately 80 non-union employees.Manufacturer DThere are 14 production employees at this facility.		
Number of workers:

		EVALUATION	
Domain	Metric	Rating	Comments
Personal protective equipment:			Require the use of full-facepiece respirators with organic vapor cartridges by the Applicator during exterior retrofit urea formaldehyde foam insulation application. This type of respiratory protective device should also be worn by employees engaged in open-bay application activities. Methods for reducing formaldehyde exposures during foam application should be investigated. Maximum usage should be made of natural ventilation, such as working upwind. General mechanical ventilation should be utilized where possible. Employees engaged in resin reactor operations, foaming agent blending, foaming agent and resin drumming, raw material handling, and foam application should wear chemical goggles and protective gloves. Install suitable eye washes and safety showers in resin and foaming agent drum fill areas, resin reactor areas, raw material storage areas, and applicator warehouses. A suitable eye wash should be taken into the field by the application crew. In addition, eye protection should be worn by application team members during drilling operations. Manufacturer CA formalized safety program was initiated in 1977. As part of the safety program, all employees are supplied with safety glasses, safety shoes, Nomex flame-retardant work clothes, and hardhats. Rubber gloves are worn when handling raw materials. MSA full-facepiece gas masks approved for use with organic vapors (NIOSH approval No. TC-14G-97) are worn by the Chemical operators when filling drums with TOI.
Engineering control:			Install local exhaust ventilation to reduce formaldehyde exposure levels to below the NIOSH/ACGIH recommended limits during urea formaldehyde drum fill operations. Manufacturer C Exposure control at the blending operation is accomplished through the use of a local exhaust ventilation system, maintenance of the integrity of the components, and use of beveled couplings which insert directly into the drums during filling and prevent spillage. The local exhaust ventilation system vents the displaced air from the drum during filling. The system has branch ducts which lead to the drum locations at the fill station. The ducts terminate in a 3-inch circular, plain (nonflanged) opening located above the open pressure relief bungs. Another branch duct terminates in a flanged canopy hood located over an overflow drum. The distance from the drum opening to the hood opening is about 4 inches; the hood openings were not positioned directly above the drum openings. Air flow measurements indicate an average face velocity of 660 fpm at the face of the first duct and 840 fpm at the face of the second duct (located upstream from the first duct). However, the calculated air velocities at each of the drum openings (based on measured air flows) are only 29 fpm and 37 fpm, respectively. Other controls include a walk-in booth (15' x 18') located in the compounding area which is used for the transfer of TDI and for the mixing of polyurethane products containing TDI. The flow rate was approximately 3300 cubic feet per minute. Located within the booth are flexible hose air ducts which can be placed at the top of a drum during mixing. However, the capture velocity of the air ducts as indicated by use of a smoke tube was insufficient to provide control. This booth has been in operation for 3 years. A walk-in oven, also located in the compounding area, was equipped with a slot hood in 1977. This oven is used to heat drums of raw materials including TDI. Two of the larger compounding vessels are equipped with local exhaust ventilation ducts which vent vapors generated while filling and mixing. The ventilation systems of the oven and the compounding vessels were not evaluated. Manufacturer D Exposure control in the production areas is accomplished through the use of a local exhaust ventilation system at the drum-fill stations and at a blend tank lid. The drum-fill stations are equipped with metal or metal and plastic canopy hoods measuring 18 inches in diameter and 25 inches high. Each hood is connected by a 6-inch diameter, flexible duct to an exhaust fan which is located inside the building. In some cases, the fans exhaust into a common duct before discharging contaminated air to the outside. The hoods, which rest on swivel stands and are equipped with access doors, provide nearly complete enclosure of the funnel and spout. The smaller drum vent opening, which remains open during filling to allow escape of the displaced air, is not covered by the hood. Consequently, vapors present in the displaced air may not be captured by the hood. Only three of the six hoods were used during the survey. One of the blend tanks is equipped with a slot hood around the outer edge of the tank lid. This hood is generally operating while raw materials are being added to the tank. The ventilation system of the vessel was not evaluated. Process controls exist which may indirectly provide exposure controls. These include automatic flow shutoff devices, which interrupt the flow of product when the drum is full, lessening the chance of overflow, and permanent connections between the blend tanks and certain raw materials storage tanks which reduce employee contact with these materials.

			Rating	Comments
	Metric 4:	Temporal Representativeness	Low	1979 - Prior to PEL(1992) and more than 20 years old
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in NIOSH method P&CAM 125.
Domain 3: Accessibility/ Clarity				
	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	High	Results from individual sampling events were provided which could be used to assess variability between locations, time, and roles. Uncertainty was not discussed but assumed that it was addressed in NIOSH method P&CAM 125.
Overall Quality Determination			High	

Study Citation:	Esswein, E. J. (1992). Health hazard evaluation report no. HETA 91-351-2252, Social Security Administration, District Office, Colorado Springs, Colorado.			
HERO ID:	3970581			
Conditions of Use:	Office Work- Building materials; furnishings			
EXTRACTION				
Parameter	Data			
Worker activity description:	The nature of the work conducted in the SSA space involves interaction with the public regarding management of social security benefits, claims management and associated paperwork processing.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Six air samples were taken at various locations in the office toevaluate for the presence of formaldehyde. As a background sample, one measurement was taken outdoors at the rear of the building. Six indoor air samples, only one measuring 1.7 micrograms per sample or 0.04 milligrams per cubic meter (mg/m3) measured above the minimum detectable concentration of 0.01 mg/m3 based on a sample volume of 40 liters. For this set of samples, the analytical limit of detection (LOD) was reported as 0.5 micrograms per sample (average sample volumes were 36 liters). The remainder of the indoor samples measured 1 or <1 micrograms per sample (an average of 0.02 ppm). Values of 1 or <1 micrograms per sample were between the limit of detection (LOD) and the limit of quantitation (LOQ) for the method. These values cannot be considered "firm" numerical amounts and should be considered semi-quantitative. The concentration for the quantifiable sample was well below the OSHA general industry standard PEL for formaldehyde of 0.75 ppm (0.92 mg/m3). The outdoor sample was reported as non-detectable. NIOSH recommends that exposure to formaldehyde be limited to the lowest feasible level since it is a potential human carcinogen.			
Number of workers:	The SSA District Office employs 35 people.			
Engineering control:	Roof-mounted HVAC exhausts serving the dry cleaning establishment should be evaluated and reconfigured to minimize reentrainment of exhaust effluent into outdoor air serving the SSA office space. The addition of a stack may be necessary to accomplish this.The Carrier three-ton unit should be modified to bring in outsideair in accordance with the current ASHRAE recommendation. Onemethod to accomplish this would be the addition of an economizer.A ventilation engineer should be consulted in regard to this issueparticularly considering that unless the problem with the stack corrected, entrainment of outside air contaminants are a continuedpossibility.

Study Citation:	Fent, K. W., Evans, D. E., Couch, J. C. (2010). Evaluation of chemical and particle exposures during vehicle fire suppression training.			
HERO ID:	8684528			
Conditions of Use:	Fire suppression of automobile fires			
EXTRACTION				
Parameter	Data			
Worker activity description:	Vehicle fire suppression training has three phases: (1) startup—when the fire is ignited and allowed to build, (2) knockdown—when the fire is suppressed with water, and (3) overhaul—when the fire fighters search for and suppress residual flames or flare-ups. Four fire fighters were involved in the suppression of the engine and cabin fires: a nozzle operator, a backup, a forcible entry, and an officer. The nozzle operator aimed the stream of water, backup assisted with holding the hose, forcible entry pried open doors or the hood to gain better access to the fires, and the officer managed the other fire fighters and assisted where needed.			
Exposure route:	Inhalation			
Physical form:	Gas			
Personal sampling data:	1st fireNozzle operator: not detectedBackup: (0.04) (mg/m^3)Officer: not detectedMotor pump operator: not detectedDuct holder: not detected2nd fireNozzle operator: (0.14) (mg/m^3)Backup: not detectedOfficer: (0.05) (mg/m^3)Motor pump operator: (0.06) (mg/m^3)Duct holder: not detected3rd fireNozzle operator: not detectedBackup: (0.06) (mg/m^3)Officer: not detectedMotor pump operator: not detectedDuct holder: 0.31 (mg/m^3)MDC: 0.06MQC: 0.22			
Exposure duration:	The fire fighters waited 2–5 minutes to let the fires build before knockdown with water. Knockdown took 1–3 minutes and was followed by 1–4 minutes of overhaul.			
Exposure frequency:	Fewer than 4% of its fire responses (~400 total runs per year) are to vehicle fires, which is below the national rate of 20% [Ahrens 2004].			
Personal protective equipment:	The fire fighters wore full turnout gear and SCBAs the entire time they fought the fires, including during overhaul except motor pump operator. Miami Township Fire and Rescue has a comprehensive written respiratory protection program that adheres to the OSHA Respiratory Protection Standard [29 CFR 1910.134] requiring annual medical clearance; respirator fit testing; and training on the use, maintenance, and care of SCBAs.

Overall Quality Determination		Uninformative	

Study Citation:	Fent, K. W., Musolin, K., Methner, M. (2013). Evaluation of chemical exposures during fire fighter training exercises involving smoke simulant.			
HERO ID:	2452610			
Conditions of Use:	Firefighting			
EXTRACTION				
Parameter	Data			
Worker activity description:	Exercises involving smoke simulant are conducted to train fire fighters on proper fire-attack and victim-rescue techniques in low visibility conditions inside the training tower. The trainers’ activities before initiating smoke simulant or propane-generated heat and fire included refilling the fog machine reservoirs (usually without wearing gloves), orienting the crew,assigning a trainer to the control room, inspecting the building, checking hose lines, opening valves, checking oil and glycol fluid levels, and turning on the built-in fogging system and/or portable fog machines. For the exercises involving propane-generatedheat and fire, the trainers also preheated the building to 400°F–425°F. The oil-based smoke simulant and propane burners and heaters operated for 10 minutes (timer-controlled). After the exercises, the trainers inside the tower opened doors, windows, and turned off equipment while an exhaust system in the tower was activated remotely to clear the building of smoke simulant and heat.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Estimated From graphsOil-based smoke simulant and propane-generated heat and fire – Personal samples: 6,000 ug/m3 (Figure 12)Glycol-based smoke simulant and propane-generated heat and fire – Personal samples: 1,900 ug/m3 (Figure 13)Oil-based smoke simulant and glycol-based smoke simulant and propane-generated heat and fire - Personal samples: 2,800 ug/m3 (Figure 14)			
Area sampling data:	Estimated From graphsGlycol-based smoke simulant - Area sampling inside room: 60 ug/m3 (Figure 10)Oil-based smoke simulant and propane-generated heat and fire – Area sampling inside the room: 1,800 ug/m3; Area sampling outside the room: 110 ug/m3 (Figure 12)Glycol-based smoke simulant and propane-generated heat and fire – Area sampling inside the room: 4,000 ug/m3 (Figure 13) Oil-based smoke simulant and glycol-based smoke simulant and propane-generated heat and fire – Area sampling inside the room 2 ft height: 3,500 ug/m3; Area sampling inside the room 5 ft height: 1,900 ug/m3; Area sampling outside the room: 450 ug/m3 (Figure 14)			
Particle size characterization:	size profiles are provided for mineral oil aerosols.			
Exposure duration:	15 minutes per episode.			
Exposure frequency:	Fire fighter trainers work 40 hours per week conducting 100 training exercises per year; fire fighters work 24 hours on and 48 hours off			
Number of workers:	255 full time fire fighters and 5 full-time fire fighter trainers; 2-5 fire fighter trainers per day			
Personal protective equipment:	Observations: All the trainers received a respirator fit test for SCBA every year; self-contained breathing apparatus (SCBA), were mandatory for the training exercisesinvolving propane-generated heat and fire. Not uncommon for trainers to wear N95 respirators, occasionally open rooms without respirators; NIOSH recommends: Ensure that trainers do not re-enter the training tower without wearing appropriate respirators until the tower is visibly clear of smoke simulant. Require trainers to wear self-contained breathing apparatus inside the training tower even if they are outside the training room during training exercises that involve heat or fire. Require trainers to wear self-contained breathing apparatus or full-facepiece air purifying respirators with cartridges or canisters that are effective against oil-based aerosol and formaldehyde during training exercises that involve only smoke simulants.Trainers should wear these respirators inside the training tower even if they are outside the training room. Respirators should also be worn during maintenance and adjustment activities if smoke simulant release is expected.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	NIOSH Study using EPA method TO-11A, however, notes that experimental temperatures were above operating range of sampling pumps. NIOSH made some adjustments to measurements to account for this but ‘The ability of the pumpsto accurately draw air at temperatures > 113°F (especially > 400°F) is unknown. (pg. 27)’

Metric 7:		Metadata Completeness	Medium	Variability is addressed by taking both personal and area samples but uncertainty is not addressed.
Overall Quality Determination			High	

Study Citation:	Frigas, E., Filley, W.V., Reed, C.E. (1984). Bronchial challenge with formaldehyde gas: Lack of bronchoconstriction in 13 patients suspected of having formaldehyde-induced asthma. Mayo Clinic Proceedings 59(5):295-299.			
HERO ID:	22222			
Conditions of Use:	Chamber study where individuals were exposed to different concentrations of formaldehyde			
EXTRACTION				
Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	Ranged from 0.1-1.2 ppm			
Exposure duration:	Mask for 20 minutes.			
Number of workers:	13			
Personal protective equipment:	Loosely fitting face mask			
Comments:	*Chamber study where individuals were exposed to different concentrations of formaldehyde to evaluate asthma responses. *Formaldehyde gas or placebo (room air) was delivered from a Dynacalibrator (model 340-23-X, Metronics, Santa Clara, California) at a flow rate of 10 to 14liters/min through Teflon tubing to a loosely fitting face			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from Minnesota, USA and may be representative of the conditions being evaluated.
	Metric 3:	Applicability	Low	The data are intended to represent home and workplace exposures which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1984, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type, but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates
Overall Quality Determination		Low		

Study Citation:	FRM Risk, (2019). [Redacted] Industrial hygiene air contaminant assessment report.			
HERO ID:	10602489			
Conditions of Use:	”blending operations”			
EXTRACTION				
Parameter	Data			
Worker activity description:	The operator lifts the supersacks via hoist on top of the hopper. The operator must then open a small door to the hopper to reach in to untie the supersack in order release paraformaldehyde into the hopper. After opening the supersack, the operator returns to the control room to observe the process. In order to start the process, three or four supersacks are added. Additional supersacks are added one by one throughout the shift to maintain the reaction. (pg 6)			
Physical form:	solid (paraformaldehyde)			
Personal sampling data:	TWA: 0.26, 1.7 ppm (pg 7)Short-term: 0.04, 0.3, 0.52 ppm (pg 8)			
Area sampling data:	TWA: 0.07, 0.024 ppm (pg 7)			
Exposure duration:	TWA sampling durations in table on pg 7; 340-480 min sampling (pg 7)short-term sampling durations in table on pg 8; 17-18 min sampling (pg 8)			
Personal protective equipment:	One employee was equipped with full facepiece (elastomeric) air-purifying respirator with an assigned protection factor (APF) of 50 (pg 2)			
Comments:	An Assay Technologies® (#571) passive dosimeter formaldehyde monitor was utilized as the collection media. In addition, an active air sampling method sampling method was conducted to compare results to the passive dosimeter monitoring. The active and passive methods are both monitoring methods used by OSHA. (pg 6)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved OSHA and NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for ”blending operations”, which may be applicable to multiple COUs but it is not clear the product of this particular facility.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Uncertainty can be determined from the sampling and analytical method, but variability is not addressed.
Overall Quality Determination		High		

Study Citation:	Gagnon, Y. T., Kennedy, E. R., Seitz, T., Teass, A. W. (1992). Development and evaluation of a method to estimate potential formaldehyde dose from inhalable dust/fibers. 7(4):231-240.
HERO ID:	6026019
Conditions of Use:	Finishing agents in textile, apparel, and leather manufacturing (garment manufacturing, waterbed accessory production)

EXTRACTION	
Parameter	Data
Exposure route:	inhalation
Physical form:	dust/fiber and vapor
Area sampling data:	"Not sampling data, but FA concentration ""floor refinishing dust"" (via chromotropic acid method (pg 7): ""Analysis of six filtered and six unfiltered 2-mg samples of the dust weighed into vials gave results of 11.0 +/- 0.8 µg/mg (6.6% RSD) and 74.7 +/- 16.4 µg/mg (20.9% RSD), respectively... [after 21 days to determine loss] The average result of 32 samples was 6.9 +/- 0.2 µg/mg (RSD = 8.2%). It should be noted that this set of samples was prepared from the same bulk sample as the filtered samples described above"" (pg 7) Table 1 (pg 8) provides area sampling data, for dust (mg/m3), formaldehyde bound in dust (µ/m3), and formaldehyde vapor (µ/m3) for garment production facility. Table 2 (pg 9) provides area sampling data, for dust (mg/m3), formaldehyde bound in dust (µ/m3), and formaldehyde vapor (µ/m3) for waterbed accessory plant. "
Comments:	Sampling location: Garment production: "At the turn-and-ticket operation, the sampling stand was placed on top of the vacuum device. In the cutting and layout area, the sampling stand was placed on a mobile cart and intermittently moved to stay in close proximity to the cutters as they worked" (pg 8)Waterbed accessory plant: "Sampling was conducted at a location where two miter saws were used simultaneously to cut waterbed rails to length" (pg 9)Garment production: 8.5 hour sampling (pg 8); Waterbed: 4.5 hour sampling (pg 9)Method: "For sample analysis, either a 4-ml aliquot was analyzed using the chromotropic acid procedure, as outlined in NIOSH Method 3500, (15) or a 1-ml aliquot was treated with 2,4-DNP and a catalytic amount of perchloric acid and analyzed by high-performance liquid chromatography for the resulting 2,4-dinitrophenylhydrazone." (pg 10)

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for fabric finishing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling multiple sites.

Overall Quality Determination	High

Study Citation:	Galarpe, V.R., Jerusalem, J.G. (2015). Determination of formaldehyde in air in selected hospital-histopathology laboratories in Cagayan de Oro, Philippines. Journal of Chemical Health and Safety 22(1):10-14.			
HERO ID:	6278435			
Conditions of Use:	laboratory use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in histopathology laboratories of three hospitals in Philippines.			
Exposure route:	Inhalation			
Physical form:	Formaldehyde is a colorless liquid and strong-smelling vapor.			
Area sampling data:	Formaldehyde concentrations in three hospitals are as follows: Hospital A [1 hr sample: using DNPH - 0.33 +/- 0.07 and using DNPH-coated silica - 0.61 +/- 0.21; 3 hr sample: using DNPH - 0.42 +/- 0.20 and using DNPH-coated silica - 0.93 +/- 0.04), Hospital B [1 hr sample: using DNPH - 0.14 +/- 0.13 and using DNPH-coated silica - 0.29 +/- 0.41; 3 hr sample: using DNPH - 0.45 +/- 0.01 and using DNPH-coated silica - 0.81 +/- 0.41), Hospital C [1 hr sample: using DNPH - 0.14 +/- 0.07 and using DNPH-coated silica - 0.51 +/- 0.18; 3 hr sample: using DNPH - 0.47 +/- 0.13 and using DNPH-coated silica – 1.03 +/- 0.36).			
Personal protective equipment:	Gloves, Laboratory gown			
Engineering control:	Exhaust fan, Laboratory chemical hood, Fire extinguisher			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	well described methodology
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	data are from a non-OECD country
	Metric 3:	Applicability	High	data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	data is less than 10 years old
	Metric 5:	Sample Size	Medium	range with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	no discussion on variability or uncertainty

Worker activity description:	Wood shaping using shaping machines			
Exposure route:	Inhalation			
Area sampling data:	ND (ppm)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for building/construction materials - wood and wood engineered products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data are greater than 20 years old. (1982)
	Metric 5:	Sample Size	Low	Sample distribution is characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing engineering control, PPE, exposure frequency, exposure duration.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination			Medium	

Study Citation:	Gerster, Melchior, F., Hopf, Brenna, N., Wild, Pierre, P., Vernez, D. (2014). Airborne exposures to monoethanolamine, glycol ethers, and benzyl alcohol during professional cleaning: a pilot study. Annals of Occupational Hygiene 58(7):846-859.			
HERO ID:	2452666			
Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	apartment, industrial, public space, patient room, and floor cleaning.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	GM = 0.023 mg/m-3; GSD = 3.5; Range = 0.003-0.189 mg/m3			
Number of workers:	Typically 3-4% of working population in developed countries.			
Engineering control:	cross ventilation			
Comments:	Increased FA concentrations observed have been attributed to a reaction between terpenes present in the cleaning products and ozone (Singer et al., 2006a). In the present study, the FA concentrations differed greatly between sampling dates. We did not sample on days where cleaning was not performed; therefore, the FA sources remain unknown.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	FA sampling and analysis were performed according to previously described methods (Huynh, 1998; Huynh and Vu-Duc, 2002). Cartridges (LpDNPH S10 cartridge; Supelco, Bellefonte, PA, USA) was used for sampling and the air sampling pump (Air Check XR5000; SKC Inc.) operated at a flow rate of 1.5 l min–1. Desorption (3ml acetonitrile) was followed by High Performance Liquid Chromatography (HPLC) (Varian, Palo Alto, CA, USA, Prostar, pump model 230, UV Diode Array Detector model 335,wavelength: 365 nm) with a packed (3 μm) column (Spherisorb; Waters, Milford, MA, USA) and equipped with ultraviolet (UV) detection. The LOD was 40ng sample–1.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Switzerland, an OECD country.
	Metric 3:	Applicability	High	The data are for an occupational scenario (cleaners) within the scope of the risk evaluation but source of exposure is unclear if due to cleaning products or other products.
	Metric 4:	Temporal Representativeness	High	2014 - after PEL (1992) and less than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized; geometric mean, geometric standard deviation, and range.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, and worker activities, but not exposure duration and frequency.
Domain 4: Variability and Uncertainty

Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in pathology labs, surgery rooms, and endoscopy wards. (2/5)			
Exposure route:	inhalation (2/5)			
Physical form:	vapors from liquid formalin or paraformaldehyde powder (2/5)			
Personal sampling data:	Pathology Labs: 0.96+-0.74 ppm Surgery Rooms: 0.25+-0.22 ppm Endoscopy Wards: 0.13+-0.18 ppm (2/5)			
Area sampling data:	Mean values are presented - Pathology Labs: 0.59-1.30 ppm Surgery Rooms: 0.15-0.51 ppm Endoscopy Laboratories: 0.01-1.62 ppm (3/5)			
Exposure duration:	1 hour, 8 hour			
Number of workers:	1/3 of 1.3 million workers are exposed to formaldehyde in America are working in medical and paramedical institutions and organizations. (1/5)			
Engineering control:	Local exhaust ventilation, typical fans, proper window ventilation, proper tissue storage, and a biological safety cabinet are measures that should be taken to reduce formaldehyde exposure. (3/5)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from Iran, a non-OECD country.
	Metric 3:	Applicability	High	Data are for the use of laboratory chemicals, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (means, medians, standard deviations, p-values) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at 8 hospitals.
Overall Quality Determination		Medium		

Study Citation:	Gibbins, J. D., Brueck, S. E., Sylvain, D., Oza, A. (2017). Health Hazard Evaluation Report: HHE-2010-0001-3295, November 2017. Evaluation of Occupational Exposures at an Insect Rearing Facility.			
HERO ID:	4794995			
Conditions of Use:	Other-Insect Rearing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Insect production - egg preparation, egg infestation, dark room, cutout room, hexcel stripping, egg production, moth production and collection, moth irradiation, moth packaging and shipping; Insect production support - diet weight room, kitchen, hexcel cleaning, carboard cleaning, tray scraping, quality control, maintenance, supervisor.			
Exposure route:	Inhalation, dermal (expected to occur but not measured)			
Personal sampling data:	0.21 ppm, 0.18 pm, 0.17 ppm, and 0.14 ppm; Sampling durations were 102, 134, 101, and 136 minutes respectively			
Area sampling data:	0.12 ppm near formaldehyde tanks and a concentration of 0.098 ppm near drying racks.			
Number of workers:	25 year round and 47 seasonal employees. Seasonal worked from March to October			
Personal protective equipment:	Depending on work area PPE were worn: N95, Elastomeric half mask respirator, gloves, hairnet, gown, lab coat, hearing protection, safety glasses, apron/boots, irradiation badge.			
Engineering control:	LEV. Facility had detailed sanitation and pest management protocols to address pathogens created by adult moths and scales. Floor to roof fire walls separated the administrative office area from the adjacent clean moth production area. The facility did not have a plenum or air exchange between the administrative office and production areas. Fume/work hoods. Negative pressure and baghouses for dust.			
Comments:	Area samples analyzed by NIOSH Method 2016			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source uses NIOSH approved sampling and analytical methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US.
	Metric 3:	Applicability	Low	Information is not clear on the function of formaldehyde in the process, it’s possible that the function is as a fungicide which would be outside of the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Data is just over 10 years old (2009).
	Metric 5:	Sample Size	High	Discrete values provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes process description, worker activities, personal and area sampling, number of workers, PPE, engineering controls but lack of clarity on the function of formaldehyde within the process.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by looking at multiple different areas for sampling data. Does not address uncertainty.

Study Citation:	Glas, B., Stenberg, B., Stenlund, H., Sunesson, A.L. (2014). Exposure to formaldehyde, nitrogen dioxide, ozone, and terpenes among office workers and associations with reported symptoms. International Archives of Occupational and Environmental Health 88(5):613-622.			
HERO ID:	2837506			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	office workers with and without sick building syndrome			
Physical form:	vapors			
Personal sampling data:	Formaldehyde concentrations (ug/m3) in 2 different places: in Umea – geometric mean – 7.6 +/- 1.7, median – 7.5, range – 0.97 – 45; in Vasa – geometric mean – 8.1 +/- 2.9, median – 9.8, range – 0.23 – 32			
Number of workers:	A total of 209 people participated in the study: 159 in Umeå and 50 in Vasa, 177 women and 32 men, with a mean age of 42.5 years for cases and 42.2 years for controls (range 23–65 years).			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	well described method
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	data is less than 10 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	addresses variabilities and uncertainties
Overall Quality Determination		High		

Study Citation:	Gockel, D.L., Horstman, S.W., Scott, C.M. (1981). Formaldehyde emissions from carbonless copy paper forms. American Industrial Hygiene Association Journal 42(6):474-476.		
HERO ID:	1317354		
Conditions of Use:	Use of Paper Products		
EXTRACTION			
Parameter	Data		
Worker activity description:	use of carbonless copy paper forms.		
Exposure route:	inhalation		
Physical form:	vapor		
Area sampling data:	Analysis of 9 carbonless copy forms 0.04-0.25 ppm		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH methods were likely used as the authors noted that the samples were analyzed spectrophotometrically using the chromotropic acid method as in NIOSH P&CM No. 125.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for use of carbonless copy forms, which is an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The article was published in 1981 before the most recent PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	High	testing results from 8 different types of forms were provided in terms of emissions per form or per kg of forms.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, and worker activities, but lacks additional metadata, such as exposure durations, and exposure frequency.=
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The study provided test results for different forms which could be used to evaluate variability. Information about uncertainty is likely included in the NIOSH methods.
Overall Quality Determination		High	

Study Citation:	Godby, M., Knutti, E. (1993). Health hazard evaluation report No. HETA-91-181-2307, Haddon Craftmen, Inc., Scranton, Pennsylvania. NIOSH(HETA-91-181-2307):91-181.
HERO ID:	1320742
Conditions of Use:	Multiple

EXTRACTION	
Parameter	Data
Worker activity description:	One operator and one helper work the Kolbus Tipper machine. Three operators and 8-11 helpers operate each binder (UB4 and UB5).An attendant on each shift diverts the flow of trimmings to the empty room and then pushes the accumulated scrap paper into an unguarded vacuum duct (floor opening) and down into the baler.One operator and one helper are at the Dexter machine producing laminated paper covers. On the ground floor, three Kolbus Liner machines employing 10 workers add reinforcement to hard covers.At the End Paper Combiner, an operator cuts liners for hard covers.Operation of the Compact 45 requires an operator and up to five helpers. The finished books are stacked onto pallets for packaging and shipment.For the shrinkwrap operation, the operator then uses a propane torch to shrink the sheeting. The shrinkwrap operation is only performed on the day shift and requires about 20-30 minutes per day.
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	The report notes one formaldehyde BZ sample was implemented but cannto not determine form the results which sample that was
Area sampling data:	Crathern Casemaker < LOQ Crathern Casemaker < LOQ Crathern Casemaker < LOQ End Paper Combiner 0.09 ppmEnd Paper Combiner 0.07 ppmEnd Paper Combiner 0.07 ppmCompact 45 0.04 ppmCompact 45 0.07 ppmCompact 45 0.07 ppmCompact 45 0.06 ppmCompact 45 0.06 ppmKolbus Liner 0.06 ppmKolbus Liner 0.07 ppmKolbus Tipper voidKolbus Tipper 0.01 ppmKolbus Tipper 0.03 ppmKolbus Tipper Operator 0.01 ppmRemote at breakroom < LOQ Remote at breakroom 0.03 ppmStamper < LOQ Stamper < LOQ UB4 0.07 ppmUB5 0.05 ppmUB5 0.07 ppm
Exposure duration:	3 shifts per day
Exposure frequency:	5 days per week
Number of workers:	265 (235 production workers)
Personal protective equipment:	Dust respirators (3M-8710) are provided to these baling area employees.
Engineering control:	The pre-melt pots' local exhaust ventilation hoods are set 2-3 feet above the pots to allow clearance for adding hot-melt glue pellets. Some of these pots incorporate strip curtains to direct the atmosphere above the pots into the hoods. Some of the various points of glue application are also fitted with an exhaust ventilation hood a few feet above the application point. Other points ofapplication do not incorporate local exhaust ventilation.It is recommended that the existing local exhaust systems over the pre-melt pots be improved to completely enclosing the hot-melt glue pots.While the above is being implemented, assure that all pre-melt pots for the hot-melt glues incorporate strip curtains to direct the atmosphere immediately above the surface of the pots into the local exhaust ventilation hoods, uninterrupted by the circulation of in-plant air. Assure that all elements of strip curtains are present and properly positioned at all times. This will help to contain the vapors within the exhaust ventilation system, and slow thespread of vapors into the work environment.

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study - Method 3500
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (book binding) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	1992 - when the PEL was set , but more than 20 years old.

...continued from previous page

Study Citation:	Godby, M., Knutti, E. (1993). Health hazard evaluation report No. HETA-91-181-2307, Haddon Craftsmen, Inc., Scranton, Pennsylvania. NIOSH(HETA-91-181-2307):91-181.			
HERO ID:	1320742			
Conditions of Use:	Multiple			
Domain		Metric	EVALUATION	
			Rating	Comments
		Metric 5: Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in NIOSH method 3500.
Domain 3: Accessibility/ Clarity		Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including exposure types, sample durations, exposure durations worker activities, and exposure frequency. It is unclear which of the samples represent breathing zone sample types, and as it is reported that all but one of the sampling events were area sampling, all the results were considered area samples.
Domain 4: Variability and Uncertainty		Metric 7: Metadata Completeness	High	Results from individual sampling events were provided which could be used to evaluate variability between locations. As this is a NIOSH study, it is assumed that uncertainty was considered in Method 3500.
Overall Quality Determination			High

HERO ID:	474862			
Conditions of Use:	Use of Metalworking fluid			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	[mg/m3] Extrusion Press 1-0.03, Extrusion Press 2-0.02, Hot Rolling Mill Entrance-0.03, Hot Rolling Mill-0.03, Cold Rolling Mill 1&2-0.02			
Number of workers:	31 workersof one shift (in a three-shift system) were incorporated inthis study: 10 workers from the Extrusion department (5from the Press 1 and 5 from the Press 2), 7 workers fromthe Hot Rolling Mill department and 14 workers from theCold Rolling Mill department (7 from Cold Rolling Mill 1and 7 from Cold Rolling Mill 2).			
Comments:	"The origin of this aldehyde is not yet clear, but we postulate that the formaldehyde could originate either from the combustion of MWF or from formaldehyde-releasing triazines used as biocides."			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology was noted that 2-hydroxymethylpiperidine impregnated tubes/ extracted with carbon disulfide analysis FID GC were used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Canada - OECD member
	Metric 3:	Applicability	Uninformative	Data are for formaldehyde as either a combustion byproduct or biocide byproduct, which is not in scope.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data are greater than 10 years old but no more than 20 years old - Published in 2008 but the data are from 2005
	Metric 5:	Sample Size	Medium	Statistical distribution of samples is fully characterized but only 1 sample taken per location.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, but lacks additional metadata: worker activities, exposure duration and frequency
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by sampling at different locations, however, only 1 measurement per location. Uncertainty in formaldehyde exposure is discussed.
Overall Quality Determination		Uninformative		

Formaldehyde

Occupational Exposure

HERO ID: 12171 Table: 1 of 1

Study Citation:	Golden, A.L., Markowitz, S.B., Landrigan, P.J. (1995). The risk of cancer in firefighters. Occupational and Environmental Medicine 10(4):803-820.			
HERO ID:	12171			
Conditions of Use:	Firefighting			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	ND-0.3 ppm inside mask			
Area sampling data:	Concentration of formaldehyde during knockdown and overhaul: up to 8 ppm and 0.4 ppm, respectively. Combined concentrations of formaldehyde and acetaldehyde levels:5 ppm mean (range 1-15 ppm). Concentration of aldehydes, including formaldehyde at 4 of 14 fires: 0.1 to 8.3 ppm. (See PDF pg. 4/18)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified, but references for the extracted data are given (and these references may contain information about sampling and analytical methodology.)
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The geographic association of the data is not stated although references for the data are stated.
	Metric 3:	Applicability	High	The data are for firefighters is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Metadata on the firefighting may representative of outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The study ws published in 1994 but the exposure data were collected prior to that time, possibly prior to the 1992 PEL, but definitely more than 20 years old.
	Metric 5:	Sample Size	Low	istribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	The study included sample type (i.e., area sampling) but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	a range of values were provided to give an sense of variability of the data but noting on uncertainty.
Overall Quality Determination		Low		

Study Citation:	Goldman, P., Flach, H. D., Hey, W., H, Hochadel, Petri, N., KU, Strassburger, Thiess, A. M. (1982). Formaldehyde morbidity study by Goldmann P et al (19).
HERO ID:	5908864
Conditions of Use:	Manufacturing

EXTRACTION	
Parameter	Data
Worker activity description:	Regular work includes as operating, measuring, and controlling instrumentation in control stations, control walks through the plants, operation of equipment, mechanical work on plants and packaging work. Irregular work includes sampling, cleaning of filters, opening of equipment, and cleaning with hot water, elimination of leakages on valves and pipelines, etc., disassembling plugged pipelines, and other mechanical work. (6/20)
Exposure route:	inhalation (9/20)
Personal sampling data:	"Group 1, up to 25% of the MAK value: <0.01-0.22 ppm Group 2, up to 60% of the MAK value: <0.01-0.60 ppm Group 3, up to the MAK value:<0.01-1 ppm (9/20)"
Exposure duration:	119 employees- from the Exposed Group worked in 12-hour shifts, alternating between day and night shifts. 80 people worked only 8-hour day shifts. (5/20)
Exposure frequency:	Up to 42 years of exposure, with an average of 18 years. (2/20)
Number of workers:	199 (2/20)
Personal protective equipment:	When carrying out irregular work, the employees are required to protect themselves against formaldehyde exposure by wearing respirators, possibly gas tight protective goggles, protective gloves, rubber boots, and possibly protective clothing if there is danger of skin contact with formaldehyde-containing solutions. (6/20)

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are form the U.S.
	Metric 3:	Applicability	High	Data are for the production of formaldehyde, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (ranges) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by sampling groups from different exposure levels (25% MAK level, etc.) Uncertainty is not addressed.

Study Citation:	Gorman, R., Aw, T. C. (1986). Health Hazard Evaluation Report HETA-1984-248-1694 Wasson Elementary school, Dubois, Pennsylvania.			
HERO ID:	8684537			
Conditions of Use:	Wood and engineered wood products or floor coverings			
EXTRACTION				
Parameter	Data			
Worker activity description:	Administrative staff at al elementary school. (5/24)			
Exposure route:	inhalation (5/24)			
Physical form:	gas (7/24)			
Area sampling data:	Formaldehyde was not detected during area sampling with a LOD of 0.04 ppm. (15/24)			
Exposure duration:	8 hours/day (7/24)			
Engineering control:	The heating, ventilation, and air conditioning (HVAC) system is primarily a zonal system with each zone consisting of a number of ceiling unit ventilators suspended above the false ceiling and a relief damper system designed to limit pressurizing the building when fresh air is brought in via the unit ventilators. Each unit ventilator delivers air through two ceiling diffusers near the outside wall; air is returned to the unit via two ceiling return grills on the inside wall. An outside temperature sensor regulates a damper in each unit ventilator that determines the mix of return air and fresh air. Fresh air enters through a vertical duct directly above each unit . In order for this type of system to work effectively, room air must have a pathway to the relief dampers, which were typically located outside of the classrooms in the corridors. (13/24)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Low	Data are for ambient air in a school, which can be similar to the in-scope occupational scenario of floor coverings, or wood products.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Low	Sample distribution is described qualitatively.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing number of workers, exposure frequency, and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.

Study Citation:	Gunson, T. H., Smith, H. R., Vinciullo, C. (2011). Assessment and management of chemical exposure in the Mohs laboratory. Dermatologic Surgery 37(1):1-9.			
HERO ID:	6199750			
Conditions of Use:	Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Laboratory technicians that process tissue for Mohs micrographic surgery. (1/9)			
Exposure route:	inhalation, dermal (3/9)			
Physical form:	vapor (7/9)			
Personal sampling data:	The results of atmospheric testing over one 8-hour shift at the decommissioned laboratory demonstrated formaldehyde levels of 9.6 and 4.1 mg/m3 for the personal sampling devices worn by two laboratory technicians. Repeat testing of formaldehyde and aromatic hydrocarbon concentration was performed at the new laboratory. Formaldehyde levels of 0.016 and 0.47 mg/m3 for the two personal sampling devices for a typical 8-hour shift were recorded.(5/9)			
Area sampling data:	The four static measuring devices recorded acceptable formaldehyde levels of 0.075 to 0.31 mg/m3 (5/9)			
Exposure duration:	8 hours (2/9)			
Exposure frequency:	5 days/week (5/9)			
Number of workers:	2 workers were sampled in this study (1/9)			
Personal protective equipment:	The appropriate use of gloves, eyewear, and gowns during the handling of hazardous chemicals should minimize the risk of direct contact. (8/9)			
Engineering control:	"All volatile chemicals are now handled within the fume hood. The position of the slide stainer within the fume hood in the new laboratory minimizes exposure considerably, and, after hours, the baths are covered to minimize vapor release. To minimize formaldehyde exposure, workers should open formaldehyde pots immediately before addition of the specimen and to close them again promptly. (8/9)"

Exposure route:	dermal (2/10)			
Physical form:	solution (2/10)			
Area sampling data:	Atmospheric concentrations of formaldehyde ranged from ND-0.04 mg/m3. (8/10)			
Exposure duration:	1-2 hours/day (8/10)			
Number of workers:	40 workers (2/10)			
Engineering control:	Ventilation should be installed in the braiding department to eliminate employee exposure to lint and dust containing formaldehyde. (4/10)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for synthetic rubber manufacturing, which is similar to the in-scope occupational scenario synthetic rubber manufacturing in transportation equipment.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure frequency and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination		High

HERO ID:	1512183				
Conditions of Use:	Use of fabric, textile and leather products				
EXTRACTION					
Parameter	Data				
Worker activity description:	Maintenance employee				
Area sampling data:	0.2-1.2 (ppm)				
EVALUATION					
Domain	Metric	Rating	Comments		
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.	
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.	
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4:	Temporal Representativeness	Low	Report is from 1980s.	
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.	
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.	
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination			Low		

Study Citation:	Hameed, Abdel, A. A., Khoder, M. I., Farag, S. A. (2000). Organic dust and gaseous contaminants at wood working shops. Journal of Environmental Monitoring 2(1):73-76.		
HERO ID:	1942922		
Conditions of Use:	Compressed Wood Product Manufacturing		
EXTRACTION			
Parameter	Data		
Worker activity description:	Two wood working shops were selected. They differ in area,location, number of workers, load of work and ventilationconditions. The first workshop has natural and mechanical (fans) ventilators, whereas the second shop has neither natural nor mechanical ventilators. Both workshops use a wide range of soft and hard woods. They produce a range of wood products, such as desks, chairs and furniture.		
Exposure route:	inhalation		
Physical form:	Gaseous		
Area sampling data:	Formaldehyde concentrations ranged from 0.28 to 0.54 ppm (mean = 0.42 ppm) in ventilated workshops and ranged from 0.48 to 0.84 ppm (mean = 0.64 ppm) in unventilated workshops.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	The data are from a non-OECD country.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Data is more than 20 years old
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low

Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Unclear if source is peer reviewed but appears to contain high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Study conducted in Iran, a non-OECD country.
	Metric 3:	Applicability	High	Data is directly applicable to use of pharmaceuticals/lab materials
	Metric 4:	Temporal Representativeness	High	Data is less than 10 years old (2011)
	Metric 5:	Sample Size	Low	Not characterized by statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes sample type, number of workers, and exposure route/physical form can be inferred.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by looking at women in different laboratory units with noticeable differences. Does not address uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Hauptmann, M., Jay, H.L., Stewart, P.A., Hayes, R.B., Blair, A. (2003). Mortality from lymphohematopoietic malignancies among workers in formaldehyde industries. Journal of the National Cancer Institute 95(21):1615-1623.			
HERO ID:	93083			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Worker activity description:	10 (3 formaldehyde production plants, 6 resin plants, 6 molding compound plants, 2 molded plastic product plants, 2 photographic film plants and 1 plywood plant)			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	for this cohort health effects study concentrations were groups into bins ranging from 0 to > 4.0 ppm which appeared to be provided by the companies participating in this study..			
Number of workers:	25619			
Comments:	data were aggregated into multiple process types: formaldehyde production, resin plants, molding compound plants, molded plastic product plants, photographic film plants and plywood plant			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Medium	The data were for operations included in the occupational scenarios for the Scope of the risk evaluation unfortunately the data aggregated multiple source types.
	Metric 4:	Temporal Representativeness	Low	Article states Exposure to formaldehyde was estimated from work histories collected through 1980 on the basis of job titles, tasks, visits to the plants by study industrial hygienists, discussions with workers and plant managers, and monitoring data
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	Hauptmann, M., Lubin, J.H., Stewart, P.A., Hayes, R.B., Blair, A. (2004). Mortality from solid cancers among workers in formaldehyde industries. American Journal of Epidemiology 159(12):1117-1130.

HERO ID:	4455619			
Conditions of Use:	lab chemical (medical)			
EXTRACTION				
Parameter	Data			
Worker activity description:	study concludes that source may be external to the clinic as higher levels found in adjacent areas (pg 4); possibly wood flooring manufacturer (pg 11)			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	TWA (NIOSH Method 2016 (pg 11)): 0.007-0.023 (Table 1, pg 12; discrete samples provided in table)Sampling locations: offices, hallways shared by clinic with neighboring businesses (pg 9); (1) midway down the hallway by the clinic’s mental health offices; (2) Mental Health Provider Office #17; (3) hallway shared by the outpatient clinic and the neighboring health clinic; (4) Exam Room #6; (5) RN Room #41; (6) open plenum space above the clinic hallway, near Mental Health Provider Office #17; (7) Exercise Room; (8) Exam Room #3; and (9) the hallway shared with the wood flooring manufacturer (pg 11)			
Exposure duration:	5-7 hour sampling (pg 11)			
Exposure frequency:	Daily exposure frequency (pg 10),			
Number of workers:	15 (pg 10)			
Engineering control:	postive pressure relative to adjacent businesses via HVAC repairs (pg 4)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH (Method 2016) method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for lab chemical, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling both in and outside the clinic, but uncertainty is not addressed.
Overall Quality Determination			High	

Study Citation:	Hawthorne, A.R., Gammage, R.B. (1982). Formaldehyde release from simulated wall panels insulated with urea-formaldehyde foam insulation. Journal of the Air Pollution Control Association 32(11):1126-1131.			
HERO ID:	5957355			
Conditions of Use:	Use of wall panels with urea-formaldehyde foam insulation			
EXTRACTION				
Parameter	Data			
Area sampling data:	Formaldehyde concentration over time in a chamber with an insulated panel shown in Figure 2 (Range 1.5-5.5 ppm). Concentrations inside wall cavities in Table 2 (range 0.08 - 6.8 ppm). Concentration in chamber with air flow in Table 4 (range 0.05-0.78 ppm). Additional data in Table , Figure 4, and Table 5.			
Comments:	Source provides data on formaldehyde in chamber and wall cavities with and without air flow. These concentrations can be translated into emission rates using the chamber / cavity volumes and equation provided in the study.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Low	The data are for a non-occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, such as a consumer DIY scenario that is similar to a worker scenario.
	Metric 4:	Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.

HERO ID:	4154223
Conditions of Use:	Laboratory Use

EXTRACTION	
Parameter	Data
Worker activity description:	Medical facility workers in Japan.
Exposure route:	Inhalation
Area sampling data:	25 medical facilities consisting of 14 pathology laboratories, 5 anatomy laboratories, 3 organ preservation facilities, 2 disinfection facilities, and one dissecting room for a gross anatomy course were selected for the study. Formaldehyde concentrations recorded in the gross anatomy course were 1.56 – 2.04 ppm. The concentrations of formaldehyde in workplace air collected before working hours by spot sampling were 0.07+/-0.08 ppm, ranging from less than 0.01 ppm in the pathology laboratory to 0.36 ppm in the anatomy laboratory. Mean formaldehyde concentration before working hours was 0.05 ppm for the workplaces where less than 1 liter to 99 liter of the containers storing formaldehyde and formaldehyde-treated materials were stored and 0.13 ppm for those where larger than 100 liter of the containers storing formaldehyde and formaldehyde-treated materials were stored. The formaldehyde concentration before working hours by spot sampling was 0.18 ppm in the organ preservation facility where many loosely sealed plastic storage containers having formaldehyde and formaldehyde-treated materials were placed. The medical facility where 40 sealed buckets containing formaldehyde and formaldehyde-treated organs were stored was maintained at 0.04 ppm formaldehyde. Formaldehyde concentration in a hospital pathology laboratory was measured as 0.12 ppm by spot sampling. Formaldehyde concentrations in the shelf were extremely high ranging from 2.86 to 4.90 ppm. The indoor formaldehyde concentrations before working hours in the medical workplaces were much higher than atmospheric concentrations of formaldehyde in that city. The atmospheric concentration of formaldehyde ranged from 0.78 ug/m3 (0.64 ppb) to 6.7 ug/m3 (5.5 ppb) with the mean value of 2.8 ug/m3 (2.3 ppb) averaged over 6 sampling spots in 2008. More data can be found in table 1.
Engineering control:	Exhaust system

HERO ID:	1986712			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Viscera removed during the autopsy were examined and then stored in a container with approximately 2 to 4 L of concentrated formalin. Once the thoracic and abdominal cavities were empty and exposed, the major blood vessels were perfused with preservative fluids and skin colorants using an injection pump.			
Exposure route:	Inhalation			
Personal sampling data:	Initial Passive Dosimeter Screening: 0.065-1.62 (ppm); Personal TWA exposure values during actual embalming ranged from 3.20 to 7.54 ppm with an arithmetic mean of 4.80 ppm (GM = 4.43/GSD = 1.53). Calculated 8-hour TWA exposures ranged from 1.32 to 2.86 ppm for a mean of 1.80 ppm (GM = 1.85/GSD = 1.38).			
Area sampling data:	Pre-ventilation upgrade exposure data: 0.01-20.89 (ppm); Post-ventilation upgrade exposure data: 0.024 - 3.44 (ppm)			
Exposure duration:	8hr TWA; Sample durations kept as close to 15-min duration as possible of OSHA STEL comparison.			
Exposure frequency:	0 - 10 cases per year; must meet a 2-week preservation requirement for overseas case processing and return of the deceased to the continental United States			
Personal protective equipment:	Full-face respirators			
Engineering control:	Local exhaust ventilation described in Figure 1.

The limit of detection is 1.0 ug per sample* sample results less than the limit of quantitation (3.0 ug/sample).
Area sampling data:	Four area samples for formaldehyde analysis were collected by impingers in each plant. In plant 2, formaldehyde concentrations ranged from 0.05 to 0.07 ppm. In plant 1, concentrations ranged from 0.04 to 0.08 ppm.Fourteen Orbo-23 tubes were also used to collect samples forformaldehyde analysis. Results of nine samples were above the limit of detection (1.0 ug/sample), but all were below the limit of quantitation (3.0 ug/sample).Method 3500Plant 2 Line 7 entrance to mold 0.07 ppm Line 8 entrance to mold 0.05 ppm Line 6 entrance to mold 0.06 ppm Line 6 exit from mold 0.07 ppm Plant 1 Line 5 loading fibrous glass 0.04 ppm Line 2 loading fibrous glass 0.05 ppm Between lines 1 & 2 pre-trim 0.08 ppm Line 2 after marriage 0.04 ppmMethod 52Plant 2 Line 8 0.02 ppm* Line 6 0.02 ppm* * sample results less than the limit of quantitation (3.0 ug/sample).
Dermal exposure data:	nan
Number of workers:	122 at plant 1 and 132 at plant 2
Personal protective equipment:	The company should provide workers with a daily change of laundered work clothes with long sleeves to protect the arms. Gloves or other types of protective clothing may be helpful. Work clothes should not be worn outside the workplace and contamination of street clothes should be prevented. Showers should be available at work for use before workers change into street clothes.
Engineering control:	The local ventilation around the hot wire operations, the fibrous glass cutting and trimming operations, and the curing presses should be improved.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH Study - OSHA Method 52 & Method 3500
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for an occupational scenario (automotive headliner production) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	1990 - Prior to PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	High	Statical data not provided but results from individual sampling events were provided and can be used to develop statistical summaries. Uncertainty not discussed but assume to be considered in OSHA Method 52 and Method 3500.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, exposure durations, and exposure frequency but lacks additional meta-data, such as worker activities.

HERO ID:	667986			
Conditions of Use:	Use of metal products			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	range <0.013-0.102 ppm			
Exposure duration:	kiln firing bisque 4-20 hrs; Glost firing 4- 13 hours; Rojud firing 30 minutes. Measurements were for 2.5 to 12 hours			
Number of workers:	10,000 potters in British Columbia			
Engineering control:	ventilation systems			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is probably an acceptable methodology - includes use of high-performance liquid chromatography (HPLC) based on Workers’ Compensation Board of British Columbia (WCB) aldehydes method
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Canada - OECD member
	Metric 3:	Applicability	High	Data are for pottery workers which is an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data are greater than 20 years and after the PEL- Article published in 1998
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (range) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing [frequency of exposure].
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by the coefficient of variance and data for 10 plants, but uncertainty is not addressed.
Overall Quality Determination		Medium

Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	dissection			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	The formaldehyde concentration values measured by the passive method ranged from 0.51 to 0.97 ppm in the center of the laboratory, with an average concentration of about of 0.67 ppm.The concentrations in the corners, ranged from 0.22to 0.70 ppm with an average of 0.44 ppm.			
Number of workers:	41 medical students			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified, though it was noted that passive aldehyde samplers were used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Japan - an OECD member
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Medium	This study was derived from data from 2004, after the most recent PEL (1992) and more than 10 but less than 20 years old.
	Metric 5:	Sample Size	Medium	Average value and range data were provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination			Low	

Occupational Exposure

Study Citation:	Ho, S., Cheng, Y., Bai, Y., Ho, K., Dai, W., Cao, J., Lee, S.C., Huang, Y., Ip, H., Deng, W., Guo, W. (2016). Risk Assessment of Indoor Formaldehyde and Other Carbonyls in Campus Environments in Northwestern China. Aerosol and Air Quality Research 16(8):1967-1980.
HERO ID:	3476957
Conditions of Use:	Office Environment

EXTRACTION	
Parameter	Data
Worker activity description:	Staff at a university in Xi'an, Shaanxi, China, including academic staffs, workers, students.
Exposure route:	Inhalation
Area sampling data:	The monitoring was conducted at 6 workplaces at a university in Xi'an, Shaanxi, China. The six workplaces include (W1) a non-smoking academic office, (W2) a smoking academic office, (W3) a dining room in the student canteen, (W4) a photocopy center, (W5) an underground supermarket and (W6) a lecture room. Formaldehyde concentrations (ug/m3) were found to be as follows: W1 - 72.2 ± 31.0 , W2 - 55.8 ± 24.1 , W3 - 8.01 ± 0.87 , W4 - 5.18 ± 1.51 , W5 - 1.75 ± 0.67 , W6 - 3.02 ± 1.69 . Formaldehyde average concentrations in the academic offices (Site W1 and W2) exceeded the recommended exposure limit (REL) of 20 ug/m3 (16.3 ppbv) for an 8- or 10-hour time-weighted average (TWA) exposure and/or ceiling. These academic offices consisted of wooden furniture and possible carbonyl emission sources including ETS. Formaldehyde was dominant carbonyl at Site W1 and Site W2, which accounted for 80.0% and 57.9%, respectively, of the total quantified carbonyls. In the dining room of the student canteen (Site W3), formaldehyde and acetaldehyde are the two largest molar contributors. Cooking emissions from the semi-open kitchen may influence the air quality in the dining area. The authors found that the formaldehyde levels in normal working hours were 46–58% higher than those in the off-duty or nonoperational periods. Office technologies including electronic copiers and printers can produce ozone by the reactions of high energy electromagnetic radiation and electrical discharge from oxygen, consequently leading to the volatile organic compounds (VOCs) formations.
Exposure duration:	In general, all employers are assumed to work eight hours per day

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology is well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	data from a non-OECD country

Study Citation:	Hollett, B. (1983). Walk-through survey report: Control technology for adhesives at National Veneer Plant, Broyhill Furniture Industries, Inc., Lenoir, North Carolina.		
HERO ID:	6558529		
Conditions of Use:	Processing: Wood Product Manufacturing		
EXTRACTION			
Parameter	Data		
Worker activity description:	The duties of the press crew are mixing, spreading, laying-up panels, loading, unloading, and separating.		
Exposure route:	Inhalation		
Physical form:	Vapor		
Personal sampling data:	See Table 1. Personal exposures for unloaders range from ND - 1.5 mg/m3.		
Area sampling data:	Generally less than 1.2 mg/m3 with the exception of two measurements taken near Press No. 3. One, a 32 minute source sample, taken directly over the hot wood pile is 2.4 mg/m3[2.0 ppm]. Another 28 minute sample taken in the work area of the Unloader is greater than 1.2 mg/m3 [1.0 ppm].		
Number of workers:	89 production workers. The three presses are operated by 11 employees. There is one glue mixer and one spreader operator who feeds the stock through the spreader. Two workers remove the glued layers and lay them in stacks according to the thickness desired. The same workers -then roll the stacks of panel stock on roller conveyors to the press input side.		
Personal protective equipment:	Personal protective equipment provided are gloves and aprons. Employees are encouraged to wash their hands whenever they have contacted glue.		
Engineering control:	Each of the three presses is equipped with a local exhaust system. In addition to the local exhaust, there are pedestal fans which the workers can position to provide cooling air, and there is a wall exhaust fan some distance behind the press area. No replacement air is supplied; it is drawn in through open windows and loading dock doors. Data on air velocity provided in Appendix.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure frequency.
Domain 4: Variability and Uncertainty

HERO ID:	6117902			
Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor/gas			
Area sampling data:	Formaldehyde exposures depend on the amount used by all workers in the same ventilated area, and the liquid-air surface area where a greater surface area of exposed liquid will increase the formaldehyde air concentration. Three studies were identified by the authors for their meta-analysis of which one covered two job types. One third of the participants were smokers, a known source of formaldehyde. Occupational formaldehyde air concentrations were measured according to occupational hygiene standards in all three studies. Air concentrations were similar (0.16–0.21 ppm) and below occupational exposure limit value (0.3 ppm for 8 hours) set by the European Scientific Committee on Occupational Exposure Limits for Chemical Agents (SCOEL). Frequency ratio for formaldehyde ranged between 2.15 (pathology and anatomy staff) and 9.77 (mortuary operators). Air concentration of formaldehyde for different job types were reported as: for pathology and anatomy staff - ranged between 2 and 7 ppm; for histopathology lab workers - 0.16 ppm; operator - 0.21 ppm, for technician – 0.28 ppm.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods (method can be found in reference articles).
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The article is less than 10 years old but most of the data used is more than 10 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by comparing different studies but uncertainty is not addressed.

EXTRACTION			
Parameter	Data		
Worker activity description:	Developing film manually or automatically with the Luth Mini 500.		
Exposure route:	Inhalation		
Physical form:	Vapor		
Area sampling data:	No formaldehyde was detected using detector tubes during thecolor film and the litho reversal development, where formaldehyde was a reagent.		
Exposure duration:	Employees spend an average of 4 to 6 hours for processing.In Room B, a long-term area sample for formaldehyde indicated an average concentration of 0.01 ppm over a six-hour time period.		
Number of workers:	Three full- and three part-time employees work at the printing laboratory.		
Personal protective equipment:	NIOSH recommends the use of aprons, gloves, and goggles while handling chemicals.		
Engineering control:	Local exhaust ventilation in the form of a canopy hood over the Luth Mini. A portable air cleaning unit was also operating in the area and was designed to filter up to 8000 cfm every 30 minutes.

EXTRACTION				
Parameter	Data			
Worker activity description:	Textile Plant: Finishing and dyeing substances			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	0.2 cm3/m3 mean (range 0.1-0.5 cm3/m3) (1977-1979)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/ analytical methodology is specified, chromotropic acid method was used at sampling times between 10min to 2 hrs.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Finland - OECD member
	Metric 3:	Applicability	High	The data are for textile workers which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were from the National Institute for Occupational Safety and Health (1976) and the National Research Council (1980), before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Distribution of samples is characterized by mean, number of samples and range.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type , sampling/analytical method, description of exposure but lacks additional meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provides a range that could be used to estimate variability but does not address uncertainty.
Overall Quality Determination		Medium		

Study Citation:	IARC, (1982). IARC monographs on the evaluation of the carcinogenic risk of chemicals to humans: Some industrial chemicals and dyestuffs. IARC monographs on the evaluation of carcinogenic risks to humans 29:1-398.

Study Citation:	Ioras, F., McNulty, T., Natthondan, V., Ratnasingam, J. (2010). Dust, noise and chemical solvents exposure of workers in the wooden furniture industry in South East Asia. Journal of Applied Sciences 10(14):1413-1420.			
HERO ID:	6022557			
Conditions of Use:	Processing: Wood Products Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Sprayers, handlers, and general workers in the surface coating department of wooden furniture factories. (4/9)			
Exposure route:	inhalation (3/9)			
Physical form:	vapors from aqueous solvents (3/9)			
Personal sampling data:	Average formaldehyde exposure was 1.93 ppm, with a range of 1.66-2.18 ppm. (6/9)			
Exposure duration:	Average sampling time of 30 min.			
Number of workers:	200 workers sampled in each of 4 countries (4/9)			
Personal protective equipment:	Masks with charcoal filters or masks with a supply of pressurized air are highly recommended based on the study. (7/9)			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from Malaysia, Indonesia, Thailand, and Vietnam, none of which are OECD countries.
	Metric 3:	Applicability	High	Data are for sealants in wood product manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (average, range) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at 30 different sites across 4 countries.
Overall Quality Determination			Medium	

Study Citation:	Ioras, F., Ratnasingam, J. (2010). The safety and health of workers in the Malaysian wooden furniture industry: An assessment of noise and chemical solvents exposure. Journal of Applied Sciences 10(7):590-594.			
HERO ID:	6229076			
Conditions of Use:	Wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in the wooden furniture industry, specifically in the surface coating departments (including sprayers, handlers and general workers), in Malaysia			
Exposure route:	inhalation			
Area sampling data:	Average formaldehyde concentration was 1.93 ppm, ranging between 1.66 and 2.18 ppm (Permissible exposure limit = 0.3)			
Number of workers:	85			
Personal protective equipment:	Workers used personal face mask, but these face masks provided insufficient protection to the workers from chemical solvents and formaldehyde exposure.			
Comments:	The air sampling was carried out over 3 subsequent days in the surface coating departments of the factories on a total of 85 workers selected randomly from the surface coating departments (including sprayers, handlers and general workers), with a total of 500 parallel samples of solvents and formaldehyde collected over an average sampling time of 30 min, throughout the 8 h shift of the workers.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from a non-OECD country.
	Metric 3:	Applicability	High	Data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Medium	Data between 10 and 20 years old.
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	NJ 0.016 ppm geometric means, 1.20 ppm GSD, 0.017 ppm median (range 0.013-0.019 ppm); NY 0.012 ppm geometric means, 1.27 ppm GSD, 0.012 ppm median (range 0.009-0.016 ppm); CT 0.011 ppm geometric means, 1.24 ppm GSD, 0.011 ppm median (range 0.008-.015 ppm)		
Area sampling data:	NJ Stage II full-service: geometric mean 0.014-0.016 ppmNY Stage II self-serve: geometric mean 0.01-0.012 ppmCT non-stage II self-serve: geometric mean 0.011-0.012 - subject to metrological conditions.		
Comments:	Initially only the measurements near the pumps were extracted. Now includes perimeter, pumps and BZ.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Midget impingers containing DNPH. samples were collected at perimeter locations and one pump location at each station and in breathing zones for customers for the NY and Connecticut locations and for attendant breathing zones for New Jersey stations. In addition, four-hour charcoal tube samples were collected in the breathing zones of all stations. Analysis was performed using HPLC method TO5
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for worker exposure at vehicle service stations which is an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data were published in 1994 based on testing implemented in 1993, after the most recent PEL (1992) but more than 20 years old.
	Metric 5: Sample Size	High	The average concentration for both testing cycles for each location was provided as well as summary statistics that include geometric means, GSD, median and range data
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Metadata included sample type, exposure type, sample durations, but lacks additional metadata, such as exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The study provided results for individual testing events for each location along with standard deviation and range data that can be used to evaluate variability. TO5 method includes uncertainty assessment that includes analysis of duplicate samples and blanks.

Comments:	Note, the monitoring data seems to have combined PBZ measurements for multiple groups (wood product and food additive workers).			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from China, a non-OECD country.
	Metric 3:	Applicability	High	Data are for building/construction materials - wood and wood engineered products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Assessment is based on current industry conditions and data no more than 10 years old. (2014)
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Uninformative	Monitoring data combines measurements from multiple activities, unable to tell which measurements are for the COU of interest.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by testing low- and high-exposure groups but uncertainty is not addressed.
Overall Quality Determination		Uninformative		

Study Citation:	Jia, Y., Li, X., Liu, Y., Shi, L., Wang, Y., Xu, L., Yao, D. (2015). Indoor air quality real-time monitoring results of pathology department. Journal of Environmental Protection 6(8):851-856.			
HERO ID:	6022288			
Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Area sampling data:	The average concentration of formaldehyde at 3 am, 10 am, 1 pm, 4 pm, 10 pm (Beijing time) was (1.32 ± 0.86) mg/m3			
Exposure duration:	24 hours real-time monitoring for pathology department technical room			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	The data are from a non-OECD country, and locality-specific factors (e.g., potentially greater differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S., or the country of origin is not specified.	
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	High	The operations, equipment, and worker activities associated with the data are expected to be representative of current operations, equipment, and activities. The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter. If no PEL is established, the data are no more than 10 years old. Metadata on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.	
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, but lacks additional metadata, such as exposure frequency, and/or worker activities.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability by measuring at different times of the day. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.

EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	low formaldehyde flooring flux (1 hrs exposure): ozone exposure 31 ug/m2hr; IR Lamp 68 ug/m2hr; Sun lamp 82 ug/m2hr; UV-A lamp 4 ug/m2hr; UVb lamp 7 ug/m2hr. Natural wood flooring flux (1 hrs exposure): ozone exposure 288 ug/m2hr; IR Lamp 103 ug/m2hr; Sun lamp 180 ug/m2hr; UV-A lamp 83 ug/m2hr; UVb lamp 83 ug/m2hr			
Exposure duration:	1 hr			
Comments:	Article looks at "secondary emissions" caused by products being exposed to UV/Sunlight. Could be useful for degradation/byproducts			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not specified though it was noted that 2,4-dinitrophenylhydrazone impregnated cartridges attached to PEM or MEM, HPLC analysis were used
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Japan - OECD member
	Metric 3:	Applicability	High	The data are for formaldehyde emissions from wood products and/or floor coatings which is within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data are greater than 10 years old but no more than 20 years old - published 2009
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - only flux rates were provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	flux rates were provided but no additional data. note chamber study and field sampling. Missing: sampling/analysis methods, number of samples, number of sites, worker activities, exposure frequency, number of workers and sampling locations
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed
Overall Quality Determination			Medium	

Study Citation:	Kaiser, E. A., Sylvain, D. C. (1994). Health hazard evaluation report No. HETA-94-0023-2473, Veterans Administration, White River Junction, Vermont.			
HERO ID:	1317748			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	Employees in Veterans Administration Medical and Research Center, White River Junction, Vermont			
Exposure route:	inhalation and skin absorption			
Physical form:	colorless gas with a strong odor			
Area sampling data:	Air sampling performed by VA staff indicated that formaldehyde concentrations exceeded 0.1 parts per million (ppm) on several dates in July 1992, in several different areas of Building 44, but primarily on the ground floor. Repeat formaldehyde sampling later that summer found concentrations to be approximately one tenth of the previous readings. Air sampling in March 1993 indicated concentrations of 0.2 ppm formaldehyde in room G-107. Two other repeat samples found <0.04 ppm in this room. Formaldehyde sampling conducted by the VA in 1992 and 1993 found concentrations ranging from none detected to 0.6 ppm. On February 17, 1994, the NIOSH investigators returned to conduct area air sampling for formaldehyde. Very low levels (<0.01 ppm) of formaldehyde were detected in the area air samples from the research laboratories. The OSHA PEL is 0.75 ppm as an 8-hour TWA and 2 ppm as a STEL. The current ACGIH TLV is 0.3 ppm as a ceiling limit.			
Exposure duration:	10 hours per day			
Exposure frequency:	40 hours per week			
Engineering control:	No engineering control was suggested relevant to formaldehyde.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is approved by NIOSH
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Low	Distribution of samples is characterized by no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in the soldering area work with formaldehyde. Soldering area: The soldering operation evaluated during this investigation takes place in a clean room. Contacts are soldered on batteries using soldering irons, 70/30 tin lead solder, a rosin flux, and small amounts of isopropanol.			
Exposure route:	Inhalation			
Personal sampling data:	Less than MDC of 1ppm			
Number of workers:	10 employees in the soldering area			
Personal protective equipment:	nothing mentioned particularly for formaldehyde			
Engineering control:	Air in the room is recirculated after being cleaned with a carbon filter and electrostatic precipitator and tempered.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is an approved NIOSH method(2539)
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Uninformative	The data are for an occupational scenario(decomposition product of soldering), which is outside of the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Medium	Discrete values are provided with only two samples taken.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include sample type, exposure type, but lacks additional metadata, such as exposure durations or exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability with samples taken at different points in the day. The uncertainty in measurements is assumed to be addressed from the sampling and analytical method.
Overall Quality Determination		Uninformative		

Study Citation:	Kawata, S., Marutani, E., Hirai, S., Hatayama, N., Omotehara, T., Nagahori, K., Li, Z., Miyaso, H., Pieroh, P., Naito, M., Itoh, M. (2019). Spraying urea solution reduces formaldehyde levels during gross anatomy courses. <i>Anatomical Science International</i> 94(2):209-215.
HERO ID:	6131386
Conditions of Use:	Laboratory chemical (gross anatomy courses)

EXTRACTION

Parameter	Data
Worker activity description:	cadaver dissection
Exposure route:	inhalation
Physical form:	vapor
Area sampling data:	"The FA levels in the area sampling and cadaver sampling were 1.10±0.09 ppm and 1.35±0.07 ppm, respectively, for the without urea group (2015); 0.70±0.08 ppm and 1.07±0 ppm, respectively, for the one practice group (2016); and 0.65±0.10 ppm and 0.79±0.28 ppm, respectively, for the every practice group (2017)" (pg 5) (differences between 2015/16/17 sampling groups detailed on pg 3)
Exposure frequency:	During the gross anatomy course, which was held for 35 practice days from April to July, the FA levels in the dissection hall weremeasured on the 14th day, when the chest and abdomen of each cadaver were opened and the FA levels were highest.
Engineering control:	""FA at a concentration of 3.8% (w/v) was prepared through the dilution of 19% (w/v) FA (Maskedform B®, Japan Tanner Corporation, Osaka, Japan) in water five times. The 3.8% (w/v) FA solution contained 1.38 mol/l of FA, so this concentration was defined as the 1× FA scavenger solution. Urea solutions with concentrations of 2×, 1/2×, and 1/4×were also created, as was a control solution without any scavengers"" Urea and L-cysteine were FA scavengers used, dissolved separately in water or 70% ethanol (pg2) ""The volatilized FA levels from the wet paper towels containing FA (n=5) exceeded 5.0 ppm when no spraying was performed. These FA levels did not change significantly after spraying the solution without urea (4.94±0.13 ppm), but they did decrease significantly (1.16±0.17 ppm) after spraying the 1× urea solution. In addition, the FA levels were significantly higher after spraying the 1/4× urea solution (2.18±0.41 ppm) or 1/2× urea solution (1.78±0.16 ppm) than after spraying the 1× urea solution. On the contrary, the FA levels after spraying 2× urea solution (1.20±0.20 ppm) were not significantly different from the FA levels after spraying1× urea solution"" (pg 4) Similar data also provided for scavenger effectiveness over time, as well as for spraying organs (as opposed to paper towels) (pg 4-5)"
Comments:	"FA levels were measured at nine points (area sampling) in the dissection hall (18.2 m×10.9 m×4.4 m) and at two points near the heads and legs of the cadavers (cadaver sampling) under air conditioning (temperature; 21.5–24.5 °C, humidity; 38–52%)"Method: Known volumes of air samples (500 mL) were gathered in gas detector tubes (GV100; GASTEC, Tokyo, Japan)... could measure FA levels of either 0.05–1.0 ppm (91LL; GASTEC) or 0.1–5.0 ppm (91L; GASTEC) (pg 3)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from Japan, an OECD country.
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4: Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5: Sample Size	Medium	Sample distribution characterized by limited statistics (mean, standard deviation) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity

HERO ID:	6131386			
Conditions of Use:	Laboratory chemical (gross anatomy courses)			
		EVALUATION		
Domain		Metric	Rating	Comments
	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure duration.
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple years, but uncertainty is not addressed.
Overall Quality Determination			Medium	

Study Citation:	Keil, C.B., Akbar-Khanzadeh, F., Konecny, K.A. (2001). Characterizing formaldehyde emission rates in a gross anatomy laboratory. Applied Occupational and Environmental Hygiene 16(10):967-972.			
HERO ID:	33780			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Instructors and Students in gross anatomy laboratories; Exposure from cadavers			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Another study- Breathing zone: 1.52 mg/m3 mean (0.09-3.61 mg/m3)			
Area sampling data:	Average daily concentrations ranged from: 0.635-1.82 mg/m3			
Exposure duration:	3-4 hrs/day			
Number of workers:	34			
Engineering control:	Not employed during study but possible examples given-"An approach to LEV for dissecting tables is the modification of the table to include lateral exhaust slots along the perimeter of the area that supports the cadaver. This modification resulted in large (>80%) reduction in vapor concentrations 5-10 cm above the cadaver at moderate exhaust rates (1.4m3/min)... Another LEV approach is to build dissecting tables with downdraft slots along the perimeter of the surface the cadaver rests on. The table has an internal air mover and treated absorbent bed to remove vapors prior to returning the air to the room. This system has reduced concentrations near the cadaver to <0.1mg/m3. These units are, however, extremely expensive."			
Comments:	Measured over 15 lab sessions with 47 dissecting tables; 0.635 to 1.82mg/m3; General ventilation rate of 9.8 air changes per hour measured over 3 different days with no local exhaust ventilation.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Used OSHA Method 52 which is similar to NIOSH Method 2541
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 2001, more than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty

Conditions of Use:	Laboratory Use			
		EVALUATION		
Domain		Metric	Rating	Comments
	Metric 7:	Metadata Completeness	High	The study addressed variability by measuring at different locations, separate days over a 16 week span. Uncertainty was accounted for in accounting for potential interferences and comparing data with previous studies.
Overall Quality Determination			High	

Study Citation:	Kelly, J. E. (1992). HETA 92-045-2260 US Department of the Interior National Park Service, New River Gorge National River, West Virginia. :92-045.			
HERO ID:	1482575			
Conditions of Use:	Firefighting			
EXTRACTION				
Parameter	Data			
Worker activity description:	fire fighters			
Exposure route:	inhalation			
Personal sampling data:	Formaldehyde concentrations ranged up to 0.10 ppm.			
Area sampling data:	Formaldehyde exposures ranged up to 0.10 ppm. The average exposure was 0.07 ppm.			
Exposure duration:	12 hr day, 6 - 7 days per week			
Personal protective equipment:	During suppression activities, fire fighters typically wear Nomex pants and shirt, Vibram-soled boots, hard hats, goggles and leather gloves.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Uninformative	The data are for an occupational scenario, however, it is a COU (wildfire) which is not within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides limited discussion of variability in the determinants of exposure . The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination		Uninformative		

Study Citation:	Keskin, H., Kucuktuek, M., Guru, M. (2015). The potential of poppy (Papaver somniferum Linnaeus) husk for manufacturing wood-based particleboards. Construction and Building Materials 95:224-231.			
HERO ID:	3073235			
Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	Used as an adhesive/resin but exposure is from vapor			
Area sampling data:	Formaldehyde emission data from experimental panels provided in Table 5 (ppm): 60.00 +/- 2.0548, 69.70 +/- 2.2136, 74.90 +/- 1.7920, 82.00 +/- 1.4907, 84.30 +/- 2.1628. Each sample described has their composition described in Table 1 ranging from particleboards consisting of 100% poppy husk up to 100% pine wood. Trend saw that as composition of pine wood increased, FE emission increased. Table 5 is shown graphically in Figure 9.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is peer reviewed so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is from Turkey, an OECD country.
	Metric 3:	Applicability	High	Data is applicable to manufacturing of wood particleboards with formaldehyde adhesives/resins.
	Metric 4:	Temporal Representativeness	High	Data is less than 10 years old (2015)
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Only contains exposure route, physical form and concentration of formaldehyde used in the resin.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by looking at emission rates of particleboards with different compositions of wood. Does not address uncertainty.
Overall Quality Determination		Medium

HERO ID:	6558304			
Conditions of Use:	Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Surgeons, others standing at the operating table, scrub nurses, circulating nurses, and surgical technicians. (9/29)			
Exposure route:	inhalation and skin absorption (10/29)			
Physical form:	smoke (6/29)			
Personal sampling data:	Formaldehyde concentrations during the procedures ranged from nondetectable to 0.021 ppm.(13/29)			
Area sampling data:	Two background samples taken outside a closed-door OR revealed levels of 0.007 and 0.005 ppm. (13/29)			
Exposure duration:	8-10 hours/day (8/29)			
Exposure frequency:	The average time spent working in ORs at Carolinas Medical Center was 8.3 years, and average total time working in ORs during their careers was 12.8 years. (13/29)			
Number of workers:	69 surgical nurses, 29 surgical technicians, and 6 in the “other” category (including physicians, nurse anesthetist, nurse managers). (13/29)			
Engineering control:	Recommended ventilation techniques include a combination of general room and local exhaust ventilation (LEV). General room ventilation is not by itself sufficient to capture contaminants generated at the source. The two major LEV approaches used to reduce surgical smoke levels for health care personnel are portable smoke evacuators and room suction systems. (27/29)

EXTRACTION	
Parameter	Data
Worker activity description:	During a typical autopsy, a pathologist and forensic assistant opened the decedent's chest cavity to remove and examine the internal organs. Organ tissue samples were removed and placed in open containers of a formalin solution. To gain access to the brain tissue, the skull cap of the decedent was removed with a hand-held oscillating Clean Cut Autopsy Saw system. Tissues collected during autopsies were fixed, processed, embedded in paraffin wax, sectioned, mounted on a slide, and stained for microscopic examination of the tissue cells in the histology laboratory. Following autopsies, these tissues were delivered to the laboratory in containers of 100–300 milliliters of formalin solution containing 37% formaldehyde. The tissues, contained in small cassettes, were removed from the containers and loaded into a tray for further processing. Processing of the tissues sequentially removed the tissue fluids and replaced them with alcohol and paraffin so that the tissue was fixed in a block of paraffin. After processing, the block was sliced, and the tissue specimens were mounted on a slide, stained, and viewed under a microscope
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	Autopsy SuitePathologist 1 0.28 ppm, 0.13 ppmPathologist 2 0.27 ppmForensic assistant 1 0.29 ppm, 0.15 ppm, 0.10 ppmForensic assistant 2 0.46 ppm, 0.23 ppm, 0.15 ppmHistology Laboratory,Histologist 0.05 ppm
Area sampling data:	Autopsy SuiteAutopsy table 0.18 ppmHistology LaboratoryTissue preparation 0.01 ppmTissue processing 0.01 ppm
Particle size characterization:	Most particles measured were 0.3–0.5 micrometers (µm) indiameter.
Exposure duration:	Most employees worked approximately 9.5 hours a day. The forensic medical assistants worked a rotating schedule of varying lengths of days on and off in order to have a minimum of three employees on duty at a time.
Exposure frequency:	Most employees worked approximately 40 hours a week,The number of years worked at the facility ranged from 1 to 24 years, with an average of 10 years.
Number of workers:	50 full time and part time staff
Personal protective equipment:	Provide employees with recommended personal protective equipment including respirators, lab coats, gloves, safety goggles or glasses, and face shields. Make sure that employees are using this equipment for specific work practices taking place in the facility.
Engineering control:	Increase room exhaust in the autopsy suite. This will increase the number of air changes per hour in that area. Install downdraft tables in the autopsy suite to help control formaldehyde exposures.

EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Report uses high quality data from frequently-used sources.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for paints and coatings, applicable to all occupational exposure scenarios.
	Metric 4:	Temporal Representativeness	Low	Report is based on data greater than 20 years old and industry conditions that are expected to be outdated.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a mean with no other statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling multiple locations in the facility.
Overall Quality Determination		High		

Study Citation:	Kinnes, G. M. (1993). Health hazard evaluation report no. HETA 89-162-2331, Growth International, Bennett Industries Division, Peotone, Illinois.			
HERO ID:	3970579			
Conditions of Use:	Plastic Material and Resin Manufacturing; Plastic Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	expected to operate machines, manually operate silk screening machine, inspection and packaging			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	During the manufacture and silk screening of plastic containers, airborne formaldehyde concentrations ranged 0.02 to 0.28 ppm. Three of the samples were also above the 0.1 ppm OSHA limit that requires worker training. The highest formaldehyde concentrationswere detected during the automatic (offset) silkscreening operation.			
Number of workers:	Bennett Industries employed 181 people at Growth International, 86 in the plastic container division, 77 in the metal container division, and 18 in general machine maintenance.			
Engineering control:	The drying ovens in the painting, roller-coat, litho, and both silkscreen operations should be properly ventilated with local exhaust ventilation. Upgrades to the paint booths and existing local exhaust ventilation systems should be implemented. These upgrades should include the control of exposures during the actual roller-coat, litho, and silkscreen application.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study - Method 3500
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (silk screening onto plastic containers) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1990 - prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range; uncertain statistics were not provided but assumed they were considered in the NIOSH method 3500
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination		Medium

HERO ID:	8048799		
Conditions of Use:	reactant: Intermediate in fertilizer and other agricultural chemical manufacture.		
EXTRACTION			
Parameter	Data		
Worker activity description:	Daily blowdown operation in the granulation plant. During this operation, an operator uses a compressed air hose to clean settled dust off equipment in the plant. The operator, who wears a half-face respirator equipped with HEPA cartridges, starts on the top deck and cleans each deck in successive order until all the dusts accumulated on the ground floor, where it can be swept up.		
Exposure route:	inhalation		
Physical form:	Vapor or as fraction of PM		
Personal sampling data:	Airborne formaldehyde vapor concentrations ranged from less than 0.006 to 2.2 ppm, with the highest concentrations encountered during the unloading of a tanker containing the formaldehyde based additive (UF-85). A PBZ sample collected from the operator performing this unloading operation had a concentration of 0.25 ppm. Unloading Operator - sorbent tube (4/14/92) 0.25 ppm Particulate Formaldehyde Equivalent Plant #2 - Operator - back end (8/8/91) 2.0 ug/m3 Plant #2 - Prill Tower Operator (8/8/91) 2.3 ug/m3 Plant #2 - Maintenance (8/9/91) 3.6 ug/m3 Plant #2 - Maintenance (8/8/91) 9.0 ug/m3 Plant #5 - Process Operator (8/8/91) 0.6 ug/m3 (sampling pump failure) Plant #5 - Helper (building scaffolds) (8/8/91) 11.5 ug/m3 Plant #5 - Operator (8/8/91) 2.9 ug/m3 Plant #5 - Electrician (8/8/91) 7.4 ug/m3 Plant #5 - Electrician (8/8/91) 5.8 ug/m3 TWA for above 2 consecutive samples (8/8/91) 6.4 ug/m3 Granular Warehouse - Loader Operator (4/13/92) 12.4 ug/m3 Granular Warehouse - Loader Operator (4/13/92) 31.2 ug/m3 Operator Performing Blow-Down (4/13/92) 363 ug/m3 (Filter damaged) Followed Operator Performing Blow-Down (4/13/92) 984 ug/m3 (filter likely overloaded) Operator Performing Blow-Down (4/14/92) 1511 ug/m3 (filter likely overloaded) Operator Performing Blow-Down (4/14/92) 1052 ug/m3		
Area sampling data:	Plant #2 - Area Near Prill Tower Melt Box (8/8/91) ND Plant #2 - Area Near Sizing Screens (8/8/91) ND Plant #5 - Area on second Deck (8/8/91) ND Plant #5 - Area on third Deck (8/8/91) trace Plant #2 - Area Near Prill Tower Melt Box (4/14/92) 0.024 ppm Plant #2 - Area Near Prill Tower Melt Box (4/14/92) 0.028 ppm Prill Warehouse - Area Near Wall (4/14/92) 0.007 ppm Granular Warehouse - Area Near Grizzly (4/13/92) 0.004 ppm Granular Warehouse - Area at South End (4/13/92) 0.004 ppm Unloading of UF-85 Tanker Area Between Tanker & Transfer Pipes (4/14/92) 2.2 ppm Area Between Tanker & Transfer Pipes – sorbent tube (4/14/92) 1.6 ppm Unloading Operator - sorbent tube (4/14/92) 0.25 ppm Particulate Formaldehyde Equivalent Area samples collected from the prill and granular plants Plant #2 - Near Sizing Screens (8/8/91) 7.9 ug/m3 Plant #2 - Near Sizing Screens (8/8/91) 5.6 ug/m3 TWA for above 2 consecutive samples (8/8/91) 6.6 ug/m3 Plant #2 - Prill Tower Melt Box (8/8/91) 7.9 ug/m3 Plant #2 - Prill Tower Melt Box (8/8/91) 5.6 ug/m3 TWA for above 2 consecutive samples (8/8/91) 6.7 ug/m3 Plant #2 - Prill Tower Melt Box (4/14/92) 16.2 ug/m3 Plant #2 - Prill Tower Melt Box (4/14/92) 28.0 ug/m3 Plant #5 - Third Deck 8/8/91 20.3 ug/m3 Plant #5 - Third Deck (8/8/91) 7.1 ug/m3 Plant #5 - Third Deck (8/8/91) 42.0 ug/m3 TWA for above 3 consecutive samples (8/8/91) 21.1 ug/m3 Plant #5 - Second Deck (8/8/91) 8.3 ug/m3 Plant #5 - Second Deck (8/8/91) 6.0 ug/m3 Plant #5 - Second Deck (8/8/91) 4.7 ug/m3 TWA for above 3 consecutive samples (8/8/91) 6.4 ug/m3 Prill Warehouse - Area Outside Loader (4/14/92) 397 ug/m3 (filter likely overloaded) Prill Warehouse - Area Inside Loader (4/14/92) 48.4 ug/m3 Prill Warehouse - Area on Floor (4/14/92) 115 ug/m3 (filter likely overloaded) Granular Warehouse - Area Inside Loader (4/13/92) 13.8 ug/m3 Granular Warehouse - Area on Floor (4/13/92) NDDaily blow-down operation in Plant 5 Area on third Deck (4/13/92) 641 ug/m3 (filter likely overloaded)		
Number of workers:	200		
Personal protective equipment:	Operators unloading the tanker are required to wear Tyvek® suits coated with polyethylene, rubber gloves, and a face shield with chemical goggles. When there is the possibility of exposure to formaldehyde vapor, such as during this operation, the Unocal safety procedures dictate that a MSA full face piece chest mounted respirator with yellow GMC-SS supersize canisters should be worn.		
Engineering control:	The use of compressed air to perform the blowdown operation in the granular plant and clean off individual uniforms should be eliminated. The feasibility of alternative methods, such as wet methods or vacuuming, should be investigated.

HERO ID:	1320509			
Conditions of Use:	Combustion Byproduct			
EXTRACTION				
Parameter	Data			
Worker activity description:	A fire department’s involvement at a fire scene typically occurs in three distinct phases; suppression, overhaul, and investigation. During the suppression phase, fire fighters are actively extinguishing the fire and ventilating the structure to remove heat and smoke. After the fire has been extinguished, fire fighters will search for hidden fire in walls, ceiling spaces, or other areas that are not easily accessible. This phase is termed overhaul and includes opening walls, pulling down ceiling materials, removing flooring, etc. to ensure that the fire has been completely extinguished. The final phase is the fire scene investigation which involves the determination of the origin and cause of the fire. Fire investigators will also determine whether the fire was accidental or incendiary in nature. Depending on the jurisdiction involved, the fire scene investigation can occur in conjunction with overhaul, where the investigators often direct the overhaul activities to ensure the preservation of evidence, or up to several days after the fire. In addition, several differences can occur in the way fire investigations are conducted, based on each jurisdiction’s standard operating procedures.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Living room scenario ND (sorbent tubes)Bedroom scenario trace (sorbent tubes)Office scenario ND (sorbent tubes)			
Area sampling data:	Nelson Place fire scene ND (sorbent tubes)Lamont Drive fire scene trace (sorbent tubes)Living room scenario 0.06 ppm and ND (sorbent tubes)Bedroom scenario 0.16 ppm and trace (sorbent tubes)Office scenario 0.18 ppm and ND (sorbent tubes)			
Exposure duration:	up to 10 hours per day			
Exposure frequency:	40 hours per week			
Personal protective equipment:	SCUBAHalf-face, air-purifying respirators equipped with combinationfilter cartridges (high–efficiency particulate, VOCs, acid mists, and formaldehyde) or powered air-purifying respirators with the appropriate filter cartridges should be used. If half-face respirators are used, they should be used in conjunction with eye goggles to help prevent eye irritation. To reduce the potential for contaminants being carried home by fire investigators, the use of disposable coveralls, boots, and gloves should be considered. If disposable items are not used, the laundering of any potentially contaminated clothing should be provided by a contractor.			
Engineering control:	The use of mechanical ventilation equipment thatremoves the contaminants from the areas where fireinvestigators are working should be utilizedwhenever possible.

Study Citation:	Kinnes, G. M., Mortimer, V. D. (1999). Health hazard evaluation report, HETA 97-0106-2770: Sommer-Allibert Industries, USA, Inc., Kansas City, Missouri, December 1999.			
HERO ID:	1317228			
Conditions of Use:	Use of Paints/Coatings			
EXTRACTION				
Parameter	Data			
Worker activity description:	There are typically one or two paint mixers who work in the paint kitchen per shift. All of the various colored base coats, the adhesive promoter, and the finishing coat have specific formulas and viscosities which have to be maintained for the pneumaticdistribution system to properly supply the robotic paint line. The main task of the paint mixers is to periodically check the viscosity of all the mixing totes, and, based on the formulation for the individual coating, either manually add solvents or raw coating to keep the liquid at the specified viscosity. The paint mixers also refill the totes as needed. The solvents and raw coatings are obtained in the preparation area and carted into the distribution area by the paint mixers. The paint mixers are also responsible for moving the 55 gallon drums of solvents or raw coatings to and from the storage area as needed.Approximately 75% of the paint mixer’s time is spent in the distribution area checking the mixing totes. The remaining 25% of their work time is split between the preparation and storage areas. All of the mixing totes are covered, but are not hermetically sealed. Therefore, the volatilization ofthe solvents and coatings continuously occurs from the mixing totes.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Formaldehyde concentrations determined from area samples ranged from 0.03 to 0.11 parts per million (ppm). The two samples collected in the distribution area had concentrations of 0.07 and 0.1 1 while the preparation and storage areas had concentrations of 0.08 and 0.03 ppm, respectively. As with the other analytes, the highest formaldehyde concentration was found in the distribution area.			
Number of workers:	120			
Personal protective equipment:	Because the mixing process generates most of the airborne contaminants, the paint mixers are required to wear half-mask air-purifying respirators when working in this distribution area. No respiratory protection is required in the other two areas. The paint mixers also use various types of protective gloves when handling the solvents and coatings.			
Engineering control:	improve HVAC in the paint distribution room.increase stack height of exhaust from the paint kitchen

	Metric 7:	Metadata Completeness	Medium	Variability was mentioned relative to different sampling locations. Uncertainty was not discussed, but assumed to be addressed in method 3500.
Overall Quality Determination			High	

Study Citation:	Kirk, K. M., Logan, M. B. (2019). Exposures to air contaminants in compartment fire behavior training (CFBT) using particleboard fuel. Journal of Occupational and Environmental Hygiene 16(7):432-439.			
HERO ID:	5432006			
Conditions of Use:	Building and construction materials (firefighting)			
EXTRACTION				
Parameter	Data			
Personal sampling data:	Formaldehyde concentrations in air outside structural firefighting ensembles (from passive sampling) was between 0.53 and 3.2 mg/m3 during 4 compartment fire behavior training (CFBT) sessions. Some of the readings were higher than the Australian short-term exposure limit (15 min STEL) of 2.5 mg/m3. Formaldehyde concentrations in air outside and inside structural firefighting ensembles (from active sampling) were as follows; outside – 1.3 to 2.2 mg/m3; inside – concentration less than reporting limit to 0.2 mg/m3. Exposure standards in Australia is 1.2 mg/m3 compared to that in US (0.92 mg/m3).			
Exposure duration:	nan			
Personal protective equipment:	Each participant donned a structural firefighting ensemble (jacket and overtrousers) (Australian Defence Apparel, Coburg, Australia) constructed of an outer shell of Nomex IIIA (Dupont, Wilmington, DE), a moisture barrier consisting of a breathable polyurethane membrane, and thermal barrier of Sontara E89 (Sontara AG, Basel, Switzerland). Additional personal protective clothing included firefighting gloves, boots, flash hood, and structural firefighting helmet. Selfcontained breathing apparatus was worn for the duration of each session, with an assigned protection factor of 10,000.			
Engineering control:	To minimize contamination, all components of the personal protective clothing were laundered according to manufacturer’s instructions prior to each CFBT session. In addition, instructors who had been involved in other firefighting activities during that work shift showered and changed all clothing (including undergarments) prior to participating in each CFBT session.

Exposure route:	inhalation, dermal			
Physical form:	aqueous solution, vapors			
Area sampling data:	”Left side of hood, sash height of 8 in: <0.5 ppm Right side of hood, sash height of 8 in: <0.5 ppm End of hood, sash height of 8 in: <0.5 ppm Left side of hood, sash height of 16 in: 2.71 ppm Right side of hood, sash height of 16 in: 1.33 ppm End of hood, sash height of 16 in: 0.85 ppm Sampler moved in and out of hood, 16 in: 4.91 ppm ”			
Engineering control:	An exhaust hood facilitates perfusion procedures and provides laboratory workers with a high degree of protection against exposures to formaldehyde as well as an inherent barrier against spills or splashes of potentially infectious material. A linear exhaust air flow rate into the hood is required to be 80-100 ft/min			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for the use of laboratory chemicals, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (averages) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at two different exhaust hood sash heights.
Overall Quality Determination			High

HERO ID: 3001774 Table: 1 of 1

Study Citation:	Knight, J.L., Sleeth, D.K., Larson, R.R., Pahler, L.F. (2013). An analysis of OSHA inspections assessing contaminant exposures in general medical and surgical hospitals. Workplace Health & Safety 61(4):153-160.			
HERO ID:	3001774			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Health care worker in general medical and surgical hospitals			
Personal sampling data:	79 personal samples. For all samples (personal and area): Median - 0; mean - 0.1 ppm (SD - 0.40); range - 0-3.1 ppm.			
Area sampling data:	Typical indoor formaldehyde concentrations range from 0.02 to 4 ppm (ATSDR 2008). The range of measured concentrations observed in these hospital data, 0 to 3.10 ppm, is consistent with this. The average concentration of all the formaldehyde samples was 0.1 ppm. 19 area samples.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Unclear if source is peer reviewed but references ATSDR, OSHA and NIOSH when comparing its samples with literature data so likely high quality.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US
	Metric 3:	Applicability	High	Data is applicable to hospital and healthcare workers.
	Metric 4:	Temporal Representativeness	Medium	Data from 2005-2009.
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Worker activity and personal/area samples provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Does not address variability or uncertainty.
Overall Quality Determination		Medium

HERO ID:	56714			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	pathology (dissection)			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	0.70 - 1.61 ppm; Large specimen storage & dissection 2.3 mean (range 0.8-5.0 ppm) peaks during dissection 8.6 ppm			
Area sampling data:	Pathology using at hospital A (no large specimen storage); 0.3 mean (range: 0.2-0.4 ppm)			
Exposure frequency:	2-3/week			
Number of workers:	5			
Engineering control:	recommended using local exhaust ventilation systems at work stations where formalin is used. when the technician opened a window concentration delcined from 8.6 ppm to 0.6-1.0 ppm, when the window was closed concentration increased to 6.3 ppm			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology may be equivalent to an approved OSHA or NIOSH method. For this study a photoacoustic infra-red detection method was used (Bruel & Kjaer Multi-gas monitor Type 1303) employing optical files type UA-0986 for formaldehyde. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Japan - OECD member
	Metric 3:	Applicability	High	The data are for pathology labs which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1999, after the most recent PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	Medium	The distribution of samples is characterized by an average value and range with uncertainty was not discussed.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, and/or exposure durations.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	reproducibility was quantified as the coefficient of variation (0.02-0.03) and data from different hospitals were included to address variability between facilities., but uncertainty was not discussed.

EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data is more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by comparing 2 hospitals but uncertainty is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Kokotti, H., Hakkinen, E., Tapola, M., Kalliokoski, P. (1993). Control of exposure to formaldehyde during dissection work by means of local exhaust ventilation system. :151-154.			
HERO ID:	5944780			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Medical students during dissection courses.			
Exposure route:	inhalation			
Personal sampling data:	The levels of personal samples varied from 0.1 to 0.2 mg/ml in the test room and 0.4 to 1.7 mg/ml in the dissection rooms.			
Area sampling data:	The formaldehyde levels of stationary samples varied from 0.03 to 0.24 mg/ml in the test room and 0.24 to 0.56 mg/m3 in the dissection rooms.			
Engineering control:	A new exhaust system was built for this experiment. The dissection table included two platforms: inner and upper one. The edges of the removable upper platform were bent over the edges of the inner one, and there were more holes in the edges near heavy parts of a body than near the feet. The formaldehyde-containing air is sucked through these holes in the edges into the space between the upper and inner platforms. From this space, exhaust air is directed to the duct below the floor under the table. The supply air is divided from ceiling to room diffusively and slightly undertempered. The fresh airflow helps to control the disturbance flows caused by motion of 10-15 students.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Finland, an OECD country.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL but greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Most critical metadata provided.

Conditions of Use:	Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Students and faculty in biology laboratories, and custodians who clean these laboratories.			
Exposure route:	inhalation and dermal (1/4)			
Physical form:	gas (1/4)			
Area sampling data:	"Teaching lab, trial 1: 7.0 ppm Teaching lab, trial 2: 16.5 ppm Rear stock room, trial 1: 1.97 ppm Rear stock room, trial 2: 2.62 ppm Public hallway, trial 1: <1.0 ppm Public hallway, trial 2: <1.0 ppm" (2/4)			
Engineering control:	"Airborne levels of formaldehyde vapor may be maintained below recommended exposure standards by a properly designed ventilation system. A cost effective method of removing large volumes of contaminated air from Site I would involve the installation of window exhaust fans. This would eliminate excessive chilling caused by open windows. A more effective but costly method would be to control emissions at the source by Installation of exhaust hoods. These hoods control the hazardous vapors before they reach individuals at risk, while permitting access to work. The contaminant would then be removed from the hood’s airstream by an activated charcoal filter prior to the air being vented from the building. Finally, vendors of dissection specimens should be encouraged to develop nonhazardous methods of preservation." (3/4)

Conditions of Use:	Ink, toner, and colorant products; Photographic supplies			
EXTRACTION				
Parameter	Data			
Worker activity description:	Employees are involved in the production of the local newspaper. In addition to normal office activities, the building contains a printing press, a photography/developing department, a photoengraving plate department, and a small print shop. (4/25)			
Exposure route:	inhalation (10/25)			
Physical form:	vapors (10/25)			
Area sampling data:	Formaldehyde concentrations were 0.003 ppm in the newsroom, display room, and circulation room, and 0.002 ppm in the ambient air. (22/25)			
Number of workers:	124 workers over two shifts. (4/25)			
Engineering control:	The HVAC system is the primary source for outside air supply. The building has five separate ventilation systems. (10/25)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for ambient air in a newspaper printing office, which is similar to the in-scope occupational scenario of ink, toner, and colorant products.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure duration, frequency and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Kurose, T., Kodera, H., Aoyama, H., Kawamata, S. (2004). Formaldehyde concentration in the air and in cadavers at the gross anatomy laboratory in Hiroshima University. Hiroshima Journal of Medical Sciences 53(3-4):33-37.		
HERO ID:	4263995		
Conditions of Use:	Laboratory use		
EXTRACTION			
Parameter	Data		
Worker activity description:	Participants in a gross anatomy course at the Faculty of Medicine of Hiroshima University.		
Area sampling data:	Atmospheric formaldehyde levels were 0.25-0.55 ppm and less than the upper limit of the guideline for formaldehyde exposure (0.5 ppm) set by the Japan Society for Occupational Health, except for one out of 10 measurements. For the first measurements when the skin of the upper limbs and trunk was removed, the formaldehyde concentration at the center of the room before and 15 min after the start of dissection was 0.05 and 0.55 ppm, respectively, and the levels at the four corners of the room were 0.37, 0.35, 0.35, and 0.3 ppm. For the second measurements, when all thoracic cavities and most abdominal cavities had been opened, the levels were 0.3 ppm at the center of the room and 0.3, 0.3, 0.3, and 0.25 ppm at the 4 corners. At the end of the day, the formaldehyde concentration was 0.15 ppm.		
Engineering control:	Dissection tables with local exhaust ventilation can markedly reduce airborne formaldehyde. Another option is use of ammonium carbonate to neutralize formaldehyde and forming harmless hexamethylenetetramine, and infusion of 2 liters of saturated ammonium carbonate solution drastically reduces formaldehyde levels in formaldehyde-prefixed cadavers.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from an OECD country. other than the U.S.
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4: Temporal Representativeness	Medium	Data are more than 10 years but no more than 20 years old.
	Metric 5: Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Monitoring study does not address uncertainty but variability addressed by measuring at different process stages.
Overall Quality Determination		Medium

Parameter	Data			
Area sampling data:	0-26.8 ppm GM (Table 2, 3/13)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country. other than the U.S., and locality-specific factors (e.g., potential differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Operations, equipment, and worker activities are expected to be reasonably representative of current conditions. The monitoring data were collected after the most recent PEL establishment or update but are generally more than 10 years old. If no PEL is established, the data are more than 10 years but generally, no more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates.

Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country. other than the U.S., and locality-specific factors (e.g., potential differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Operations, equipment, and worker activities are expected to be reasonably representative of current conditions. The monitoring data were collected after the most recent PEL establishment or update but are generally more than 10 years old. If no PEL is established, the data are more than 10 years but generally, no more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates.
Overall Quality Determination		Medium		

Study Citation:	Ladeira, C., Viegas, S., Carolino, E., Prista, J., Gomes, M.C., Brito, M. (2011). Genotoxicity biomarkers in occupational exposure to formaldehyde—the case of histopathology laboratories. Mutation Research 721(1):15-20.			
HERO ID:	1239491			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Macroscopic specimen exam; disposal of specimen and used solution; jar filling; specimen wash; biopsy exam			
Area sampling data:	0.04-0.51 (ppm); Ceiling: 0.18-2.93 (ppm)			
Number of workers:	56			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method. (NIOSH method 2541)
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Portugal, an OECD country.
	Metric 3:	Applicability	High	Data are for laboratory chemical use, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data are no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing engineering controls, PPE, exposure frequency, exposure duration.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling multiple worker activities.
Overall Quality Determination			High	

Formaldehyde

Occupational Exposure

HERO ID: 2592890 Table: 1 of 1

Study Citation:	Laitinen, J., Mäkelä, M., Mikkola, J., Huttu, I. (2010). Fire fighting trainers’ exposure to carcinogenic agents in smoke diving simulators. Toxicology Letters 192(1):61-65.			
HERO ID:	2592890			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Worker activity description:	firefighters			
Exposure route:	inhalation			
Area sampling data:	The emissions of formaldehyde were the highest in the gas simulator. Formaldehyde concentrations (mg/m3) in air due to burning materials were: Firehouse, chipboard – 0.7; Firehouse, conifer plywood board – 1.5; Firehouse, pure spruce and pine wood – 0.3; Gas simulator – 11. The reason for this was probably the artificial smoke, which was produced by mineral oil in the smoke generator. Pure spruce and pine wood seemed to be the best material according to these results. Formaldehyde has also been found to be a problem in wild land fires, where the highest measured formaldehyde concentrations have been over the occupational exposure limit value of 0.37mg/m3.			
Dermal exposure data:	Dermal exposure data			
Exposure duration:	nan			
Number of workers:	3 fire house simulators were used and 4 smoke diving trainers participated in each fire house simulator test. One gas simulator test was conducted and 2 smoke diving trainers participated in that test.			
Personal protective equipment:	protective clothing, including protective fire suits, fire gloves, and compressed air line breathing protectors.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	method well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	data is less than 10 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	no discussion on uncertainties
Overall Quality Determination		High		

Formaldehyde

Occupational Exposure

HERO ID:	5077873			
Conditions of Use:	Personal care products (nail salons)			
EXTRACTION				
Parameter	Data			
Number of sites:	6 in study			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	8 hr averages: Table 3 (pg 5): 5.32 - 20.6 ppm (6 values presented, 1 per each salon, unsure if average of multiple samples or what)			
Exposure duration:	up to 10 hours (9 am to 7 pm business hours) (pg 2)			
Number of workers:	3-5 for each salon, 20 total (pg 2)			
Personal protective equipment:	Seventy percent of all workers reported wearing either nitrile or latex gloves, with 65% wearing latex gloves. Sixty-five percent reported wearing some type of facemask when performing nail services, with 55% wearing surgical style facemasks. No workers reported wearing N95 dust masks. (pg 5)			
Comments:	Sampling location: 1 near manicure/pedicure stations, 1 at opposite end of salon (pg 3)Analytic Method: Indoor formaldehyde levels were measured using DNPH-Silica cartridges analyzed with High-Performance Liquid Chromatography (HPLC), according to US EPA Method TO-11A (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved EPA method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Low	Nail products for both home and salon use are regulated by the Food and Drug Administration. Under the Federal Food, Drug, and Cosmetic Act (FD&C Act), these products are generally regulated as cosmetics [FD&C Act, section 201(i)].
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (assumed mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple salons, but uncertainty is not addressed.

Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	The median (10th, 90th percentile) formaldehyde air exposure level in the 29 exposed workers was 1.38 (0.78, 2.61) ppm as an 8-h time-weighted average while in the controls the level was 0.026 (0.015, 0.026) ppm.			
Number of workers:	29 workers who were exposed to formaldehyde and 23 unexposed controls			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data collected in non-OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The report is less than 10 years old but data was collected more than 10 years ago.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination			Medium	

Study Citation:	Lavoue, J., Beaudry, C., Goyer, N., Perrault, G., Gerin, M. (2005). Investigation of determinants of past and current exposures to formaldehyde in the reconstituted wood panel industry in Quebec. Annals of Occupational Hygiene 49(7):587-602.			
HERO ID:	492149			
Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Table 1 provides details about worker activities in 12 sites			
Exposure route:	inhalation			
Physical form:	Vapor			
Personal sampling data:	personal measurements 0.17 ppm (GSD 2.3 ppm)(Table 3 is for personal sampling and Table 5 combines personal and area monitoring)			
Area sampling data:	Formaldehyde concentrations are provided for OSB/ MDF, and PB processes for research and government projects for specific worker designations . The geometric mean for that area measurements is 0.28 ppm (GSD 3.1ppm)			
Exposure duration:	Sampling duration for personal monitoring was 4.8 hrs median for research and 5.9 hrs for Government			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not specified though it was noted that 2-hydroxymethylpiperidine impregnated solid tubes/ extracted with carbon disulfide analysis GC - nitrogen Phosphorus detection. Earlier government studies used impinger using dinitrophenylhydrazine and perchloric acid using liquid chromatography; solid sorbent tube impregnated with n-benzylethanolamine analyzed with GC NPD were used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Sampling/analytical methodology is not specified.
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data are greater than 10 years old but no more than 20 years old - Published in 2005 but data range from 1984 to 2002
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - Geometric mean , geometric SD and sample size was provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	The data came from multiple studies so meta data appeared to be difficult to compile. Missing: Exposure frequency, number of workers and sampling locations
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Variance is discussed there was some discussion of uncertainty related to the differences between older government surprise visits vs more recent planned research visits
Overall Quality Determination		Medium		

Study Citation:	Lavoue, J., Begin, D., Beaudry, C., Gerin, M. (2007). Monte Carlo simulation to reconstruct formaldehyde exposure levels from summary parameters reported in the literature. Annals of Occupational Hygiene 51(2):161-172.			
HERO ID:	492150			
Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Personal measurements reported in reviewed data sources were classified into the following exposure groups: group 1 ‘Office’ includes administration and foremen; group 2 ‘Maintenance-quality control’ includes laboratory technicians, maintenance workers and cleaners; group 3 ‘Production’ includes press operators, assistant press operators, finishers, shippers; and group 4 ‘Floater’ includes floaters and press-miscellaneous tasks			
Exposure route:	inhalation			
Physical form:	Vapor			
Personal sampling data:	Personal measurements (including simulated values) had a geometric median of 0.53 mg/m3 GSD 2.8. See Also Table 2.			
Area sampling data:	Area monitoring data (including simulated values) gemetric median of 0.79 mg/m3 and GSD of 4.36 , these values varied by study year			
Exposure duration:	Sampling duration varied by study ranging from unknown to up to 6 hrs			
Comments:	The following is stated in the data source: ”more extensive simulation studies should be conducted to fully evaluate the methods presented here”			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Canada - OECD member
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Published in 2007 includes data from 13 studies that were implemented from 1965-1995
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics -Geometric mean , geometric SD and sample size provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Missing: sampling/ analysis methods, number of sites, exposure frequency, number of workers and location of the sampling sites.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	data were provided on bias and precision
Overall Quality Determination			Low

Comments:	formaldehyde were examined on 113 commutes throughsuburban New Jersey and 33 New Jersey/New Yorkcommutes			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Formaldehyde samples were collected on dinitrophenylhydrazine (DNPH) silica cartridges (7). Air was drawn through the cartridge. Analysis was done on a gradient high-performance liquid chromatography (HPLC) system with an ultraviolet (UV) detector at 360 nm (7).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for within a vehicle’s passenger compartment which is an occupational scenario (e.g. taxi driver) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1996, after the most recent PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with standard deviation provided. The data were also presented for each vehicle and compared with other similar studies.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	The data include all associated metadata, including sample types, exposure types, sample durations, exposure durations, and worker activities
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides average values and standard deviation but no uncertainty statistics
Overall Quality Determination		Medium		

Study Citation:	LBNL (1980). Trace organics in offices.			
HERO ID:	6023126			
Conditions of Use:	Offices			
EXTRACTION				
Parameter	Data			
Area sampling data: Formaldehyde concentrations in offices range from 19 - 35 ppb (see table 2). Outdoor concentrations at these same sites is 1-3 ppb.				
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates.

Number of workers:	cohort study of 1477			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Canada - OECD member
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1984 based on data compiled in 1978, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Some metadata were provided such as duration of embalming events, worker activities, and exposure frequency. No additional metadata were provided such as sampling and analytic methods, number of sites, and worker activities
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	Li, J. F. (2017). Health Hazard Evaluation Report: HHE-2016-0145-3292, October 2017. Evaluation of Employee Exposures at a Plastic Bag Sealing Plant.			
HERO ID:	4794766			
Conditions of Use:	Heating of polyethylene bags			
EXTRACTION				
Parameter	Data			
Worker activity description:	The wicketers unwound and drew in rolls of polyethylene film and folded them. Depending on the customer’s order, zippers or tear perforations were attached to some films prior to sealing. The wicketer added two holes at the top of the film and then heat-sealed and thermally cut the film. This formed two sides and one end of the bag and left the other end of the bag unsealed. The bags were stacked on wire wickets (Figures 1 and 2) and then manually removed by the wicketer operator and packaged into cardboard boxes for shipment. During the site visit, two of the three wicketers were operating, and one wicketer operator was working nearby folding and packaging bags. Employees stated that typically all three wicketers were in operation. The flatbed bagger produced various sizes of bags by unwinding and drawing rolls of polyethylene film, folding the film, and heat-sealing and thermally cutting the edges to form bags. No wickets were used at the flatbed bagger, and the operator was responsible for placing finished bags into boxes for shipment. Only two of the three flatbed baggers were operational, and only one was running during our site visit.			
Exposure route:	inhalation			
Physical form:	vapor, gas			
Personal sampling data:	Table 2 provides short term (15 minutes) in ppm: Flatbed bagger operator: 0.068, 0.024, 0.025; Wicketer operator: 0.028, 0.016, 0.0046, 0.024, 0.015, 0.030, 0.023, 0.019, 0.026			
Engineering control:	The company had installed LEV at the wicketer machines in 2016 that consisted of a slot hood mounted next to the wicketer heat-sealer (Figure 5). Flexible duct connected the slot hood to a fan that exhausted the air through the ceiling to the outdoors			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source contains high quality data by following and abiding NIOSH and OSHA safety rules.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US
	Metric 3:	Applicability	High	Data is directly applicable to exposure to FA from heating of polyethylene bags.
	Metric 4:	Temporal Representativeness	High	Data is less than 10 years old (2017)
	Metric 5:	Sample Size	Medium	Characterized by range of data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes worker activity, physical form, exposure route, personal sampling data, and engineering controls.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty not addressed.

Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from a plant in Western Massachusetts and maybe representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for chemical worker which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1984, and covers the period from 1976 to 1980; before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range, but ncertain statistics were not provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	No metadata were provided such as sampling and analytic methods, sample durations, exposure durations, worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	Lillienberg, L., Burdorf, A., Mathiasson, L., Thörneby, L. (2008). Exposure to metalworking fluid aerosols and determinants of exposure. Annals of Occupational Hygiene 52(7):597-605.		
HERO ID:	1313606		
Conditions of Use:	Use of Metalworking fluid		
EXTRACTION			
Parameter	Data		
Worker activity description:	Most machines were highly automated and (almost) fully enclosed. In most shops, more than one type of MWF was used during the production of metal pieces, varying from small to medium pieces of about 0.2–10 kg except where bearings were made up to 1 ton, with machining times from a few minutes to several hours. Most of the operators worked in the direct vicinity of the machines during the whole shift. When not machining, the operators programmed the machine, performed quality measurements, changed tools or products, used compressed air for cleaning and conducted repairs. A limited time was spent away from the machines, e.g. transporting product and doing administrative tasks. During most shifts, operators performed the same routine activities on the same machines.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	From Table 3: Company 1: 0.128 mg/m3 mean, 0.125 mg/m3 geometric mean, GSD 1.29 (range 0.087-0.154 mg/m3) - note elevated values may be due to use of recirculated air.; Company 2: 0.012 mg/m3 mean, 0.009 mg/m3 geometric mean, GSD 2.24 (range 0.001 - 0.042 mg/m3); Company 3: 0.003 mg/m3 mean, 0.003 mg/m3 geometric mean, GSD 1.57 (range 0.001-0.007 mg/m3) Assumed units based on units noted in the text summary		
Exposure duration:	6 - 8 hours ("Full shift")		
Number of workers:	21		
Engineering control:	In all shops, general ventilation and exhaust ventilation systems were present. The general ventilation varied from 2.5 to 5.2 turnovers per hour..		
Comments:	This study noted the use of compressed air is the most important factor in peak concentrations.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified, though it was noted that samples using activated carbon were analyzed with high-performance liquid chromatography with ultravioletdetection.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Sweden - an OECD member
	Metric 3: Applicability	High	The data are for metal shop workers which is an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Medium	The data were published in 2008, after the most recent PEL (1992) and more than 10 but less than 20 years old.
	Metric 5: Sample Size	High	Descriptive statistics were used to calculate means (arithmetic and geometric) and geo-metric standard deviations (GSDs)
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and much more.
Domain 4: Variability and Uncertainty

Conditions of Use:	fabric, textile, and leather products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Hotel housekeepers in four groups: room cleaners, laundry workers, maintenance, and office workers. (2/14)			
Exposure route:	inhalation (2/14)			
Physical form:	gas (9/14)			
Area sampling data:	Formaldehyde, a toxic aldehyde, averaged 10 ± 6 and 14 ± 6 µg/ m3 in the break and laundry rooms, respectively. (6/14) Supplemental Table S6-> US Hotel (exhaust air) 28 µg/m3; China Hotels: 10, 140, 114 µg/m3 [mean values]; These are from other published studies: 2015003, 2214101, 626839 5956712, 1978790.			
Exposure duration:	Housekeepers work for 3-8 hours/day. (4/14)			
Number of workers:	There are 1.8 million hotel housekeepers in the U.S. (1/14)			
Engineering control:	All spaces, including lobby, office, break, laundry, and guest rooms, were mechanically ventilated and used separate and independent unit ventilators that provided heating, cooling, and exchange with outdoor air. (4/14)			
Comments:	Authors do not know the source of formaldehyde, they note that it could come from building materials, furnishings, beddings, towels, or as a byproduct of terpenes and ozone. "Additional studies are needed to verify formaldehyde sources in hotels."(9/14)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for commercial use of fabric and textile products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (average, standard deviation) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at multiple hotels during different seasons.
Overall Quality Determination			High	

Study Citation:	Lindskov, R. (1982). Contact urticaria to formaldehyde. Contact Dermatitis 8(5):333-334.			
HERO ID:	1314820			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	fixation of tissues in fume cupboard in the laboratory of a pathology department using 10% and 20% solutions of buffered formaldehyde			
Exposure route:	dermal			
Physical form:	vapor			
Area sampling data:	The values varied between 0.7 and 1 ppm in the fume cupboard.			
Dermal exposure data:	Dermal exposure data			
Number of workers:	1			
Engineering control:	Use of fume hood			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified though it was noted that formaldehyde concertation at the fume hood wasmeasured with a Drager Tubes.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Denmark - and OECD country
	Metric 3:	Applicability	High	The data are for a pathology worker which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data were published in 1982 before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Range data provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, and worker activities, but lacks additional metadata, such as sample durations, exposure durations, and exposure frequency
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range data that can be used to evaluate variability. Information about uncertainty was not provided.
Overall Quality Determination		Medium		

Study Citation:	Lippmann, M., Melville, R. (2001). Influence of data elements in OSHA air sampling database on occupational exposure levels. Applied Occupational and Environmental Hygiene 16(9):884.			
HERO ID:	6020747			
Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Embalmers in funeral homes			
Exposure route:	inhalation			
Physical form:	vapor, gas			
Personal sampling data:	The average 8-hr TWA formaldehyde exposure among embalmers comprising this exposure group was 0.44 ppm and the standard deviation was 0.66 ppm. The geometric mean and standard deviation were 0.19 ppm and 4.18, respectively. Seventeen (15%) of the individual concentrations were above the current OSHA PEL-TWA of 0.75 ppm and 12 (11%) were at or above the PEL-TWA in effect at the time of inspection.In a study of formaldehyde exposure in the funeral industry in Manitoba, Canada, Korczinski (34) reported the results of 48 personal breathing zone samples collected during embalming of intact and autopsied bodies. Airborne formaldehyde concentrations ranged from 0.11–5.64 mg/m3 ; none of the measurements were below the limit of detection.			
Area sampling data:	In a study of formaldehyde and paraformaldehyde, Kerfoot and Mooney (57) collected 187 measurements for determination of airborne formaldehyde levels in the embalming rooms of six Detroit, Michigan-area funeral homes. Airborne formaldehyde concentrations ranged from 0.09–5.26 ppm with no sampling results below the analytical limit of detection.			
Exposure duration:	8-hr TWA			
Number of workers:	A total of 111 measurements collected during 68 inspections were included in this case study.			
Engineering control:	Local exhaust ventilation			
Comments:	Data from OSHA database so likely a common source.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is from OSHA so it is for U.S.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old.
	Metric 5:	Sample Size	High	Full characterized by statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes worker activity, exposure route, physical form, area sampling and exposure duration.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Does not address variability or uncertainty.

Conditions of Use:	Installation/Demolition of Building Materials				
EXTRACTION					
Parameter	Data				
Worker activity description:	construction workers and museum workers during construction				
Exposure route:	inhalation				
Area sampling data:	Per Table 2: Formaldehyde Concentration (mg/m3) by location: Hall (1st floor) – 0.1; East exhibition hall (2nd floor) – 0.05; West exhibition hall (2nd floor) – 0.05				
Engineering control:	ventilation is an effective method to remove indoor VOCs during construction				
EVALUATION					
Domain		Metric	Rating		Comments
Domain 1: Reliability		Metric 1:	Sampling and Analytical Methodology	High	methodology well described
Domain 2: Representativeness		Metric 2:	Geographic Scope	Low	The data is from China, a non-OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4:	Temporal Representativeness	Medium	data collected between 10 and 20 years old	
	Metric 5:	Sample Size	Low	no statistics	
Domain 3: Accessibility/ Clarity		Metric 6:	Metadata Completeness	Low	no other metadata
Domain 4: Variability and Uncertainty		Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination			Low		

Study Citation:	Loh, M.M., Houseman, E.A., Gray, G.M., Levy, J.I., Spengler, J.D., Bennett, D.H. (2006). Measured concentrations of VOCs in several non-residential microenvironments in the United States. Environmental Science and Technology 40(22):6903-6911.			
HERO ID:	2442846			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Personal sampling data:	Formaldehyde geometric mean concentrations ranged from 5.96 ug/m3 in electronics stores to 53 ug/m3 in housewares stores. Formaldehyde was highest in housewares and furniture stores, most likely due to the sale of pressed wood products known to emit formaldehyde. Overall, formaldehyde geometric mean concentrations in stores was found to be 19.6 ug/m3 while in diners the geometric mean was reported as 14.3 ug/m3. Formaldehyde showed significantly higher levels in summer in both types of stores.			
Exposure duration:	Varied; 1-3 hrs sampling durations- Field staff mimic general population/consumer exposure			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	Low	The data are for microenvironments for commercial buildings but sampling was done to mimic general population/consumer, not workers within these environments, which would be an occupational scenario. Therefore data is similar to an occupational scenario. In addition, microenvironments may include sources within and outside of the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	data is between 10 and 20 years
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, but lacks additional metadata, such as source attribution or more detailed environment information.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability by considering different types of environments and seasons. Uncertainty is discussed in limitations section.
Overall Quality Determination			Medium

HERO ID:	3259031			
Conditions of Use:	Use of Paper Products			
EXTRACTION				
Parameter	Data			
Area sampling data:	Mean (arithmetic) formaldehyde concentrations were measured in three rooms in a library in Guangzhou, China: L1, stack room (with an area of 520 m2); L2, electronic reading room (with an area of 320 m2); L3, compact stack room (with an area of 476 m2). Formaldehyde concentrations (ug/m3) were as follows: L1 - 3.12 ±1.00 (morning), 3.84 ±1.11 (afternoon), 4.36 ±1.37 (night); L2 - 6.97 ±6.12 (morning), 5.82 ±3.78 (afternoon), 7.59 ± 3.08 (night); L3 - 2.61 ±0.58 (morning), 2.73 ±0.46 (afternoon), 3.83 ±0.95 (night). Outdoor formaldehyde concentrations (ug/m3) were 2.25 ±1.93 (morning), 3.64 ±1.56 (afternoon), 8.56 ±7.98 (night). Indoor/outdoor (I/O) concentration ratios of formaldehyde in the library is 1.21 (mean), 0.80 (SD), 0.45 (min.), 3.09 (max.).

Physical form:	vapor			
Area sampling data:	all workers 1-2.5 ppm			
Number of workers:	Total Full time workers exposed 15,000			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Medium	The data are for an occupational scenario but lacks clarity to determine if it refers to data that would be out of scope.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL and is older than 20 years - Article published in 1984 but data from 1979 study
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - Only Range
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	missing sampling and analytic method, exposure duration and frequency, sampling locations, worker activity, Types of measurement and number of samples
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Range provided to get a sense of variability but no indication of uncertainty
Overall Quality Determination			Medium	

Study Citation:	Lucier, G.W., Hook, G.E. (1984). Report on the consensus workshop on formaldehyde. Environmental Health Perspectives 58(12):323-381.			
HERO ID:	21849			
Conditions of Use:	Plastic Manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Injection mold operators 0.037 ppm mean (range 0.01-0.1 ppm); Operators <2 (range <2 ppm); Sand mold production 0.31ppm mean, 0.2 median (0.1-0.7)			
Area sampling data:	Area 0.2 ppm mean (range 0.01-0.53 ppm); Near grinder hopper 3 ppm mean, 3 ppm median (2-4 ppm); Sand mold 0.17 ppm mean, 0.1 ppm median (range ND-1.1 ppm)			
Exposure duration:	Exposure duration: sand mold production 8 hr/day Sampling period: injection mold 100-350 min sampling; Area samples 55-425 min; sand mold production 4 hr sampling			
Number of workers:	Total Full time workers exposed 15,073; part time 1,527			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology was not specified for all data thought it was noted that for area and and injection mold sampling Chromotropic Acid was used and for others Draeger Tubes
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data (Warren MI and Louisville, KY)
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL and is older than 20 years - Article published in 1984 but the Warren MI study was from 1973 and the Louisville, KY study ws from 1976
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - Range and mean provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but missing sampling location and worker activity
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	range quantifies variability, but no discussion of uncertainty
Overall Quality Determination		Medium

HERO ID:	21849			
Conditions of Use:	Paper Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Paper treatment resin impregnated:filter treating of paper, press; Treated paper products			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	paper treatment dataset 1 0.08 ppm mean (range 0.04-0.16 ppm); dataset 2 0.05 ppm mean (range 0.01-0.23 ppm); dataset 3 0.05ppm mean (0.02-0.28); Treated paper products 0.34 median (0.14-0.9))			
Area sampling data:	resin area 0.06 ppm mean (range 0.03-0.07 ppm);treated paper products area 0.59 ppm median (range 0.14-0.99 ppm);			
Exposure duration:	Sampling 4 hours for treatment and resin. Coating 30 second sampling 20 times per day			
Exposure frequency:	8 hrs/day			
Number of workers:	Total Full time workers exposed 6,000-45,000			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not specified though it was noted that Bisulfite Impinger/Charcoal Tubes and Chromotropic Acid was used for Paper treatment and resin, others unknown
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US Cincinnati, OH and Buckport ME others are believed in the US
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL and is older than 20 years - Article published in 1984
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - mean and range provided for paper treatment and resin; median and range provided for treated paper, and mean, median and range provided for coating
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	missing sampling location and worker activity
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Range provided to access variability but no indication of uncertainty
Overall Quality Determination		Medium

Conditions of Use:	Rubber Product Manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	0.04 ppm mean (range ND-0.04 ppm)			
Number of workers:	Total Full time workers exposed 6,128-27,586			
Comments:	Formaldehyde used as a preservative			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is missing details on sampling period and worker activities though it was noted that samples were collected using bisulfite impinger and Colorimetric Analysis was used
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States (Denver, CO)
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL and is older than 20 years - Article published in 1984 but data were from 1977
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - Range and mean provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata but missing worker activities, sampling location exposure and duration
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides no discussion of the uncertainty in the exposure estimates.

Conditions of Use:	Paper Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	By mix and storage tanks; data indicated no exposure in work area where majority of work time spent			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	coating preparation 1 ppm mean, 0.01 median (range <0.01-3 ppm); coating preparation 0.51 ppm mean 0.42 ppm median(range 0.8-42)**			
Exposure duration:	Sampling period grab, 30-200 min. Exposure duration ca. 30 sec			
Exposure frequency:	20 times/day			
Comments:	** Range provided for Coating preparation indicates error in provided range.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Uninformative	No sampling or analytical methodology not specified and provided data indicates error in reporting.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study does not provide discussion of the uncertainty in the exposure estimates.
Overall Quality Determination		Uninformative

Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	0.01 ppm geometric mean, standard deviation 0.008 ppm; Maximum 0.046 ppm			
Particle size characterization:	PM10 0.012 mg/m3 geometric mean max 95th percentile 0.04 mg/m3			
Number of workers:	15,704 occupants (NSA employees) Of the 15,704 qualified employees, 7,637 (48.6%) responded to the survey.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Based on NIOSH study - Passive sampling dosimeters, usually 3/study area: SKC (Eighty Four, PA) UMEX-100 first 2 rounds, 3M (Minneapolis, MN); model 3720 third round
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Uninformative	Office exposure may be subject to other regulations
	Metric 4:	Temporal Representativeness	Medium	The study was published in 2014 using data from a 2005 survey, after the most recent PEL (1992) and more than 10 but less than 20 years old.
	Metric 5:	Sample Size	Medium	Geometric mean, standard deviation and maximum value
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Data included sample type and exposure type, butlacks additional metadata, such as sample durations, exposure durations, exposure frequency, and worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The study provided standard deviation data that can be used to evaluate variability. As the data for this report is based on a NIOSH study uncertainty was likely considered in the sampling and analysis methodology used.
Overall Quality Determination		Uninformative		

Study Citation:	Luker, M.A., Vanhouten, R.W. (1990). Control of formaldehyde in a garment sewing plant. American Industrial Hygiene Association Journal 51(10):541-544.		
HERO ID:	5951421		
Conditions of Use:	Processing for incorporation into an article		
EXTRACTION			
Parameter	Data		
Worker activity description:	Sewing pants in industrial setting with machine; steam pressing pants; resin curing in oven ; packing/shipping pants after curing		
Physical form:	Off-gas from use in resin system that has 350 to 400ppm formaldehyde (and transition to resin with 160 ppm formaldehyde)		
Personal sampling data:	Worker formaldehyde exposure ranged from 0.46 ppm to 1.13 ppm (Mean of 0.82 ppm) for 400 ppm formaldehyde fabric; Worker formaldehyde exposure ranged from 0.09 ppm to 0.24 ppm (Mean of 0.13 ppm) for 160 ppm formaldehyde fabric;		
Area sampling data:	Area formaldehyde exposure ranged from 0.42 ppm to 1.40 ppm (Mean 0.92 ppm in A.M. and 1.05 ppm in P.M.) for 400 ppm formaldehyde fabric; Area formaldehyde exposure ranged from 0.11 ppm to 0.47 ppm (Mean 0.20 ppm in A.M. and 0.38 ppm in P.M.) for 160 ppm formaldehyde fabric;		
Number of workers:	Sewing: 270, Steam Pressing: 30, Resin Curing: 2, Packing/Shipping: 15		
Engineering control:	Decrease from 400 ppm resin system to 160 ppm resin system caused reduction of 80-85% in formaldehyde concentrations; suggests need for exhaust ventilation and not 100% recirculation of air		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data are from the U.S.
	Metric 3: Applicability	High	Data are for incorporation into article, an in-scope occupational scenario.
	Metric 4: Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5: Sample Size	High	The sample is well characterized (separate data for each occupation and also A.M. and P.M. data).
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All metadata provided.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability addressed by changing process parameters and temporal changes for various areas, but uncertainty is not addressed.
Overall Quality Determination		High

Conditions of Use:	Foundries

EXTRACTION	
Parameter	Data
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	type of sampling not provided assumed it was area. Short duration sampling: 51 ug/m3 mean, SD 49 ug/m3, geometric mean 37 ug/m3 GSD 2.1 ug/m3 (range 13-190 ug/m3)
Particle size characterization:	Short duration sampling- total dust: 510 ug/m3 mean, SD 500 ug/m3, geometric mean 360 ug/m3 GSD 2.3 ug/m3 (range 62-2900 ug/m3)
Exposure duration:	8 hrs
Number of workers:	48
Comments:	the data pertain to workers who were exposed to emissions arising from the thermal degradation of the chemical binders used in the Hot Box method

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified, but all analyses were performed in the laboratory of the Department of Occupational and Environmental Medicine, Orebro University Hospital. The laboratory is accredited by the Swedish Board for Accreditation and Conformity Assessment.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Sweden - an OECD member
	Metric 3:	Applicability	High	The data are for bronze foundry workers which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The study was published in 2011 after the latest PEL (1992) and less than 10 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized with mean and standard deviation, geometric means and geometric standard deviation and range data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	no meta data were provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range data that can be used to evaluate variability. Information about uncertainty was not provided.

Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	plywood workers			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	1.13 ppm mean			
Area sampling data:	range 0.28-3.48 ppm; Plywood: 0.64 ppm mean (range 0.22-2.3 ppm); Particle board 2.36 ppm mean (range 1.16-3.48 ppm); 0.50 ppm mean (range 0.38-0.61 ppm); logistic warehouse 0.07 ppm mean; sawmill 0.02 ppm mean; log pond 0.07 ppm mean; woodworking 0.003 ppm mean.			
Particle size characterization:	plywood 0.47 mg/m3 respirable dust 0.77 mg/m3 total dust; particle board 1.30 mg/m3 respirable dust 5.78 mg/m3 total dust; block board 0.62 mg/m3 respirable dust 1.28 mg/m3 total dust; sawmill 0.73 mg/m3 respirable dust 2.16 mg/m3 total dust; logistic warehouse 0.17 mg/m3 respirable dust 0.28 mg/m3 total dust; Average 0.60 mg/m3 respirable dust 1.35 mg/m3			
Number of workers:	186 male worker			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not an approved OSHA or NIOSH method. Differences in methods are not expected to lead to lower quality data. Sampling was implemented using a passive bubbler and a compact dedicted colorimeter using 3-methyl-2-benzothiazoline hydrazone hydrochloride as recommended by the American Public Health Association
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	location for data was Indonesia - not an OECD member
	Metric 3:	Applicability	High	The data are for plywood manufacture which is an occupational scenario within the scope of the risk evaluation. Though it may be excluded as it may be subject to other regulations
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1990, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by an average values and range for different wood products; uncertain statistics not provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) and type of wood product, but no other metadata.
Domain 4: Variability and Uncertainty

Study Citation:	Marsh, G.M., Youk, A.O. (2004). Reevaluation of mortality risks from leukemia in the formaldehyde cohort study of the National Cancer Institute. Regulatory Toxicology and Pharmacology 40(2):113-124.			
HERO ID:	56914			
Conditions of Use:	Industrial/commercial use			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Personal sampling data:	For highest peak exposure, the authors observed statistically significant 50–63% deficits in leukemia mortality for unexposed subjects and subjects in the lowest exposure category (>0–1.9 ppm), which NCI used as the baseline category for RRs. US and regional SMRs in NCI’s middle exposure category (2.0–3.9 ppm) are essentially null (SMRs = 1.00 and 1.04, respectively) and only moderately elevated in the highest exposure category (4.0+ ppm) (SMRs = 1.24 and 1.31, respectively). For all leukemia, we observed slightly smaller 29–30% deficits in deaths among subjects in NCI’s RR baseline category (>0–0.4 ppm), but these deficits remain statistically significant or nearly significant.

Occupational Exposure

HERO ID: 6116836 Table: 1 of 1

Study Citation:	Marshall, E. (1987). EPA indicts formaldehyde, 7 years later. Science 236(4800):381.			
HERO ID:	6116836			
Conditions of Use:	Garment industry			
EXTRACTION				
Parameter	Data			
Area sampling data:	<0.5 ppm			
Number of workers:	777,000			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.	
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.	
	Metric 5: Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination		Low		

Formaldehyde

Occupational Exposure

HERO ID: 626188 Table: 1 of 1

Study Citation: Matanoski, G. M. (1989). Risks of pathologists exposed to formaldehyde (final report).
HERO ID: 626188
Conditions of Use: Laboratory Use

EXTRACTION

Parameter	Data
Exposure route:	inhalation
Physical form:	vapor
Number of workers:	6411 physicians who would have had occupational exposure to formaldehyde because of their membership in pathology societies...It assumes all members of these societies are likely exposed (not sure about bacteriologists). Some the societies include clinical staff who may not be involved in pathology.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	no sampling involved
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for an occupational scenario (pathologist) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Published in 1989, 3 years prior to the PEL (1992).
	Metric 5: Sample Size	Low	Data was limited to mortality data, no other exposure or engineering data provided.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Data was limited to mortality data, no other exposure or engineering data provided.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Uninformative	Data was limited to mortality data, no other exposure or engineering data provided.

Overall Quality Determination **Uninformative**

Study Citation:	Materna, B.L., Jones, J.R., Sutton, P.M., Rothman, N., Harrison, R.J. (1992). Occupational exposures in California wildland fire fighting. AIHA Journal 53(1):69-76.		
HERO ID:	13709		
Conditions of Use:	Firefighting		
EXTRACTION			
Parameter	Data		
Worker activity description:	waiting at base camp; fireline mopping up and prescribed burning.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	0.16 mg/m3 mean (range 0.048-0.42 mg/m3)		
Particle size characterization:	base camp 3.27 mg/m3 mean (range 1.8-4.4 mg/m3); Fireline mop up 9.46 mg/m3 (range 2.7-37.4 mg/m3); fireline mop up respirable 1.75 mg/m3 mean (range 0.327-5.14 mg/m3); prescribed burning respirable 1.15 mg/m3 mean (range 0.235-2.71 mg/m3)		
Number of workers:	80,000 firefighters involved in 70,000 fires burning a total of 2 millions acres		
Personal protective equipment:	Recommended use of appropriate respirators		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling / analytical methodology was implemented using NIOSH method 2539 for 10% of the samples, all samples were analyzed using appropriate NIOSH methods used by NIOSH chemists at the Methods Research and Support Branch, Cincinnati, Ohio.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from California and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for wild fire fighters which is a scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Medium	The data were from three fire seasons from 1987 to 1989, prior to the most recent PEL (1992) and was more than 20 years old.
	Metric 5: Sample Size	High	Distribution of samples is characterized by a mean and range uncertain was assumed to be considered in the use of NIOSH methods.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	The monitoring data were for personal sampling for mountainous locations at elevations up to 7800 ft, but no additional metadata were provided such as sampling and analytic methods, number of sites, sample durations, exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study provides data ranges for different firefighting activities which can be helpful in evaluating variability. Uncertainty was included in the NIOSH methods used.

Study Citation:	Matthews, T.G., Fung, K.W., Tromberg, B.J., Hawthorne, A.R. (1986). Surface emission monitoring of pressed-wood products containing urea-formaldehyde resins. Environment International 12(1-4):301-309.		
HERO ID:	22183		
Conditions of Use:	Installation/Demolition of Building Materials		
EXTRACTION			
Parameter	Data		
Worker activity description:	Consumer- Indoor air of residential homes		
Exposure route:	Inhalation		
Physical form:	Vapor		
Area sampling data:	measurement ranged from 0.09 mg/m3 to 0.31 mg/m3, each measurement is done at different combination of temperature, relative humidty, and air exchange.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling /analytical methods does not referenced a NIOSH/OSHA method, but the study used Formaldehyde Surface Emission Monitor (FSEM) is a short tubular monitor constructed from a 20-cm mechanical sieve that seals with a compressible flange to a flat test surface. Emissions specific from the measurement site are sorbed inside the FSEM on a planar distribution of 13 X molecular sieve. The sorbent is analyzed for formaldehyde using a water-rinse desorption and calorimetric analysis procedure.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for an occupational scenario (commercial use of building/construction materials – wood and engineered wood) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Provided data may represent outdated product emission compared to current manufactured products. The data were published in 1986, before the most recent PEL (1992) as well as the formaldehyde wood product rule and more than 20 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Average emission rates and variance were provided for six different wood products from three different manufacturers.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata which also included temperature and humidity levels, but lack other metadata for exposure.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	Data were provided showing variability between different types of wood products from 3 different manufacturers - not a formal one-way analysis of variance was performed. Additionally, the Formaldehyde Surface Emission Monitor (FSEM) which were compared to measured emission rates to evaluate uncertainty in the analysis.

Overall Quality Determination		High	

Study Citation:	Mauer, M. P., Cook, C. K. (1999). Health hazard evaluation report HETA 97-0242-2725, Delphi Chassis Systems, Dayton, Ohio, February 1999.			
HERO ID:	1317810			
Conditions of Use:	Construction Manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	HEIM operator Dept 37 0.03 ppmHEIM operator Dept 37 0.03 ppmHEIM operator Dept 37 0.02 ppmQuality operator Dept 37 0.03 ppmHEIM operator Dept 2 0.02 ppmFork truck operator 0.03 ppm			
Area sampling data:	Curing oven #2 0.02 ppmAdjacent to curing oven #6 0.02 ppmCuring oven #1 0.04 ppmPaint line #2 0.01 ppmPaint line #3 0.02 ppm			
Exposure duration:	8 to 10 hrs per day			
Number of workers:	Approximately 280 workers (assemblers, machine operators, and quality operators) are employed in these departments over three shifts.			
Personal protective equipment:	Respirator use, including the use of dust-mist masks was reported by only a few employees. The MSDS for the epoxy powder paint recommends the use of appropriate NIOSH listed respiratory devices for particulates and fumes. The MSDS for the glass beads recommends the use of a NIOSH approved dust respirator. The MSDS for the metallic disk brake lining compound states that respiratory protection is not generally needed, as long as localexhaust and general ventilation maintain acceptable exposure levels. Exposure levels for all these substances should be minimized due to the complex composition of the dust and the uncertain health effects potentially related to it.Safety glasses should be used in all work areas. Dust-proof goggles are recommended for exposures to the epoxy powder paint dust,particularly when working directly with the paint application apparatus.Employees working with the epoxy powder paint should use protective coveralls, sleeve protectors, and permeation resistant gloves to minimize contact with skin and personal clothing.Machine operators who work with metalworking fluids should discontinue using latex rubber gloves for skin protection. Instead,gloves made of nitrile rubber material should be used. This material is more effective against permeation by metalworking fluids.			
Engineering control:	Due to the potential health effects associated with exposure to brake dust, epoxy resins, formaldehyde, and HMTA (at unspecifiedconcentrations), exposure to these air contaminants should be minimized to their lowest feasible concentrations. One way tofurther reduce exposures would be to improve the exhaust ventilation effectiveness by providing an adequate supply of replacement air, thus eliminating excessive negative pressure. Inaddition, exhaust ventilation systems serving HEIM machines, unloader bins, paint lines, and cure ovens should be further evaluated and modified by a qualified industrial ventilation engineer to assure optimum service and performance.			
EVALUATION

Study Citation:	McCammon, C.S., Robinson, C., Waxweiler, R.J., Roscoe, R. (1985). Industrial hygiene characterization of automotive wood model shops. American Industrial Hygiene Association Journal 46(7):343-349.			
HERO ID:	1944517			
Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description: Area sampling data:	Workers in wood working shops. Job categories included model makers, sweepers, machine operators, workers in plastic shop, and multi-axis machine operators. Formaldehyde concentrations were between 0.1 and 0.3 ppm above routing and shaping operations. However, one of the blind blank samples showed to be one of the highest concentrations. Therefore, these data were discounted.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data greater than 20 years old.
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Mccleery, R. E. (2000). Health Hazard Evaluation Report: HETA 99-0185-2787, Wonder Industries, Wyoming, Minnesota.		
HERO ID:	4678855		
Conditions of Use:	Other- Thermal degradants in Plastic Product Manufacturing		
EXTRACTION			
Parameter	Data		
Worker activity description:	Injection molding machine operators; Plastic injection molding for corner guards, handles, pallet legs and diaper pales.		
Exposure route:	inhalation		
Physical form:	colorless gas/vapor		
Area sampling data:	Concentrations ranged between 0.01 to 0.015 ppm. Highest FA concentration (0.015 ppm) was located on injection-molding machine #7 (white mattress corner guard, HDPE). All air sample results were lower than relevant evaluation criteria. Full table of samples provided in Table 2 (p.16)		
Exposure duration:	Exposure duration is 3 shifts per day period with 5 to 6 people per shift. Week starts Sunday night at 11pm and ends on Friday night at 11pm. Most workers are exposure up to 10 hours a day, 40 hours per week.		
Number of workers:	15-18 per day period.		
Personal protective equipment:	Workers not required to wear hearing protection while in the injection molding area of the facility. They are offered 3M® 1100 Foam Ear Plugs. The Noise Reduction Rating (NRR) for these plugs is 29 decibels (dB). There are also 3M 8500 respirators (single strap respirators for nuisance dust) offered. However, these respirators are not NIOSH approved under the current regulation, 42 CFR Part 84. NIOSH investigators did not observe any employees wearing any personal protective equipment (PPE) during the site visit. Recommendations suggest PPE should be stored in one area, respirators (N95) should be worn.		
Engineering control:	Heating system exists for the facility but is rarely operated in the injection molding area due to the heat generated by the process. During the site visit, the rear overhead door leading ot the docking area was open throughout the day as well as the front entrance door. Does not have a local exhaust ventilation for the injection molding machines. A wall exhaust fan was in operation in the southwest corner of the production area. Employees indicated those exhaust fans are not typically in operation but they were during the NIOSH site visit. Recommendations suggest exhaust fans should be in continuous operation to enhance air movement.		
Comments:	Analyzed by NIOSH method 2016, 2549, 1501, 1550 and 1552		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data is for US.
	Metric 3: Applicability	Uninformative	Data is applicable to the emission of formaldehyde as a decomposition for polypropylene and polyethylene (byproduct formation), therefore it does not appear to be applicable for use of formaldehyde in plastic product manufacturing.
	Metric 4: Temporal Representativeness	Low	Source is over 20 years old.
	Metric 5: Sample Size	High	Individual samples are provided.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Includes worker activity, exposure route, physical form, area sampling data. exposure duration, PPE, and engineering control.
Domain 4: Variability and Uncertainty

Conditions of Use:	Other- Thermal degradants in Plastic Product Manufacturing

		EVALUATION	
Domain	Metric	Rating	Comments
	Metric 7: Metadata Completeness	Low	Limited discussions on variability and uncertainty.

Overall Quality Determination	Uninformative

Study Citation:	Mcmanus, K. P. (1992). Health Hazard Evaluation Report HETA 91-251-2218, New Hampshire Ball Bearing, Laconia, New Hampshire. 4(HETA-91-251-2218):91-251.
HERO ID:	2780125
Conditions of Use:	Use of Adhesives and Sealants

EXTRACTION

Parameter	Data
Worker activity description:	Employees worked in the Teflon Room, where teflon cloth is adhered to the inside of bushings to provide lubrication of the bearings; adhesive "AD", which contains a phenolic resin, free phenol, ethylalcohol, and free formaldehyde. Teflon fabric pieces, measuring 18 x 24 inches, are roll coated with adhesive and allowed to cure in a drying room. Curing times vary from 7-14 days. One side of the fabric is roll coated with adhesive and allowed to cure before the other side is coated and allowed to cure. Sometimes a third coat is required to meet certain specifications.
Exposure route:	inhalation and dermal
Physical form:	gas
Area sampling data:	The following concentrations of formaldehyde were noted: Drying Rm - 0.08 ppm, Cloth Rm - 0.03 ppm, Teflon Rm Cab - ND.
Exposure duration:	The plant operates 2 shifts: between 7A.M. and Midnight, with staggering start and stop times.
Number of workers:	New Hampshire Ball Bearing, Inc. employs approximately 490 workers in the manufacture of self-lubricating bearings. The majority of the workforce is employed in the machine shop. Approximately 40 employees work in the Teflon Department, where teflon cloth is adhered to the inside of bushings to provide lubrication of the bearings.
Personal protective equipment:	air supplied respirators, which are only used when applying certain adhesives. However, the air supply was not monitored to warn against carbon monoxide or oil mist contamination. Additionally, there was no respirator program to indicate proper use, storage, cleaning and limitations of these respirators, nor were employees medically cleared to wear respirators; NIOSH recommends use of respirators. The air supply to the respirators in the Cloth Room must be equipped with high temperature and carbon monoxide warning systems. Gloves made of the appropriate material to protect against exposure to specific chemicals in use need to be selected and provided.
Engineering control:	dedicated ventilation system that provides 10 air changes per hour. The air is exhausted directly to the outside; NIOSH recommended substitution of adhesives to eliminate the potential for exposure to formaldehyde.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Methodology is approved by NIOSH (NIOSH Method 3500)
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include all associated metadata except exposure frequency.
Domain 4: Variability and Uncertainty

Comments:	Analytic Method: EPA method T0-11 (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved EPA method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for personal care products (nail salons), an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, media, standard deviation) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple salons, but uncertainty is not addressed.
Overall Quality Determination			High	

Study Citation:	Mehta, M., Jenkins, J., Liveright, T. (1987). Health Hazard Evaluation Report HETA-86-0486-1799 New Jersey Education Associaton, Trenton, New Jersey.			
HERO ID:	8198273			
Conditions of Use:	Commercial Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Office workers in an education building. (3/19)			
Exposure route:	inhalation (4/19)			
Physical form:	gas (4/19)			
Area sampling data:	Formaldehyde was not detected in the area sampling with a LOD of 0.5ppm. (10/19)			
Number of workers:	140 people (4/19)			
Engineering control:	The air for the NJEA Building is supplied and exhausted through a Heating Ventilation and Air Conditioning (HVAC) system. The air distribution on floors 4, 5 and 6 was from the Air Handling Unit (AHU) located in the penthouse and that of floors 1, 2, and the basement was from the AHU located in the basement. The air was distributed on each floor through diffusers located on the ceiling and exhausted through return air grills located on the side walls. Some of the air was distributed through grills provided on the periphery of each floor approximately 2 feet above floor level. (7/19)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Low	Data are for ambient air in an office, which is similar to the in-scope occupational scenario use of furniture products.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Low	Sample distribution is described qualitatively.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure frequency, and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Mehta, M., Liveright, T., Dawkins, S. (1987). Health Hazard Evaluation Report HETA-87-0171-1840 New Jersey Department of Transportation, Trenton, New Jersey.
HERO ID:	8245069
Conditions of Use:	Furniture and furnishings not covered elsewhere

EXTRACTION	
Parameter	Data
Worker activity description:	"Source of exposure is thought to be upholstered partitions, chairs and carpeted floors. (4/30)"
Exposure route:	inhalation, dermal (3/30)
Physical form:	vapor (8/30)
Area sampling data:	The average air concentration for all 12 samples was 0.054 ppm, with a range of 0.035 to 0.094 ppm. (15/30)
Exposure duration:	8-10 hours (7/30)
Number of workers:	1200 people (4/30)
Engineering control:	The North Wing and South Wing on each floor have separate air handling units (AHUs). The air is supplied through the AHU to the work areas of each wing via a Variable Air Volume (VAV) unit or box. Each VAV box is connected by ducts to a number of air inlet registers located on the false ceiling with a closed plenum. VAV boxes are provided with dampers. The movement of the dampers is controlled by thermostats located on the side walls which detect room temperature. (4/30)

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for commercial use of furniture and furnishings, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure frequency and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at many locations at different temperatures and humidities.

Overall Quality Determination	High

Study Citation:	Menziez, D., Tamblyn, R.M., Nunes, F., Hanley, J., Tamblyn, R.T. (1996). Exposure to varying levels of contaminants and symptoms among workers in two office buildings. American Journal of Public Health 86(11):1629-1633.			
HERO ID:	3391045			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Area sampling data:	Buildings were sampled with increased and decreased ventilation as described in Table 1: Ventilation increased: 0.034, 0.012 ppm; Ventilation decreased: 0.038, 0.048;			
Exposure duration:	Workers are full-time and exposed 8 hours a day, 40 hours a week			
Number of workers:	Of 840 eligible workers in the twobuildings, 702 (84%) participated.			
Engineering control:	Building’s HVAC system had 30% efficient pre-filter and 80-90% efficient bag-filters.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is peer reviewed so likely contains high quality data
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is for Canada, an OECD country.
	Metric 3:	Applicability	Low	Data is for general office space workers.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old (1996).
	Metric 5:	Sample Size	Low	Data characterized by a range of data but no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes engineering controls, exposure route, sampling data, exposure duration and frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Address variability by looking at different building with different ventilation rates. Address uncertainty by looking at attributes for formaldehyde levels and accounting for unknown/unexplained sources.
Overall Quality Determination		Medium		

Study Citation:	Merkle, S.E. (1985). Ambient concentrations of formaldehyde and ammonia in a screwworm fly rearing facility. American Industrial Hygiene Association Journal 46(6):336-340.			
HERO ID:	1318482			
Conditions of Use:	Non-TSCA			
EXTRACTION				
Parameter	Data			
Worker activity description:	Transfer flies to oviposition room, remove eggs and transfer to petri dishes and transferred to larvae rearing area. Larvae strain testing. media preparation which is where formaldehyde is an additive. Periodically vacuum larvae waste products from vat and replenish food. operate hot room where materials an equipment are held to kill any remaining larvae.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	1981 Media preparation 340 ug/m3 mean (range 240-440 ug/m3); larvae rearing 46 ug/m3 mean (range 23-82 ug/m3);1983 Media preparation 426 ug/m3 mean (range 425-427 ug/m3); larvae rearing 73 ug/m3 mean (range 10-190 ug/m3); Centrifuge 35 ug/m3 mean (range 18-52 ug/m3); 1984 larvae rearing 44 ug/m3 mean (range 22-77 ug/m3); Total for all years media preparation 383 ug/m3 mean; larvae rearing 58 ug/m3 mean; centrifuge 35 ug/m3 mean			
Number of workers:	1000			
Engineering control:	recommended use of enclose piping system to transfer formalin into media prep mixers; dilution ventilation was used			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Appears NIOSH methods were used - used two glass bubbler in series. Each bubbler contained sodium bisulfite absorbing solution, Samples were analyzed using the chromotropic acid-spectrophotometric method (P&CAM no. 125) recommended by NIOSH.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Mexico - not an OECD member
	Metric 3:	Applicability	Uninformative	The data are for formaldehyde used as a bactericide and fungicide which is an occupational scenario not within the scope of the risk evaluation (non-TSCA).
	Metric 4:	Temporal Representativeness	Low	This study was published in 1985 using data from 1981-84, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	mean and range values were provided for three different production areas and the different sampling years
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include critical metadata, such as sample type and exposure type, sample durations, and worker activities butlacks additional metadata, such as exposure durations, and frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Range data were provided for 3 different production areas and three different years; these data can be used to evaluate variability. Uncertainty is addressed in the NIOSH methods.

HERO ID:	1318482
Conditions of Use:	Non-TSCA

Domain	Metric	EVALUATION Rating	Comments
Overall Quality Determination		Uninformative	

Study Citation:	Methner, M. M., Tapp, L., Ramsey, J. (2014). Health Hazard Evaluation Report: HETA-2012-0025-3207, May 2014. Evaluation of Metals, Solvents, Formaldehyde, Ventilation, and Ergonomic Risks During the Manufacture of Electrical Cable Accessories.			
HERO ID:	2452612			
Conditions of Use:	Use of Plastic and Rubber Products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Employees at a plant that produced underground electrical power distribution cable accessories			
Exposure route:	Inhalation			
Physical form:	Vapo/gas			
Personal sampling data:	Formaldehyde concentration in personal air ranged between 0.0032 to 0.0058 ppm.			
Area sampling data:	Formaldehyde concentration in area air ranged between 0.0011 to 0.0063 ppm for longer duration and 0.051 ppm for short duration			
Exposure duration:	production employees worked 8-hour shifts, except for paintdepartment employees who normally worked 12-hour shifts.			
Number of workers:	The 41 interviewed employees included 20 molders, 6 assemblers, 5 material preparers in the paint department, 3 testers, 2 material handlers, 2 maintenance staff, 2 quality assurance staff, and 1 production operator.			
Personal protective equipment:	Recommended PPE - gloves			
Engineering control:	local exhaust ventilation system was not operating. Recommended engineering controls – 1) Repair the local exhaust ventilation system. 2) Provide adjustable workstations for assembly tasks. Parts bins that support the assembly process should be in front of the employee at a vertical height of 24"–70" and a forward reach ≤ 16". 3) Provide foldup steps on the platforms that support the molding machines. 4) Lower paint booths or provide a raised platform to allow employees to use the spray gun with their elbow at a 90° angle. 5) Locate the parts drying racks in the paint department at heights of 27"–62" to eliminate reaching overhead or bending at the back. 6) Continue to evaluate ways to eliminate excessive reaching and bending when working on the deflasher. Provide employees with a retrieval tool such as a rake or hoe to pull parts from the machine into the bin. 7) Provide rotating lift tables or load levelers for stackable parts and boxes. Do not use pallets placed directly on the floor. 8) Provide antifatigue mats at all standing workstations. 9) Choose a tool (e.g., hammer) of the right size and shape for the task and the user.

EXTRACTION

Parameter	Data
Exposure route:	inhalation
Physical form:	liquid
Area sampling data:	From Table 2 (mean): 0.24 ppm - UF Resin Mfg, 0.25 ppm - Textile industry, 0.35 ppm - Plywood Mfg, 0.41 ppm - US Funeral Homes, 0.94 - Acid cure varnishes. Table 2 also provides maximum levels as well.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The data are for occupational scenarios within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Data is over 20 years old
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics (mean and max provided for most COU's)
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Unclear if samples are personal or area, article does provide the references used which may still be useful.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Overall Quality Determination **Uninformative**

Study Citation:	Meyer, B., Hermanns, K. (1986). Formaldehyde release from wood products - an overview. ACS Symposium Series 316:1-16.			
HERO ID:	5946044			
Conditions of Use:	Mobile homes and furniture made with wood products containing formaldehyde resins			
EXTRACTION				
Parameter	Data			
Area sampling data:	Mobile homes: See figure 1 - 2 and Table 2. Air concentration in a mobile home ranges from 0.25 - 1.25 ppm and depends on ventilation rates and types of boards.			
Comments:	// Furniture: See Figure 3-4. Air concentration from chamber study shows 0-0.7 ppm. This article talks about the factors considered when modeling air concentrations and emissions.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination		Medium		

Study Citation:	Meyers, A.R., Pinkerton, L.E., Hein, M.J. (2013). Cohort mortality study of garment industry workers exposed to formaldehyde: Update and internal comparisons. American Journal of Industrial Medicine 56(9):1027-1039.			
HERO ID:	1998382			
Conditions of Use:	Use of fabric, textile and leather products			
EXTRACTION				
Parameter	Data			
Worker activity description:	At the garment manufacturing facilities, shirts were made from fabrics treated with formaldehyde resins to impart crease resistance and other desirable properties.			
Exposure route:	inhalation			
Personal sampling data:	Formaldehyde levels across all departments and facilities were similar with an overall geometric mean concentration of 0.15 ppm (geometric standard deviation = 1.90).			
Area sampling data:	Average levels of formaldehyde in the garment industry were characterized as 0.3–2.7 ppm among eight US garment plants in 1966 and industry average levels in the 1970s and 1980s were characterized as 0.2–2 ppm			
Number of workers:	549 workers (12 - 73 within each department)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	the data presented is from 1980s
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low

Conditions of Use:	Manufacture

EXTRACTION	
Parameter	Data
Worker activity description:	Operators are responsible for operating the formaldehyde production process, unloading methanol from tank cars, loading formaldehyde into rail cars and trucks, sampling the process, and prevention and clean-up of spills. Operators also change the catalyst in tubes during shut-down periods. Maintenance personnel, working day shifts, Monday through Friday, are responsible for maintenance of the entire facility, including the resin plant. Specific maintenance requests are recorded by the unit operators on a board in the maintenance shop. Maintenance personnel keep a log on all maintenance to be performed during the day shift and may be called in at any time during the evening shifts to repair serious mechanical problems that require immediate attention. Lunches are eaten on-the-Job, inside the control/lab room or shop. Approximately two trucks are loaded with formaldehyde per day. It takes approximately 30 minutes to load a truck. The operator supervises the loading, which is performed by the truck driver who is not an employee of the plant. The truck driver initially opens the tank top hatch (Figure 4) and places the loading spout into the tank (Figure 5). The operator sets the required load for the tank on the automatic delivery control device (Figure 6) located at the loading area. He remains in the vicinity of the loading area for most of the loading period, often talking to the operator. On occasion, he may get involved in starting automatic delivery of resin to a truck a short distance away while formaldehyde loading is proceeding. The operator remains in the resin loading area for a very short time, either to start or stop automatic delivery of the resin. Consequently, it is not believed that exposure to formaldehyde vapors resulting from resin loading is of any significance, and it is not expected to add to the exposure resulting from formaldehyde loading. Approximately 16 rail cars are loaded per month. The operator performs all required duties. He initially opens the top hatch and then attaches a reinforced flexible line to the bottom of the tank car for bottom delivery. The operator starts automatic delivery by setting the load on the automatic delivery control device located at the loading area. The operator then usually leaves the area because loading usually takes 1.5 to 1.75 hours. Again, the operator may be involved in loading the resin. The operator withdraws 50-51 percent formaldehyde solution from the absorber four times per shift by opening a ball valve and filling a 100-mL graduated cylinder (Figure 10). A catch basin, located below the sample point, is used to collect the purge of the sample line (Figure 11) and any excess solution or water to rinse. A formaldehyde gas sample is drawn by an operator or the quality control supervisor into a syringe through a sample valve in the aftercooler inlet. This sample is then injected by an operator or quality control supervisor into the gas chromatograph in the control/lab room and analyzed. This is usually done once every third shift, or more often, up to three-four times per shift, if process changes such as catalyst adjustment are involved.
Exposure route:	Inhalation
Physical form:	Gas
Personal sampling data:	Long-term sampling Operator 1: 0.11-0.70 (ppm) Operator 2: BDL-0.28 (ppm) Operator 3: 0.13-0.31 (ppm) Operator 4: 0.02-0.20 (ppm) Maintenance worker 1: 0.02-0.46 (ppm) Maintenance worker 2: 0.15-2.22 (ppm) Short-term sampling [formaldehyde process sampling] Operator 1: 0.07-0.62 (ppm) Operator 2: BDL-0.64 (ppm) Operator 3: 0.29 (ppm) Short-term sampling [formaldehyde loading supervision] Operator 2: 1.04 (ppm) Operator 3: 0.86-1.07 (ppm) Short-term sampling [gas sample at aftercooler] Supervisor 3: 1.34 (ppm)
Area sampling data:	Adjacent to east downer knock out tank: 0.13-0.31 (ppm) Adjacent to center tank: BDL-0.05 (ppm) Above north adsorber sample point: 0.09-0.36 (ppm) West side of east converter electrical outlet: 0.10-0.64 (ppm) East side of west converter electrical outlet: 0.08-0.20 (ppm) Formaldehyde storage area: 0.56-1.06 (ppm) Methanol storage area: 0.32-0.55 (ppm) Formaldehyde Source Sampling Side agitator - Tank F8: >92.83 (ppm) * Side agitator - Tank F10: >83.65 (ppm) * Absorber pump #2: 14.78->33.15 (ppm) * Loading pump: >54.69 (ppm) * Adsorber Pump #1: 6.05 (ppm) * Tube analysis indicated breakthrough; slightly off calibration-extrapolated value.
Exposure duration:	Operators work in 8-hour shifts. Truck loading operations take approximately 30-minutes. Rail car loading takes 1.5-1.75 hours.
Exposure frequency:	The plant operates 7 days/week.
Number of workers:	The total plant employs approximately 40 employees, which include approximately 15 production operators.

Personal protective equipment:	Rain gear, face shields, gloves, helmets, safety glasses, disposable dust masks, and protective clothing are available as needed, or on request. Safety shoes and respirators are provided. An MSA self-contained breathing apparatus is available in the control room. Several supplied-air respirators are available, and the plant compressed air is monitored and meets the criteria for breathing air. An emergency eyewash and shower unit is located on the ground level of the production unit in the vicinity of the tank truck and rail car HCHO loading areas, and at the resin loading area which is near the formaldehyde loading area. All employees are required to wear hard hats and safety glasses with side shields while working in production areas. Specific PPE requirements are: Formaldehyde Loading: half-face organic vapor cartridge respirator, rubber gloves. Formaldehyde solution sample withdrawal: rubber gloves. Sample removal of HCHO gas from aftercooler inlet: half-face respirator and rubber gloves. Formaldehyde storage tank entry: full protective suit, boots, gloves, air-supplied respirator. Maintenance formaldehyde leak repair: Gloves, half-face respirator.			
Engineering control:	Pump seals were used on pumps along with natural ventilation.

Conditions of Use:	Manufacture			
EXTRACTION				
Parameter	Data			
Worker activity description:	The formaldehyde operators’ duties include turning valves and other general operational duties as well as loading tank trucks. The service operators are involved in miscellaneous service work and clean-up. Service operators spend most of their time on duties with the sulfuric acid plant.			
Exposure route:	Inhalation.			
Physical form:	Gas.			
Personal sampling data:	8-hr TWA Loader: 0.02-1.02 (ppm)HCHO Operator: 0.12-0.50 (ppm)Shipper: 0.01-0.06 (ppm)Chief operator: 0.01-0.13 (ppm)15-min TWA HCHO operator: 0.05-0.68 (ppm)Chief Operator: not detectedHCHO operator startup: 4.1-22.4 (ppm)			
Area sampling data:	Start up (4-hr TWA): 0.32 (ppm)Start up (3-hr TWA): 0.89 (ppm)Tank truck loading (5-hr TWA): 0.71 (ppm)Sump (5-hr TWA): 0.56 (ppm)			
Exposure duration:	Most tasks take 3-5 hours per day.			
Exposure frequency:	Operating days 7 days a week			
Number of workers:	The workforce covers two production areas (formaldehyde and sulfuric acid) consists of seventeen employees: two supervisors, five chief operators, four formaldehyde operators, five service operators, and one shipper. Formaldehyde operators devote 100 percent of their time, and service operators about 20 percent, to formaldehyde production. In addition, the area has a shipper who is a clerk with minimal field (outside) responsibility in formaldehyde. The shipper, as the service operator, is shared with the sulfuric acid plant. The maintenance group consists of a supervisor and 8 to 10 persons. They cover a large area and are estimated to spend no more than 20 percent of their time in the formaldehyde area.			
Personal protective equipment:	Training in use of respirators is an integral part of the overall training program. The safety department is responsible for cleaning and maintenance of the respirators. All full-face respirator users are fit-tested (qualitative) once a year. Specific PPE requirements are as follows All formaldehyde operations: hard hats and side-shield safety glasses. Startup operations: full-face respirators. Loading operations: rubber gloves, coverall goggles, full-face respirator during hookup. Opening blocked piping: supplied air mask. Operating overhead valves: overall goggles.			
Engineering control:	Vent-scrubber system. A laboratory hood was recently added to the control laboratory. Samples are stored and analyzed in this hood. When the analysis is completed, samples are grouped outside the hood while awaiting disposal (sample containers are closed). The loading area and delivery arm have a vapor collector and exhaust ventilation to minimize exposure

Study Citation:	Mortimer, V. (1981). Preliminary survey report: Particleboard and plywood plants, Springfield Wood Products Facility, Weyerhaeuser, Inc., Springfield, Oregon.			
HERO ID:	6558524			
Conditions of Use:	Processing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Production workers in a plywood plant. (5/13)			
Exposure route:	inhalation (5/13)			
Physical form:	vapor from adhesive sprays (6/13)			
Personal sampling data:	In a survey in Oregon, 9 area samples and 1 personal sample ranged from 0.21-4.39 ppm. In another survey that year, 2 area and 2 personal samples ranged from 0.83-2.92 ppm. (8/13)			
Area sampling data:	Area close to particleboard press: <0.5 ppm Area above caul plate separator: 1 ppm Area along plywood press: <0.5 ppm Area along loading platform: <0.5 ppm (7/13) In a survey in Oregon, 9 area samples and 1 personal sample ranged from 0.21-4.39 ppm. In another survey that year, 2 area and 2 personal samples ranged from 0.83-2.92 ppm. (8/13)			
Number of workers:	250 (5/13)			
Personal protective equipment:	Hearing protectors and safety glasses are required for some jobs. Respirators are available if workers want to use one. (9/13)			
Engineering control:	Curtains are hung around the particleboard press to contain heated rising emissions , and roof fans remove them. Control rooms have been built for press operators. An air conditioner has been installed in each control room. The board cooler and cooling tunnel have been built onto the outside of the plant so that the cooling air doesn't enter the building. In the plywood plant there are roof fans above the presses.(8/13)			
EVALUATION

Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Report is published by NIOSH, so sampling/analytical methodology is an approved method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for adhesives and sealant chemicals in wood product manufacturing, am in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		Medium		

Study Citation:	Mortimer, V. (1982). Preliminary survey report: Particleboard plant, Timber Products Company, Medford, Oregon.
HERO ID:	6558525
Conditions of Use:	Processing: Wood Product Manufacturing

EXTRACTION	
Parameter	Data
Worker activity description:	Workers in a wood product manufacturing plant
Exposure route:	inhalation
Personal sampling data:	On October 5, 1977, 10 personal samples were taken, averaging 30 minutes in duration, were taken by the Oregon Workers' Compensation Department. The calculated concentrations ranged from approximately 1.0 to 3.2 ppm, with a mean (+ standard deviation) of 1.4(+ 0.6) ppm.
Area sampling data:	No values were greater than 2 parts formaldehyde per million parts of air (ppm); however, some were in the area of 1 ppm.
Exposure duration:	Average of 30 minutes for the personal samples
Number of workers:	70
Personal protective equipment:	No single personal protective equipment item is required for every worker. Hearing protectors and safety glasses are required for some jobs; respirators are not mandatory for any worker.
Engineering control:	Local exhaust ventilation is used over the cooling wheel. A canopy hood covers the boards as they make a 1800 pass over a supply of air from underneath. Smoke tube analysis showed fairly good capture by the hood, although there was an interfering flow of air horizontally across the boards. A detector tube (Drager 0.5/a) sample taken at floor level required 13 pump strokes, indicating less than one part formaldehyde per million parts of air. The sampling site was about 5 to 15 feet below the boards, close to both the cooling wheel and the unloaded stack of boards. Two roof fans located above the press remove much of the heated air from the press. although there is not much air flow observable at the level of the platform which provides worker access to all points of the production line. A detector tube sample taken close to the press showed less than 1.5 ppm (8 strokes), and this location is not usually occupied by any employee. Around 1973, control rooms were built for the press operator and for the former-operator who controls the layering of particles on the caul plates. Now only a few workers involved in maintenance and clean-up regularly work outside these booths. An air conditioner has been installed in each control room for cooling during hot weather. The units are small, commercially available, window models which are vented to the indoor workplace air just outside the booth. They were not operating on the day of the survey, and it is not known what effect, if any, they would have on formaldehyde levels in the control rooms.

	Metric 3:	Applicability	High	data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	data is more than 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Moseley, C. L. (1979). Hazard Evaluation and Technical Assistance Report No. TA 79-16, Johnson Memorial Hospital, Stafford Springs, Connecticut.			
HERO ID:	4223253			
Conditions of Use:	Chemical substances in products not described by other codes-Laboratory Chemicals (e.g.,mortuary science)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Administrative and health care functions of Johnson Memorial Hospital...no clearly identifiable source for formaldehyde in CSS other than that brought in by soiled equipment from themorgue/autopsy area (pdf pg 3) It was postulated at one time that chemicals from the autopsy area beneath the Administration Area vi~re the cause of the reported symptoms. The most likely chemical is formaldehyde...the Administration Aera value probably represents normal background level in the hospital and may be indicative of poor handling or storage of formaldehyde in areas where it is normally used. The CSS value may be due to residual formaldehyde on incoming soiled equipment. (pdf pg 9)			
Exposure route:	inhalation			
Area sampling data:	The results of area samples for aldehydes taken in the Administration and CSS Areas are presented in Table II. Two compounds were identified–formaldehyde and furfural.Recommended personal exposure level§ are 1.2 mg/m3 ~NIOSH, 15 minute ceiling exposure limit) and 20 mg/m (ACGIH, TWA Limit) , respectively. Inspection of Table II indicates all values were below these criteria. (pdf pg 8)Environmental sampling in the Administration Area indicated a concentration of °326 mg/m3 (one sample). Formaldehyde was also detected in CSS at 0.61 mg/m (pdf pg 9)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH methods used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evalu-ated.
	Metric 3:	Applicability	Medium	Source of formaldehyde was not confirmed, so occupational scenario may not be within scope, though it likely is, given the hospital setting.
	Metric 4:	Temporal Representativeness	Low	Data are from 1979 and occupational scenario has likely changed.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sam-pled site or sector.
Overall Quality Determination			High

HERO ID:	1318499
Conditions of Use:	Use of fabric, textile and leather products

EXTRACTION	
Parameter	Data
Worker activity description:	Three areas of the warehouse were the center of employee complaints; the area where clothing is unpacked and placed on hangers and placed in the conveyer system (aka "T" area), the aisle area between the "B" and "C" areas where clothing is arranged by size and ticketed, and the Ticket area which is adjacent to the "B" and "C" areas and where the stamping of tickets is done. (Page 4 out of 23). These three areas were where personal and area samples were taken.
Exposure route:	inhalation and dermal were tested in this study
Physical form:	vapor (page 2 of 23)
Personal sampling data:	Seven personal breathing zone samples were taken, all below the NIOSH recommended criteria for 1ppm on the day of sampling, with concentrations ranging from 0.16 ppm to 0.73 (see Table 1, page 18 of 23, for all the personal sample results). However some of these levels were above the "action level" of 0.5ppm for formaldehyde, which required steps to be taken to reduce exposure. (Page 7 of 23).
Area sampling data:	General area samples were all below the NIOSH recommended criteria for 1ppm. (Page 7 of 23) This includes samples taken where an unopened box of clothing from India Imports (one of the brands associated with the illness) was obtained, and a hole large enough to withdraw an air sample was made. This sample was analyzed for formaldehyde. (Page 4 of 23)See Table 1 (Page 18 of 23) for all the area sample results (which ranged between 0.4 and 0.19) and results of formaldehyde levels within a box of newly arrived clothing (concentrations of 0.16 and 0.15 were observed).
Dermal exposure data:	nan
Exposure duration:	8-10 hours/day (Page 6 of 23)
Number of workers:	225 affected employees (Page 2 of 23)
Engineering control:	The warehouse area is ventilated by a centrally located, 86,000 cubic feet per minute (cfm) intake rooftop fan and by whatever air exchange that takes place when the shipping and receiving doors are open. There are no windows in the warehouse. There are also four 10,000 cfm exhaust fans located along one side of the roof to help relieve the positive pressure buildup. The warehouse is not air conditioned and is heated by a city gas-fire furnace. Figure 1 (on page 21 of 23) shows the general layout of the building and the ventilation system. In addition, after the first episode [where many employees reported illness] management rented and installed 12 pedestal fans to help eliminate areas of stagnant air. (Page 3 of 23). However, this was not adequate at moving air through the warehouse, and it was believed that racks of hanging clothes on upper levels act as a barrier to air exchange in the lower level. The air in aisles where this is not fan directed may become stale and with noticeable odors from hanging clothes. (Page 7 of 23)
Comments:	Symptoms were associated with certain brands of clothing (Outlander, India Imports, Organically Grown). These brands were not being handled at the time of the investigation, though an unopened box of India Imports clothing was obtained to test for formaldehyde. (Page 4 of 23)

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	From the US
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Study more than 20 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.

HERO ID:	1318499		
Conditions of Use:	Use of fabric, textile and leather products		
Domain	Metric	EVALUATION Rating	Comments
Domain 3: Accessibility/ Clarity			
Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations, worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty			
Metric 7:	Metadata Completeness	High	Results from individual sampling events were provided which could be used to evaluate variability between locations/jobs. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods
Overall Quality Determination		High	

Study Citation:	Moss, C. E., Bryant, C., Stewart, J., Whong, W. Z., Fleegeer, A. (1990). Health Hazard Evaluation Report HETA 88-101-2008, University of Utah Health Sciences Center, Salt Lake City, Utah.				
HERO ID:	1322411				
Conditions of Use:	Unknown				
EXTRACTION					
Parameter	Data				
Worker activity description:	laser surgery and animal research procedures (page 2 of 40)				
Exposure route:	inhalation of smoke generated by medical lasers (page 2 of 40)				
Physical form:	vapor (page 2 of 40)				
Personal sampling data:	Equipment was positioned as close as possible to the active surgical site(hand held in the employees breathing zone) without interfering with the medical procedure. (Page 2 of 40) This is assumed as personal sampling data. For the Medical Center and Animal Evaluations, Formaldehyde was detected from trace amounts to 0.44 (though noted that some sampling took place over over very short procedures). See discussion on page 8 of 40. See Tables IX-X on page 22-23 of 40 for more data points. Personal sampling data is also provided for the first and second preliminary evaluations in Table IV on page 17 (brief discussion on page 7), and Table VII on page 20 (brief discussion on page 7).				
Area sampling data:	See discussion on page 8 of 40. See Tables IX-X on page 22-23 of 40 for more data points. Data ranged from trace to 0.013				
Exposure duration:	range from a few minutes to an hour or more (see page 22 for some sample durations, which represent how long exposure would be per event)				
Exposure frequency:	most of the operating room personnel were involved in more than one laser surgery procedure daily. (Page 8 of 40)				
Personal protective equipment:	All personnel involved with these operations were required to wear operating room clothing, including masks, head covers, laser goggles, shoe covers, and surgical gloves. (Page 2 out of 40)				
Engineering control:	Filtered vacuum system to suction away the laser-produced smoke (page 2 of 40)				
EVALUATION					
Domain	Metric	Rating		Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study Method 3500	
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US	
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, in terms of the type of industry, operations, and work activities. (laser surgery)	
	Metric 4:	Temporal Representativeness	Medium	1998 - after PEL (1992) but more than 20 years old	
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in NIOSH method 3500.	
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.

Study Citation:		Moss, C. E., Bryant, C., Stewart, J., Whong, W. Z., Fleegeer, A. (1990). Health Hazard Evaluation Report HETA 88-101-2008, University of Utah Health Sciences Center, Salt Lake City, Utah.		
HERO ID:		1322411		
Conditions of Use:		Unknown		
Domain		Metric	EVALUATION	
			Rating	Comments
Metric 7:		Metadata Completeness	High	Results from individual sampling events were provided which could be used to assess variability between different laser types and locations. Uncertainty was not discussed but assumed that it was addressed in NIOSH method 3500.
Overall Quality Determination			High	

Study Citation:	Mui, K.W., Wong, L.T., Hui, P.S., Chan, W.Y. (2009). Formaldehyde exposure risk in air-conditioned offices of Hong Kong. Building Services Engineering Research & Technology: An International Journal 30(4):279-286.		
HERO ID:	2574572		
Conditions of Use:	Office Environment		
EXTRACTION			
Parameter	Data		
Worker activity description:	office workers in Hong Kong		
Exposure route:	inhalation		
Physical form:	vapor		
Area sampling data:	Formaldehyde concentrations in one group of offices were between 2 and 1,300 ug/m3 with an arithmetic mean of 54 +/- 113 ug/m3 and a geometric mean of 32 +/- 2.7 ug/m3. Formaldehyde concentrations in the second group of offices were between 4 and 208 ug/m3 with an arithmetic mean of 41 +/- 41 ug/m3 and a geometric mean of 29.3 +/- 2.1 ug/m3.		
Exposure duration:	Data were taken on an 8-hour basis		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	The data are from a non-OECD country
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, in terms of the type of industry, operations, and work activities.
	Metric 4: Temporal Representativeness	Medium	Operations, equipment, and worker activities are expected to be reasonably representative of current conditions. The monitoring data were collected after the most recent PEL establishment or update but are generally more than 10 years old. If no PEL is established, the data are more than 10 years but generally, no more than 20 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data includes most critical metadata.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates.
Overall Quality Determination		Medium

Area sampling data:	up to 0.10ppm

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	The sampling/analytical methodology is not specified, however, NIOSH HHEs generally use approved NIOSH methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Uninformative	The data is occupational however forest fires are outside the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The report is published in 2004, however, the cited information is from an HETA from 1992 (HETA-92-0045-2260), which is before the most recent PEL.
	Metric 5: Sample Size	Medium	Maximum value provided with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Report states that personal breathing zone and area samples were collected but does not specified for 0.10ppm if its for area or personal.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The report does not address variability or uncertainty.

Overall Quality Determination**Uninformative**

Study Citation:	(1989). Formaldehyde. AMA Council on Scientific Affairs. Connecticut Medicine 53(4):229-235.			
HERO ID:	1986544			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Area sampling data:	One study indicated that white male morticians in West Virginia were exposed to low levels of formaldehyde (at least a timeweighted average not exceeding 1.2 ppm or a half-hour peak of 2.1 ppm). Another study showed that 76 female histology technicians were exposed daily to formaldehyde at concentrations of 0.2 to 1.0 ppm. One of the earliest surveys of environmental levels of formaldehyde in funeral homes was an evaluation of ventilation systems (essentially wall-mounted exhaust fans) in six funeral homes. Ambient levels of formaldehyde ranged from 0.75 to 2.50 ppm {without ventilation} and 0.25 to 1.39 ppm (with ventilation). Another survey of seven funeral homes in 1980, involving both area and personal sampling, determined that embalmers were exposed to 0.1 to 0.4 ppm of formaldehyde when working with intact bodies and 0.5 to 1.2 ppm of formaldehyde when working with autopsied bodies. Ambient air samples during class in eight gross anatomy laboratories of a major medical school over a 12-week period were evaluated. Only 11% of the ambient air samples exceeded 1.0 ppm whereas 44% of the personal samples were above 1.0 ppm. Most (62%) of the daily mean exposures varied between 1.0 and 2.0 ppm, and half were between 0.6 and 1.0 ppm; the lowest was 0.3 ppm and the highest was 2.63 ppm. In one medical center autopsy service, weekly time-weighted average exposures for pathologists, residents, and technicians were between 0.61 and 1.32 ppm.			
Number of workers:	See Table 2 for estimations of exposed groups			
Engineering control:	ventilation system			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., area) but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability and uncertainty are addressed by looking at multiple settings
Overall Quality Determination		Medium		

Study Citation:	(1989). Formaldehyde. Council on Scientific Affairs. JAMA: Journal of the American Medical Association 261(8):1183-1187.			
HERO ID:	1986547			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Personal sampling data:	Table 1: 0.4-3.0 (ppm)Table 2: 0.1-0.5 (ppm)In one medical center autopsy service, weekly time-weighted average exposures for pathologists, residents, and technicians were between 0.61 and 1.32 ppm.			
Area sampling data:	Seventy-six female histology technicians who were exposed daily to formaldehyde (ambient levels, 0.2 to 1.9 ppm). Ambient levels of formaldehyde in funeral homes ranged from 0.75 to 2.50 ppm (without ventilation) to 0.25 to 1.39 ppm (with ventilation).Another survey of seven funeral homes in 1980, involving both area and personal sampling, determined that embalmers were exposed to 0.1 to 0.4 ppm of formaldehyde when working with intact bodies and 0.5 to 1.2 ppm of formaldehyde when working with autopsied bodies.In laboratories of a major medical school over a 12-week period daily mean exposures varied between 1.0 and 2.0 ppm, and half were between 0.6 and 1.0 ppm; the lowest was 0.3 ppm and the highest was 2.63 ppm.			
Engineering control:	Engineering controls come under the purview of the professional industrial hygienist and ventilation engineer, who should be competent to survey the work environment, to design an adequate ventilation system, and to monitor and maintain exposurelevels to meet the OSHA standard.			
Comments:	In few cases no distinction was made between area sampling and personal sampling. In this form, those data were extracted as area sampling data.			
EVALUATION

	Metric 3:	Applicability	Medium	The data are for a bench study of an occupational scenario (Janitors/maids) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	2006 - after the PEL (1992) more than 10 years but less than 20
	Metric 5:	Sample Size	High	Detailed statistics and modeling of 15 different bench studies were provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	It should be noted that this is simulation of occupational exposure based on bench study. That said the data provided included all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study provided details of 15 different simulation allowing for an assessment of variability between the different scenarios. Some of the results included estimates for uncertainty (see table 4.2)
Overall Quality Determination		High

Occupational Exposure

HERO ID: 4071561 Table: 1 of 1

Study Citation:	Neghab, M., Delikhoon, M., Baghani, A.N., Hassanzadeh, J. (2017). Exposure to Cooking Fumes and Acute Reversible Decrement in Lung Functional Capacity. International Journal of Occupational and Environmental Medicine 8(4):207-216.			
HERO ID:	4071561			
Conditions of Use:	Cooking and kitchen use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Kitchen workers			
Exposure route:	inhalation			
Physical form:	vapor/gas			
Personal sampling data:	mean concentration of 0.45 +/- 0.41 [0.12-1.73] mg/m^3			
Exposure duration:	Exposure duration is estimated to be normal full 8 hour shift.			
Number of workers:	60 workers studied			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is peer reviewed so likely contains high quality data
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data is for China, a non-OECD country
	Metric 3:	Applicability	Medium	Data is applicable to kitchen workers
	Metric 4:	Temporal Representativeness	High	Data is from 2017, less than 10 years old.
	Metric 5:	Sample Size	Medium	Characterized by a range of data with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes worker activity, exposure route, physical form, sampling data, exposure duration and number of workers
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Does not address variability or uncertainty.
Overall Quality Determination		Medium		

Formaldehyde

Occupational Exposure

HERO ID: 1313485 Table: 1 of 1

Study Citation:	Neghab, M., Soltanzadeh, A., Choobineh, A. (2011). Respiratory morbidity induced by occupational inhalation exposure to formaldehyde. Industrial Health 49(1):89-94.			
HERO ID:	1313485			
Conditions of Use:	Processing as a reactant			
EXTRACTION				
Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	0.78 ppm mean +/- 0.40 standard deviation			
Number of workers:	70			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Used the protocol recommended in NIOSH method 3500; using two impingers in series each containing 20 ml of 1% sodium bisulfite solution, as the absorbing medium. The sampling time for each sample was 40 minutes. Chromtropic and concentrated sulfuric acids were, then, added to each sample and the solutions were analyzed for formaldehyde using visible absorption spectrometry technique at 580 nm by Unicam UV/Vis Spectrophotometer (model 8625).
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Iran - not an OECD member country
	Metric 3:	Applicability	High	The data are for a melamine-formaldehyde resin plant which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The report was published in 2011, after the most recent PEL (1992) and less than 10 years old.
	Metric 5:	Sample Size	Medium	Results were provided as an average value and associated standard deviation.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	variability in the determinants of exposure is not discussed.
Overall Quality Determination		Medium		

Formaldehyde

Occupational Exposure

HERO ID: 2801581 Table: 1 of 1

Study Citation:	Nethercott, J.R., Albers, J., Guirguis, S., Ching, G., Hofstader, S., From, L. (1982). Erythema multiforme exudativum linked to the manufacture of printed circuit boards. Contact Dermatitis 8(5):314-322.				
HERO ID:	2801581				
Conditions of Use:	Multiple				
EXTRACTION					
Parameter	Data				
Exposure route:	inhalation, dermal(evidence suggests dermal contact)				
Area sampling data:	Ambient levels of formaldehyde in the area above the metalization process were less than 0.07 ppm.				
Comments:	In 2 cases, the patch tests produced a positive response to formalin. Skin biopsies taken from the patient test sites showed histopathologic changes in keeping with allergic contact dermatitis.				
EVALUATION					
Domain	Metric	Rating	Comments		
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.	
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	OECD country	
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.	
	Metric 4:	Temporal Representativeness	Low	the data is more than 20 years old	
	Metric 5:	Sample Size	Low	no statistics	
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	critical metadata included	
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination			Low		

Study Citation:	Newman, M., Klein, M. (1990). Health Hazard Evaluation Report HETA 88-068-2077, Schmidt Cabinet Company, New Salisbury, Indiana. :40.			
HERO ID:	1510135			
Conditions of Use:	Furniture Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Production workers at Schmidt Cabinet Company, which manufacturer kitchen cabinets and bathroom vanities			
Exposure route:	Inhalation			
Physical form:	gas			
Personal sampling data:	The general area air concentration of formaldehyde was 2.67 ppm at the face of spray booth #10 in an area equivalent to the operator’s breathing zone.			
Area sampling data:	A formaldehyde concentration of 2.57 ppm was determined at an area approximately 10 feet from spray booth #10 in the drying area for the varnished cabinets. A formaldehyde concentration of 2.33 ppm was found at an area approximately 6 feet from spray booth #9 in another drying area for the varnished cabinets.			
Exposure duration:	8 hour samples			
Number of workers:	The company employed 90 production workers.			
Personal protective equipment:	The company required half face respirators to be worn by all employees classified as ”sprayers”. The respirator cartridges (TC-23C-737) supplied were for organic vapors and for pesticides, paints, lacquers, and enamel mists and dusts and, where deemed appropriate by the company, cartridges (TC-23C-754) were supplied for formaldehyde. During the survey it was noted that the respirators were not being properly maintained (e.g. inhalation and exhalation valves damaged or missing, improper storage and cleaning of the respirators). The ”sprayers” and ”stain wipers” were supplied with nitrile gloves.			
Engineering control:	Only the spray booths had local exhaust ventilation to control emissions from the spraying. Other than this, the plant was under general dilution ventilation.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology is an approved NIOSH method (3500)
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Medium	Discrete samples were provided, 3 samples taken at the three different locations.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include sample type and exposure type but no other metadata (duration and frequency)
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site by testing at various location. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination			High	

Study Citation:	Newton, L. R. (1982). Formaldehyde emission from wood products: Correlating environmental chamber levels to "secondary" laboratory tests. 16:45-61.			
HERO ID:	6019448			
Conditions of Use:	Release			
EXTRACTION				
Parameter	Data			
Area sampling data:	The formaldehyde background levels observed in the environmental chamber was 0.037 +/- 0.019 ppm. To determine if double loading of the same product would result in the doubling of formaldehyde concentrations within the chamber, particleboard from two different production lots was divided into sets A and B. The environmental chamber was loaded with Sets A and B, and in 24 hours, chamber formaldehyde level for the combined set was determined to be 0.58 ppm. Set A was removed, and 24 hours later the single load formaldehyde chamber concentration of Set B was 0.41 ppm. Set B was replaced by Set A, and the chamber formaldehyde concentration was found to be 0.53 ppm. Chamber concentrations of formaldehyde were determined for a total combination of 1.57 m2/m3 for particleboard and paneling loaded at 0.52 m2/m3 and 1.05 m2/m3, respectively. With only particleboard, formaldehyde concentration ranged from 0.08 to 0.32 ppm. With only paneling, formaldehyde concentration ranged from 0.13 to 0.70 ppm. With combination of particleboard and paneling, formaldehyde concentration ranged from 0.20 to 0.69 ppm.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	Low	Data simulate off-gassing that may occur in a mobile home
	Metric 4:	Temporal Representativeness	Low	Data is more than 20 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium

EXTRACTION				
Parameter	Data			
Worker activity description:	Patients are connected to an artificial kidney (dialyzer) and dialysis console for three to five hours depending on the patient's diet, condition of the dialyzers being reused, and other medical factors. Once the patient is disconnected from the dialyzer, the nurse or technician connects the dialyzer to the sterilizing unit (lixivitron®), The Lixivitron system is designed to automatically clean, test, and disinfect up to four dialyzers simultaneously. The operator starts the cleaning operation which uses water, cleaning solution, and formaldehyde to automatically wash, rinse, clean, in-vitro leak and pressure drop test, and disinfect the dialyzers. Failure of a test halts the process. Once the cleaning operation is completed, the patient data is printed out and the dialyzer is removed from the Lixivitron®; then the dialyzer and the printout are sealed in a plastic bag. The Lixivitron® is operated by trained personnel.			
Exposure route:	inhalation and dermal			
Physical form:	vapor and liquid			
Area sampling data:	Concentrations of airborne formaldehyde ranged from 0.04 to 1.28ppm. Eight of the seventeen air samples were collected from the self-care unit for one hour periods. Formaldehyde concentrations ranged from 0.06 to 1.28 ppm. Six of the seventeen air samples were collected from the Leeward satellite facility during dialyzer sterilization. Formaldehyde air concentrations ranged from 0.04 to 0.28 ppm based on one hour air samples. Three of the seventeen air samples were collected for 20 minute periods during sterilization of the dialysis consoles in the limited care unit. Formaldehyde air concentrations ranged from 0.12 to 0.28 ppm. Self Care/top of Travenol # 5841 0.06 ppmSelf Care/right side of Lixivitron Odor of formalin from drains 0.31 ppmSelf Care/ left side of Lixivitron Odor of formalin from drains 1.28 ppmSelf Care/left side of Lixivitron Formalin spill occurred 0.48 ppmSelf Care/right side of Lixivitron 0.66 ppmSelf Care/right side of Lixivitron 0.12 ppmSelf Care/left side of Lixivitron 0.12 ppmSelf Care/right side of Lixivitron 0.37 ppmLeeward/left side of Lixivitron 0.23 ppmLeeward/right side of Lixivitron 0.41 ppmLeeward/Nurses Station 0.07 ppmLeeward/left side of Lixivitron 0.28 ppmLeeward/right side of Lixivitron 0.32 ppmLeeward/Nurses Station 0.04 ppmLimited Care/Nurses Station 0.12 ppmLimited Care/Middle of larger room 0.28 ppmLimited Care/Middle of small room 0.12 ppm

HERO ID:	1317161		
Conditions of Use:	Foundries		
EXTRACTION			
Parameter	Data		
Worker activity description:	Three core making processes were used: hot shell, oil-baked, and no-bake.		
Exposure route:	inhalation		
Physical form:	vapor		
Area sampling data:	Range 0.014 to 0.016 ppmPoring floor 0.016 TWA-ppm; Core making area: pepset mixer 0.16 TWA-ppm; Core making area baking ovens 0.015 TWA-ppm; molding area 0.014 TWA-ppm; Core making area pepset mixer 0.014 TWA ppm. (range 0.014 to 0.016 ppm)		
Personal protective equipment:	Safety shoes, hard hats, hearing protection (disposable plugs), and safety glasses were required throughout the facility. The grinders and cut-off saw operator used NIOSH/Mine Safety and Health Administration (MSHA) approved air-purifying respirator helmets which had high efficiency particulate air (HEPA) filters and a built-in face shield. The Bobcat operator used a NIOSH/MSHA approved disposable dust, mist, and fume mask. Flame retardant clothing was worn by the pourers and furnace operator.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH study - Five area air samples were collected using impingers filled with 1% sodium bisulfite solution at a flowrate of 1 l/min. For analysis, color was developed by adding chromotopic acid and concentrated sulfuric acid to each sample. Samples were heated in a 95C water bath for 15 minutes and allowed to cool 2 to 3 hours. The samples were read by visible spectroscopy accordingto NIOSH Method 3500.3
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for foundry operations which is an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data were published in 1991, before the most recent PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	High	actual data for each sampling event were presents
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, and worker activities. but lacks additional metadata, such as exposure durations, and exposure frequency,
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The study provided actual data from different processes at the site that can be used to evaluate variability. Information about uncertainty was likely included in the NIOSH methods used.

HERO ID:	1317776
Conditions of Use:	Use of fabric, textile and leather products

EXTRACTION	
Parameter	Data
Worker activity description:	During three shifts, approximately 25 employees work in the Input and Inspection Department, and 13 employees work in the Preparation and Finishing Department. The employees in the Stock-Paste Department make a carrier for the dye from a complex recipe. The Stock-Paste carrier is used to adjust the viscosity and application characteristics of the dye. Most of the chemicals are weighed manually and added by hand. The management of Texprint has written plans to automate the Stock-Paste Department. One employee works in the Stock-Paste Department. Stock paste is fed to the Dye Mixing Department ("color kitchen"). The auto-mixing machine is operated by one employee. One or two other employees are often in the area performing peripheral tasks (hauling barrels of dye, cleaning barrels, etc.). The manual mixing area is used to make fine adjustments in dye color or prepare low volume colors. Dye is scooped out of vats by hand, weighed, and mixed into other vats. A total of 12 employees work in this area. In the Strike-Off Department (Sample Department), dyes are mixed by hand, and trial patterns and colors are produced on an experimental basis. Dye is added to the roller with a hand-held pump. Approximately 15 employees work in this department, which operates over two shifts. In the Rotary Printing Department, dye is printed on cloth in a similar manner to that in the Strike-Off Department; except the operation is automated. There are four rotary printers, and one or two employees are stationed at each printer. The employees monitor the printing process for quality or mechanical problems and start new rolls of cloth when needed. Twelve employees work in the Rotary Printing Department. In the Finishing Department, three Hirano® machines are used for heat-tenting and application of soil-resist substances (Scotchgard®, Zonyl®) or "resists," which are actually resins, are applied to the cloth for shrinkage control.
Exposure route:	Inhalation
Physical form:	vapor
Personal sampling data:	Machine Operator Hirano #1 detected
Area sampling data:	Near Permafresh tank 0.23 TWA ppm On electrical Box 0.09 TWA ppm Back end of Hirano 0.06 TWA ppm Chemical Tank detected Back end of Hirano #1 detected Work Desk of Hirano #2 detected

Study Citation:	NIOSH, (1980). Health hazard evaluation report: HHE-77-74-720. Ottenheimer and Sons, Inc., Dawson, Springs, Kentucky. NIOSH:77-74.			
HERO ID:	1318533			
Conditions of Use:	Use of fabric, textile and leather products			
EXTRACTION				
Parameter	Data			
Worker activity description:	The report does not make clear what specifically is done by the workers, but the following is potential contact with the clothing: rolls of cloth are spread by machine on large tables and tracing paper is placed on top of the cloth layers and marked. The cloth is then cut by an automatic cutter with a blade which moves in an up and down motion. Next there is a sewing room, which comprises most of the floor space in the main plant, and subdivided into six sections for the various phases of assembly of the uniforms. (See page 2 of 8)			
Exposure route:	inhalation, dermal			
Physical form:	vapor (page 1 of 8)			
Personal sampling data:	3/13/78 Pressing Operation 0.14 ppm (Table 1, page 7 of 8)			
Area sampling data:	See Table I for values (page 7 of 8, and listed below). See page 3 of 8 for discussion.6/23/77 General Area - Cutting Room 0.20 ppm6/23/77 General Area - Cutting Room 0.13 ppm6/23/77 General Area - Sewing Machine 0.57 ppm6/23/77 General Area - Pressing Operation 0.40 ppm6/23/77 General Area - Pressing Operation 0.30 ppm3/13/78 General Area - Pressing Operation 0.26 ppm3/13/78 General Area - Pressing Operation 0.21 ppm3/13/78 General Area - Sewing Operation 0.15 ppm3/13/78 General Area - Sewing Operation 0.16 ppmFor latent formaldehyde content of cloth samples, including various colors and two companies' clothing, see Table 3 (page 8 of 8). 3/21/78 values were 938, 912, 700, and 580ppm. On 4/5/78 they were 86, 88, 70, and 84ppm. See page 4 of 8 for discussion (pasted here): A decrease of 86 - 91% over three weeks. Although these data are limited, they show a definite correlation between the age of the resin treated fabric and latent formaldehyde content. Storage of the fabric in a ventilated area for a determined time period, therefore, should significantly reduce the potential for worker exposure to vaporous formaldehyde.			
Dermal exposure data:	nan			
Exposure duration:	There is one shift per day at the plant (2 of 8)			
Number of workers:	210 employees total at the plant, 175 production workers (2 of 8)			
Comments:	Three durable press fabrics including "MEDA," "Valid Poplin," and "Resolute," were reportedby the workers to be of primary concern (2 of 8)

HERO ID:	1319165			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Two technicians conduct the slide preparation. The third one logs the specimens, assists in gross tissue examination and disposes of the specimens. The pathologist conducts the gross tissue examination. (Page 4 of 10)			
Exposure route:	inhalation (Page 4 of 10)			
Physical form:	airborne vapor (Page 4 of 10)			
Personal sampling data:	The formaldehyde concentrations ranged from 0.08 to 2.58ppm. Two of the technicians exposure ranged from 0.08 to 0.27, however it is not exposed to the lowest feasible level. Another technician had exposures of 0.43 (134 minutes long with about 20 minutes being disposing of old specimens, then misc. work not related to the use of formaldehyde), 0.93 (logging in specimens, doing misc. work, and working with pathologist during gross tissue examination, the latter work which lasted 43 minutes "undoubtedly" was the highest portion of this sample where the concentration was probably higher than 1 ppm), and 2.58ppm (over 30 minutes while disposing of old specimens. Technician stated his eyes and nose burned and he squinted his eyes when disposing of the specimens, but once task was complete the symptoms ceased). The pathologist's formaldehyde exposure, while he conducted gross examination of tissue, was 1.26 ppm, and he stated that his eyes and nose did not burn but that it was a light day (small specimens and not much formaldehyde) and on heavy days his eyes and nose will burn. Other technicians did not report any symptoms during the sampling periods. (Page 7 of 10)See Table 1 on Page 10 of 10, the formaldehyde information is transcribed below:7/13/82 Lab Tech# 1 -Slicing Specimens, Preparing Blocks 0.23ppm (over 186 minutes) & 0.27 ppm (over 124 minutes)7/13/82 Lab Tech #3 -Disposal of Specimens 2.58 ppm (over 30 minutes)7/13/82 lab Tech #3 -Log Specimens in, Assist in Gross Exam,Miscellaneous work 0.93 ppm (over 82 minutes)7/13/82 Pathologist - Gross Examination of Tissue 1.26 ppm (over 43 minutes)7/21/82 Lab Tech #1 - Slicing Specimens, Slide Preparations 0.08 ppm (over 152 minutes)7/21/82 Lab Tech #1 - Slicing Specimens, Slide Preparations 0.14 ppm (over 141 minutes)7/21/82 Lab Tech #2 - Slicing Specimens, Slide Preparations 0.18 ppm (over 152 minutes)7/21/82 Lab Tech #2 - Slicing Specimens, Slide Preparations 0.22 ppm (over 141 minutes)7/21/82 LabTech #3 - Disposal of Specimens, Loqged in New Specimen, Misc. Work 0.43 ppm (over 134 minutes)			
Dermal exposure data:	nan			
Exposure duration:	3 technicians full time, 3 pathologist 1 hour per day on a rotational basis (Page 4 of 10)			
Engineering control:	There is one local exhaust hood in the room. It is a canopy type hood over the counter next to one of the two sinks. It is not enclosed on the sides or front, is 21 inches above the counter top, has 10.5 square feet of open face area and exhausts approximately 250 cfm. Smoke tube tests show that it captures very little of the vapor emitted from the specimens during gross tissue examination of from the sink. (page 4 of 10)

HERO ID:	1319169			
Conditions of Use:	Distribution in commerce			
EXTRACTION				
Parameter	Data			
Worker activity description:	Duties include billing and shipping of work clothing. (Page 4 of 9)			
Physical form:	Vapor (page 4 of 9)			
Area sampling data:	Airborne concentrations of formaldehyde were determined to be present by two methods of survey. Concentrations of airborne formaldehyde were 1 to 1.5 ppm throughout the NYASCO area and the retail store area using detector tubes as the sampling medium. Using chromatropic treated charcoal sampling tubes as the sampling media, the concentrations of airborne formaldehyde ranged from 0.1 to 0.6 ppm. The detector tube sampling method has not been certified for accuracy by NIOSH, and should be considered only an approximation of the true concentration of airborne formaldehyde. The four samples of permanent press fabrics were determined to contain formaldehyde ranging from 190 to 710 ppm (latent formaldehyde method of analysis), identifying the fabrics as probable sources of the airborne formaldehyde. (page 5 of 9)			
Number of workers:	3 (page 4 of 9)			
EVALUATION				
Domain	Metric	Rating	Comments

	Metric 3:	Applicability	High	The data are for an occupational scenario (retail) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1981 - Prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range. Uncertain statistics not provided, but as this is a NIOSH study it is assumed that uncertainty was considered in the methods.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as exposure type, sample type, and worker activities, but lacks additional metadata, such as sample durations, exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study does not address variability or uncertainty, but it is assumed that uncertainty was considered in this NIOSH study in the sampling and analysis methods.
Overall Quality Determination		Medium		

Study Citation:	NIOSH, (1982). Health hazard evaluation report: HETA-80-190-1135, American Cyanamid Company, Kalamazoo, Michigan. NIOSH:1-23.			
HERO ID:	1319179			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Exposure route:	Employee exposure to chemicals are predominantly from leaks in pipe lines, and transfer junctions, and leaks from seals and fittings around kettle agitators. Also, high chemical exposure from inadvertent spills of chemicals or emergency repair of process equipment during a batch process cycle. (Page 4 of 23)			
Personal sampling data:	The 1.6 ppm was a short-term personal sample collected from a specialty chemical operator. (Page 7 of 23)The sampling results are as follows (from page 16 of 23):January 6, 1981 Reactor Vessel EI20-Q03 1.6 ppm (1.9 mg/M3)January 7, 1981 Quench Tank 0.11 ppm January 7, 1981 Weigh Tank 0.04 ppm			
Area sampling data:	Formaldehyde was detected in 8 of 8 samples in the specialtychemical building, and ranged from 0.03 ppm to 1.6 ppm. The mean concentration was 0.33 ppm. (Page 7 of 23)The sampling results are as follows (from page 16 of 23):January 6, 1981 Reactor Vessel 0.05 ppmJanuary 7, 1981 Quench Tank 0.30 ppm January 7, 1981 Operator’s Desk 0.43 ppmJanuary 7, 1981 Weigh Tank 0.06 ppm January 7, 1981 Near Reactor Vessel EI20-003 0.03 ppm			
Number of workers:	There are 43 workers in production, 11 in maintenance, and approximately 14 salaried workers. (Page 3 of 23)			
Personal protective equipment:	Personal protective equipment such as boots, gloves, safetyglasses, coveralls, hard hats, and respirators are supplied by thecompany. (Page 3 of 23)			
Engineering control:	Ventilation measurements taken during chemical operations atvarious hoods show average face velocities generally exceeded 100feet per minute (fpm). (Page 8 of 23, where these rates are also summarized)The main positive engineering control feature was operation of a number of well-designed and sturdy local exhaust ventilation units installed on reactor vessel sampling stations, drum handling stations, certain major transfer or recirculation pump sites, and pre-mix tanks. However, there were a number of process equipment units on which both local and general exhaust ventilation were either nonexistent or ineffective (particularly in the specialty chemical department). (Page 10 of 23)

HERO ID:	1319222
Conditions of Use:	Installation/Demolition of Building Materials

EXTRACTION

Parameter	Data
Worker activity description:	The Deeds offices are on the ground floor of a recently-built brick courthouse annex, first occupied in August 1981, and consist of a main office, records room, and copy/storage room. Activities of the five regular employees consist of recording, storing, and copying deeds and other documents. Binding of deed books is done elsewhere. Three sides of the offices are exterior brick cavity walls containing urea-formaldehyde foam insulation, according to the building architect's office. The offices are carpeted. Records and furnishings, except for some table tops and a built-in counter with drawers and cabinets, were moved from the facility's previous location , where no respiratory problems were experienced during the previous several years.The regular employees have desks located in the main office area behind the service counter, but their duties take them to the records and copy rooms frequently. Smoking is not permitted in the Deeds offices. (Page 3 of 13). See page 4 for a floorplan and corresponding formaldehyde concentrations mapped onto it.
Exposure route:	Inhalation
Area sampling data:	Five 4-hour samples were collected on September 16, and four 24-hour samples on December 13. In addition, several short-term formaldehyde analyses were made with detector tubes during the December 13 survey. (Page 5 of 13). Formaldehyde concentrations in the air of the Deeds office varied from 0.05 to 0.69 ppm, concentrations associated with some of the reported symptoms. (Page 8 of 13). See Table 1 on page 9 for all the concentrations found at the various locations during the two sampling events. After results [in September] indicated substantial formaldehyde concentrations, further sampling was carried out in December in an attempt to discover the source. In December there was little formaldehyde detected in the office air, and the only indicated emission source was the built-in cabinetry, principally in the Deeds office service counter. Although some wooden cabinets are known to contain and emit formaldehyde, there is some question whether the counter installation alone could deliver the concentrations found in September. The lower general air formaldehyde concentrations may be indicative of higher winter ventilation rates. (Page 10 of 13).
Number of workers:	five regular employees (page 3 or 13)
Comments:	Possible sources of formaldehyde in the air of office buildings are urea-formaldehyde foam insulation, cigarette smoke, carpeting, laminated and particle-board furniture, wall fabrics, and carbonless forms if present in abundance. Experience has shown that the formaldehyde contamination, if caused by emissions from materials other than foam insulation, often disappears in a year or more. (Page 10 of 13)

EVALUATION

Worker activity description:	Eight workers are employed in the core production area. Three operators, two on the smaller core system (small blower) and one on the larger, are involved in actual core production. The remaining workers are involved in painting cores with an alcohol-based substance, trimming, and transporting the cores to, temporary storage. Seven workers are employed in the mold production areas. Three operators, two on the large mold system and one on the small, filling the mold shells with the chemically treated sand. The remaining four workers strike off, transport, and "finish" the molds. The primary job categories for the metal pouring operation are the Pourer (the worker who pours molten metal into the molds) and the Skimmer (involved with skimming contaminants from the top of the molten metal during pouring operations). The primary job in shakeout area involves the manual separation of the casts from the broken sand molds at a position downstream, yet adjacent to the mold destruction process. Two workers are normally stationed at this position and manually remove the casts.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Eight breathing zone samples for formaldehyde collected at the core and mold area indicated exposure levels ranging from 0.18 to 0.50 mg/M3. Three breathing zone samples collected from workers in the core production area and three from the mold production area indicate an overall average of approximately 0.36 mg/M3 for both locations. The highest measured exposure, 0.50 mg/M3, was obtained from the Stripper at the core production location. 3/10/1981 Lg. Mold/Head Operator 0.29 mg/m3/10/1981 Core/Stripper 0.50 mg/m3/10/1981 Core/Head Operator 0.18 mg/m3/11/1981 Lg. Mold/Head Operator 0.36 mg/m3/11/1981 Sm. Mold/Head Operator 0.43 mg/m3/11/1981 Core/Head Operator 0.41 mg/m3			
Number of workers:	Isocure 7 Other core and molding 41 Pouring and Skimming 14 Other 22			
Personal protective equipment:	Half-face respirators are required for entry into the metal pouring area.			
Engineering control:	Engineering controls for reduction of chemical exposures include . general dilution ventilation, local exhaust ventilation, and the use of seals around closure points on the metal molds. Union officials and workers in this area said that these controls, installed and improved within the year prior to the survey, substantially reduced chemical exposures. Eight workers are employed in the core production area. Three operators, two on the smaller core system (small blower) and one on the larger, are involved in actual core production. The remaining workers are involved in painting cores with an alcohol-based substance, trimming, and transporting the cores to, temporary storage. Recommended: Exhaust ventilation in the shakeout area should be improved.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study Method P&CAM 318
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (foundry) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1981 Prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in NIOSH method P&CAM 318.
Domain 3: Accessibility/ Clarity

Exposure duration:	8, 12, 21, and 50 hours per week			
Number of workers:	Three full-time and 8 to 10 part time employees, plus students. In 1973, a new addition for embalming services wasadded to the building which now employs four full-time employees.			
Personal protective equipment:	Recommended: Protective clothing should be provided for the embalming employees. Such clothing should include gloves made of impervious materials, protective aprons, leather or rubber safety shoes, and eye protection.			
Engineering control:	Recommended:A ventilation consultant should be retained to evaluate the efficiency of the present exhaust system. An adequate system should eliminate the recirculation of air by incorporating a "once-through" air handling system. This involves resizing the refrigeration and heating elements. Removal of formaldehyde and other vapors can also be achieved by charcoal adsorptionprocesses.A formaldehyde meter with an audible alarm system should be installed in the embalming area. The alarm on the device should be set to sound when the 1.0 ppm level is reached. When the alarm sounds, respiratory protection such as a gas mask with an organic vapor canister or a chemical cartridge full facepiece respirator should be donned.
