Exposure route:	Inhalation and dermal			
Physical form:	included in phenol-formaldehyde binder			
Area sampling data:	Air concentrations of formaldehyde ranged from 0.007 to 0.033 ppm. [Range cited here, but discrete values are in table 2]			
Number of workers:	Four men and one woman			
Personal protective equipment:	During this evaluation, the installers wore coveralls taped at the wrists.			
Engineering control:	Cartridge-type half-face respirators (for dust) were worn but not during the entire time the materials were being handled or the entire time spent in the crawl space.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is approved by NIOSH (77-126)
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old prior to recent PEL
	Metric 5:	Sample Size	High	Discrete samples are provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include sample type, job position but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination		High		

Formaldehyde

Occupational Exposure

HERO ID: 1357922 Table: 1 of 1

Study Citation:	NIOSH, (1984). Health hazard evaluation report: HETA-83-276-1499. Charlie’s Taxidermy And Gifts, Fleetwood, Pennsylvania. NIOSH:83-276.			
HERO ID:	1357922			
Conditions of Use:	Taxidermy			
EXTRACTION				
Parameter	Data			
Worker activity description:	Taxidermy			
Exposure route:	Inhalation and dermal			
Physical form:	vapor			
Personal sampling data:	No personal sample for formaldehyde was reported in this article			
Area sampling data:	Formaldehyde in air was found to be below evaluation criteria.			
Exposure duration:	The taxidermist would normally work on a couple of trophies per day and would process several hundred trophies per year. Time spent on each trophy would vary from hours to days depending upon the specimen type and treatment processes.			
Personal protective equipment:	It is recommended that gloves and aprons should be used to prevent solvents or other toxic materials from getting on the hands and clothing. These gloves and aprons should be impervious to the materials being used and should be left in the work area. Protective goggles should be used when working with caustics, acids, and solvents. Safety glasses should be worn when there is a chance for eye injury.			
Engineering control:	It was recommended that toxic compounds, including formaldehyde, be substituted with less toxic material. It is recommended that taxidermy shops have a forced draft ventilation system. Just an open window is usually not adequate when working with solvents to any degree. A simple and well-placed exhaust fan with an open door or window to provide make up air would provide adequate ventilation for nearly all taxidermy shops. It is recommended that such process steps as pouring of a urethane form, spray painting, and cleaning with solvents, be done immediately in front of the exhaust fan (within a foot or two). Sometimes it is possible to work out-of-doors, where a great amount of natural dilution usually occurs.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	The data collected is more than 20 years old.
	Metric 5:	Sample Size	Low	Distribution of samples is characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	NIOSH, (1982). Health hazard evaluation report: HETA-81-283-1224. Southern Minnesota Beet Sugar Cooperative, Renville, Minnesota. 40:1-32.			
HERO ID:	1516473			
Conditions of Use:	Non-TSCA			
EXTRACTION				
Parameter	Data			
Worker activity description:	welders, lime kiln employees, process area, and general laborer			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	No formaldehyde detected			
Number of workers:	A medical questionnaire was administered to eight employees (full-time welders during the off-season) and seven workers (three lime kiln employees, three employees in the carbonation-Peterson filter area, and one general laborer) on the initial and follow-up surveys, respectively.			
Personal protective equipment:	NIOSH recommended use of respirators till engineering controls have been implemented and by employees engaged in welding on stainless steel.			
Engineering control:	NIOSH recommended substitution of less hazardous process materials, automation, redesign or replacement of existing mechanical ventilation systems or a combination of these measures.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Methodology is not referred to by a numbered method and the report indicates some IH confusion on the appropriate method. Method appears to be short-term, direct reading, colorimetric tube detector
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Uninformative	The report is for an occupational scenario, however, the condition of use is outside of the scope of the risk evaluation due to non-TSCA uses. Formaldehyde is being used as a bactericide, which may be cover under FIFRA and/or under FDA due to use during food manufacturing.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old prior to recent PEL
	Metric 5:	Sample Size	N/A	Below detection, unknown number of samples.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study does not address variability(appears to only measure for formaldehyde in one location at the site). Uncertainty is assumed to be addressed in methodology method.
Overall Quality Determination		Uninformative		

Study Citation:	NIOSH, (1982). Health hazard evaluation, report: HETA-81-033-1208. Placer County Distributors, Tahoe City, California. NIOSH:81-033.		
HERO ID:	1599520		
Conditions of Use:	Multiple		
EXTRACTION			
Parameter	Data		
Worker activity description:	Monitored silkscreen operators and area samples near dryer, therefore workers who may work near dryer.		
Exposure route:	inhalation		
Physical form:	gas		
Personal sampling data:	Formaldehyde was non-detectable		
Area sampling data:	During the survey period the formaldehyde results ranged from non -detectable to 0.02 mg/M3 .Laboratory limit of detection: 0.005 mg/sample		
Exposure duration:	8 to 10 hrs day		
Exposure frequency:	operates daily, 7 days a week; the number of days an employee would work is not specified		
Number of workers:	2-3 employees		
Engineering control:	The present shop has general room ventilation and local exhaust type ventilation which helps reduce and/or eliminate any buildup of gases or vapors generated by the heat drying operation.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Methodology is approved by NIOSH P&CAM 127
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5: Sample Size	High	All values provided, sample size was 5.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations, worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The monitoring study does not address variability. Assume that uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination		High

Occupational Exposure

HERO ID: 1627795 Table: 1 of 1

Study Citation:	NIOSH, (1981). Health hazard evaluation report No. HHE-80-077-847, Signetics Corporation, Sunnyvale, California. NIOSH:80-077.				
HERO ID:	1627795				
Conditions of Use:	Office Environment				
EXTRACTION					
Parameter	Data				
Worker activity description:	Clerical staff working in the Military Division office at Signetics Corporation, Sunnyvale, California				
Exposure route:	inhalation				
Physical form:	gas				
Area sampling data:	No formaldehyde was detected using gas detector tubes				
Number of workers:	Medical interviews were conducted with 15 of the approximately 50 employees who usually work in the area.				
Engineering control:	The heating and ventilation system of the area does not appear to provide optimal comfort conditioning; therefore ventilation adjustments should be attempted to improve comfort control.				
EVALUATION					
Domain	Metric	Rating	Comments		
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is an approved NIOSH method	
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States	
	Metric 3:	Applicability	Low	The data are for an occupational scenario, however a potential source of formaldehyde is not specified to determine which condition of use fits the scenario.	
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old	
	Metric 5:	Sample Size	Low	Not detected, number of samples is unclear.	
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.	
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study does not address variability. The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.	
Overall Quality Determination			Low		

Study Citation:	NIOSH, (1976). Criteria for a recommended standard: Occupational exposure to formaldehyde.		
HERO ID:	192344		
Conditions of Use:	Distribution in Commerce		
EXTRACTION			
Parameter	Data		
Exposure route:	inhalation and ingestion		
Physical form:	vapor and liquid		
Area sampling data:	Pg. 45/177: Air sampled in the dress shops was found to contain 0.13-0.45 ppm formaldehyde. Samples of apparel from these same shops contained 5-8 mg of formaldehyde for each 10 g of rayon textiles and 3.4 mg/10 g of cotton, while a wool dress was found to be formaldehyde-free. In a 1966 study [53] of a clothing store, the California Department of Public Health reported airborne work zone concentrations of 0.9-3.3 ppm formaldehyde.		
Dermal exposure data:	Dermal exposure data		
Exposure duration:	up to 10 hours per day		
Engineering control:	The authors recommended a ventilation rate of 15 air changes/hour for the shops to remedy the situation in the case of the dress shop.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling and Analytic methods not always provided, but as this is a NIOSH study I assume it is acceptable.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for an occupational scenario (retail shop) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	NIOSH Study was published in 1976, but test data is earlier. Still all data are prior to the PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	Low	Distribution of samples is not characterized nor are uncertain statistics provided.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low	

Occupational Exposure

Study Citation:	NIOSH, (1976). Criteria for a recommended standard: Occupational exposure to formaldehyde.			
HERO ID:	192344			
Conditions of Use:	Processing as a reactant			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation, dermal (including possibly contact of skin with formaldehyde vapor and/or resin)			
Physical form:	vapor			
Personal sampling data:	Glass reported in 1961 that breathing-zone concentrations of 16- 30 ppm formaldehyde, as determined by detector tubes, produced irritation of the throat and smarting of the eyes in an unspecified number of the 60 employees in a resin-manufacturing and paper plant.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling and Analytic methods not always provided, but as this is a NIOSH study I assume it is acceptable.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	NZ which is an OECD member
	Metric 3:	Applicability	High	The data are for an occupational scenario (resin manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	NIOSH Study was published in 1976, but test data is earlier (1961). Still all data are prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	A range of exposure concentrations is reported.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.

Area sampling data:	type of sampling undetermined assumed it was area samplingPlywood Industry 1.0-2.5 ppm		
Dermal exposure data:	Dermal exposure data		
Exposure duration:	57,000 employees are exposed to formaldehyde 4 or more hours per day.		
Number of workers:	1.6 million workers in more than 60 industrial categories.		
Personal protective equipment:	respirator, goggles, gloves		
Engineering control:	enhanced HVACenclosure of operation vented externally separation of equipment and employees		
Comments:	noted that a pack of cigarettes contains 40 ppm of formaldehyde by volume or 0.38 mg per pack.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH Study
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	1982 - Prior to PEL (1992) and more than 20 years old
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range; uncertain statistics not provided.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Monitoring data do not include any needed metadata
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Uninformative	

Study Citation:	NIOSH, (1984). Health hazard evaluation report: HETA-83-301-1478. Lion Uniform Company, Beattyville, Kentucky. 83-301-1478:1-26.		
HERO ID:	201729		
Conditions of Use:	Textile Finishing		
EXTRACTION			
Parameter	Data		
Worker activity description:	The fabric is cut to order, and the various pieces are stored in binsawaiting assembly. The sewing operators are responsible for making one part of the jacket; they locate and sew the pieces needed to make this part (e.g., a collar or a sleeve). This completed piece is then passed on to the assembly people who sew the pieces together, add linings, pockets, collars, sleeves, and buckles until a jacket has been completed. The completed jacket is then passed on to another area for quality control checking.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	eight-hour time-weighted averages were 0.15 to 0.18 ppm		
Area sampling data:	Airborne formaldehyde levels ranged between 0.15 and 0.23 ppm;		
Dermal exposure data:	nan		
Personal protective equipment:	Long-sleeve shirts		
Engineering control:	- source fabric with the lowest concentration of formaldehyde- Set fabric aside to allow for off-gassing before use.-improve HVAC		
Comments:	In addition to the facility being evaluated, the study also noted other occupational exposure studies of similar textile facilities: 8 permanent press fabric plants 0.3-2.7 ppm; 1977 uniform manufacturer 0.13-0.57 ppm; 1982 uniform manufacture 0.08-0.44 ppm; another 1982 uniform manufacturer 0.12-0.53 ppm (area), 0.11-0.27 ppm (personal 8 hr TWA), 1984 study 0.34-0.53 ppm; shirt manufacture 0.07-0.34 (1980) and 0.15-0.30 ppm (1981) - personal, Additional east European studies were provided.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	NIOSH report indicates area and personal sampling data was done by the Kentucky Department of Labor but did not further state the sampling and analytical methodology used.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States (Kentucky).
	Metric 3: Applicability	High	The data are for an occupational scenario (textile workers) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	report came out in 1984 prior to the release of the PEL (1992)
	Metric 5: Sample Size	Low	The distribution of samples is characterized by a range with no uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (personal breathing zone) but no other metadata (method, duration, worker activities, exposure frequency).
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The study addresses variability in the determinants for the sampled site by comparing with other reported studies for similar sites. The uncertainty is not addressed.

Formaldehyde

Occupational Exposure

HERO ID: 2068882 Table: 1 of 1

Study Citation:	NIOSH, (1983). Health hazard evaluation report: HETA-82-96-1259. Kaiser Aluminum and Chemical Corporation, Ravenswood, West Virginia.			
HERO ID:	NIOSH:19831983.			
Conditions of Use:	Other Byproduct			
EXTRACTION				
Parameter	Data			
Worker activity description:	workers involved in rolling mills [more specific information detailed in source]			
Exposure route:	inhalation			
Physical form:	gas			
Personal sampling data:	Mean personal breathing zone exposure to fonnaldehyde was 0.024 mg/M3 (0.011-0.031 mg/M3)			
Area sampling data:	Mean concentration of area formaldehyde concentrations was 0.010 mg/M3 (0.005-0.016 mg/M3)			
Dermal exposure data:	Dermal exposure data			
Number of workers:	There were about 700 hourly employees working in the area covered by this request at the time of the survey. Eight workers from areas in the plant with the greatest oil mist exposure			
Comments:	Article states that the personal breathing zone data was statistically higher than area samples. The report mentions that workers wore the personal samplers for the full shift including breaks and lunch, it is possible that some formaldehyde exposure could come from cigarette smoke (pg. 16)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is a NIOSH method, P&CAM 125 with minor modification.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Medium	The data are for an occupational scenario(decomposition product) not specified within the scope of the risk evaluation but may be useful for other occupational scenarios(metal products).
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include almost all associated metadata, including sample types, exposure types, sample durations, exposure durations. worker activities, but not exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site. The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination		High		

Study Citation:	NIOSH, (1982). Health hazard evaluation report: HETA-79-119-1068. The Evening News, Southbridge, Massachusetts. NIOSH:1-24.			
HERO ID:	2147572			
Conditions of Use:	Use of photographic supplies			
EXTRACTION				
Parameter	Data			
Worker activity description:	pressroom workers			
Exposure route:	inhalation			
Physical form:	gas			
Personal sampling data:	No personal samples collected for formaldehyde			
Area sampling data:	Measurements for formaldehyde, which is sometimes found in photo processing, were negative.			
Exposure duration:	8-hour TWA			
Number of workers:	Sixty-five production workers are employed at the Southbridge facility, excluding reporters, administrators, and administrative support personnel. Nine employees were administered confidential medical questionnaires by the NIOSH investigator.			
Engineering control:	The ventilation design of the new facilities should make provisions for local exhaust of the hand plate developing operations in addition to the minimum four air changes per hour recommended for photo processing laboratories. The newsroom photo lab should be provided general exhaust and replacement air inlet at the opposite end of the room to ensure good air circulation at a minimum of four air changes per hour.

Number of workers:	200

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH study - P&CAM 354
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	Uninformative	The data are for an occupational scenario (transit rail operator) but automobile exhaust (by-product formation) is not within scope
	Metric 4: Temporal Representativeness	Low	1982 - prior to the PEL (1992)
	Metric 5: Sample Size	N/A	No formaldehyde was detected therefore no summary statistics were provided.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, exposure durations, and exposure frequency, but lacks additional metadata, such as sample durations, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	No formaldehyde was detected therefore there was no variabilities between the sites studied. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods.

Overall Quality Determination **Uninformative**

Study Citation:	NIOSH, (1982). Health hazard evaluation report: HETA-81-100-1140. Raybestos Friction Materials Company, Crawfordsville, Indiana. NIOSH Cincinnati:1-25.
HERO ID:	3649297
Conditions of Use:	Use of fuels and related products

EXTRACTION

Parameter	Data
Worker activity description:	Raw Material Prep.; Curing Press Operator; Rotary Briquetter Operator; Curing Press Operator
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	Formaldehyde concentrations collected on eight personal samples ranged from below the limit of detection to 0.82 parts formaldehyde per million parts of air (ppm). One partial shift sample (3 hours) had a concentration of 1.24 ppm. Detector tube sampling during the morning of the day shift near the rotary briquetter indicated employee exposure to formaldehyde ranging from nondetected to 3.0 ppm. Therefore, a personal sample was obtained on an employee working at the rotary briquetter for the remaining 3 hours of the shift. Highest exposures were for rotary briquetter operators, although one sample, as noted, was for a 3-hour period. Subsequent to the field survey, NIOSH laboratory personnel discovered that the method (P&CAM No. 318) used to collect formaldehyde samples had a problem of sample stability. Quality control tests of the method indicated that actual airborne concentrations are 20 to 50% higher than reported values. Therefore, the values in Table I1 must be considered as minimum concentrations. Results of sampling using direct-reading indicator tubes to measure airborne concentrations of formaldehyde ranged from nondetected to 4.0 ppm. Four tubes (two per shift) used at a height of approximately 5 feet indicated airborne formaldehyde concentrations of 1.0, 2.0, 3.0, and 4.0 ppm in the rotary briquetter area. Three other detector tubes used in the curing press area, on a platform on top of the rotary briquetter, and in the finishing department (as background for other areas) detected no airborne formaldehyde concentrations. These values should be considered as indicating a range of potential exposures rather than exact exposure concentrations. Certified direct-reading indicator tubes have +35% accuracy at one-half the exposure limit and - +25% at 1 to 5 times the limit. The formaldehyde tubes have not been certified and thus may not be as accurate as certified tubes are. The formaldehyde indicator tubes are still useful for estimating air-borne contaminant concentrations and for evaluating short-term or ceiling values. Raw Material Prep. LLD Curing Press Oper 1 LLD Curing Press Oper. 0.39 ppm Rotary Briquetter Oper 2 1.24 ppm Curing Press Oper. LLD Curing Press Oper. LLD Curing Press Oper. 0.37 ppm Rotary Briquetter Oper. 0.82 ppm LLD-Below limit of detection
Number of workers:	the company employed approximately 430 hourly workers. Of this total, approximately 270 worked in the sintered metal division, 93 worked in the brake block division, and approximately 68 were employed as machinists, mechanics, and other skilled craftsmen.
Engineering control:	local exhaust ventilation equipment The only machinery without local exhaust ventilation was the rotary briquetter, which was partially enclosed, and the curing presses, which were not enclosed.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low
			Sampling or analytical methodology is an approved NIOSH method, however NIOSH notes that the method causes loss of formaldehyde so the actual concentration could be higher than measured (NIOSH P&CAM 318). Data is still usable as a minimum concentration.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High
	Metric 3:	Applicability	High
	Metric 4:	Temporal Representativeness	Low
	Metric 5:	Sample Size	High
			US
			The data are for an occupational scenario (brake and clutch manufacture) within the scope of the risk evaluation.
			1981 - prior to the PEL (1992) and more than 20 years old.
			Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was discussed.

HERO ID: 3649297 Table: 1 of 1

...continued from previous page

Study Citation:	NIOSH, (1982). Health hazard evaluation report: HETA-81-100-1140. Raybestos Friction Materials Company, Crawfordsville, Indiana. NIOSH Cincinnati:1-25.		
HERO ID:	3649297		
Conditions of Use:	Use of fuels and related products		
Domain	Metric	EVALUATION Rating	Comments
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations and/or worker activities.but lacks additional metadata, such as exposure durations and exposure frequency,
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability between different jobs and also addresses uncertainty, in the report and implicitly in the NIOSH method P&CAM 318.
Overall Quality Determination		Medium	

Study Citation:	NIOSH, (1983). Health hazard evaluation report: HETA 82-127-1370. Hoover Company, Industrial Park, North Canton, Ohio. 82-127-1370:1-31.			
HERO ID:	3970584			
Conditions of Use:	Plastic and Rubber products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Involved in several industrial processes, including a foundry operation, injection molding, spray painting, degreasing, plating, extruding, and numerous assembly line operations. The primary operations include assembly, injection molding, plastic blending and pelletizing, painting, metal fabrication, and plastic extrusion. Formaldehyde monitoring was done in injection molding area because an 'aldehyde-containing' plastic material was in use.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Environmental monitoring was conducted for formaldehyde by obtaining breathing zone samples from two set-up operators for the duration of the shift, and during a purge cycle (15 minute cycle). Short-term monitoring for formaldehyde in the breathing zone of set-up operators indicated exposure levels of up to 1.3 mg/m3.			
Area sampling data:	General area and process formaldehyde samples (sample acquisition directly adjacent to the injection molder using the Delron material) were collected, using both solid sorbent and liquid media sampling devices. All solid sorbent results were below the 5 microgram limit of detection (<0.23-0.44 mg/m3 air volume adjusted). An additional liquid media sample was placed near an injection molder during the use of the Delron material. Results indicate average airborne formaldehyde levels of 0.33 mg/m3 in the general area of the molder.			
Number of workers:	3000 workers in the plant-Three set-up operators normally work in the injection molding area where most of the formaldehyde emissions occur.			
Personal protective equipment:	Furnish respirators for the set-up operators for use when conducting purge operations. A chemical cartridge respirator with an organic vapor cartridge is recommended.

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Uninformative	No condition of use identified as a potential formaldehyde source, and no formaldehyde found in the samples.
	Metric 4: Temporal Representativeness	Low	More than 20 years old
	Metric 5: Sample Size	N/A	N/A - This metric is not applicable to the data being extracted
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site . The uncertainty can be determined from the sampling and analytical method.

Overall Quality Determination	Uninformative

Study Citation:	NIOSH, (1982). Health hazard evaluation report: HETA-82-196-1187. U.S. Department of Treasury, Bureau of Government Financial Operations, Washington, D.C. NIOSH:1-5.			
HERO ID:	4040306			
Conditions of Use:	Office source of Formaldehyde was unknown			
EXTRACTION				
Parameter	Data			
Worker activity description:	office work			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	below the limit of detection (<0.5 ppm)			
Number of workers:	24			
Engineering control:	The ventilation system in the Treasury Annex Building should beredesigned so that fresh air is uniformly supplied to all the occupied areas. Air supply and circulation also should be increased,particularly during the winter, to help improve office working conditions.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study, so assumed used an approved NIOSH method
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Medium	The data are for an occupational scenario (office work) within the scope of the risk evaluation, but unknown source of formaldehyde.
	Metric 4:	Temporal Representativeness	Low	1982 - prior to PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	Low	only less than value provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., short term detector tube) but no other meta-data
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	No information on variability and assume uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination		Medium

HERO ID:	4058405			
Conditions of Use:	Baking			
EXTRACTION				
Parameter	Data			
Worker activity description:	In mixing, there are two major types of workers, those who transfer mixing tubs, both full of dough and empty, and mixer operators who operate the mixer controls. A typical oven requires 1 operator, 1 inspection person, and a few troubleshooters. The operators spend most of their time at the discharge end of the oven operating the control panel. The remaining time is spent making periodic checks on oven operation by walking the oven line. Inspection personnel are responsible for picking broken crackers off the conveyor belt at the discharge end of the oven. Troubleshooters are located about 100-200 feet downstream from the inspector and are responsible for keeping crackers properly aligned on the conveyor belt. The workforce in Redi Serve consists of around 10 people, 2 machine operators, 4 packers, 1-2 box makers, and 2-3 nonclassified packers. The machine operators monitor the control of all 4 packing machines. The relief (nonclassified) employees monitor the line of crackers being fed into the machine on the conveyor belt system. The box makers assemble small cardboard boxes and give them to the packers who manually transfer the two cracker packages from the machines into the box. Machine operators, packers, box makers, and relief people alternate jobs spending about 2 hours at each.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Generally, formaldehyde exposures measured on the machine operators were higher than those measured on the oven operators which would be expected, since machine operators are located on the receiving end of the oven where cracker dough is first exposed to this oven heat causing the alcohols liberated from the yeast fermentation to form aldehydes. Also as expected, samples collected around the older #4 oven in general resulted in higher level than those taken around the new enclosed #A-1 oven. The #A-1 Redi Serve packer exposure measured was much lower than the old Redi Serve packer. This is easily explained by the fact that A-1 Redi Serve is located in a separate room from the machine and oven area, whereas the old Redi Serve is located in the same room, relatively close to the ovens. Packer/old redi serve line 0.16 mg/m3 Machine operator/ # 4 oven 1.08 mg/m3 Oven operator/ #4 oven 0.34 mg/m3 Machine operator/ #A1 oven 0.78 mg/m3 Oven operator/ #A1 oven 0.16 mg/m3 Packer/A-1 Red1 Serve Line 0.09 mg/m3			
Area sampling data:	Between oven #3 and #4, column 32 1.28 mg/m3 Between oven #A1 and #2, column 30 0.25 mg/m3			
Exposure duration:	8 hours per day			
Exposure frequency:	40 hours per week			
Number of workers:	1000			
Engineering control:	Since the old #4 oven appears to be causing the majority of the inside air contamination, NIOSH supports Keebler's intentions of taking it out of service.

Engineering control:	If certain climatic conditions (hot or cold weather) require the buses to remain running in order to maintain the interior temperature of the bus then a means to exhaust the emissions from the buses tail pipe should be developed. This could be an exhaust system with flexible ducting which extends down to the buses exhaust pipe. An alternative to the exhausting of the buses emissions would be an exterior means of heating or cooling the interior of the bus during those periods required. A heating/refrigeration type system is presently being used by another bus company which operates on the other side of the Denver terminal. This system effectively meets the needs of the heating and cooling concerns of the buses interior and would then eliminate the need for running the buses during hot or cold periods.

Study Citation:	NIOSH, (1996). Initial submission: prepublication version of health hazard evaluation of a Unocal Corp urea fertilizer facility, Kenai AK, with cover letter dated 6/13/96.			
HERO ID:	5888126			
Conditions of Use:	Processing into Reactant- Fertilizer			
EXTRACTION				
Parameter	Data			
Worker activity description:	Unloading operators, prill tower operators, maintenance, electricians, process operators. (30/38) The environmental samples were collected during the manufacture of the urea fertilizer, as well as during the loading of the product on a freighter for sea transport. Environmental sampling was also performed during the unloading of a truck tanker containing the UF-85 additive and during the cleaning or "blow-down" of the #5 urea granulation plant.			
Exposure route:	inhalation (7/38)			
Physical form:	vapors, and formaldehyde on dust (7/38)			
Personal sampling data:	Unloading Operator (sorbet tube) : 0.25 ppm (29/38); Airborne concentration particulate formaldehyde equivalent [note method does not distinguish free from reacted formaldehyde]Plant #2- Operator (back-end): 2 ug/m3; prill tower operator: 2.3ug/m3; maintenance: 3.6 ug/m3; maintenance: 9.0; Plant #5-process operator: (0.6)ug/m3*; Plant #5-helper: 11.5 ug/m3; operator: 2.9 ug/m3; electrician: 7.4 ug/m3; electrician: 5.8 ug/m3.			
Area sampling data:	Plant #2- Area Near Prill Tower Melt Box: ND Plant #2 - Area Near Sizing Screens: ND Plant #5 -Area on second Deck: ND Plant #5 - Area on third Deck: trace Plant #2 -Area Near Prill Tower Melt Box: 0.024 ppm Plant #2- Area Near Prill Tower Melt Box: 0.028 ppm Prill Warehouse -Area Near Wall: 0.007 ppm Granular Warehouse- Area Near Grizzly: 0.004 ppm Granular Warehouse- Area at South End : 0.004 ppm (29/38) Area Between Tanker & Transfer Pipes (sorbet tube):2.2 &1.6 ppm Airborne concentration particulate formaldehyde equivalent [note method does not distinguish free from reacted formaldehyde]-> Area samples range from 5.6 to 42ug/m3			
Particle size characterization:	Total inhalable weight and particulate formaldehyde equivalent for personal samples are listed in Table 2. (30/38)			
Exposure duration:	8-10 hours/day (16/38) [part of the evaluation criteria]			
Exposure frequency:	40 hours/week for a working lifetime (15/38)[part of the evaluation criteria]			
Number of workers:	200 workers (11/38)			
Personal protective equipment:	During daily blow down operations: operator wears a half-face respirator equipped with HEPA cartridges. During unloading: wear Tyvek® suits coated with polyethylene, rubber gloves, and a face shield with chemical goggles. When there is the possibility of exposure to formaldehyde vapor, the Unocal safety procedures dictate that a MSA full face piece chest mounted respirator with yellow GMC-SS supersize canisters should be worn. (19/38)			
Engineering control:	Daily blow down starts on the top deck and cleans each deck in successive order until all the dust is accumulated on the ground floor, where it can be swept up.

...continued from previous page

Study Citation:	NIOSH, (1996). Initial submission: prepublication version of health hazard evaluation of a Unocal Corp urea fertilizer facility, Kenai AK, with cover letter dated 6/13/96.		
HERO ID:	5888126		
Conditions of Use:	Processing into Reactant- Fertilizer		
Domain	Metric	EVALUATION Rating	Comments
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability is addressed by looking at different locations and days.
Overall Quality Determination		High	

Study Citation:	NIOSH, (1983). In-depth industrial hygiene survey report of the arrow shirt company Atlanta, Georgia no: 125.12 (36). 14:B2-14.		
HERO ID:	5908875		
Conditions of Use:	Commercial Use of Fabric, textile, and leather products not covered elsewhere		
EXTRACTION			
Parameter	Data		
Worker activity description:	workers involved in shirt making		
Exposure route:	inhalation		
Physical form:	gas		
Personal sampling data:	The results of multiple personal air samples for formaldehyde collected by Travellers’ Insurance Company are as follows: Laundry apparel press – 0.05 to 0.07 ppm; Final fusing area – 0.13 to 0.23 ppm; Crease band area – 0.07 ppm. Each of these samples was collected for a duration of 1 hour. Formaldehyde exposure levels were determined for 54 of 72 job titles in 5 different departments. 1 hour sampling time.		
Number of workers:	1000 workers at the facility, 916 operated sewing machines while the rest worked managerial, administrative, and maintenance duties. 188 workers sampled		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	methodology is referenced (chromotropic acid method) but not enough information to determine if equivalent to NIOSH methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US data
	Metric 3: Applicability	High	data are for an occupational scenario within the scope of the risk evaluation
	Metric 4: Temporal Representativeness	Low	data greater than 20 years old
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include almost all associated metadata including sample type, sample duration, work area.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability is measured by sampling at different locations within the site, report does not have any discussion on uncertainties for these measurements.
Overall Quality Determination		Medium

Parameter	Data			
Worker activity description:	workers involved in shirt making			
Exposure route:	inhalation			
Physical form:	gas			
Personal sampling data:	Formaldehyde exposure levels were determined for 54 of 72 job titles in 5 different departments. Exposure concentrations ranged from 0.037-0.456 TWA.			
Number of workers:	Includes # of workers per job title(Table 1). 1000 workers at the facility, 916 operated sewing machines while the rest worked managerial, administrative, and maintenance duties. 188 workers sampled			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Uninformative	Report indicates that there was a problem with instability with P&GAM 318, which was used for personal sampling. Sample loss occurred due to shipment of samples as well as the temperature and time of sample storage. The sample loss was estimated to range from 30 to 70%.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	data greater than 20 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include almost all associated metadata including sample type, sample duration, work area.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is measured by sampling at different locations within the site, report does not have any discussion on uncertainties for these measurements.
Overall Quality Determination		Uninformative

	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability is addressed by including personal and area samples from different locations, uncertainty is not addressed.
Overall Quality Determination		High	

Study Citation:	NIOSH, (1981). Health hazard evaluation report: HHE 80-103-827. Joel & Aronoff, Ridgefield, NJ.			
HERO ID:	8610377			
Conditions of Use:	Production of Printed Decals			
EXTRACTION				
Parameter	Data			
Worker activity description:	Major operations consisted of the printing, chopping, laminating, cutting, and sewing of decals.			
Exposure route:	inhalation			
Physical form:	gas			
Personal sampling data:	Personal breathing zone samples of laminating employees for formaldehyde had ranged from non-detectable levels to 0.20 milligrams per cubic meter (mg/M3) in a 30-minute sample. The mean TWA exposure was 0.04 mg/M3 .			
Number of workers:	At the time of the study, the plant employed 54 workers. 2 laminating employees.			
Engineering control:	A local-exhaust canopy hood was located against the wall about three feet over the spraying area. (5/18)NIOSH recommended that local exhaust ventilation be increased in the screen cleaning room. The main problem with the existing ventilation system was the long distance from the spraying area to the exhaust hood (about 3 feet). Although hood face velocities ranged from 100-175 feet per minute, the actual capture velocity was minimal. Simply lowering the exhaust hood would increase its efficiency. A much better approach would be to enclose as much of the spraying area as possible within the exhaust system. This could be mostly easily achieved by hanging solvent-resistant curtains from the sides and front of the hood while leaving an opening just large enough to allow the spray cleaning of the screens inside. The ideal solution would be to replace the existing system with one of the spray booths. A minimum capture velocity of 100 feet per minute is required to control organic vapors. Screenwashing should be suspended in this area when the fan is not working.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is assumed to done by OSHA, however, the OSHA method is not specified or further discussed.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Low	Distribution of samples is characterized by no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not expand on the formaldehyde testing done by OSHA so therefore does not address variability or uncertainty.
Overall Quality Determination			Low	

Formaldehyde

Occupational Exposure

HERO ID: 8620035 Table: 1 of 1

Study Citation:	NIOSH, (1981). Health hazard evaluation report: HHE 80-240-855. New York University, New York, NY.			
HERO ID:	8620035			
Conditions of Use:	Commercial Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Staff of New York University in an office building. (4/20)			
Exposure route:	inhalation (14/20)			
Area sampling data:	Formaldehyde levels ranged from 20 to 30 ppb in all locations. The mean value for the sixth floor was 25 ppb. (8/20)			
Number of workers:	40 employees (5/20)			
Engineering control:	The fifth and sixth floors share an air ventilation system. Air intake is located on the north side of the building, facing a courtyard, at the fifth floor level. Fresh air averaged about 20%, but has been increased at times since July to "air out" the office. Windows in the exterior offices can be opened, but generally were kept closed for temperature control. The second, third and fourth floors share a separate air ventilation system. (5/20)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Low	Data are for ambient air in an office, which is similar to the in-scope occupational scenario use of furniture products.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, range) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but mission exposure duration, frequency, physical form, and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination		Medium

Occupational Exposure

HERO ID: 8620325 Table: 1 of 1

Study Citation: NIOSH, (1981). Health hazard evaluation report: HHE 79-128-806. Bob Gerren Ford, Inc., Manistee, MI.
HERO ID: 8620325
Conditions of Use: Other-Unknown

EXTRACTION

Parameter	Data
Worker activity description:	Automobile sales and servicing.
Exposure route:	Inhalation
Physical form:	Vapor
Area sampling data:	Formaldehyde general area sampling was done at the accounting office, the middle of the loft area for sample parts, the warranty parts room, and the ceiling in showroom near the sink. All samples for formaldehyde were non-detects.
Comments:	NIOSH investigated an automotive sales and service facility, however, the building was no longer in use during the environmental sampling. Potential sources of formaldehyde are not clearly identified but the report did test emissions of formaldehyde from heating polyurethane foam insulation, which had been used as a building material.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling and analytical methodology is an approved NIOSH method (Sipin monitoring pumps with specially impregnated charcoal tubes operated at 200 ml per minute and were analyzed by ion chromatography (IC), P & CAM 318).
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Uninformative	The data are for an occupational scenario but the source of formaldehyde is unknown. As formaldehyde was not detected, it's uncertain if products containing formaldehyde were present.
	Metric 4: Temporal Representativeness	Low	The data were collected before the most recent PEL establishment.
	Metric 5: Sample Size	Low	Non-detect
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site by sampling multiple areas. Assumed some uncertainty can be determined from the sampling and analytical method.

Overall Quality Determination

Uninformative

Study Citation:	NIOSH, (1981). Health hazard evaluation report: HHE 80-181-909. Ralston Purina Company, Cincinnati, OH.			
HERO ID:	8621028			
Conditions of Use:	Use in cleaning products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Site is animal feed producer, who uses a liquid product to clean extruders. On Fridays, two operators pump the liquid product into a closed mixing tank to dilute with water, then a piping system fills extruders. Workers do monitor the process and move plastic bins to catch extra liquid product during this process, which is then emptied down the floor drain. On Sundays, the filled extruders are heated then drained and rinsed by two operators. Operators also mentioned opening the mixing tank.			
Exposure route:	Inhalation, dermal			
Physical form:	Vapor			
Area sampling data:	Drum Head Space: 7.5 (ppm)Plastic cart: Non-detectExtruder exit port: Non-detect			
Exposure duration:	Exposure occurs for 2 hours on friday and 2 hours on Sunday			
Exposure frequency:	indicates a weekly cleaning (2 days/week, unknown weeks/yr)			
Engineering control:	Adding an external sight gauge to the mixing tank, equipping the plastic cart with a drain plug so that it can be easily emptied into the floor drain, adding a clear plastic cover to the cart to reduce emissions.			
Comments:	NIOSH reported that formaldehyde was not an ingredient of the liquid product (pg. 7)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method (an impinger containing 10 milliliters of 1% SodiumBisulfide and analyzed by direct injection into a gas chromatographequipped with a flame ionization detector.)
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Medium	The data are for an occupational scenario but lacks information on source of formaldehyde. Report states that it was not an ingredient of the product. This data may be similar/useful for the use of cleaning products.
	Metric 4:	Temporal Representativeness	Low	The data were collected before the most recent PEL establishment
	Metric 5:	Sample Size	High	: Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, sample durations, exposure durations, exposure frequency, worker activities but lacks source information.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability and uncertainty in the determinants of exposure for the sampled site.

EXTRACTION			
Parameter	Data		
Exposure route:	inhalation		
Physical form:	vapor		
Area sampling data:	A total of 23 area air · samples were collected for evaluation of formaldehyde vapor concentrations in the school. The levels measured are considered to represent a worst possible case situation since ventilation systems were not and had not been operating in the two weeks prior to sampling, and temperature and humidity conditions favored high formaldehyde levels originating from the insulation. The time-weighted average formaldehyde concentrations inside the school ranged from 0.02 parts per million (ppm) to 0.17 ppm (0.03 mg/M3 to 0.20 mg/M3), with an arithmetic mean of 0.07 ppm (0.09 mg/M3). Short term {i.e. about 2 hours) area sample concentrations ranged from 0.01 ppm (0.01 mg/m3) to 0.11 ppm (0.14 mg/m3). The time-weighted average over the total sampling period combining three short-term samples ranged from 0.02 PJJTI (0.03 mg/m3) to 0.07 ppm (0.09 mg/m3}. A sample of about three hours in duration obtained above the suspended ceiling tile in room 213 demonstrated a concentration of 0.005 ppm (0.006 mg/m3)Rm 201 center-desk 0.12 ppmRm 202 center-desk 0.17 ppmRm 204 center-desk 0.08 ppmStudent Affairs Office-desk 0.09 ppmRm 206 center-desk 0.04 ppmRm 213 back filing cabinet 0.05 ppmRm 213 front center desk 0.04 ppmRm 214 front desk 0.02 ppmRm 219 center-desk 0.05 ppmCommons - locker area 0.07 ppmBand room closet (exposed insulation) 0.08 ppmArithmetic mean: 0.07 ppm +/- 0.04 ppmShort term Sampling Rm 213 front center desk 0.02 ppmRm 213 front center desk 0.01 ppmRm 213 front center desk 0.11 ppm TWA 0.05 ppm Rm 219 center-desk 0.02 ppmRm 219 center-desk 0.04 ppm Rm 219 center-desk 0.01 ppm TWA 0.02 ppmBand room closet (exposed insulation) 0.07 ppm Band room closet (exposed insulation) 0.09 ppm Band room closet (exposed insulation) 0.06 ppm TWA 0 .07 ppmRm 213 above suspended ceiling 0.005 ppm		
Engineering control:	The operation of the ventilation system along with normal infiltration and system design air changes is considered sufficient to keep formaldehyde concentrations at a low level, most likely below the documented levels presented here.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH study - Method P&CAM 125
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for an occupational scenario (school) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	1982 - prior to PEL (1992) and more than 20 years old
	Metric 5: Sample Size	High	Statistical data provided plus results from individual sampling events were provided. Uncertainty was not discussed but assumed that it was addressed in NIOSH method P&CAM 125.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, but lacks additional metadata, such as exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty

	Metric 5:	Sample Size	N/A	No sample data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure duration and frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	N/A	No scope to address variability and uncertainty since data values are not given.
Overall Quality Determination		High		

Study Citation:	NIOSH, (1983). Health hazard evaluation report: HETA 82-391-1303. Mitchell Plastics, Inc., Cheswick, PA.			
HERO ID:	8639198			
Conditions of Use:	Reactant-Adhesives and sealant chemicals in: Plastic and resin manufacturing; Wood product manufacturing; All other basic organic chemical manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Personal sampling data:	In reviewing the air sampling data it is interesting to note that the formaldehyde levels for the personal samples were higher than the levels measured at the mold head. The higher exposure levels for the mold press operators may suggest that workers are being exposed to formaldehyde from other sources. One likely source could be from cigarette smoke present in the break room.			
Area sampling data:	Detectable levels were measured in seven of the eight air samples, with concentrations ranging from 0.005 to 0.084 ppm. The highest levels were measured in sample~ collected from the mold press operators, with progressively lower levels measured for the air samples collected from above the mold head, main office, and outdoors. (pdf pg 8)			
Exposure frequency:	Production scans 3 shifts/day, 5 days/week. (pdf pg 4)			
Number of workers:	The plant employs 16 production workers including 10 mold press operators, 4 material handlers and set-up persons, an inspector, and a shipper. The mold press operators normally rotate machines on a daily basis. (pdf pg 4)			
Comments:	Table 1: Formaldehyde Concentrations			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data are from 1982 and are unlikely to be associated with representative operations, equipment or activities.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination			High	

Study Citation:	NIOSH, (1984). Health hazard evaluation report: HETA 83-191-1423. National Zoological Park Conservation Center, Front Royal, VA.			
HERO ID:	8646306			
Conditions of Use:	Wood and engineered wood products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers at the Smithsonian Zoo Conservation Center doing daily chores, changing habitats, and conducting observations in the Small Mammal building. (4/10)			
Exposure route:	inhalation (4/10)			
Physical form:	gas (4/10)			
Area sampling data:	Formaldehyde levels ranged from 0.11 to 0.43 ppm and averaged .26 ppm. (6/10)			
Exposure duration:	One worker will work 8 hours a day. Up to three will work on an as-necessary basis. Once a month, researchers will conduct 24-hour observations. (4/10)			
Number of workers:	1-3 workers (4/10)			
Engineering control:	Repeated treatment with ammonia gas reduced exposure levels considerably. (4/10)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method (P & CAM 125).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for commercial use of wood products, an in-scope occupational scenario,
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	All sample measurements provided, statistics can be determined.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Most critical metadata provided, except exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability is addressed by sampling at different locations, height of above floor, and time of the day.
Overall Quality Determination			High

Overall Quality Determination			High	

Study Citation:	NIOSH, (2006). Niosh health hazard evaluation report- Bower Corporation.			
HERO ID:	8684535			
Conditions of Use:	Processing aids, not otherwise listed			
EXTRACTION				
Parameter	Data			
Worker activity description:	Metal workers in the following departments: heat treating, turning, race grinding, surface grinding, roll grinding, tool and die, maintenance, training, outdoor operations, and cone grinding. (26/28)			
Exposure route:	inhalation, dermal (13/28)			
Physical form:	vapor, fluid (11/28)			
Personal sampling data:	Personal samples for formaldehyde ranged form ND-0.06 ppm. (26/28)			
Area sampling data:	Area samples for formaldehyde ranged from ND-Trace amounts. (26/28)			
Exposure duration:	8 hours (8/28)			
Number of workers:	250 people (8/28)			
Personal protective equipment:	Some employees reported using nitrile gloves, and short sleeves to prevent wicking. (17/28)			
Engineering control:	Exhaust ventilation for the oil quenching operation is provided by a canopy hood located about 10 feet above the quenching oil. (8/28) Most of the metal processing machines have mist collectors. (16/28)			
Comments:	Table 6HETA 2004-0399-3007Formaldehyde Sample Results			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	Data are for metalworking fluids, which is similar to the in-scope occupational scenario processing aids not otherwise listed.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling different worker activities during different days.
Overall Quality Determination		High		

Study Citation:	NIOSH, (2003). Niosh health hazard evaluation report- Bemis.		
HERO ID:	8684536		
Conditions of Use:	Plastic material and resin manufacturing		
EXTRACTION			
Parameter	Data		
Worker activity description:	Extruding plastic materials together, hardening mat boards in mold-making machines using a heated process, using hardened mat boards to make rubber printing plates, heat-sealing plastic films to make plastic bags for packaging.		
Exposure route:	Dermal and inhalation		
Physical form:	Gas		
Personal sampling data:	Floater: 0.04 ppmBag machine #42: 0.06 ppmBag machine #37: 0.09 ppmBag machine #25: 0.04 ppm		
Area sampling data:	Column 26, near bag machine #10: 0.06 ppm		
Exposure duration:	8 hours/day		
Exposure frequency:	5 days/week		
Number of workers:	600 total employees50 people work in the extrusion department230 people work in the press department170 people work in the bag department		
Engineering control:	The automated bag machines in the bag department are equipped with local exhaust ventilation.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling and analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	U.S. data
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Medium	The data was collected in 2002-2003, after the most recent PEL but more than 20 years ago.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sam-pledsite or sector. The uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination		High	

Study Citation:	NIOSH, (1976). Health hazard evaluation: Hersey Products Company, Inc.			
HERO ID:	8688008			
Conditions of Use:	Adhesive			
EXTRACTION				
Parameter	Data			
Worker activity description:	Metal pouring, furnace tending			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	The measured concentrations of formaldehyde, evolved from the exothermic curing and thermal decomposition of bonding agents used in the core sand, did not exceed the evaluation criteria (2ppm ceiling).			
Exposure duration:	8-10 hour workday			
Number of workers:	seven core-makers, fourteen molders, and ten utility-men			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Study conducted by NIOSH using their methods to measure formaldehyde.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for formaldehyde from the curing of the adhesive, which is an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Report is based on data greater than 20 years old and industry conditions that are expected to be outdated.
	Metric 5:	Sample Size	Low	No values given, just indication that it did not exceed evaluation criteria
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, butlacks additional metadata, such as exact measurement, sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	NIOSH, (1976). Health hazard evaluation determination: Masonite Corporation.			
HERO ID:	8688419			
Conditions of Use:	Adhesives and sealant chemicals in wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Saw operators (21/27)			
Exposure route:	inhalation, dermal (6-7/27)			
Physical form:	exposure to wood dust generated by the woodworking machinery. The gaseous contaminants included formaldehyde and phenolic vapours released during the sawing and sanding of the Masonite board (3/27)			
Area sampling data:	Area samples for formaldehyde ranged from 0.09-0.17 mg/m3. (21/27)			
Exposure duration:	8 hours/day (8/27)			
Number of workers:	Approximately 88 persons are employed in the plant, with 54 of those being classified as production workers; 25 employees are "directly affected" by the alleged hazard. (2/27)			
Engineering control:	All machinery, except punch presses, are ventilated by a typical woodworking extract system. It consists of hoods for the pickup of wood dust and chips at the machines, ductwork, a collection device (cyclone), a storage bin, and a fan blower to supply air for conveying purposes. (3/27)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for adhesives and sealants in wood product manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination			High	

Study Citation:	NIOSH, (1976). Health hazard evaluation: Rock Hill Printing and Finishing Company.			
HERO ID:	8688438			
Conditions of Use:	Finishing agents in textiles, apparel, and leather manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	One or two operators/shift work at the starting end of the hot frame lines tending the water boxes and dryer cans with an offtake operator working each of the lines or a total of four/shift. The emissions which are the source of employee complaints occur as the fabric leaves the hot frame dryer tunnel at the offtake end of the line. (3/32)			
Exposure route:	inhalation (1/32)			
Physical form:	vapors (4/32)			
Area sampling data:	Area samples for formaldehyde ranged from 0.09-0.21 mg/m3 (21/32)			
Exposure duration:	8 hours/day and three separate shifts/day (2/32)			
Exposure frequency:	day, 5 days/week, days/yr. not specified (2/32)			
Number of workers:	10 administrative, 86 production, and 2 maintenance workers (2/32)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for finishing agents in textile manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data is over 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but missing exposure duration and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling on different days at different locations.
Overall Quality Determination		High		

Formaldehyde

Occupational Exposure

HERO ID: 8688540 Table: 1 of 1

Study Citation:	NIOSH, (1976). Health hazard evaluation determination: Rycraft, Inc..			
HERO ID:	8688540			
Conditions of Use:	Likely source is combustion as formaldehyde is not a chemical included in the glaze.			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Kiln Room 0.16 ppmKiln Room 0.07 ppm			
Engineering control:	A local exhaust ventilation system directly over the kilns to capture the gases as they are emitted was recommended.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (ceramic manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1976 - Prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, and sample durations, but lacks additional metadata, such as exposure duration, exposure frequency, and worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability was not discussed, but results from individual sampling events were provided which could be used to evaluate variability between different sampling days. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods.
Overall Quality Determination		High

Engineering control:	Recommendation- Local exhaust ventilation should be used for molding operations.

		EVALUATION		
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Study was done by NIOSH so assumed approved NIOSH method.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.	
	Metric 3: Applicability	High	Data are for plastic material and resin manufacturing, which is an in-scope occupational scenario.	
	Metric 4: Temporal Representativeness	Low	The data were collected before the most recent PEL establishment.	
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure frequency.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The uncertainty can be determined from the sampling and analytical method	

Overall Quality Determination	High

Formaldehyde

Occupational Exposure

HERO ID: 8688637 Table: 1 of 1

Study Citation: NIOSH, (1975). Health hazard evaluation determination: The Timken Company.
HERO ID: 8688637
Conditions of Use: Coolant

EXTRACTION

Parameter	Data
Worker activity description:	Operator grinders, maintenance mechanics, process checkers, and inspectors at a railroad bearing plant. (2/16)
Exposure route:	dermal, inhalation (3/16)
Physical form:	coolant mist (1/16)/
Personal sampling data:	Total coolant mist concentrations during personal sampling was 5.49-6.07 mg/m3. (7/16)
Area sampling data:	Formaldehyde was not detected by area sampling/ (7/16).
Number of workers:	100 men worked in the affected area (2/16)
Personal protective equipment:	The grinders were furnished with gloves and aprons on a voluntary but free basis. Respirators were said to be available but were not used. Aprons were said to be changed several times a week . Maintenance men were furnished coveralls. Skin barrier creams (Kerodex and Silicate) were available for use but rarely used. (2/16)
Engineering control:	In the grinding area general room ventilation was in operation but not machine local exhaust ventilation. (2/16)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from the U.S.
	Metric 3: Applicability	Uninformative	Data are for process coolants, which isn't in the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5: Sample Size	Medium	Sample distribution characterized by limited statistics (average) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Exposure type, worker info, and sampling data provided, but missing exposure duration and frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by comparing night vs day shift and different operating machines.

Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination			High	

Study Citation:	NIOSH, (1990). In-depth survey report: Evaluation of a ventilation system to control formaldehyde exposures during embalming at Cincinnati College of Mortuary Science, Cincinnati, Ohio.			
HERO ID:	8727994			
Conditions of Use:	Laboratory chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Applying formaldehyde-based gel to the face, hands, and feet of the anatomical body.			
Exposure route:	Inhalation			
Physical form:	Gas			
Personal sampling data:	Mean: 0.60 (ppm), n=32			
Area sampling data:	Means-Isolation room: 0.24 (ppm)Hallway: 0.21 (ppm)Laboratory Office: 0.18 (ppm)Exhaust duct outlet: 0.81 (ppm)			
Number of workers:	75,000			
Engineering control:	Local exhaust ventilation.			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	The data were collected before the most recent PEL establishment
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, butlacks additional metadata, such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site. The uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination			High	

Study Citation:	NIOSH, (1984). In-depth survey report: Control technology for formaldehyde emissions at Dixie Furniture Plant, Lexington, North Carolina.			
HERO ID:	8728028			
Conditions of Use:	Adhesives and sealant chemicals in wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Glue-urea-formaldehyde resin adhesive, core may be particleboard, fiberboard, or edge glued solid-wood lumber-core. In addition, the core may be banded with solid wood edges prior to veneering, which may use an adhesive containing formaldehyde (6/22)Press loaders and unloaders, core stockers, glue spreaders, glue mixers, stock pullers, and elevator operators. (19/22)			
Exposure route:	inhalation (4/22), dermal (5/22)			
Physical form:	vapor (7/22)			
Personal sampling data:	PBZ samples ranged from 0.12-0.71 ppm. (19/22).			
Area sampling data:	Area samples ranged from 0.11-1.78 ppm. (21/22)			
Dermal exposure data:	nan			
Number of workers:	The plant employed 900-1100 people, 90% of which were hourly production workers. 50 workers were assigned to the glue room, and less than 20 worked close to a hot press.(5/22)			
Engineering control:	The primary control was a row of six wall fans. In addition, the multiple-opening presses were located under canopy hoods and the RF press was surrounded by a ventilated enclosure. Two supply-air outlets had been installed in the unloading area of the large multiple-opening press. (12/22)

Study Citation:	NIOSH, (1982). Preliminary survey report: Control technology for formaldehyde emissions at Hoosier Panel, New Albany, Indiana.			
HERO ID:	8728035			
Conditions of Use:	Adhesives and sealant chemicals in wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	The loaders prepare a stack of sandwiched, plate/layer of boards/plate triplets—one triplet for each opening of the press—while the previous load is being pressed. When the press opens, they partially push-out the triplets of pressed panels so the unloaders on the other side of the press can grasp them, remove them from the press, and stack them on a cart. Then the loaders insert the next load into the now-empty openings. After the press is loaded and activated, and information about the current load of boards has been recorded on the production log, they begin preparing the next load. Meanwhile, the unloaders are separating the pressed panels from the caul plates, stacking the panels and standing the plates on edge on a wheeled plate rack. Then they move the stack of boards on roller conveyors towards the finishing area, push the rack of plates into the plate cooling room, and wait for the next load.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	Peak formaldehyde concentrations ranging from less than 1 ppm to between 1 and 2 ppm were measured on the loading side of press 1.			
Exposure duration:	Production work hours are from 7:00 a.m. till 3:30 p.m., with a half hour for lunch. [8 hours/day]			
Number of workers:	At the time of the survey, 131 employees were working at the plant, down from a normal work force of 250. Sixteen of these were assigned to the glue room, the department which makes the veneered panels.			
Personal protective equipment:	Some of the workers in the glue room wear gloves and aprons. The glue-mix man wears an apron and, at certain times, goggles and gloves.			
Engineering control:	A canopy hood is installed over each press, extending 10 to 12 inches beyond the sides of the press. Some of the slot openings have baffles, which may have been inserted to increase slot velocity. Each hood is vented through a 14- or 16-inch circular duct to a separate fan on the roof. These hoods have been in place for over 35 years. There are also some fans in the ceiling above the presses. There are six wall fans in the plate cooling room, and some outside air is blown in through a grated floor. Since more air is exhausted from this room than is supplied from below, there is a net flow into the plate cooling room from the press area. Airflow across the glue room is further aided by auxiliary fans positioned throughout the room and open doors and windows along the southwest wall. Some of these fans are hung from the ceiling in fixed positions, generally blowing towards the plate cooling room; the others are set on the floor, often blowing away from the plate cooling room. The fans, intended to cool the workers, may still be operated in cool weather due to the heat given off from a steam-heated press; but the doors and windows are closed when the influx of outside air is no longer desired. Other than in the plate cooling room, there is no make-up air supply.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data are more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.

Study Citation:		NIOSH, (1982). Preliminary survey report: Control technology for formaldehyde emissions at Hoosier Panel, New Albany, Indiana.		
HERO ID:		8728035		
Conditions of Use:		Adhesives and sealant chemicals in wood product manufacturing		
Domain		Metric	EVALUATION	
			Rating	Comments
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination			Medium	

Study Citation:	NIOSH, (1974). Survey of Burlington Industries, Inc., Burlington House Finishing Plant, Form Fabrics Plant, Durham Domestics Plant, Brookneal Finishing Plant.			
HERO ID:	8728041			
Conditions of Use:	Finishing agents in textiles, apparel, and leather manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Yarning, weaving, bleaching, heat setting, finishing, cutting, sewing, preparation of distribution, dyeing, screen printing (7-9/26)			
Area sampling data:	Formaldehyde not directly measured, BCME is measured, which formaldehyde assists in forming (5/26)			
Number of workers:	55 to 1050 workers at each of 88 plants in operation. (6 and 8/26) At the Durham NC plant there are 1300 persons with 40 in finishing area (7/26).			
Engineering control:	Most of the plants visited appeared to be properly ventilated. All were said to meet the OSHA requirements of six air changes per hour for manufacturing plants' but time did not permit checking into this. Most were observed to be under slight negative pressure due to the large exhaust fans which are needed to vent the excessive moisture and heat in the drying and curing areas of the finishing frames. (10/26)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for finishing agents in textile manufacturing, an in-scope occupational scenario. However, data reported is not formaldehyde directly.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	N/A	N/A - This metric is not applicable to the data being extracted
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Only number of workers and engineering controls provided, no formaldehyde sampling or exposure information.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	N/A	N/A - This metric is not applicable to the data being extracted
Overall Quality Determination		Medium		

Study Citation:	Nirlo, E.L., Crain, N., Corsi, R.L., Siegel, J.A. (2014). Volatile organic compounds in fourteen U.S. retail stores. Indoor Air 24(5):484-494.			
HERO ID:	2542987			
Conditions of Use:	Use of fabric, textile and leather products			
EXTRACTION				
Parameter	Data			
Worker activity description:	workers in retail stores in Texas and Pennsylvania			
Exposure route:	inhalation			
Area sampling data:	Formaldehyde was detected indoors during every sampling event at concentrations that ranged from 4.6 +/- 0.3 ppb at a home improvement store in Pennsylvania to 67 +/- 8.3 ppb at an office supply store in Texas. Office and furniture stores exhibited the highest formaldehyde concentrations; it is likely that much of the formaldehyde originated from the pressed-wood furniture, displays, and carpet used in these stores. Average formaldehyde concentrations across all test visits in the current investigation (18.1 +/- 13.8 ppb) were significantly higher than concentrations observed in offices (13 +/- 7 ppb), but not significantly different from concentrations in residences (21 +/- 11 ppb). In this investigation, formaldehyde exceeded health guidelines in some stores. Outdoor formaldehyde samples were collected at test visits to a home improvement store and a general merchandise store, where the formaldehyde outdoor concentrations were 3.4 +/- 1.0 ppb (indoor-to-outdoor ratio = 1.4 +/- 0.8) and 2.6 +/- 0.3 ppb (indoor-to-outdoor ratio = 3.2 +/- 0.8), respectively.			
Engineering control:	ventilation with higher air exchange rates

Conditions of Use:	Compressed Wood Product Manufacturing

EXTRACTION	
Parameter	Data
Worker activity description:	Fiberboard manufacture
Exposure route:	inhalation
Physical form:	vapor
Area sampling data:	Unknown but assumed to be based on area sampling: Table 3-11 (Aydin 2013) 0.20+/- 0.06 ppm 8 hr TWA (Range 0.10-0.33 ppm)
Number of workers:	46

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	unknown
	Metric 3:	Applicability	High	The data are for the manufacture of fiberboard which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The study was published in 2013, after the most recent PEL (1992) and less than 10 years old.
	Metric 5:	Sample Size	High	mean, standard error and range data provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	no metadata provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range and standard error data that can be used to evaluate variability. Information about uncertainty was not provided.

Conditions of Use:	Commercial uses			
EXTRACTION				
Parameter	Data			
Life cycle description:	Chemical substance in products not described by other codes: Pathology Autopsy room			
Process description:	Embalming is a procedure that delays the decomposition of a cadaver. To accomplish this, the embalmer injects into either the common carotid or femoral artery usually 12 to 18 L of an aqueous solution of formaldehyde at a concentration ranging from about 1.25% to 32%, depending on how much the body has changed since death			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	4.8 ppm mean (range 0.06-7.9 ppm)			
Personal protective equipment:	General work practices that will reduce exposure include closing jars promptly when not in use, prompt disposal of formaldehyde soaked rags, proper storage and disposal of products, and periodic equipment inspections. Personal protective equipment should be used during procedures involving high formaldehyde concentrations.			
Engineering control:	Methods to reduce formaldehyde exposure include product substitution and modifications of work areas and work practices. Work-station modifications that can reduce exposure include confining difficult embalming cases; physically separating embalming tasks from restoration tasks; installation and proper use of capture equipment at the source, such as hoods over the injection equipment; and design of work stations to ensure adequate ventilation.

EXTRACTION				
Parameter	Data			
Life cycle description:	Furnishing, Cleaning, and Treatment/Care products: Woodworking shop			
Process description:	Most furniture is manufactured from either wood-based composite or hardwood, and the manufacturing process can be generalized into four steps: (1) processing (sawing, sanding, assembly, inspection), (2) painting, staining, or varnishing (mixing, applying, drying, sanding, repair), (3) upholstery and installation of hardware, and (4) packaging and shipping			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Ventilate workshop: 0.42 ppm mean (range 0.28-0.54 ppm); Unventilated workshop: 0.64 ppm mean (range 0.48-0.84 ppm)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Egypt - Not an OECD member
	Metric 3:	Applicability	High	The data are for furniture manufacture which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The study was derived from data from 1990s prior to the latest PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by an average value and range data
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	No meta data were provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The data include range information which be used to evaluate variability, but uncertainty is not quantified
Overall Quality Determination		Low		

Study Citation:	NTP (2010). Final report on carcinogens. Background document for formaldehyde. (10-5981):i-512.			
HERO ID:	1041161			
Conditions of Use:	Commercial uses			
EXTRACTION				
Parameter	Data			
Life cycle description:	Metal products not covered elsewhere: Iron Foundry Core Machine Operator			
Process description:	The foundry process consists of pouring molten metal into a mold to obtain a cast product of specific shape. The mold can also contain a core that determines the dimensions of any internal cavity of the final product. Formaldehyde-based resins (both UF and PF) are commonly blended with sand to produce the molds and cores used in foundries. Important manufacturing steps in the foundry process include manufacturing and assembling the molds and cores, melting the metal, pouring the metal into the mold, cooling the molded part, removing the mold and core (shake-out), and dressing and deflashing.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	0.43 ppm median (range <0.02-18.3 ppm)			
Personal protective equipment:	Recommended use of personal protective equipment for tasks where the formaldehyde concentration is high.			
Engineering control:	The main means of controlling formaldehyde exposure include use of mold and core-making materials that do not contain formaldehyde, replacement of hot-mold production processes with cold hardening processes, using resins with lower emission rates, confinement of production steps that produce formaldehyde emissions, installation of fume hoods at emission sources, and sufficient general ventilation.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for foundries which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The study was published in 1979, prior to the latest PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a median value and range data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	No meta data were provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Range data were provided that can be used to evaluate variability, uncertainty was likely considered in the NIOSH methodology.
Overall Quality Determination		Medium

Conditions of Use:	processing			
EXTRACTION				
Parameter	Data			
Life cycle description:	Reactant: blockboard mill			
Process description:	Regardless of the type of fiber used, the manufacturing process is basically the same: (1) the wood fiber is bonded together with a thermosetting resin to form a mat, (2) the mat is hot pressed, and (3) the pressed mat is then cooled and allowed to mature. The wood fibers typically are bonded with UF, MF, MUF, or PF resins. During hot pressing, the mat is heated and compacted to the desired density and thickness, and the resin polymerizes to bind the particles and stabilize the panel.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	0.5 ppm mean (range 0.4-0.6 ppm)			
EVALUATION

Parameter	Data			
Life cycle description:	Chemical substance in products not described by other codes: Anatomy laboratory - Dissecting			
Process description:	Embalming is a procedure that delays the decomposition of a cadaver. To accomplish this, the embalmer injects into either the common carotid or femoral artery usually 12 to 18 L of an aqueous solution of formaldehyde at a concentration ranging from about 1.25% to 32%, depending on how much the body has changed since death			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	a) 0.4 ppm mean (range 0.06 - 1.04 ppm) b) 2.4 ppm mean			
Personal protective equipment:	General work practices that will reduce exposure include closing jars promptly when not in use, prompt disposal of formaldehyde soaked rags, proper storage and disposal of products, and periodic equipment inspections. Personal protective equipment should be used during procedures involving high formaldehyde concentrations.			
Engineering control:	Methods to reduce formaldehyde exposure include product substitution and modifications of work areas and work practices. Work-station modifications that can reduce exposure include confining difficult embalming cases; physically separating embalming tasks from restoration tasks; installation and proper use of capture equipment at the source, such as hoods over the injection equipment; and design of work stations to ensure adequate ventilation.

EXTRACTION				
Parameter	Data			
Life cycle description:	Building and construction materials: Insulating buildings with UFFI			
Worker activity description:	Construction workers who varnish floors can have high exposures, these workers are also potentially exposed to wood dust and various solvent vapors from varnishes, putties, and adhesives. Working with UFFI or fiberglass insulation manufactured using formaldehyde-based resins also can result in formaldehyde exposure. Since the 1980s, glass-fiber mats have become an important material for roof shingles, asphalt roofing tiles, and roll roofing. UF and occasionally PF resins are used as binders to hold the glass fibers together until an asphalt coating is applied. Machining of wood-based composites and other formaldehyde-containing wood products are other sources of exposure in the construction industry.

EXTRACTION				
Parameter	Data			
Life cycle description:	Other commercial uses: Manufacture of Textiles and Garments- Permanent-press clothing production			
Process description:	The finishing process involves impregnating the fabric in an aqueous solution and then pressing it to remove the excess solution (IRSST 2006). The main factors that affect worker exposure to formaldehyde include the types of processes and products used, the presence and efficiency of fume hoods and emission collection systems, and the level of general ventilation. Jobs that may result in formaldehyde exposure include resin preparer, process operators (various types), colorist, and maintenance worker. The main means of controlling exposure include use of formaldehyde-free finishes, the use of fume hoods at the source of emissions, sufficient general ventilation, and the use of personal protective equipment where formaldehyde levels are high.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	0.31 & 0.74 ppm means for two data sets (range 0.0-2.7 ppm)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for the textile and garment industries which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The study was published in 1966 & 68, prior to the latest PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by mean and range data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	No meta data were provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Range data is provided that can be used to evaluate variability, uncertainty not presented.

Conditions of Use:	Commercial uses			
EXTRACTION				
Parameter	Data			
Life cycle description:	Chemical substance in products not described by other codes: Anatomy laboratory - Dissecting			
Process description:	Embalming is a procedure that delays the decomposition of a cadaver. To accomplish this, the embalmer injects into either the common carotid or femoral artery usually 12 to 18 L of an aqueous solution of formaldehyde at a concentration ranging from about 1.25% to 32%, depending on how much the body has changed since death			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	range 0.11-0.62 ppm			
Personal protective equipment:	General work practices that will reduce exposure include closing jars promptly when not in use, prompt disposal of formaldehyde soaked rags, proper storage and disposal of products, and periodic equipment inspections. Personal protective equipment should be used during procedures involving high formaldehyde concentrations.			
Engineering control:	Methods to reduce formaldehyde exposure include product substitution and modifications of work areas and work practices. Work-station modifications that can reduce exposure include confining difficult embalming cases; physically separating embalming tasks from restoration tasks; installation and proper use of capture equipment at the source, such as hoods over the injection equipment; and design of work stations to ensure adequate ventilation.

	Metric 3:	Applicability	High	The data are for an occupational scenario (foundary) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1984 - Prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range though uncertain statistics were not provided. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type and location but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	no data were provided regarding variability also uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Overall Quality Determination		Medium		

Study Citation:	Ochs, S., Grotz, L., Factorine, L.S., Rodrigues, M.R., Netto, A.D. (2011). Occupational exposure to formaldehyde in an institute of morphology in Brazil: a comparison of area and personal sampling. Environmental Science and Pollution Research 19(7):2813-2819.			
HERO ID:	2566605			
Conditions of Use:	Embalming			
EXTRACTION				
Parameter	Data			
Worker activity description:	Personnel in morphology department of an university in Brazil			
Exposure route:	inhalation			
Personal sampling data:	The average personal exposure of the monitors was 3.44 +/- 0.94 mg/m3 and ranged from 1.89 to 4.82 mg/m3. The average personal exposure levels were approximately 0.4 to 2.3 fold higher than the area levels of formaldehyde in the anatomy laboratory.			
Area sampling data:	The average concentration of formaldehyde found in the corridor that links the teachers’ rooms (second floor) (0.20 mg/m3) and in the entrance hall (first floor) (0.18 mg/m3) were less than those detected in other study areas. Concentrations in these areas varied between 0.03 and 0.37 mg/m3 in the corridor that links the teachers’ rooms and 0.09 and 0.35 mg/m3 in the entrance hall. In general, the concentrations of formaldehyde in the basement were higher than in the other floors. The average concentration found in the anatomy laboratory was 0.93±0.62 mg/m3 and ranged from 0.22 to 2.07 mg/m3. The concentration of formaldehyde in the air of the embalming room showed a nearly constant value between 2.21 to 2.52 mg/m3. The lowest formaldehyde concentrations were those found in the entrance hall (first floor) and corridor of the second floor, but despite this fact, the observed values are higher than the exposure limits established by the World Health Organization and NIOSH. In contrast, the concentrations found in the anatomy laboratory exceeded all international guideline limits, except those of the Brazilian PEL, which represents the most permissive guideline. The very high formaldehyde concentration found in the embalming room was higher than the values found in the other sampling areas and also exceeds the Brazilian guidelines.

Personal protective equipment:	Respiratory protection: Suitable respiratory protection for lower concentrations or short-term effect: Suitable respiratory protection for higher concentrations or long-term effect: Gas filter EN 141 Type B for gases/vapours of inorganic compounds. Self-contained breathing apparatus. Hand protection: Chemical resistant protective gloves (EN 374) Suitable materials also with prolonged, direct contact (Recommended: Protective index 6, corresponding > 480 minutes of permeation time according to EN 374): butyl rubber (butyl) - 0.7 mm coating thickness nitrile rubber (NBR) - 0.4 mm coating thickness Eye protection: Tightly fitting safety goggles (splash goggles) (EN 166) Body protection: chemical-protection suit (according to DIN-EN 465)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is from Germany and US
	Metric 3:	Applicability	High	The data are for occupational scenarios within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old
	Metric 5:	Sample Size	Medium	Discrete samples are not provided but number of samples taken, range, and limited percentile info provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination			Low	

Study Citation:	Ogawa, M., Kabe, I., Terauchi, Y., Tanaka, S. (2019). A strategy for the reduction of formaldehyde concentration in a hospital pathology laboratory. Journal of Occupational Health 61(1):135-142.			
HERO ID:	5946168			
Conditions of Use:	commercial use			
EXTRACTION				
Parameter	Data			
Worker activity description:	workers (doctors and technicians) in a hospital pathology laboratory in Japan			
Exposure route:	inhalation			
Area sampling data:	Change in the formaldehyde concentrations (ppm) before and after the interventions in points (1)-(5) are as follows: before the interventions - (1) 0.34, (2) 0.03, (3) 0.02, (4) 0.02, (5) 0.06; after the engineering and software interventions - (1) 0.13, (2) 0.07, (3) 0.03, (4) 0.03, (5) 0.08; after the intervention with video camera - (1) 0.11, (2) <0.01, (3) <0.01, (4) <0.01, (5) 0.07. Following the engineering interventions and asking the workers not to block the ventilation systems or keep the waste fluid tank open, the formaldehyde concentrations in points (1)-(5) improved.			
Engineering control:	First, engineering controls were implemented, and workers were asked not to block the ventilation system and not to keep waste fluid tanks open. The first step in working environment control is the measurement of the working environment, which entails three processes. First, the airborne concentrations of chemicals in the workplace atmosphere must be measured. Second, the indices (1st evaluation value and 2nd evaluation value) must be calculated by statistical treatment of the measurement results. The 1st evaluation value (EA1) is the estimated value suited to 5% of the highest level among the actual value of the airborne substances while the 2nd evaluation value (EA2) is the estimated value of the arithmetic mean concentration. Third, the calculated values must be compared with the “administrative levels” that are stipulated for each hazardous chemical by the government, and the control class is then determined. Next, using a video camera and a formaldehyde detector, the authors attempted to visually educate workers about how much formaldehyde is emitted from the sample container based on the type of action undertaken.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	methodology is well described	
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	data are from an OECD country. other than the U.S.	
	Metric 3: Applicability	High	data are for an occupational scenario within the scope of the risk evaluation	
	Metric 4: Temporal Representativeness	High	data is less than 10 years old	
	Metric 5: Sample Size	Low	characterized by no statistics	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Monitoring data include most critical metadata	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	has no discussion on uncertainties

HERO ID:	8442101			
Conditions of Use:	Asphalt, paving, roofing, and coating materials manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	A "splicer" and "splicer helper" are responsible for feeding and splicing the rolls of paper or fibrous glass matte. One worker ("coaterman") handles the coater and one employee tends the pressroll and cooling section areas of the shingle line. One employee handles the slate granules and other minerals used in the shingles. This "slateman" is responsible for monitoring the flow of granules and/or loading the minerals into ventilated hoppers in the slateroom which is located above the coater. (4/18)			
Exposure route:	inhalation (9/18)			
Physical form:	vapor (8/18)			
Area sampling data:	Two area samples were 0.03 and 0.07 ppm. (11/18)			
Number of workers:	12 employees handle the main shingle line (4/18)			
Personal protective equipment:	NIOSH recommends certified respirators in certain areas of the plant. (12/18)			
Engineering control:	The saturators and the coater have mechanical ventilation systems are known as "HEAF" units (High Efficiency Air Filters). The saturators are enclosed and under negative pressure. Employees only enter the saturator during breakdowns and spot checks and the greatest exposures to asphalt fumes plus any substances contained in the fumes occur at this time. The coater has partial enclosure and this HEAF unit captured most of the fumes and smoke. (4/18)

Exposure duration:	3 hr			
Engineering control:	Ventilation controls was implemented and proved to be effective in reducing formaldehyde vapor levels.			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified, though it was noted that formaldehyde samples were collected by passive diffusion with the aid of 3M monitors. The monitors were used as personal samplers and were clipped onto the collars of individuals as close to their breathing zone as possible. All chemical samples were taken and analyzed in accordance with 3M Analytical Method 4D (3M 1985), this being the prescribed method for 3M monitor #3720 or #3721, by an independent SABS approved laboratory in Johannesburg. A control monitor or ‘field blank’ was subjected tothe same environmental conditions as the other formaldehyde monitors by placing an unopened monitor in the laboratory environment. The blanks were sent together with the batches ofsamples to the laboratory where they were also analyzed, as specified by the manufacturer. Temperature and humidity levels were monitored to ensure that the equipment was used within manufacture specified limits.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	South Africa - not an OECD member
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	The study was based on data from 1993-1995, after the most recent PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	High	Actual results for each sampling event were provided noting the dates of the sample, location and section of the body being dissected.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, exposure durations, and worker activities, but did not include exposure frequency.

Area sampling data:	15-135 (g/m^3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	South Korea is an OECD member country
	Metric 3:	Applicability	High	The data are for an occupational scenario (commercial use of building/construction materials – wood and engineered wood) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Assessment is based on data greater than 10 years old but no more than 20 years old and industry conditions that are expected to be representative of current industry conditions. (2007)
	Metric 5:	Sample Size	High	Discrete sample results included.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Discussed sample type and sample duration, but it included no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Only provided a limited discussion of the variability and uncertainty of the results.
Overall Quality Determination		Medium		

Study Citation:	Pang, X., Mu, Y. (2007). Characteristics of carbonyl compounds in public vehicles of Beijing city: Concentrations, sources, and personal exposures. Atmospheric Environment 41(9):1819-1824.			
HERO ID:	2095287			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Number of sites:	12 taxis, 9 buses, 8 subways			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Taxi A driver 212 ug/day mean (257 ug/day 95th percentile); Taxi B driver 181 ug/day mean (226 ug/day 95th percentile); Bus A driver 181 ug/day mean (227 ug/day 95th percentile); Bus B driver 121 ug/day mean (151 ug/day 95th percentile); Bus C driver 304 ug/day mean (710 ug/day 95th percentile)Taxi A driver 212 ug/day mean (257 ug/day 95th percentile);			
Area sampling data:	Taxi A 28 ug/m3 mean (range 15-34 ug/m3); Taxi B 24 ug/m3 mean (range 13-30 ug/m3); Bus A 24 ug/m3 mean (range 19-30 ug/m3); Bus B (LNG) 16 ug/m3 mean (range 13-20 ug/m3); Bus C (LNG) 40 ug/m3 mean (range 14-94 ug/m3); subway (electric) 19 ug/m3 mean (range 15-27 ug/m3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	The methodology was not specified, but it was noted that carbonyls were sampled by Sep-Pak cartridges (Waters) coated with 2,4-dinitrophenylhydrazine. The sampled cartridges were eluted by 5.0 mL acetonitrile and analyzed by a HPLC system(HP1050).
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	China - not an OECD member
	Metric 3:	Applicability	High	The data are for taxi, bus, and subway drivers, which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The study was published in 2006, after the most recent PEL (1992) and more than 10 but less than 20 years old.
	Metric 5:	Sample Size	Medium	Mean and range data were provided for area sampling and mean and 95th percentile values were provided for personal sampling.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range and percentile data that can be used to evaluate variability. Information about uncertainty was not provided.

Study Citation:	Partanen, T., Kauppinen, T., Hernberg, S., Nickels, J., Luukkonen, R., Hakulinen, T., Pukkala, E. (1990). Formaldehyde exposure and respiratory cancer among woodworkers - an update. Scandinavian Journal of Work, Environment and Health 16(6):394-400.
HERO ID:	626500
Conditions of Use:	Use of Floor coverings

EXTRACTION	
Parameter	Data
Worker activity description:	particle board plants, plywood plants, construction carpentry, furniture manufacture, saw mills glue manufacture plants
Exposure route:	inhalation
Physical form:	vapor
Area sampling data:	less than 0.1 to 3 ppm - the study does not provide any additional details, instead the health impact component of the study considers exposure concentrations in bins < 0.1 ppm, 0.1-1 ppm, and >1.0 for different latency periods.
Number of workers:	408 out of 7307 retrospective cohort

EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	data are from Finland - OECD member country
	Metric 3: Applicability	Low	Data are for woodworking, is in-scope occupational scenario but the detailed data for specific subgroups considered are not provided
	Metric 4: Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL - Published in 1990
	Metric 5: Sample Size	Low	Sample distribution is characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Uninformative	Sample type and exposure type not provided.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability addressed by and uncertainty are discussed in a qualitative manner

Overall Quality Determination **Uninformative**

Conditions of Use:	Installation/Demolition of Building Materials

EXTRACTION	
Parameter	Data
Worker activity description:	General activities for site: Plasma arc cutting, welding, air arc repairing, chipping, gouging, tank cleaning, and grinding. Source of formaldehyde: Fibrous glass insulation used to seal the furnace doors. The doors were re-sealed with new insulation upon completion of each heating cycle. Typically these insulations are made with phenol-formaldehyde resins, which is the assumed source for formaldehyde emissions.
Exposure route:	inhalation
Physical form:	vapor
Area sampling data:	Plant 3 - Annealing FurnaceWest Burner Room - Near door leading into Panel Room >10 ppmWest Burner Room - Near door leading into Panel Room 2 ppmPanel Room <0.5 ppmWest Burner Room - Near door leading into Panel Room 0.5 ppmWest Burner Room - Near door leading into Panel Room 0.5 ppmF&D Annealing FurnacesWest Burner Room 0.5 - 0. 7 ppmWest Burner Room 2 ppmSouth Door - Around seal of south door of furnace 2 - 4 ppmNorth Door - Around seal of north door of furnace NDPanel Room NDSouth Door - Around seal of south door of furnace > 10 ppm
Exposure duration:	3 shifts per day
Number of workers:	1030 production personnel and 80 administrative staff
Personal protective equipment:	air supplied respirators, self-contained breathing apparatus, and a variety of air purifying respirators. A written respirator program. Processes which used respirators were tank cleaning, application of urethane foam, and rarely when welding.
Engineering control:	"Contaminant generation was primarily controlled through means of mechanical dilution ventilation and natural air movements. Occasionally, local exhaust ventilation was employed when processes involved welding, chipping, gouging, and/or grinding inside the tanks... The exhaust velocity at the face of a typical air ejector duct, with a two inch diameter, was approximately 6000 ft/min and decreased to approximately 100ft/min one foot from the duct. Since ducts were observed to be placed anywhere from one to several feet from the contaminant source, the efficiency of the system varied considerably."; waterbed to contained emissions released during the cutting of shell plates.

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability				
	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling methodology is provided but does not cite the NIOSH method but does report that the tubes used were not NIOSH certified.
Domain 2: Representativeness				
	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (tank car manufacture) within the scope of the risk evaluation. The source of the formaldehyde exposure was investigated and assumed to come from the fibrous glass insulation(phenol-formaldehyde resin used in the insulation) used to seal the furnace doors.
	Metric 4:	Temporal Representativeness	Low	1977 - prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	Medium	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed
Domain 3: Accessibility/ Clarity

Conditions of Use:	Laboratory Chemicals

EXTRACTION	
Parameter	Data
Worker activity description:	Patients are connected to an artificial kidney (dialyzer) and dialysis console. Once the patient is disconnected from the dialyzer, the nurse 'or technician send the unit to reuse/sterilization for cleaning in a 4% formalin solution. Here one person will spend approximately 1 1/2 to 2 hours sterilizing all the dialyzers. On the weekends, employees are required to pack and sterilize all the consoles. Normally 3 to 5 employees are in the room during this procedure although only 2 to 3 are required to perform the actual process. This process requires the complete draining of each unit followed by filling and packing with a 10% formalin solution. This solution sets in the individual units for the entire weekend and is drained early Monday morning.
Exposure route:	inhalation & dermal
Physical form:	vapors and liquid
Personal sampling data:	Formaldehyde levels measured at the dialysis center ranged from 0.28 to 1.0 mg/M3 for personal samples. Formalin Mixing 0.79 mg/m3Reuse/Sterilization 1.0 mg/m3 & 0.75 mg/m3Dialysis Unit Packing 0.32 mg/m3; 0.90 mg/m3 & 0.42 mg/m3Nurses/Technicians 0.32 mg/m3; 0.37 mg/m3; 0.28 mg/m3 & 0.35 mg/m3
Area sampling data:	Reuse/Sterilization 0.42 mg/m3 & 0.75 mg/m3Dialysis Console Area Number 3 0.47 mg/m3 Number 4 0.50 mg/m3 Number 5 0.33 mg/m3Other Areas Directors Office ND Reception/Clerical Office ND Nurses Desk ND
Number of workers:	20 - including director/manager, technicians, nurses, dietitian, social worker, and clerical workers.
Personal protective equipment:	The employees on the main floor normally wear a lab coat or smock while attending to the patient during treatment. These employees also wear surgical gloves during weekend packing procedures.The employees who performed the reuse/sterilization procedures wore surgical gloves, a NIOSH/MSHA approved formaldehyde type disposable respirator, and goggles during the reuse process. Rubber aprons were an optional garment that could be worn by the employee while performing this activity.
Engineering control:	The slot exhaust is positioned along the back portion of the sink, directly below the dialyzer holders and is actually flush with the top of the sink. This system is designed to draw air across the front of the sink to the back and thus remove the formaldehyde contaminant from the workers breathing zone. The face velocity across the slot averaged between 30 to 40 feet per minute (fpm) and the capture velocity at the front of the sink, averaged between. 5 to 10 fpm. This is inadequate and should be redesigned. Local exhaust ventilation should be improved in areas where formaldehyde will be used extensively. A capture velocity of at least 100 fpm is required in order to exhaust the formaldehyde vapors at the source of generation and away from the operatorbreathing zone. This exhaust system will also require appropriate make-up air for the system to work properly. General room ventilation allowing for a minimum of five air changes per hour should be maintained in the general work areas. This would assist in lowering the formaldehyde levels found in all those areas tested.

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study - Method 250
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	1984-85 - prior to PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics.
Domain 3: Accessibility/ Clarity

HERO ID:	4057870			
Conditions of Use:	Chemical substances in automotive and fuel products-Automotive care products; Lubricants and greases; Fuels and related products			
EXTRACTION				
Parameter	Data			
Worker activity description:	employees who work in the bus repair and storage area from diesel emissions from buses as they were first started in the morning, during idling periods, driven from and into the storage area and during maintenance procedures. (pdf pg 5)			
Exposure route:	Inhalation			
Physical form:	Vehicle exhaust			
Area sampling data:	Area formaldehyde concentrations were also slightly higher during the winter survey (range 0.01 - 0.10 mg/m3) than during the summer survey (range 0.004 - 0.01 mg/m3).(pdf pg 11)Twelve area samples were collected for determination of formaldehyde concentrations. . The samples were collected in impingers containing sodium bisulfite and analyzed according to NIOSH Method P&CAM 125. (pdf pg 9)			
Engineering control:	Any engine running in a repair stall requires that the bus be hooked up to the tail pipe exhaust system. (pdf pg 6)The ventilation system was designed to either conform to or exceed requirements of 1 cubic foot per minute (CFM) of outside air per square foot of floor area. The 1 CFM/ft2 outside air is designed as the level of ventilation needed to maintain exhaust pollutants below OSHA recommended criteria. This is based upon gasoline engines, and is conservative for diesel engines. The overall ventilation scheme is to introduce the outside air in the zones of primary worker exposure, and then let it migrate through the areas of progressively greater tail pipe emissions, tending to keep the more offensive air in the zones that are occupied only intermittently by workers. Stage 2 ventilation operated simultaneously with Stage 1 makeup during the hours of considerable bus activity in the storage and circulation areas. A second make-up air unit, adds a second 20,000 CFM of outside air which is introduced in the occupied bus repair area and migrates through the unoccupied storage area where it is exhausted to the outdoors from the west end by running at high speed (20,000 CFM). The anticipated hours of operation were from 5:00 a.m. until about 9:00 a.m., and from about 6:00 p.m. until 11:00 a.m. This second stage is started either manually by the supervisor, or by automatic oxygen sensors that measure the reduction of oxygen in the space. Stage 3 ventilation operates when the paint booth is turned on. When its 25,000 CFM exhaust fan, EF-4, is started, MUA-2 runs at high speed, delivering 30,000 CFM, and EF-1 operates at low speed, exhausting 10,000 CFM. An underfloor engine exhaust system with 5 inch diameter retractable tail pipe adaptor hoses is furnished. Outlets are located at each end of each repair stall. The vehicles with high tail pipe outlets require the use of 5 inch diameter "cane" adaptor. Exhaust volume is 400 CFM per outlet based upon 3 outlets in simultaneous use. (pdf pg 6-8)

Study Citation:	Rahman, M.A., Rossner, A., Hopke, P.K. (2017). Occupational exposure of aldehydes resulting from the storage of wood pellets. Journal of Occupational and Environmental Hygiene 14(6):417-426.			
HERO ID:	3870738			
Conditions of Use:	Commercial use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers involved in wood pellets production and storage			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	Air sampling was performed in a wood pellet warehouse at a pellet mill, and in controlled laboratory experiments. Sampling was conducted in five locations in the warehouse from April–June 2016 when it contained varying quantities of bagged pellets. In April 2016, the warehouse was about 30% full of bags of softwood and blended wood pellets. By May, it was 50% full. Finally, by the June sampling day, the warehouse was full of the pellet bags. Formaldehyde concentrations in the warehouse ranged from 0.15–0.44 ppm Formaldehyde concentrations in the warehouse are above the NIOSH REL (0.02 ppm, 8 hr), NIOSH REL-C (0.10 ppm, 15 min), and ACGIH TLV-C (0.30 ppm, ceiling) when the warehouse was filled to 50–100% of its capacity for pallets of bagged wood pellets. The laboratory studies of the aldehydes off-gassing were conducted by using softwood and blended wood pellets. In the laboratory, formaldehyde concentrations in the drums ranged from 0.13–0.15 ppm.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling and analytical methodology well described.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	Data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	Data less than 10 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty
Overall Quality Determination		Medium		

Study Citation:	Reeves, W.A., Day, M.O., McLellan, K.R., Vigo, T.L. (1981). Formaldehyde release in formaldehyde-finished and resin-finished fabrics. Textile Research Journal 51(7):481-485.			
HERO ID:	5960898			
Conditions of Use:	Processing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in finishing plants, fabric storage and cutting rooms, and retail stores. (1/5)			
Exposure route:	inhalation (1/5)			
Area sampling data:	Five finishing agents were tested with cotton and polyester/cotton fabric. Initially, formaldehyde releases ranged from 560-12,800 ppm. After one wash, formaldehyde releases ranged from 18-1,128 ppm. (Full data available in text). (4/5)			
Engineering control:	"One approach [to reduce formaldehyde emissions] has been to develop N-methylol compounds that resist hydrolysis. One of the best and most frequently used compounds is dimethylol 4,5-dihydroxyethyleneurea. This reduced free formaldehyde to about 1100 ppm... Another approach to reduce formaldehyde release is to wash and dry fabrics after treatment. This approach has reduced free formaldehyde to about 800 ppm... A less expensive approach is to steam the treated fabrics for several seconds. This leaves about 1000 ppm on formaldehyde in the fabric." (1/5)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for textile finishing and the use of fabric, which are in-scope occupational scenarios.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling two fabric types with five different finishing agents.
Overall Quality Determination		High		

Study Citation:	Regazzoni, L.G., Grigoryan, H., Ji, Z., Chen, X., Daniels, S.I., Huang, D., Sanchez, S., Tang, N., Sillé, F.C., Iavarone, A.T., Williams, E.R., Zhang, L., Rappaport, S.M. (2017). Using lysine adducts of human serum albumin to investigate the disposition of exogenous formaldehyde in human blood. Toxicology Letters 268:26-35.			
HERO ID:	4454115			
Conditions of Use:	Formaldehyde Production Factory			
EXTRACTION				
Parameter	Data			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	Exposed subjects worked in a formaldehyde-production factory and control workers were employed in a nearby medical school and other local institutions in jobs that did not involve use of formaldehyde. The formaldehyde exposure levels in the production factory were assessed with air samples collected annually at three locations representing the range of formaldehyde air concentrations in the workplace. Between 2012 and 2014 the estimated air concentrations ranged from a low value of 0.3 ppm to a high value of 10 ppm, which were at the upper end of reported exposure concentrations in Chinese factories. Based on all measurements, the authors estimated that workers in this factory were exposed to formaldehyde at the median air concentration of 1.5 ppm.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data from a non-OECD country
	Metric 3:	Applicability	High	Data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Data is no more than 10 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	Reh, B. D. (1995). Health hazard evaluation report HETA-95-0153-2549, Fort Wayne Foundry Machining Division, Fort Wayne, Indiana. GRA and I(GRA and I):95-0153.			
HERO ID:	1320737			
Conditions of Use:	Use of metal products			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	The formaldehyde samples were all less than 0.06 ppm (minimum quantifiable concentration was 0.05 ppm and minimum detectable concentration was 0.02 ppm). This is not surprising since the last addition of Grotan® (biocide added to the MWF - noted formaldehyde releaser) occurred over three weeks before the survey. The fact that is was still detectable suggests that the concentrations might be higher when the Grotan® is first added.			
Dermal exposure data:	nan			
Exposure duration:	8-10 hours per day			
Exposure frequency:	40 hours per week			
Personal protective equipment:	NIOSH investigators recommend that each employee have uniforms and that they be required to shower and change before leaving work. Used uniforms should not be stored in contact with clean ones or with personal clothing. Employees should also beencouraged to change clothes that have become soaked with MWFs. The uniforms should be laundered at the facility.			
Engineering control:	Local exhaust ventilation (LEV) should be installed for each operation.			
Comments:	Formaldehyde concentrations were low, so the ultimate source may be cigarette smoke.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study - Method 2541
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (aluminum metal work) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	1995 - after PEL (1992) but more than 20 years old
	Metric 5:	Sample Size	Medium	Only maximum value provided, no statistical analysis. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, exposure durations, exposure frequency, but lacks additional metadata, such as sample durations, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability could not be assessed as only one maximum value was provided. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods.

Conditions of Use:	Incorporation into a formulation, mixture, or reaction product

EXTRACTION	
Parameter	Data
Worker activity description:	The pants, service suits, shop coats, and some of the jackets are pressed by one of twelve operators. The machines used by these operators are oriented in two rows and in such a manner that permits the operator to control two machines. After these items have been pressed, one of two employees places them on hangers so that a third employee may place them on a conveyor (chain) which travels through the curing oven. One employee removes the items cured in the oven and folds and sizes the pants. Other items are sent to two other employees for folding and packaging. Shirts are pressed on the opposite side of the room by utilizing a sleeve presser, a collar presser, and a body presser. Each of five "shirt pressers" operates two machines; a collar presser and a sleeve presser. The remaining three "shirt pressers" operate single machines which press the body of the shirts. In addition to the employees mentioned above, there are two employees who fold shirts, one "bundle boy" who delivers bundles of clothes to be pressed to the operators, one utility person, and one supervisor in this room.
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	November 12-13, 1975 Pants Presser (a) Machine 604 & 605: 53.4 ug/m3 and 77.7 ug/m3 Pants Presser (b) Machine 608 & 609: 54.9 ug/m3 and 133.9 ug/m3 Pants Presser (c) Machine 600 & 601: 59.9 ug/m3 and 8.5 ug/m3 Presser (d) removing cured clothing from the conveyor: 93.0 ug/m3 and 67.0 ug/m3 Pants Presser (e) Machine 616 & 617: 72.8 ug/m3 and 16.7 ug/m3 Pants Presser (f) Machine 622 & 623: 5.9 ug/m3 and 73.3 ug/m3 Shirt Presser (g) Machine 629: 6.6 ug/m3 and 11.9 ug/m3 Shirt Presser (h) Machine 631: 112.4 ug/m3 and 9.1 ug/m3 Shirt Presser (i) Machine 636 & 637: 1188.4 ug/m3 and 73.2 ug/m3 Presser (j) removing cured clothing from the conveyor: 36.0 ug/m3 and 74.1 ug/m3 Pants Presser (f) Machine 622 & 623: 81.3 ug/m3 Pants Presser (k) Machine 606 & 607: 83.9 ug/m3 November 13, 1975 Pants Presser (a) Machine 604 & 605: 50.9 ug/m3 and 70.1 ug/m3 Pants Presser (c) Machine 600 & 601: 28.4 ug/m3 and 137.3 ug/m3 Pants Presser (l) Machine 614 & 615: 319.9 ug/m3 and 35.0 ug/m3 Pants Presser (m) Machine 618 & 619: 41.3 ug/m3 and 76.8 ug/m3 Pants Presser (n) Machine 610 & 611: 53.9 ug/m3 and 48.2 ug/m3 Jacket Presser (o): 14.7 ug/m3 and 118.4 ug/m3 Pants Presser (f) Machine 622 & 623: 67.2 ug/m3 and 72.7 ug/m3 Shirt Presser (h) Machine 631: 88.8 ug/m3 and 121.8 ug/m3 Folder & Boxer (p) 50.5 ug/m3 and 63.2 ug/m3
Number of workers:	30
Personal protective equipment:	Long sleeve shirts.
Engineering control:	Increase air supply to cool the pressers.

Occupational Exposure

Study Citation:	Roper, C. P., Jr (1976). Health Hazard Evaluation Determination, Report No. 74-120-260, Goodyear Tire and Rubber Company, Gadsden, Alabama.			
HERO ID:	1009699			
Conditions of Use:	Rubber Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Three employees per shift (the Banbury operator, the batch builder, and the rubber opener) add the raw ingredients to the top of the Banbury. Each batch of sleeve stock is run through a series of rolling mills and then cut into 3x4 ft. sheets and stacked by the cutter man. Four employees per shift are exposed at the mill line and 8-inch tuber, a milling and extrusion operation. The mill man loads the sleeve stock which has come from the Banbury area onto a warm-up mill where the stock is heated slightly and milled. One person operates the tuber where the stock is cut into lengths after extrusion and two bookers layoff the slugs into trays. One operator (cure man) per shift works in the sleeve curing area. His duties include (1) cutting slugs of previously extruded sleeve stock to the proper length and weight, (2) curling the slugs into a circular shape, (3) placing the slugs into a pre-heating oven at 125 degrees F, (4) inserting the pre-heated slugs into the mold presses and removing the molded sleeves, and (5) inspecting the sleeves. The operator removes the sleeves manually from the presses and throws them onto metal tables to cool.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Range from ND to 0.55 ppm, data for each sampling event are provided in Table 2			
Area sampling data:	One area sample was taken which found concentration of 0.01 ppm			
Exposure duration:	varies by job, for example milling sleeve stock is done for 2 hours per batch.			
Exposure frequency:	varies based on task for example the Banbury mixer is operated 1 shift per week compared to cure man who operate three shifts per day.			
Number of workers:	varies by job			
Engineering control:	- improve exhaust system- find substitute resins			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Study was implemented in 1975 prior to the PEL (1992)
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Samples were taken for different operators and locations, thus addressing variability. Uncertainty is not addressed.

Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination			High	

Study Citation:	Rossiter, W.J., Mathey, R.G. (1985). Urea-formaldehyde foam insulations: a review of their properties and performance.			
HERO ID:	6020303			
Conditions of Use:	Commercial use			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Area sampling data:	The CPSC analyzed data on formaldehyde levels in 1,164 residences which contained urea-formaldehyde foam and 103 residences without foam. Data included measurements in foam-insulated houses from a few weeks after installation to 9 years after installation. The data analyzed by CPSC indicated that the average level of formaldehyde in residences with urea-formaldehyde foam was 0.12 ppm, while that in residences without foam was 0.03 ppm. The analysis also indicated that the level of formaldehyde in foam insulated residences declined relatively rapidly in about the first 40 weeks after installation and more slowly after that time. For example, within 40 weeks after installation, the formaldehyde levels were generally in range of 0.2 - 0.3 ppm, while about 1 year after installation they dropped to slightly less than 0.1 ppm on the average. A limited study was conducted in the United States whereby formaldehyde levels were determined in 3 control residences, one mobile home having urea-formaldehyde foam, 10 residences having urea-formaldehyde foam, and 2 residences from which foam had been removed. These homes were located in Colorado and the age of the foam was greater than 2 years. The average formaldehyde level in the foam insulated homes was 0.039 ppm. That in the control homes averaged 0.019 ppm. For two of the homes in the Colorado area, the formaldehyde measurements were made in both the winter and following spring. These results in general showed the levels to increase in the spring time. This study also included measurements of formaldehyde levels of 11 foam-insulated residences located in Wisconsin. Nine of these residences had urea-formaldehyde foam insulation with a minimum age of 2 years; the foam age of the other two residences was a year or less. The average formaldehyde concentration was 0.079 ppm, which was higher than that for the residences surveyed in Colorado.			
Personal protective equipment:	PPEs during foam removal: wearing of protective equipment (e.g., masks, respirators) and clothing during removal, handling of chemicals.			
Engineering control:	Some engineering controls are as follows: (1) Reducing moisture levels in wet cavities through drying, and keeping the cavities as dry as possible. (2) Sealing air leakage paths both where outside air enters the structural walls, and where it finally enters the building. (3) Ventilation to reduce the formaldehyde gas concentration. (4) Removal of the Urea-Formaldehyde Foam Insulation.			
EVALUATION

Formaldehyde

Occupational Exposure

HERO ID: 4157290 Table: 1 of 1

Study Citation:	Rothman, N., Lan, Q., Smith, M.T., Vermeulen, R., Zhang, L. (2017). Response to letter to the editor of Carcinogenesis by Pira et al., 2017. Carcinogenesis 38(12):1253-1255.			
HERO ID:	4157290			
Conditions of Use:	Processing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in factories that manufacture plastic plates and light utensils using a formaldehyde based resin.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	The median exposure was 1.38 ppm and the 10th to the 90th percentile was 0.78 to 2.61 ppm			
Number of workers:	43			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data is from China.
	Metric 3:	Applicability	High	Data are for formaldehyde use in factories, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (median, percentiles) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing most other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by pairing individuals and excluding potential confounding subjects, but uncertainty is not addressed.
Overall Quality Determination		Medium		

Formaldehyde

Occupational Exposure

HERO ID: 1314193 Table: 1 of 1

Study Citation:	Roto, P., Sala, E. (1996). Occupational laryngitis caused by formaldehyde: A case report. American Journal of Industrial Medicine 29(3):275-277.			
HERO ID:	1314193			
Conditions of Use:	Use of food packaging			
EXTRACTION				
Parameter	Data			
Worker activity description:	During the packing process. milk boxes (Pure-Pack TM) are closed thermally and aldehydes are emitted in low quantities.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Likely area sampling: 0.03 mg/m3			
Number of workers:	1			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Finland - an OECD member
	Metric 3:	Applicability	High	The data are for food packaging (milk carton) which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data were published in 1996, after the most recent PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	Low	only a single value was provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	no metadata were provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The study does not address variability or uncertainty.
Overall Quality Determination		Low		

Formaldehyde

Occupational Exposure

HERO ID: 3362355 Table: 1 of 1

Study Citation:	Rovira, J., Roig, N., Nadal, M., Schuhmacher, M., Domingo, J.L. (2016). Human health risks of formaldehyde indoor levels: An issue of concern. Journal of Environmental Science and Health, Part A: Toxic/Hazardous Substances & Environmental Engineering 51(4):357-363.			
HERO ID:	3362355			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Area sampling data:	Indoor air levels of formaldehyde from study (ug/m^3): 27.3 [10.7-47.7] for indoor air; 22.5 [9.6-37.2] in bedrooms and living rooms; 21.8 [5.9-40.4] for offices; 1.6 [1.0-3.4] for outdoor terraces or balconies; Figure 1 provides graphical depiction of formaldehyde levels of what was previously described. Long series of indoor air levels of formaldehyde shown in Table 3 for various studies as referenced literature sources. Typical indoor concentrations range form 10 to 50 ug/m^3 being 46 and 37 ug/m^ in bedrooms and living rooms. Northern Europe have levels of 29.8 [4.8-115]; Southern Europe have levels of 12.7 [5.2-32.9]; Usual US levels between 20-40 with outdoor ranges between 1 and 4.			
Exposure duration:	Sample duration of 8 hours			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Unclear if source is peer reviewed but appears to contain high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is for Spain, an OECD country.
	Metric 3:	Applicability	Low	Data not applicable to most COUs as it is for indoor homes and offices.
	Metric 4:	Temporal Representativeness	High	Less than 10 years old (2016)
	Metric 5:	Sample Size	Medium	Characterized by a range of data with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes sampling duration, area sampling and exposure route.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Roy, D.R. (1999). Histology and pathology laboratories. Chemical hazard prevention and medical/health surveillance. American Association of Occupational Health Nurses Journal 47(5):199-205.			
HERO ID:	1986779			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Hospital workers			
Exposure route:	Inhalation			
Area sampling data:	In postmortem rooms and specimen dissection areas, average exposures in the 1980s have been reported in the range of 0.6 to 1.3 ppm, with occasional levels up to 8 ppm.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data is greater than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination			Low	

Study Citation:	Rudell, B., Sandstrom, T., Hammarstrom, U., Ledin, M.L., Horstedt, P., Stjernberg, N. (1994). Evaluation of an exposure setup for studying effects of diesel exhaust in humans. International Archives of Occupational and Environmental Health 66(2):77-83.			
HERO ID:	77214			
Conditions of Use:	Incorporation into a formulation, mixture, or reaction product			
EXTRACTION				
Parameter	Data			
Worker activity description:	light work, riding and ergometer-bicycle			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	0.5 mg/m3 median during 1 hr exposure (interquartile range 0.3-0.8 mg/m3; TLV-TWA 0.6 mg/m3)			
Number of workers:	8 participants			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling and analysis methods not provided, though it was noted that samples were collected on glass fiber filters impregnated with 2,4-dinitrofenylhydrazine and analyzed with HPLC
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Appears that study was implemented in Sweden - OECD member
	Metric 3:	Applicability	High	The data are for vehicle exhaust which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Monitoring data are greater than 20 years old -Published in 1994
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics - Median and Interquartile rang e provided along with TLV-TWA
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	nothing additional provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	variability could be estiamted from the interquartile range but no discussion of uncertainty
Overall Quality Determination		Medium		

Study Citation:	Ruhe, R. L. (1985). Health hazard evaluation report: HETA-84-151-1544 - Nutrun Corporation, New Castle, Indiana.			
HERO ID:	8632586			
Conditions of Use:	adhesives and sealants			
EXTRACTION				
Parameter	Data			
Worker activity description:	Mixer operators, manual preform operators (20/21)			
Exposure route:	inhalation, dermal (8/21)			
Physical form:	gas (8/21)			
Personal sampling data:	A personal and an area sample for formaldehyde both were below the limit of detection of 2 ug. (20/21)			
Area sampling data:	A personal and an area sample for formaldehyde both were below the limit of detection of 2 ug. (20/21)			
Exposure duration:	8-10 hours (6/21)			
Number of workers:	135 production workers and 35 salaried workers. (4/21)			
Engineering control:	Personal and environmental monitoring should be performed every 6 months. Periodic maintenance of ventilation equipment should be performed to prevent malfunction. Areas where employees are allowed to eat or drink should be kept free of toxic material. (13/21)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for industrial use of adhesives and sealants, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker activity provided, but missing exposure frequency and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is addressed in sampling/analytical methodology. Variability is not addressed.
Overall Quality Determination		High		

Study Citation:	Ruhe, R. L., Ehrenberg, R. (1985). Health hazard evaluation report: HETA-84-172-1573 - Philadelphia Limerick Power Plant, Pottstown, Pennsylvania.			
HERO ID:	1322380			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	The insulation workers use a power saw to cut cured Thermo-Lag 330-1 insulation to the contour of the pipes and conduits. In this procedure the material becomes airborne. Joints are sealed with uncured Thermo-Lag 330-1 applied with a trowel. (Page 4 of 22)			
Personal sampling data:	Formaldehyde concentrations from six personal air samples ranged from 0.03 to 0.08 mg/m3 8-hour TWA. (Page 9 of 22). See Table 2 on page 17 for all data and locations of each data point.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study - Method 354
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (Construction activity) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1984 - prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Results from individual sampling events were provided which could be used to evaluate variability between locations. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods.
Overall Quality Determination			High

EXTRACTION				
Parameter	Data			
Worker activity description:	Anatomy lab workers			
Exposure route:	inhalation			
Physical form:	vapor, gas			
Area sampling data:	Samples were between 1.5 - 3.5 ppm			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	From a peer reviewed source so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old.
	Metric 5:	Sample Size	Medium	Only characterized by a range but no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes worker activity, exposure route, physical form, and area sampling data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Rumph, P.F. (1987). Formaldehyde vapor levels in a gross anatomy laboratory during dissection of the dog. Anatomia, Histologia, Embryologia 16(2):144-149.			
HERO ID:	5945158			
Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Veterinary medical students and their mentors during dissection of specimens.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	The overall mean time weighted average was 0.197 ppm, with a maximum of 0.31 ppm and a minimum of 0.09 ppm.			
Exposure duration:	100 minutes			
Exposure frequency:	average of 3.25 days/week			
Number of workers:	89 students and 5 faculty members			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, maximum, minimum, range) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling the laboratory during different weeks while students were performing different tasks.
Overall Quality Determination			High

Number of workers:	14-68			
Comments:	This data source contains a summary of previous studies of formaldehyde in labs			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for laboratory chemical use, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data are greater than 20 years old. (1983-2001)
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing engineering controls, PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by data from multiple studies over multiple years, but uncertainty is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Salem, M.Z., Boehm, M., Srba, J. (2013). Evaluation of Mechanical Properties and Formaldehyde Emission of Plywood Manufactured for Construction Applications. Drvna Industrija 64(2):87-93.			
HERO ID:	2872646			
Conditions of Use:	Installation/Demolition of Building Materials			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Table 3 provides formaldehyde emission data (mg/m^3): 0.01 +/- 0.001; 0.013 +/- 0.0008; 0.014 +/- 0.0005; 0.015 +/- 0.0009; 0.019 +/- 0.0017; 0.027 +/- 0.0018; mean - 0.016 (0.013 ppm) Figure 3 provides Box-Whiskers plots of different formaldehyde concentration variation among plywood panels (ranges from 0.10 up to 0.33 mg/m^3)			
Comments:	Formaldehyde emission was measured by European small-scale chamber method (EN 717-1, 2004). Two test pieces with the dimensions of 0.2m x 0.28m x 15., and a total area of 0.225 m^2 were used with a loading factor of 1m^2/1m^3. Temp and RH were 23 +/- 0.5 C and 45 +/- 3 %. In the factory quality control method (EN 717-2) was measured for formaldehyde.			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data is for Egypt, a non-OECD country.
	Metric 3:	Applicability	High	The data are for an occupational scenario (commercial use of building/construction materials – wood and engineered wood) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Data is less than 10 years old.
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Provides sample type, exposure type, physical form, concentration of formaldehyde in the resin.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by looking at different plywood samples with some various conditions. Does not address uncertainty.

Environmental Science and Pollution Research 22(23):19002-19012.			
HERO ID:	3001567			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Students, professors, embalming and dissection of cadavers			
Exposure route:	inhalation			
Physical form:	vapor, dermal			
Personal sampling data:	The FA concentrations of personal exposure ranged between 0.126 and 0.770 ppm (mean±SD=0.448±0.322 ppm) for medical students and 0.216 to 1.176 ppm (mean±SD= 0.696±0.480 ppm) for instructors, as shown in Table 2. Means of personal FA samplings in breathing zone were 0.193±0.120, 0.271±0.159, and 0.828±0.182 ppm for medical students and 0.219±0.140, 0.438±0.229, and 1.144± 0.374 ppm for instructors in the muscular system, thoracic organ system, and abdominal organ system sessions, respectively. The average of FA concentration of personal breath in Fig. 1 come from means of the students and the instructors was 0.57 ppm.			
Area sampling data:	The mean of FA concentrations in indoor air ranged between 0.117 and 0.415 ppm (mean±SD=0.266± 0.149 ppm). Individual indoor exposure to FA (means±SD) in muscular system, thoracic organ system, and abdominal organ system classes were 0.137±0.063, 0.226±0.063, and 0.435±0.104 ppm, respectively. The FA concentration in indoor air before observation was at 0.098±0.047 ppm.			
Exposure duration:	Exposure duration of 3 hours.			
Number of workers:	36 students and 4 instructors sampled.			
Engineering control:	10 air conditioning systems were attached to the ceiling of the lab and there were three exhausts opening for general ventilation during the period of session. Absolute ventilation of dissection room was 52.5 m³/min. There were 8 air cleaners turned on for 30 minutes before class and switched off 30 minutes after class.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is peer reviewed so data is likely high quality.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data is for Thailand, a non-OECD country.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	Data is less than 10 years old (2014)
	Metric 5:	Sample Size	Medium	Characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Provides worker/student activities, exposure route, physical form, personal and area sampling, number of students/workers, and engineering controls.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by sampling over 3 different months (January, August, October). Does not address uncertainty.

HERO ID:	1317726			
Conditions of Use:	Furniture Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Cabinet Making Workplace; Activities: Sawing, sanding, assembly, laminating graphics, glueing; Type of woods: hard-or soft-wood, the former including birch, cherry, oak and walnut, and the latter including cedar, poplar, fir, pine, spruce, chipboard, particleboard and fir plywood. Potential sources of formaldehyde exposure: When particleboard and chipboard are sawed or sanded, formaldehyde release from the resin is expected to increase as a result of the exposure of fresh resin surface; from inhaled particles which are deposited in the respiratory tissue[only gaseous HCHO measured]. Formaldehyde-based adhesives used in sandpaper production.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	Sawing, Sanding, and Assembly - 0.06 (ppm) +/- 0.01; Laminating graphics and gluing- 0.03 (ppm) +/- 0.01, miscellaneous (e.g., foreman, shipping/receiving areas) - 0.09 (ppm) +/- 0.02. Soft-wood-0.1 (ppm) +/- 0.04, hard-wood- 0.06 (ppm) +/- 0.1, mixture- 0.06 (ppm) +/- 0.08, neither- 0.07 (ppm) +/- 0.02			
Area sampling data:	mean 0.06. Fig. 2 graphically displays sample values.			
Exposure duration:	Sampling time 3- 8.5 hrs			
Number of workers:	48			
Engineering control:	"3 of the 4 plants studied, all table saws and stationary sanders were equipped with local exhaust systems. Generally, down-drafted systems were installed on table saws and, on visual inspection, appeared to be similar in design to ACGIH recommendations. The stationary sanders utilized in these plants-were principally belt sanders. The design of the local exhaust hoods for these sanders was less uniform throughout the plants and, for the most part, consisted of a receiving hood at one end of the sander:" pp.5			
Comments:	"The mean relative humidity (RH) in each of the four plants studied ranged from 24% to 49%. Of the 48 workers investigated, 31 worked in areas with approximately 24% RH, 12 at 34% RH and 5 at 49% RH. The mean temperatures in each plant ranged from 17 to 22° C. " pp.5			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling and analytical methodology is provided but article notes the following issues: use of expired 3750 monitors by 30 days and samples below limit of detection for passive sampling. However these issues only effect some of the samples taken, not all per article.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Canada, an OECD country.
	Metric 3:	Applicability	High	Data are for furniture and furnishings not covered elsewhere, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Assessment is based on data greater than 20 years old and industry conditions that are expected to be outdated. (1986)
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, standard deviation) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity

HERO ID:	1317726			
Conditions of Use:	Furniture Manufacturing			
		EVALUATION		
Domain	Metric	Rating	Comments	
	Metric 6: Metadata Completeness	Medium	Methods, results, and assumptions are clearly documented, but underlying data sources are not fully transparent.	
Domain 4: Variability and Uncertainty				
	Metric 7: Metadata Completeness	Medium	Variability addressed by sampling multiple worker activities but uncertainty is not addressed.	
Overall Quality Determination		Medium		

Study Citation:	Scheepers, P.T., Graumans, M.H., Beckmann, G., Dael, M.v., Anzion, R.B., Melissen, M., Pinckaers, N., Wel, L.v., Werdt, L.M., Gelsing, V., Linge, A.v. (2018). Changes in Work Practices for Safe Use of Formaldehyde in a University-Based Anatomy Teaching and Research Facility.			
HERO ID:	5944973			
Conditions of Use:	Laboratory chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Gross anatomy teachers and students			
Exposure route:	Inhalation			
Personal sampling data:	Geometric mean concentrations (range) of FA (ug/m3) of full work-shift measurements in the breathing zone: 10.6-1120Geometric mean concentrations (range) of FA (ug/m3) of task-based 15 min measurements in the breathing zone: 20.4-2769.2			
Area sampling data:	7.7-554 (ug/m^3)			
Exposure duration:	8 hr full shift and 15 min task based measurements			
Number of workers:	Varied from 12 to 26			
Personal protective equipment:	During these tasks, a full face mask was used with an organic vapor and FA filter class A1 organic vapors and FA filter (6075, 3M Nederland, Delft, The Netherlands).			
Engineering control:	The technical mitigations (T-1 to T-4) were aimed at a reduction of emissions from leakage (leak prevention, T-1, Figure 3) and emissions from the use of absorbent materials used to collect any residualdraining of formalin from the anatomical specimens while they were put on display in TR-1 or TR-2. A jerry can was installed under the dissection table (T-2). So, instead of collecting the leak drainedfluid in the absorbent disposable tissue and an open bucket to collect any formalin dripping from the table, (allowing the FA to evaporate from this secondary source) the drained liquid would be removedand collected in a closed containment (Figure 4). Emissions were further reduced by introducing an LEV at the workbench that was used to flush the smaller specimens (e.g. brains, extremities) priorto putting them on display on the section tables on the day of the training (T-3). This LEV system was installed in a Perspex cover that completely sealed off the process from the room and created anunder pressure (Figure 5). The cover would only have to be opened for introduction or removal of specimens. In the storage room a down flow ventilation system was installed to introduce fresh air into the breathing zone of the worker and keep down any FA vapors from opening storage tanks and taking out specimens out of it. For this a plenum was installed above the location where an electrically powered lift was used to heave complete cadavers or body parts from the storage tank. Optimization involved a free flow of air from the plenum down to an extraction ventilation installed in the wall.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country. other than the U.S.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	Data collected in the last 10 years.
	Metric 5:	Sample Size	Medium	Contains sample size, mean and range.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, worker activities.

HERO ID:	21233			
Conditions of Use:	Processing as a reactant			
EXTRACTION				
Parameter	Data			
Worker activity description:	impregnating filter material with phenol-formaldehyde resin, repair and maintenance of equipment			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	initial testing 0.5-1 mg/m3, follow-up testing 10.6 to 16.8 mg/m3			
Number of workers:	53			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling and analytic methods not noted, but it was documented that Four breathing zone samples used Drager colorimetric indicator tubes. On another occasion, three breathing zonesamples were collected in sodium bisulfite and measured by_ titration with a standard iodine solution.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Medium	The data are for a filter manufacturing facility which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1975, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized only by a range of values, uncertain statistics not provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Key metadata were not provided such as sample durations, exposure durations, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range values what could be helpful in assessing variability. The study did not provide any information on uncertainty.
Overall Quality Determination			Medium

HERO ID:	626707			
Conditions of Use:	Textile Finishing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Around 85% of the workforce operated sewing machines, the remaining individuals worked as press operators, oven operators. cut, spreaders, glue sprayers. bundlers. and maintenance workers.			
Exposure route:	inhalation			
Physical form:	Vapor			
Personal sampling data:	Formaldehyde air sampling results from the initial survey ranged from 0.14 ppm to 0.46 ppm in five personal breathing zone (PBZ) air samples. On the follow-up survey, formaldehyde exposureswere lower, with PBZ concentrations ranging from 0.19 ppm to 0.21 ppm.			
Area sampling data:	Formaldehyde air sampling results from the initial survey ranged from 0.32 ppm to 0.70 ppm in 13 area air samples obtainedthroughout the plant. On the follow-up survey, formaldehyde exposures were lower, ranging from 0.18 ppm to 0.22 ppm in area air samples obtained in production departments.			
Dermal exposure data:	nan			
Number of workers:	191			
Engineering control:	(1) Work with supplier to provide post-cure fabrics(2) installation of exhaust ventilation above the steampress tables, (3) installation of canopy hoods above the three fly press stations, (4) increasing the amount of outside air supplied to the plant by increasing the opening of the air supply louvers on the three air handling units, (5) installation of a ceiling exhaust system above the sewing area, with a 10,000 cubic feet per minute design specification, (6) installation of a receiving hood in the area wherespot cleaning of soiled garments is performed, and (7) replacing the practice of blowing lint from workstations with compressed air (and subsequent dry sweeping of the floors) withvacuuming, which was performed on breaks and at the end of theworkshift.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study Method 3500 / 2502
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (textile operation) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Study implemented in 1987- five years prior to the PEL (1992)
	Metric 5:	Sample Size	High	Results from each sampling event were provided (Table 1 and 2), and includes monitor- ing results using different methods.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, sample durations, and worker activities, but lacks additional metadata, such as exposure durations, and frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study provides actual results of each sampling event and range values which could be used to approximate variability in the determinants of exposure. It was assumed that uncertainty was considered in the NIOSH methods.

Occupational Exposure

HERO ID: 5951448 Table: 1 of 1

Study Citation:	Shinohara, N., Okazaki, Y., Mizukoshi, A., Wakamatsu, S. (2019). Exposure to benzene, toluene, ethylbenzene, xylene, formaldehyde, and acetaldehyde in and around gas stations in Japan. Chemosphere 222:923-931.			
HERO ID:	5951448			
Conditions of Use:	Gas station use.			
EXTRACTION				
Parameter	Data			
Worker activity description:	Gas station employees			
Exposure route:	inhalation			
Physical form:	gas, vapor			
Personal sampling data:	the personal exposure, indoor, and ambient concentrations of formaldehyde were 5.08, 10.1, and 4.29 mg/m3, respectively, in spring and 11.6, 24.1, and 6.04 mg/m3, respectively, in winter. Exposures are depicted in Figure 1c. Concentrations were max in the spring at 10 ug/m^3 for indoor office, at the refueling station it was maxed at about 8 ug/m^3 with max background exposure at about 5 ug/m^3. For winter sampling, max indoor exposure was at about 30 ug/m^3, max refueling exposure at about 13 ug/m^3 and max background exposure at about 8 ug/m^3.			
Area sampling data:	formaldehyde concentrations indoors in spring (10.1 mg/m3) and winter (24.1 mg/m3)			
Comments:	Duration and frequency of exposure testing was every 2 hours but assumed exposure duration and frequency is constant or during refueling process.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is peer reviewed so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is for Japan, an OECD country.
	Metric 3:	Applicability	Medium	Data applicable to primarily ambient exposure at a gas station.
	Metric 4:	Temporal Representativeness	High	Data is under 10 years old (2019)
	Metric 5:	Sample Size	Medium	Characterized by range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Includes worker activity, physical form, exposure route, sampling data, duration and frequency
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Addresses variability by looking at different gas stations over different times of the year. Does not address uncertainty
Overall Quality Determination		Medium		

Study Citation:	Siew, S.S., Kauppinen, T., Kyyrönen, P., Heikkilä, P., Pukkala, E. (2012). Occupational exposure to wood dust and formaldehyde and risk of nasal, nasopharyngeal, and lung cancer among Finnish men. Cancer Management and Research 4:223-232.			
HERO ID:	1313381			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Exposure concentrations were derived from measurements, surveys and assessments from occupation health professionals			
Particle size characterization:	PM estimated concentrations were provided for 13 occupational groups			
Number of workers:	1.2 finish men born between 1906-1945			
Comments:	It is not clear where the measurements for 13 occupational groups are. Page 4/10 contains following six air measurements. Technical nursing assistants 0.35 ppm; cooks, furnace men 0.50 ppm; Chemical workers, nec 0.20 ppm; plastic product workers 0.10 ppm; plastic product workers, nec 0.10 ppm; paper product workers 0.20 ppm.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	it is unclear which estimates are based on sampling, survey or professional judgement	
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Finland - and OECD member	
	Metric 3: Applicability	High	The data are for 13 different occupational groups included in the occupational scenarios within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	High	The report was published in 2012 after the PEL (1992) and less than 10 years old.	
	Metric 5: Sample Size	Low	only mean exposure for each worker group was provided (note all values are multiples of 5	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	No meta data were provided	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination		Low

Study Citation:	Simon, G.E. (1992). Epidemic multiple chemical sensitivity in an industrial setting. Toxicology and Industrial Health 8(4):41-46.			
HERO ID:	1317069			
Conditions of Use:	Construction Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	aerospace manufacturing firm-producing fire-retardant composite plastics			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	All measured levels of formaldehyde were less than 10% of Occupational Safety and Health Administration Permissible Exposure Limits (PEL).			
Particle size characterization:	All measured levels of total particulates were less than 10% of Occupational Safety and Health Administration Permissible Exposure Limits (PEL).			
Number of workers:	400 on site, & ~200 worked directly with the composite plastic material.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for aerospace manufacture which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data were published in 1987, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Low	percent of PEL was provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, exposure frequency, and/orworker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The study does not address variability or uncertainty.
Overall Quality Determination		Low

Study Citation:	Sinks, T. H., Hartle, R. W. (1988). Health Hazard Evaluation Report HETA 86-456-1877, South Texas Nuclear Project, Wadsworth, Texas, March 1988.			
HERO ID:	1392386			
Conditions of Use:	Installation/Demolition of Building Materials			
EXTRACTION				
Parameter	Data			
Worker activity description:	Construction workers, particularly carpenters			
Exposure route:	dermal, inhalation			
Physical form:	gas			
Area sampling data:	Carpenter shop: No airborne formaldehyde was detected			
Dermal exposure data:	Dermal exposure data			
Personal protective equipment:	It was recommended that carpenters working on scaffolding crews and, those sawing treated lumber, should wear gloves and long-sleeve shirts whenever practical. Carpenters sawing wood should wear particulate masks to avoid inhalation exposure to wood dust. Personal hygiene measures, including washing of hands and arms at lunch and following work, should be made mandatory.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology is an approved NIOSH method
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Low	No values above limit of detection but number of samples taken is unknown.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include sample type and specific area with worker activities but no other metadata (duration or frequency).
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study does not address variability in exposure estimates (e.g., different locations). Assume that uncertainty canbe determined from the sampling and analytical method.

Study Citation:	Sparks, P.J., Ayars, G.H., Simon, G.E., Katon, W.J., Altman, L.C., Johnson, R.L. (1991). Depression and panic attacks related to phenol-formaldehyde composite material exposure in an aerospace manufacturing plant. Allergy Proceedings 12(6):389-393.			
HERO ID:	1316651			
Conditions of Use:	Construction Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers used fiberglass composite material impregnated with phenol-formaldehyde resin to fabricate aircraft interior parts in a process called "lay up". The material came in rolls with plastic backing film stored in a frozen state. The rolls were then thawed and put on a rack. The employee, called a plastic bench mechanic, would unroll the sheets, cut of appropriate lengths, peel of the plastic backing film and then form it into the shape desired by molding it over a tool or mandrel. Employees would use gloves and a small squeegee-type tool to press the material on the tool. "Liquid gloves," a hand barrier cream, was used on the gloves to prevent sticking. The part was then bagged, oven cured, and reworked to thecorrect specification by sanding, trimming, applying epoxy to holes, and prepping surfaces for painting and then packaged.			
Exposure route:	Inhalation			
Physical form:	vapor			
Area sampling data:	0.003-0.073 (ppm)			
Number of workers:	200 employees working in one building of a large aircraft manufacturing company.			
Personal protective equipment:	Use of gloves was mandatory although the use of lab coats, sleeves, and respirators was optional. The masks available were half-mask, combination organic vapor and acid gas respirators, but most workers used them infrequently.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for plastic material and resin manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data are greater than 20 years old. (1991)
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range .
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data included worker activities, but excluded sample type and exposure type, sample durations, exposure durations, and exposure frequency.

Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Low	India - not and OECD country	
	Metric 3: Applicability	Medium	The data are for paper manufacture is an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, in terms of the type of industry, operations, and work activities, but there may be significant difference between operations in India in 1992 and the US now.	
	Metric 4: Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1992, around the time of the most recent PEL (1992) and more than 20 years old.	
	Metric 5: Sample Size	Low	Distribution of samples is just a single air concentration, no statistics concerning the distribution was provided	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	It is assumed that the monitoring data were for area sampling, but no other metadata were provided such as sampling and analytic methods, sample durations, exposure durations, worker activities, and exposure frequency.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.	
Overall Quality Determination		Low

Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not specified though it was noted that GMD system dosimeter and HPLC were used
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Norway - OECD member
	Metric 3:	Applicability	High	Data are for an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data are greater than 10 years old but no more than 20 years old - Published in 2007 data covered the period from 1970-2005
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics -mean, SD, range, geometric mean , geometric SD and sample size provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Missing: sampling and analytic methods, number of sites, exposure duration and frequency, number of workers, and sampling locations
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Range, arithmetic and geometric standard deviation provided to assess variance but nothing provided for uncertainty
Overall Quality Determination			Medium	

Study Citation:	Stephenson, R. L., Aw, T. C. (1986). Health Hazard Evaluation Report HETA-1984-0132-1703 Purex Industrial Division, Marion, Ohio.			
HERO ID:	8251533			
Conditions of Use:	Processing-Reactant-All other chemical product and preparation manufacturing			
EXTRACTION				
Parameter	Data			
Area sampling data:	Five formaldehyde air samples were collected: four in the Purex Industrial Packaging Department (three on the Pail Line and one on the Laub line); and, one in the Compound Room - Purex Industrial Liquid (LOD 0.002 mg/sample). No formaldehyde was detected.			
Exposure duration:	The majority of the work is accomplished on one shift, 0730-1600.			
Number of workers:	The total plant workforce (80 employees), consists.of 50 production workers, 25 administrative and clerical staff and 5 maintenance employees.			
Personal protective equipment:	...some of the workers wore disposable ornon-disposable half-face piece respirators with dust/mist filters,organic vapor, acid gas or combination organic vapor-acid gas chemical cartridges or cartridges for specific contaminants; for example ammonia, methyl amine or formaldehyde. More recently, however, (in September 1985), plant management provided several workers in the Compound Room with positive pressure hood-type supplied-air respirators.			
Engineering control:	Extensive changes were made in the ventilation system for the Compound Room in 1984 when local exhaust ventilation equipment was installed on most of the processing equipment. In January 1986, engineering control equipment was installed in the Compound Room to further enclose and automate the ammonia handling procedures and production operations utilizing liquid ammonia.			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evalu-ated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Metadata on the operations, equipment, and worker activities associated with the data show that the data agree representative of outdated operations, equipment, and activities rather than current operations, equipment, and worker activities. The data were collected before the most recent PEL establishment or update or are more than 20 years old if no PEL is established.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty
Overall Quality Determination			High	

Study Citation:	Stephenson, R. L., Murphy, D. C., Habes, D. J. (1985). Health hazard evaluation report: HETA-81-369-1591 and HETA-81-466-1591 - Electric Machinery McGraw Edison Company. Minneapolis, Minnesota.			
HERO ID:	1320981			
Conditions of Use:	Incorporation into a formulation, mixture, or reaction product			
EXTRACTION				
Parameter	Data			
Worker activity description:	Coil winding Coil forming Hand tapingArmature windingPole winding VPI			
Exposure route:	Inhalation			
Physical form:	vapor			
Personal sampling data:	Two personal samples collected during soldering operations in thearmature winding area revealed formaldehyde levels of 7.8 ug/m3 (0.006 ppm) and 53.5 ug/m3 (0.04 ppm)			
Dermal exposure data:	nan			
Exposure duration:	8 hours per day			
Exposure frequency:	5 days per week			
Number of workers:	550 employees, 165 admin and clerical, 350 production workers and 35 maintenance staff.			
Personal protective equipment:	Recommended: Personal protective equipment including long sleeved shirts, coveralls or aprons, and gloves should be provided_ for and used by those employees exposed to epoxy resins. The gloves used should be tear-resistant, disposable, impervious to the epoxy resin materials, and of sufficient length.			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH study - Method P&CAM 125
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (Electric motor manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1983 - prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	Medium	Results from two sampling events was provided - no other statistics. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data includes most critical metadata, such as sample type, exposure type, exposure durations, exposure frequency, and worker activities, but lacks sample durations.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Results from two sampling events was provided - which has limited value in assessing variability. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.

Study Citation:	Stone, R. A., Youk, A. O., Marsh, G. M., Buchanich, J. M., Smith, T. J. (2004). Historical cohort study of U.S. man-made vitreous fiber production workers IX: summary of 1992 mortality follow up and analysis of respiratory system cancer among female workers. Journal of Occupational and Environmental Medicine 46(1):55-67.			
HERO ID:	1313829			
Conditions of Use:	Construction Manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	0.03-0.1 ppm			
Number of workers:	32,110			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for fiberglass manufacture which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The study was published in 2004 but is based on data collected from 1946-1992 prior to the 1992 PEL and over 20 years old. Actual sampling was performed form 1970-1990.
	Metric 5:	Sample Size	Medium	range data were provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	no metadata were provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range data that can be used to evaluate variability. Information about uncertainty was not provided.

HERO ID: 1319726 Table: 1 of 1

Study Citation:	Sundell, J. (1994). On the association between building ventilation characteristics, some indoor environmental exposures, some allergic manifestations and subjective symptom reports. Indoor Air 4(S2):7-49.			
HERO ID:	1319726			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	Office workers (2/42)			
Exposure route:	inhalation (2/42)			
Area sampling data:	In a study of office locations, concentrations were 11-59 ug/m3. (24/42)			
Number of workers:	5986 workers in the study (2/42)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Sweden, an OECD country.
	Metric 3:	Applicability	Low	Data are for ambient air in an office/building, which is similar to the in-scope occupational scenario use of furniture products.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data were collected after the most recent PEL and greater than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by analyzing and comparing the results from 8 studies.
Overall Quality Determination		Medium		

Study Citation:	Sundell, J., Andersson, B., Andersson, K., Lindvall, T. (1993). Volatile organic compounds in ventilating air in buildings at different sampling points in the buildings and their relationship with the prevalence of occupant symptoms. Indoor Air 3(2):82-93.		
HERO ID:	21346		
Conditions of Use:	Office Environment		
EXTRACTION			
Parameter	Data		
Exposure route:	inhalation		
Physical form:	vapor		
Area sampling data:	31 Ug/m3 mean (min 11 Max 59 ug/m3) geometric mean 26 ug/m3; rooms with low SBS: 29 ug/m3 mean 24 ug/m3 geometric mean; high SBS: 33 ug/m3 mean 27 ug/m3 geometric mean. The document also includes adjusted values to account for outdoor temperature. also provided are adjusted values for different flooring materials, air recirculation cleaning, temperature and humidity		
Number of workers:	nearly 6000 from 210 office buildings		
Comments:	29 (14 buildings classified as high Sick Building Syndrome (SBS) and 15 classified as low SBS		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling and analysis methods were not provided but it was documented that Formaldehyde was collected by diffuse samplers in two parallel sampling trains and analyzed by liquid chromatography (HPLC)
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Sweden - OECD member
	Metric 3: Applicability	High	The data are for an office exposure, an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1993, after the most recent PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized, though uncertainty not documented
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	data were provided for sampling type, building ventilation rates, year of remodeling, use of plastic floors, frequency of cleaning, air temperature, and humidity. But, other key metadata were noted provided such as sampling and analytic methods, number of sites, sample durations, exposure durations, worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The monitoring data included range information for high SBS and Low SBS scenarios which could be used to evaluate variability. There was no discussion about uncertainty in the exposure estimates.

Conditions of Use:	Embalming			
EXTRACTION				
Parameter	Data			
Worker activity description:	embalming			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Average 1.4 ppm during embalming (range 0.15-4.3 ppm) 8 hr TWA 0.33 ppm the study further disaggregated exposure into: normal bodies, 0.9 ppm mean (range 0.2-2.1 ppm); bodies for anatomical donation 1.3 ppm mean (range 0.5-4.3 ppm); autopsied bodies 1.5 ppm mean (range 0.4-3.8 ppm); other cases 0.2 ppm mean (range 0.15-0.9 ppm); outside funeral homes 1.06 ppm mean (range 0.58-3.32 ppm)			
Number of workers:	29 students			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology based on NIOSH 2502 method. Additionally, NIOSH staff were present during the first 2 weeks of the course to provide training.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1993, soon after the posting of the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability thgou the provision of data ranges, while uncertainty was address in the sampling and analytical method.
Overall Quality Determination		High		

Formaldehyde

EXTRACTION				
Parameter	Data			
Exposure route:	inhalatin			
Physical form:	Vapor			
Area sampling data:	0.5 mg/m3			
Exposure duration:	4-30 years			
Number of workers:	52			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling/analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Unknown but believe it is likely Russia
	Metric 3:	Applicability	Low	older article in a location that does not have the same worker safety standards
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL and is older than 20 years - article published in 1981 but no sense how old the data are
	Metric 5:	Sample Size	Low	Sample distribution is characterized by no statistics - just a single concentration value was provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Uninformative	nothing provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	no discussion of uncertainty
Overall Quality Determination		Uninformative		

Study Citation:	Sussell, A. (1995). Health hazard evaluation report No. HETA-91-0239-2509, Medite Of New Mexico, Las Vegas, New Mexico. :91-0239.			
HERO ID:	1316591			
Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	job titles mentioned were press operator, former operator, sander operator, utilityman, and (production) laborer. Report does not clarify which positions are the most risk via formaldehyde dust exposure.			
Exposure route:	inhalation			
Physical form:	dust			
Area sampling data:	Formaldehyde in Dust (6/2/93)NIOSH 5700 [mg/m3] Blender room: 0.61, 0.55; Form Line: 0.33, 0.26 Form Station Control room: 0.016, 0.020; Inline Saw: 0.007, 0.019; Outside (at EOM sign): 0.0005, 0.003Ella et al. [mg/m3] Blender room: 0.094, 0.064; Form Line: 0.050, 0.039 Form Station Control room: 0.003, 0.003; Inline Saw: 0.002, 0.001; Outside (at EOM sign): 0.0003, 0.0003			
Exposure duration:	three 8-hour shifts per day			
Exposure frequency:	operating 7 days per week			
Number of workers:	133-135 hourly and 20 administrative employees			
Personal protective equipment:	Workers were provided NIOSH-approved full-facepiece air-purifying respirators with formaldehyde/organic vapor cartridges and dust/mist filters for certain jobs associated with high formaldehyde exposures, such as press maintenance.			
Engineering control:	The former, form line, form line saw, press, cooling wheel, in-line saw, and sander were provided with local exhaust ventilation to remove airborne wood dust and formaldehyde vapors. The warehouse was provided with general dilution ventilation.Additional openings were installed in outside walls to provide for passive movement ofmake-up air.Larger exhaust fans were installed on the board cooler to drop temperatures faster andproduce more air movement in the plant.The molar ratio of formaldehyde to urea was reduced in the urea-formaldehyde resins used for binding both the “face” and “core” areas of the fiberboard.			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	As this is an NIOSH study NIOSH methods 3500 and 5700 was used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (composite wood product manufacturing) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Study implemented from 1991 and 1993, around the period that the PEL was implemented and study results are more than 20 years old.
	Metric 5:	Sample Size	Medium	Appears to have taken 1 sample in 1991 and 2 samples in 1992, but only provides the mean for the 1992 sample. Uncertain statistics with low sample size.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, and sample durations, but lacks additional metadata, such as exposure duration, exposure frequency, and/or worker activities (beyond job title).
Domain 4: Variability and Uncertainty

Study Citation:	Sussell, A. L. (1990). Heta 89-335-2041 May 1990 Sheffield Lake Service Department Sheffield Lake, Ohio.			
HERO ID:	8156936			
Conditions of Use:	Fuels and related products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Administrative employees, diesel truck maintenance and service workers. (2/13)			
Exposure route:	inhalation (2/13) from diesel exhaust or off-gas from office furniture/building materials			
Physical form:	gas (4/13)			
Area sampling data:	Area samples for formaldehyde were 0.003 mg/m3 outdoors, 0.026 mg/m3 in the office area, 0.023 mg/m3 in the parking bays, and 0.024 mg/m3 in the maintenance shop. (9/13)			
Exposure duration:	6-7 hours (2/13)			
Number of workers:	11 employees (2/13)			
Engineering control:	Ventilation consists of a wall fan on the south wall and two overhead ceiling vents which must be opened manually. (2/13)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method (NIOSH 3500).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for commercial use of fuels and related products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sampling data, exposure type, and worker information provided, but mission exposure frequency and PPE.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling inside and outside the shop.
Overall Quality Determination			High	

Study Citation:	Suuronen, K., Henriks-Eckerman, M.L., Riala, R., Tuomi, T. (2008). Respiratory exposure to components of water-miscible metalworking fluids. Annals of Occupational Hygiene 52(7):607-614.			
HERO ID:	632121			
Conditions of Use:	Use of Metalworking fluid			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	From Table 2: 0.040 mg/m3 mean (0.011-0.150 mg/m3)			
Exposure duration:	sampling duration 2 hrs			
Comments:	Exposure measurements were carried out in 10 metal workshops in southern Finland during the year 2004. The companies were selected from a pool of 60 metal workshops where machining was one of the main activities.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods. (Sampling methods used described in Table 1)
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Finland - OECD member
	Metric 3:	Applicability	High	Data are for metal workshops which is an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Medium	Monitoring data are greater than 10 years old but no more than 20 years old - Article published in 2008.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (me and range) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing details about sampling location and exposure frequency
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by range, but uncertainty is not addressed.
Overall Quality Determination			Medium

Conditions of Use:	Use/exposure in restaurant kitchens as cooking fumes			
EXTRACTION				
Parameter	Data			
Worker activity description:	Kitchen employees in Hotel Kitchens, Hamburger Chains, Restaurants with Grills, Local Restaurants.			
Exposure route:	inhalation			
Physical form:	vapor/gas			
Personal sampling data:	Table 1 provides the results of sampling (ug/m^3): hotel kitchen: mean - 11, SD - 8, Min - 4, Max - 24, GM - 8; Hamburger chain: Mean - 7, SD - 0, Min - 7, Max - 7, GM - 7; Restaurants with grill: mean - 15, SD - 11, Min - 2, Max - 60, GM - 12; Small local restaurants: mean - 14, SD - 6, Min - 7, Max - 26, GM - 13; Total: mean - 14, SD - 9, Min - 2, Max - 60, GM - 11			
Engineering control:	Deep fryer, cooking tops, frying cabinets all were equipped with ventilation hoods.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Source is peer reviewed so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation, in terms of the type of industry, operations, and work activities.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old.
	Metric 5:	Sample Size	Medium	Range of data with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Provides worker activity, exposure route, physical form, some engineering controls.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by looking at multiple different type of kitchens from hotel kitchens to fast food places. Does not address uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Sylvain, D. (1999). Health hazard evaluation report: HETA 98-0194-2721, U.S. Fish and Wildlife Service, Nashua, New Hampshire.			
HERO ID:	6558295			
Conditions of Use:	commercial use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers at Nashua National Fish Hatchery (NFH) in Nashua, New Hampshire, specifically employee exposure to formaldehyde during the treatment of sea-run Atlantic Salmon.			
Exposure route:	Inhalation			
Personal sampling data:	Formaldehyde concentration in personal breathing zone (PBZ) sample was 1.1 ppm. PBZ sampling indicates that worker exposure to formaldehyde exceeded the REL (ceiling limit) and TLV while filling of the sprayer and applying formalin to a broodstock tank. The PEL was not exceeded.			
Area sampling data:	Formaldehyde concentrations in area samples: (1) at perimeter of tank during spraying – 0.59 ppm; (2) at perimeter of tank during aeration – 0.23 during the first 31 minutes of aeration (following spraying) and 0.03 ppm during the final 35-minute sampling period.			
Personal protective equipment:	Personal protective equipment (PPE) worn during treatment consisted of a full-face respirator, respirator equipped with formaldehyde cartridges, neoprene apron, and rubber gloves. The effectiveness of the PPE ensemble was limited by: (1) the use of neoprene, which can be permeated by methanol, and (2) uncertainty regarding the type of rubber comprising the gloves.			
Engineering control:	The routine exposure to airborne formaldehyde due to formalin spraying could be eliminated by applying the formalin beneath the surface of the water in the broodstock tanks, possibly using the aeration system to mix the formalin into the water.			
Comments:	NIOSH has established the REL for formaldehyde at the lowest concentrations that can be reliably quantified: 0.016 ppm for up to a 10-hour TWA exposure, and 0.1 ppm as a 15-minute ceiling concentration. ACGIH has set the TLV for formaldehyde at 0.3 ppm. The OSHA general industry formaldehyde standard (29 CFR 1910.1048), sets the PEL for airborne exposure to formaldehyde at 0.75 ppm as an 8-hour TWA and 2 ppm as a 15-minute STEL.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	data are from the United States
	Metric 3:	Applicability	High	data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	data is more than 20 years old
	Metric 5:	Sample Size	Low	characterized by no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Study Citation:	Sylvain, D. C. (1996). Health Hazard Evaluation Report HETA 96-0120-2608, Acton Post Office, Acton, Massachusetts, October 1996.
HERO ID:	1316934
Conditions of Use:	Use of Cleaning and Furniture Care Products

EXTRACTION	
Parameter	Data
Worker activity description:	Mail is manually sorted in “cases,” which are two or three sided metal units with vertically divided shelves. The cases measure approximately 5½ feet wide, 5½ deep, and 6 feet in height. Newsprint and other bulk mail is kept on the workroom floor until it is sorted and delivered. The amount of mail that moves through the post office was reported to vary throughout the week, with lightest volumes on Wednesday, and heaviest on Friday. Postal staff reported that newsprint comprises the largest part of the mail stream. Of the approximately 60 clerks and carriers who are employed at the post office, 15 to 20 remain in the building throughout the day. Carriers typically remain in the building for several hours in the morning while preparing mail for delivery
Exposure route:	inhalation
Physical form:	vapor
Personal sampling data:	The results of personal breathing zone (PBZ) air sampling revealed formaldehyde concentrations below 0.02 parts per million (ppm).Administrative clerk <0.02 ppmBulk mail clerk <0.01 ppmClerk <0.02 ppmWindow distribution <0.01 ppm
Area sampling data:	Area sampling, using a more sensitive sampling and analytical method, indicated formaldehyde concentrations of approximately 0.01 ppm in all area samples. Carrier supervisor office 0.01 ppmWorkroom 0.082 ppmAdministrative office 0.011 ppmCustomer window 0.0087 ppm
Exposure duration:	up to 10 hours per day
Exposure frequency:	40 hours per week.
Number of workers:	60
Engineering control:	Replace the floor wax with a product that does not have formaldehyde.

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study using Method 3500 and 2541
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (government office work) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	sampling initiated in 1995, after the release of the PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	Medium	actual results from each sampling event was provided, which can be used to generate statistics , no discussion of uncertainty.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include the critical metadata, such as sample type and exposure type, sample durations, exposure durations, exposure frequency, and worker activities.

Domain 4: Variability and Uncertainty

Domain		Metric	EVALUATION	
			Rating	Comments
	Metric 7:	Metadata Completeness	High	variability was not discussed but results from each sampling event were provided allowing for assessment of variability between locations and jobs. As NIOSH Methods were used it is assumed that uncertainty is considered in the method.
Overall Quality Determination			High	

Study Citation:	Takahashi, M., Abe, M., Yamagishi, T., Nakatani, K., Okade, T., Ogawa, T., Konishi, H., Kiryu-Seo, S., Kiyama, H., Nakajima, Y. (2010). Local ventilation system successfully reduced formaldehyde exposure during gross anatomy dissection classes. Anatomical Science International 85(4):251-252.			
HERO ID:	2582385			
Conditions of Use:	Laboratory use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Dissection			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	The mean FA concentration of the room (“A” measurement) and the estimated maximum exposure to FA (“B” measurement) during dissection classes were 0.520 and 0.480 ppm.			
Engineering control:	Use of ventilated tables: 0.035 ppm average for room and 0.054 ppm peak during dissection - the system consists of a simple plenum-chambered dissection table and a transparent vinyl duct which connects the table to the pre-existing general ventilation duct via a flow control valve in the ceiling. However, the formaldehyde concentration exceeded 0.08 ppm during the dissections of specific areas of the room, so it may be necessary to consider additional strategies for formaldehyde reduction, such as downward flow of air supply above the table and the utilization of personal protective equipment by students with hypersensitivity to formaldehyde.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified, but it was noted that HPLC analysis performed by Panasonic Health Organization Science Center of Industrial Hygiene, Osaka, Japan. Also used used a photoelectronic method (FP-30, Rikenkeiki, Tokyo, Japan).
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Japan - an OECD member
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Medium	The data are more than 10 years old but no more than 20 years old.
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided results for each sampling event that can be used to evaluate variability. Information about uncertainty was not provided.
Overall Quality Determination			Medium	

Study Citation:	Takigawa, T., Horike, T., Ohashi, Y., Kataoka, H., Wang, D.H., Kira, S. (2004). Were volatile organic compounds the inducing factors for subjective symptoms of employees working in newly constructed hospitals?. Environmental Toxicology 19(4):280-290.			
HERO ID:	1313804			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Worker activity description:	doctor, nurse, co-medical, clerk			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Indoor formaldehyde was detected in all rooms investigated; crude- 20 ug/m3 median (range 6–32 ug/m3) and adjusted 33 ug/m3 adjusted median (range 4 –59 ug/m3). The ambient air outside the hospitals was 7 ug/m3 median (range 4 –13 ug/m3) .			
Number of workers:	312			
Comments:	It is unclear what the source of the formaldehyde is, could be disinfectant or off gasing from construction or furniture			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology was not specified, but it was noted that formaldehyde was collected using 2,4-dinitrophenylhydrazine (DNPH)-coated silica cartridges (SepPak DNPH-Silica cartridge, Waters, Milford, MA, USA), kept cool in an insulated container and sent to our laboratory. The cartridgeswere eluted with 3 mL of acetonitrile before analysis with ahigh-performance liquid chromatograph (Hewlett PackardSeries 1100, Hewlett Packard, Palo Alto, CA, USA)equipped with a photodiode array detector (Hewlett Packard, USA). Analytical column (Hypersil ODS Agilent Technologies, Palo Alto, CA, USA) was used. The mobile phase was acetonitrile and distilled water. The column was thermostated at 40°C. The detection wavelength was 360 nm. The temperature and relative humidity (RH) of the air were also recorded during sampling with an Assmanpsychrometer. Formaldehyde concentrations were adjustedfor the values of 20°C and 50% RH according to MHLWrecommendations.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Japan - and OECD member
	Metric 3:	Applicability	High	The data are for hospital exposure which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The study was published in 2004, after the most recent PEL (1992) and more than 10 and less than 20 years old.
	Metric 5:	Sample Size	Medium	crude and adjusted (temp & Humidity) median values are provided for all rooms tested and outside concentrations. Also range data provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	No metadata were provided.
Domain 4: Variability and Uncertainty

	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data is more than 20 years old
	Metric 5:	Sample Size	Low	Distribution of samples is characterized by no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Thetkathuek, A., Yingratanasuk, T., Ekburanawat, W. (2016). Respiratory Symptoms due to Occupational Exposure to Formaldehyde and MDF Dust in a MDF Furniture Factory in Eastern Thailand. 2016:3705824.			
HERO ID:	4454841			
Conditions of Use:	Medium-density fiberboard (MDF) furniture manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	The MDF furniture making process included tasks such as cutting, sawing, drilling holes, polishing, and gluing. Workers are at-risk of exposure to MDF dust and formaldehyde released from the work process and the storage of raw materials and the finished products. In the furniture production process there are 10 working departments which cover similar exposure groups (SEG), namely, office, combination, edging, fitting, clearing, drilling, laminating, wrapping, packing, and line.			
Personal sampling data:	See Table 2. Mean and Range as follows. Office: 1.52 ppm (0-4.21 ppm), Combination: 0.90 ppm (0-5.37 ppm), Edging: 0.68 ppm (0-4.51 ppm), Fitting: 2.36 pm (0-5.97 ppm), Clearing: 8.32 ppm (0.43-20.85 ppm), Drilling: 0.57 ppm (0-1.70 ppm), Laminating: 4.55 ppm (0.39-11.96 ppm), Wrapping: 1.41 ppm (0-4.12 ppm), Packing: 1.89 ppm (0-6.57 ppm), Line: 4.46 ppm (0-14.0 ppm), Total: 2.62 ppm (0-20.85 ppm).			
Area sampling data:	A study conducted by Vaizo’glu et al. [21] indicated that the concentration of formaldehyde at 100 furniture factories in Japan was 0.6 ppm (SD 0.3).			
Exposure duration:	8 hours			
Number of workers:	The total number of employees at this factory was 535			
Personal protective equipment:	Table 1 indicates the number and percent of employees that use PPE in the form of masks (62% use PPE).			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	The data are from a non-OECD country, and locality-specific factors (e.g., potentially greater differences in regulatory occupational exposure limits, industry/ process technologies) may impact exposures relative to the U.S., or the country of origin is not specified.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The operations, equipment, and worker activities associated with the data are expected to be representative of current operations, equipment, and activities. The monitoring data were collected after the most recent permissible exposure limit (PEL) establishment or update or are generally, no more than 10 years old, whichever is shorter. If no PEL is established, the data are no more than 10 years old. Metadata on the operations, equipment, and worker activities associated with the data show that the data should be representative of current operations, equipment, and activities.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized. Mean, Median, Range, and SD included.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as exposure frequency.

EXTRACTION				
Parameter	Data			
Worker activity description:	Curtain painting, Automatic spray-painting, Manual spray-painting, Manual painting, Dip painting, Assistant, manual spray-painting, Conveyor work (feeding/receiving), Grinding, Other work tasks.-Norwegian furniture and woodworking factories			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Curtain painting 0.51 ppm geometric mean 2.53 GSD (range 0.08–1.48 ppm) 95% CI 0.35–0.75 ppm; Automatic spray-painting 0.11 ppm geometric mean 1.48 GSD (range 0.04–0.24 ppm) 95% CI 0.10–0.12 ppm; Manual spray-painting 0.15 ppm geometric mean 2.29 GSD (range 0.01–1.14 ppm) 95% CI 0.14–0.17 ppm; Manual painting 0.07 ppm geometric mean 1.32 GSD (range 0.05–0.16 ppm) 95% CI 0.06–0.09 ppm; Dip painting 0.16 ppm geometric mean 1.39 GSD (range 0.10–0.27 ppm) 95% CI 0.12–0.21 ppm; Assistant, manual spray-painting 0.16 ppm geometric mean 1.88 GSD (range 0.07–0.81 ppm) 95% CI 0.12–0.22 ppm; Conveyor work (feeding/receiving) 0.09 ppm geometric mean 1.43 GSD (range 0.07–0.24 ppm) 95% CI 0.07–0.12 ppm; Grinding 0.17 ppm geometric mean 2.36 GSD (range 0.04–1.00 ppm) 95% CI 0.14–0.19 ppm; Other work tasks 0.11 ppm geometric mean 2.14 GSD (range 0.02–0.48 ppm) 95% CI 0.08–0.13 ppm; All work tasks 0.15 ppm geometric mean 2.26 GSD (range 0.01–1.48 ppm) 95% CI 0.14–0.16 ppm.			
Exposure frequency:	3 year period in the late 1990			
Number of workers:	235			
Personal protective equipment:	During painting operations the workers used personal protective equipment of different kinds, i.e. charcoal filter masks, battery-driven air-purifying masks with charcoal filters or masks with supplies of pressurized air. Regarding formaldehyde, the results were somewhat contradictory. At one factory with moderate formaldehyde concentrations (0.17–0.18 ppm) the breakthrough was 100% or even higher using filters with long user time (430 h). In another factory with rather high formaldehyde concentrations (0.61–1.54 ppm) the AM breakthrough was only 5.7% (SD 6%, n ¼ 5), but also in this factory there was a tendency to higher breakthrough with longer user time. The breakthrough increased from 3.3% (1 h use) to 16% (11 h use). By changing to new filters the breakthrough was again reduced to 3%.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified but it was noted that sampling was performed using Sep-Pak DNPH-Silica sampling cartridges. The Sep-Pak DNPH-Silica cartridges contain silica gel coated with 2,4-dinitrophenylhydrazine. The Sep-Pak DNPH-Silica cartridges were slowly eluted with acetonitrile and analyzed by liquid chromatography (LC) in isocratic mode.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Norway - an OECD member
	Metric 3:	Applicability	High	The data are for woodworkers exposed to acid-cured lacquers and paints which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The report was published in 2005, but data used in the report was from a 3 year period in the late 1990s, after the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Geometric mean and geometric standard deviation values, range data and 95% confidence interval was provided

Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Figure 5 (pg 4) presents concentration in mg/m3. The averageHCHO value of each mill is Mill A: 0.128, Mill B: 0.275, Mill C: 0.230, Mill D: 0.100, Mill E: 0.103. 3.1.2 discusses data and provides comparison to standards (Chinese standards, NIOSH). Table 1 presents comparisons to standards (pg 5)			
Comments:	Chinese national standards (GBZ, 2004; GB/T, 1995), and the detailed sampling and determination methods refer to those of our reported works (Tong et al., 2016) (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from China, a non-OECD country
	Metric 3:	Applicability	High	Data are for paper manufacturing, an in-scope occupational scenario
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (graphically, comparison to standards) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing other metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling multiple mills, but uncertainty is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Traviss, N., Thelen, B.A., Ingalls, J.K., Treadwell, M.D. (2010). Biodiesel versus diesel: a pilot study comparing exhaust exposures for employees at a rural municipal facility. Journal of the Air and Waste Management Association 60(9):1026-1033.			
HERO ID:	1940647			
Conditions of Use:	Automobile Exhaust			
EXTRACTION				
Parameter	Data			
Area sampling data:	Formaldehyde emission concentration at a municipal facility for diesel operated heavy equipment ranged between approximately 0.65 to 2.5 ug/m3. Formaldehyde emission concentration at a municipal facility for biodiesel operated heavy equipment ranged between approximately 0.3 to 1.2 ug/m3. In both cases, the maximum was observed near the small front loader.			
Exposure duration:	Preparation and calibration of the equipment is a precision-based process that was used as an instructional activity for the students, resulting in a reduced (6 vs. 8 hr) sampling period. Despite this shorter sampling time, exposures were still measured over most of the work shift.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	method well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	data less than 10 years old

EXTRACTION				
Parameter	Data			
Worker activity description:	Sailors working in a compartment in Navy ship. The compartment’s volume is approximately 115 m3 (4050ft3). There is no mechanical ventilation to this compartment and it has a single opening for access. It contained approximately 2000 sheets of sandpaper.			
Exposure route:	Inhalation			
Physical form:	Solid (component in glue)			
Personal sampling data:	3.16-3.69 ppm (385 min sample) (samples taken after compartment was ventilated with portable ventilation unit (see area sample data for information about this ventilation.)			
Area sampling data:	Initial: 6 and 7 ppm. A portable ventilation unit was set up to exhaust the contaminated air from the compartment at a rate of 0.35 m3 / sec (750 CFM) for 24 hr. After this, the concentration was 4.5 ppm (379 min. sample)			
Exposure duration:	7 to 8 hours per day			
Exposure frequency:	nan			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved OSHA/NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for plasticizer, additive and impurity in adhesives, sealants and lubricants, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data are greater than 20 years old. (1984)
	Metric 5:	Sample Size	Medium	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	most meta data given.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling personal breathing zone and area concentrations but uncertainty is not addressed.
Overall Quality Determination			High	

Study Citation:	TVA, (1991). Formaldehyde in urea product and urea production – status report with cover letter dated 02/01/91 and attachments.			
HERO ID:	5899360			
Conditions of Use:	Processing into a formulation- Fertilizer (Urea)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Occupational exposure during the urea fertilizer manufacturing occurs chiefly during maintenance and repair operations.			
Area sampling data:	Several workplace and storage area were checked for formaldehyde level, and results ranged from 0.51 parts per million under the evaporator close to the point where formaldehyde is added to 0.03 parts per million in the fume from the product melt. Formaldehyde levels 3 inches away and downwind from a vent on an outside formaldehyde storage tank were 13.69 and 42.16 parts per million in two samples collected on two different days. Available data on formaldehyde levels in and around the urea production process frequently are below or near the limits of detection. Average formaldehyde levels varied from not detectable (< 0.005 parts per million (ppm)) to one ppm. The highest exposure levels for formaldehyde were measured around pumps. The formaldehyde concentrations around urea concentrations and solidification processes (prilling or granulations) typically were 0.05 ppm.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	well described sampling and analytical methods
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	data more than 20 years old
	Metric 5:	Sample Size	High	Discrete sampling value is provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

EXTRACTION				
Parameter	Data			
Worker activity description:	garment workers			
Exposure route:	inhalation			
Personal sampling data:	The principal source of HCHO in the garment manufacturing workplace, is the release of HCHO from fabric treated with resins that impart durable or permanent-press properties. HCHO levels in apparel manufacturing facilities were generally below 3 ppm prior to 1980. OSHA had established a 3 ppm TWA in 1967. The ACGIH level is 1 ppm TWA. In recent years, however, HCHO levels observed were generally below 1 ppm. The surveys were done at two large manufacturing sites producing men’s dress shirts. HCHO exposure levels were determined for 54 of 72 job titles in two different plants. All levels of exposure were less than 0.51 ppm TWA. Also, the combined range of data was very narrow (0.01-0.39 ppm) for 5 of the 6 departments in the two plants. The range of mean concentrations of all departments (0.13-0.20 ppm) is also very narrow and compares well within the overall combined mean exposure level of 0.17 ppm. In addition, the average exposure levels used in EPA’s section 4(f) determination (EPA, 1984b), were 0.23 ppm (area) and 0.64 ppm (personal) (Versar, 1982).			
Area sampling data:	The principal source of HCHO in the garment manufacturing workplace, is the release of HCHO from fabric treated with resins that impart durable or permanent-press properties. Number of workers:	103 medical students			
Comments:	'The time-weighted average exposure to formaldehyde vapor was measured during gross anatomy laboratory by using personal sampling devices (impingers) located in the breathing zones of the medical students... portable infrared spectrophotometer (Miran 1 B, Foxboro Instruments). Samples were analyzed by using chromotropic acid as a spectrophotometric reagent (NIOSH method 3500).			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is an approved [NIOSH/OSHA] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States (i.e., University of Southern California School of Medicine).
	Metric 3:	Applicability	Medium	Data are for medical students, this may be used as surrogates for the medical occupation.
	Metric 4:	Temporal Representativeness	Low	Data collected before the most recent PEL (1992). Published in 1989. Sample collection before then.
	Metric 5:	Sample Size	Medium	Data characterized by median and range, but full statistical distribution not provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other metadata. Metadata included is more relevant to health outcomes (e.g., asthmatic, male/female).
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability.
Overall Quality Determination		Medium		

Study Citation:	Ulfvarson, U., Alexandersson, R. (1990). Reduction in adverse effect on pulmonary function after exposure to filtered diesel exhaust. American Journal of Industrial Medicine 17(3):341-347.			
HERO ID:	4948589			
Conditions of Use:	Distribution in Commerce (roll-on-roll-off ships to trucks)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Diesel exhaust from trucks (pg 1)			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	62 samples: 0.27+/-0.05 ppm (Table 1, pg 3)			
Number of workers:	24 subjects exposed without filter, 18 with, 6 on both occasions (pg 3)			
Engineering control:	Exhaust filters - 99.97% degree of retention of dioctylphthalate mist with particle size 0.3 μm (pg. 2)			
Comments:	Analyzed via HPLC (pg 3)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Sweden, an OECD country.
	Metric 3:	Applicability	High	Data are for distribution in commerce, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (mean, standard error) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure duration and frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability addressed by sampling workers exposed to both filtered and unfiltered diesel exhaust, but uncertainty is not addressed.
Overall Quality Determination		Medium

Conditions of Use:	Commercial use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workplaces investigated were bus garage, car ferry, and roll-on roll-off ships. Staff from the bus garage included marshaler (2 workers), cleaner (1 worker), foreman (2 workers), and mechanic (12 workers). Staff from car ferry included upper deck crew who directed vehicles to and from their parking places on the car deck, and staff who assisted in the unloading of vehicles from the deck after the ferry had docked. Staff from the roll-on roll-off ships included the lower deck crews.			
Exposure route:	Inhalation			
Personal sampling data:	Formaldehyde concentrations (mg/m3) obtained with a personal sampling technique were: bus garage – 0.04–0.8; car ferry (2 hr run) - 0.03-0.31; car ferry (20 min run) - 0.1-0.3; roll-on-roll-off ship - <= 0.03 (1st phase) and 0.1-0.5 (2nd phase).			
Area sampling data:	no area samples were collected for formaldehyde			
Number of workers:	Number of workers participating were: bus garage – 17, car ferries – 25, roll-on-roll-off ships – 23 (during 1st phase) and 24 (during 2nd phase), with 10 persons taking part on both occasions.

EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Uninformative	Does not appear to be sampling data, rather assigned exposure levels for epidemiology study.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data are from the U.S.
	Metric 3: Applicability	High	Data are for plastics manufacturing, an in-scope occupational scenario.
	Metric 4: Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Sample type provided but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability addressed by considering exposures across multiple years for multiple job types, but uncertainty is not addressed.

Overall Quality Determination **Uninformative**

Study Citation:	USTMA, (2020). Comment submitted by U.S. Tire Manufacturers Association (USTMA), dated 06/08/2020.				
HERO ID:	8802196				
Conditions of Use:	Incorporation into Article- Tire Manufacturing				
EXTRACTION					
Parameter		Data			
Worker activity description:		Workers involve with mixing, milling, curing, block cutting, and machine operation (e.g. cutters, conveyers, andchippers)			
Exposure route:		Inhalation			
Physical form:		vapor			
Personal sampling data:		the median (50th percentile) air concentration in these tire manufacturing areas was 0.02 ppm and the 95th percentile was 0.15 ppm.Raw data available on pdf pg. 18-84			
Area sampling data:		The air concentrations in these areas ranged from <0.01 to 0.04 ppm.Raw data available on pdf pg. 18-84			
Number of workers:		250,000 workers (pdf pg. 1)			
Personal protective equipment:		For example, the standard PPE requirements in main operational areas of the factory (i.e., raw materials weighing and transfer, rubber mixing, milling, calendaring, extrusion, and curing)include safety glasses, steel toe shoes, work gloves and in some areas hearing protection. (pdf pg. 9)			
Engineering control:		Engineering controls may include local exhaust ventilation for various operations including mixers (which are also generally enclosed with dedicated exhaust), mills, grinding or machining, and curing ovens. Examples of other engineering controls may include use of pre-melt bags for adding minor ingredients to the mixer or mills, various floor sweeper/cleaners to ensure particulate does not accumulate on working surfaces, and isolation of noisy equipment to minimize sound levels in the factory. (pdf pg. 9)			
EVALUATION					
Domain		Metric	Rating	Comments	
Domain 1: Reliability		Metric 1:	Sampling and Analytical Methodology	Medium	Majority of the sampling/analytical methods cited are OSHA, NIOSH, or EPA. A few sampling data note 'modified', which is uncertain if equivalent to NIOSH methods.
Domain 2: Representativeness		Metric 2:	Geographic Scope	High	The data are from the United States
		Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
		Metric 4:	Temporal Representativeness	Medium	Data were collected after the most recent PEL establishment, but range from very recent to more than 20 years.
		Metric 5:	Sample Size	High	Full distribution of samples are provided in the appendix.
Domain 3: Accessibility/ Clarity		Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but additional metadata lacks details such as explanation of job tasks, frequency of tasks, durations, and additional environmental details(i.e., unable to determine which set of data belong to the same or different site).
Domain 4: Variability and Uncertainty		Metric 7:	Metadata Completeness	Medium	Uncertainty is not addressed and not enough details on sampling/analytical method to determine uncertainty. The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled sector.

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling and analytical method is well described and it is not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Finland is an OECD country
	Metric 3: Applicability	Uninformative	Data are for byproduct creation during cooking, a scenario that is out of scope.
	Metric 4: Temporal Representativeness	Low	Article was published in 1993, so data is more than 20 years old.
	Metric 5: Sample Size	Medium	Sample distribution characterized by limited statistics (mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Article indicates a range of sample durations and a range of exposure durations for area monitoring samples.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The article provides a discussion for variability between sites and within sites, but does not address uncertainty.

Overall Quality Determination Uninformative

HERO ID:	1357393		
Conditions of Use:	Use of Paints/Coatings		
EXTRACTION			
Parameter	Data		
Worker activity description:	rod cutting with gasoline powered cut-off saw fitted with a cutting wheel or with an oxy-acetylene cutting torch and painting uncoated steel with a "patch" kit consisting of a two-part epoxy resin paint. (Page 3 of 15)		
Exposure route:	inhalation and dermal (page 2 of 13)		
Physical form:	vapor/fumes or liquid (Page 4 of 15)		
Area sampling data:	A trace level of formaldehyde was detected on the sampling tube. The presence of trace levels of formaldehyde was also detected by thermal desorption. Formaldehyde levels were below the limits of detection of the direct reading Interscan monitor or the Draeger detector tubes. (Page 8 of 15)		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	From the US
	Metric 3: Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	From 1991
	Metric 5: Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site or sector. The monitoring study addresses uncertainty in the exposure estimates or uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination		High	

Study Citation:	Vicente, E.D., Ribeiro, J.P., Custodio, D., Alves, C.A. (2017). Assessment of the indoor air quality in copy centres at Aveiro, Portugal. Air Quality, Atmosphere and Health 10(2):117-127.
HERO ID:	3870802
Conditions of Use:	Electrical and electronic products

EXTRACTION	
Parameter	Data
Worker activity description:	Workers at commercial copy centers. (1/11)
Exposure route:	inhalation (1/11)
Area sampling data:	Hourly average formaldehyde concentrations of 0.04 ± 0.01 and 0.03 ± 0.01 mg/m ³ for copy centers A and B, respectively. (5/11)
Exposure duration:	10 hours/day at Center A, 3 hours/day at Center B (2/11)
Engineering control:	"Among the measures recommended to protect the health of those who work in copying facilities, we may refer to (i) choose low emission equipment (e.g. dry-process photocopiers, instead of wet-process ones) and which do not run so hot; (ii) ensure that photocopiers are equipped with ozone filters and replace these latter regularly; (iii) perform photocopiers maintenance on a regular basis; (iv) photocopiers should be placed such that exhaust affect as little as possible personnel or workstations; (v) maintain the room well ventilated; and (vi) avoid spillage when refilling the toner in dry machines." (11/11)

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is equivalent to an approved [OSHA/NIOSH] method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Portugal, an OECD country.
	Metric 3:	Applicability	High	Data are for workers who commercially use ink and toner products, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (averages, graph) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provides only limited discussion of the variability in the determinants of exposure for the sampled site or sector. The monitoring study provides only limited discussion of the uncertainty in the exposure estimates. Variability addressed by sampling at two copy centers, both indoors and outdoors.

Overall Quality Determination

High

Study Citation:	Viegas, S., Ladeira, C., Gomes, M., Nunes, C., Brito, M., Prista, J. (2013). Exposure and genotoxicity assessment methodologies - the case of formaldehyde occupational exposure. Current Analytical Chemistry 9(3):476-484.			
HERO ID:	2454064			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers involved in anatomy and pathology laboratories (pathologists, technicians and technical assistant) in Portuguese hospitals and workers in formaldehyde and formaldehyde-based resins production factory (production of resins, impregnation and quality control).			
Exposure route:	inhalation			
Physical form:	vapor/gas			
Personal sampling data:	Mean formaldehyde concentrations in 10 laboratories studied range between 0.28 and 3.24 ppm, while in the factory, the mean values ranged between 0.08 and 0.21 ppm. In laboratories, the concentrations were between 0.18 ppm and 5.02 ppm, while in the factory, the concentrations were between 0.0 and 1.04 ppm. Results in laboratories indicate “macroscopic examination” as the task involving the highest exposure. In the case of the factory, the task that included collecting a sample from the reactor was manual. The proximity of the reactor and the fact that it was opened might have promoted exposure.			
Area sampling data:	no data available			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	methodology well described
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	OECD country
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	data is less than 10 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	presented the most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	no discussion on uncertainties
Overall Quality Determination		High

Area sampling data:	Autopsy room: 0.10 mg/m3 mean, 0.08 mg/m3 median, SD 0.07 (range 0.04-0.24 mg/m3); Pathology anatomy lab - Lab #1: 0.24 mg/m3 mean, 0.24 mg/m3 median, SD 0.08 (range 0.11-0.34 mg/m3); Lab #2: 0.12 mg/m3 mean, 0.13 mg/m3 median, SD 0.05 (range 0.06-0.17 mg/m3); Lab #3: 0.06 mg/m3 mean, 0.05 mg/m3 median, SD 0.02 (range 0.04-0.08 mg/m3)			
Number of workers:	16			
Personal protective equipment:	Recommended provision to technicians of appropriate masks for the protection of airways (filtering masks with carbon filters)			
Engineering control:	Recommended: 1) installation of dedicated chemical cloaks with aspiration from the bottom and suited filters; 2) Installation of a suitable system of forced ventilation that guarantees the correct exchange of the air in the laboratories.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not specified; though it was noted that air sampling was performed using diffusive samplers which collect airborne carbonyl compounds as 2, 4-dinitrophenylhydrazine (DNPH) derivatives. Sampling, storage and analysis were performed according to manufacture instructions. Analysis was performed by HPLC with ultraviolet absorbance detection.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Italy - an OECD member
	Metric 3:	Applicability	High	The data are for exposure in an anatomy lab which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The study was based on data from 2006, after the most recent PEL (1992) and more than 10 but less than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized with mean, median, standard deviation, and range data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, exposure type, and sample durations, but lacks additional metadata, such as exposure duration, exposure frequency, and worker activities.

Study Citation:	Vohra, M.S. (2011). Personal formaldehyde exposure level in the gross anatomy dissecting room at College of Medicine King Saud University Riyadh. International Journal of Occupational Medicine and Environmental Health 24(1):108-113.			
HERO ID:	2575943			
Conditions of Use:	Laboratory use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Instructors and students in gross anatomy laboratory			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	The average personal exposure level for the students was 0.75 (range 0.62 – 0.89), 1.20 (range 0.98 – 1.42), and 1.10 (0.88 – 1.31) ppm and 1.27 (range 0.82 – 1.72), 1.44 (range 1.18 – 1.70) and 1.33 (0.94 – 1.72) ppm for instructors during the 4th, 10th and 14th week, respectively. These levels were relatively higher than the World Health Organization guideline. These levels were always higher than the average indoor concentrations throughout the laboratory sessions and the difference in formaldehyde personal exposure levels between instructors and students might reflect both the time spent in a particular area in the dissection room and the region of the cadaver they dissect.			
Area sampling data:	The average concentration of FA in dissection room was 0.68, 0.85, and 0.73 ppm in the 4th, 10th and 14th weeks, respectively. During the 4th week, the concentrations varied between 0.53 and 0.80 ppm for different locations of the dissection room. During the 10th week, the concentrations varied between 0.64 and 1.29 ppm for different locations of the dissection room. During the 14th week, the concentrations varied between 0.65 and 0.92 ppm for different locations of the dissection room. In general, formaldehyde levels near the dissecting table were higher than in the areas away from it.			
Exposure duration:	Personal sampling and area sampling collected for 2 to 3 hours during the dissection class.			
Number of workers:	Ten instructors and 20 students			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling or analytical methodology is an approved OSHA or NIOSH method or is well described and found to be equivalent to approved OSHA or NIOSH methods.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	The data are from a non-OECD country.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	Data less than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	No discussion on uncertainty but data from different sample areas included for variability.

Conditions of Use:	Compressed Wood Product Manufacturing			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	data from individual homes (range 30-1800 ug/m3), offices (30-2300 ug/m3) and schools (range 50-1500 ug/m3) were provided			
Engineering control:	sealed with paint, ventilation			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	sampling and analytic methods not provide, but the article did document that that air was led through an absorber with distilled water for 30-60 minutes, followed by the addition of Pararosaniline, mercuric chloride and sodium sulfite. Analysis was performed using a spectrophotometer.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Netherlands - OECD member
	Metric 3:	Applicability	High	The data are, use in composite wood products, which is an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1982, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	testing values were provided for each site
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sampledurations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study provided data for individual test sites which could be used to assess variability. But the study did not provide any discussion of uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Wallingford, K. M., Elliot, L. J., McAuley, D. B. (1988). Health Hazard Evaluation Report HETA 82-354-1897, Kemper-Tappan, Richmond, Indiana, May 1988.			
HERO ID:	8139239			
Conditions of Use:	Adhesive and sealant chemicals in wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Millroom operators (band sawing, drilling, sanding), assembly workers, salvage room workers, finishing (sealing), and final assembly. (23/30)			
Exposure route:	inhalation (8/30)			
Physical form:	gas (8/30), vapor (10/30)			
Personal sampling data:	TWA exposure levels ranged from non-detectable to 0.56 ppm. By department area, the primary assembly and finishing areas had the highest exposure levels ranging from 0.11 ppm to 0.22 ppm (mean=0.15, N=4) and 0.10 to 0.56 ppm (mean=0.25, N=5) respectively. (11/30)			
Area sampling data:	Area samples ranged from 0.07 ppm in the particle board storage area to greater than 2.14 ppm at the drying oven exit in case finishing. (10/30) During the 1983 survey, the GA formaldehyde concentrations ranged from 0.05 ppm at the Giben Saw #2 to 0.25 ppm at the Giben Saw #1 and also at the case finishing area.			
Number of workers:	At the time of these evaluations, there were approximately 270 production employees operating on a single work shift. (5/30)			
Engineering control:	Local exhaust ventilation was utilized at the majority of powered woodworking machinery, spray booths, and drying ovens used in the production operations at the Kemper plant. (6/30)			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method (NIOSH Method 2501 & 3500).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for adhesives and sealant chemicals in wood product manufacturing, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Monitoring data were collected prior to the most recent PEL.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Most critical metadata provided.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling multiple locations and different job operations.
Overall Quality Determination			High

Study Citation:	Wang, H.X., Zhou, D.X., Zheng, L.R., Zhang, J., Huo, Y.W., Tian, H., Han, S.P., Zhang, J., Zhao, W.B. (2012). Effects of paternal occupation exposure to formaldehyde on reproductive outcomes. Journal of Occupational and Environmental Medicine 54(5):518-524.			
HERO ID:	1070240			
Conditions of Use:	Commercial use, Industrial Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in wood processing industry			
Exposure route:	Inhalation			
Area sampling data:	In China, the current occupational exposure limit for FA is 0.5 mg/m3; however, studies have shown that the levels of FA in some occupational environments were far higher than this limit, with a few extreme instances where FA concentrations measured between 5.84 and 20.94 mg/m3. For this paper, the daily mean exposure was calculated as follows: daily exposure index = concentration of FA (mean value of three measurements, in mg/m3) x the proportion of the exposed work time during a workday x 100 (100 = whole day). Actual value of FA exposure not indicated in the paper.			
Number of workers:	302 workers exposed to FA and 305 non-exposed workers			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	Data are from a non-OECD country.
	Metric 3:	Applicability	High	Data are for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Medium	Data is more than 10 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

Study Citation:	Westberg, H., Löfstedt, H., Seldén, A., Lilja, B.G., Nayström, P. (2005). Exposure to low molecular weight isocyanates and formaldehyde in foundries using hot box core binders. Annals of Occupational Hygiene 49(8):719-725.			
HERO ID:	5943728			
Conditions of Use:	Binder in Metal Manufacturing (Foundries)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers in Swedish foundries using Hot Box binders			
Exposure route:	Inhalation			
Physical form:	gas			
Personal sampling data:	Personal sampling results for formaldehyde in grey iron foundry: GM - 260 +/- 2.1 ug/m3, AM – 343+/-339 ug/m3, Range - 100–1600 ug/m3. Personal sampling results for formaldehyde in brass foundries: GM - 71 +/- 2.5 ug/m3, AM – 105+/-9.6 ug/m3, Range - 14–440 ug/m3. Personal sampling results for formaldehyde for core makers: GM - 136 +/- 2 ug/m3, AM – 169+/-110 ug/m3, Range - 50–440 ug/m3. Personal sampling results for formaldehyde for die-caster: GM - 63 +/- 2.1 ug/m3, AM – 80+/-58 ug/m3, Range - 21–220 ug/m3. Personal sampling results for formaldehyde for others: GM - 32 +/- 2.2 ug/m3, AM – 46+/-50 ug/m3, Range - 14–170 ug/m3. The formaldehyde levels ranged from 14 to 1600 mg/m3, but the ACGIH-TLV (600 mg/m3) was exceeded in only 3% of the samples.			
Area sampling data:	Air concentrations (ug/m3) for formaldehyde (total): GM - 120 +/- 2.8, AM – 190+/-250, Range - 14–1600. Air concentrations (ug/m3) for formaldehyde for core-maker: GM - 200 +/- 2.1, AM – 280+/-290, Range - 50–1600. Air concentrations (ug/m3) for formaldehyde for die-caster: GM - 63 +/- 2.1, AM – 80+/-58, Range - 21–220. Air concentrations (ug/m3) for formaldehyde for others: GM - 32 +/- 2.2, AM – 46+/-50, Range - 14–170. The air concentrations of formaldehyde were higher for core-makers (GM = 200 mg/m3) than for die-casters (GM = 63 mg/m3). The formaldehyde concentrations were higher for the core-makers, although still below the ACGIH-TLV for most of the exposed workers.			
Exposure duration:	Measurements are given as 8-hr time-weighted averages.			
Number of workers:	64 (15 die-casters, 39 core-makers and 10 other workers in the foundry); In the brass foundries, all coremakers, die-casters and fettlers were included (in total 40 workers) and in the grey iron foundry 24 coremakers			
Comments:	Swedish occupational exposure limit is 600 mg/m3;

Exposure route:	Inhalation (Report states that the off-gases of the plume evolving from the fresh hot foam)			
Physical form:	Vapor			
Area sampling data:	Fresh urethane plume saw area 0.52 mg/m3			
Exposure duration:	The foam process is a continuous 10 to 12-hour operation, whereas the foam peeling process is an 8-hour shift, three shifts per operation. Second shift peels the most fresh foam, with a third shift peeling a lesser amount than the second. The first shift peels mostly 1-day-old foam. A limited amount of foam is peeled at Bush Street too.			
Number of workers:	234 total The Jessup facility employs 138 hourly and 13 salaried employees, plus one part time office clerk. All the hourly and all but three of the salaried personnel are males. The Bush Street facility employs 57 hourly and 7 salaried workers. Approximately 10 of the 57 hourly employees and 2 of the salaried employees are female.			
Personal protective equipment:	Respirators			
EVALUATION

			Rating	Comments
Metric 7:		Metadata Completeness	Medium	The monitoring study does not address variability. The monitoring study addresses uncertainty in the exposure estimates or uncertainty canbe determined from the sampling and analytical method.
Overall Quality Determination			High	

Formaldehyde

Occupational Exposure

HERO ID: 3970612 Table: 1 of 1

Study Citation:	White, G. L., Schwartz, E. (1979). Health Hazard Evaluation Determination, Report No. HEE 79-41-594, Stout Sportswear, Queens Long Island City, New York.			
HERO ID:	3970612			
Conditions of Use:	Fabric, textile, and leather products not covered elsewhere; Photographic supplies			
EXTRACTION				
Parameter	Data			
Worker activity description:	The job categories included officer personnel, photomakers, markers , graders and cutters. Cutting is performed with reciprocating electric cutters, both straight and disc.			
Exposure route:	inhalation, dermal			
Physical form:	vapor			
Area sampling data:	Measured non-detect in office, copy machine(on, off, and off with compartments open), sewing area.			
Number of workers:	19 employees			
Engineering control:	Site had 7 exhaust fans equally distributed along exterior walls.			
Comments:	Report does not clearly indicate a source of formaldehyde and testing shows formaldehyde was not detected.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Direct reading measurement tools (drager indicator tubes) for sampling, assumed an approved NIOSH method based on type of report (NIOSH HHE).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Uninformative	No indication of a source of formaldehyde from the raw materials in the process and formaldehyde was not detected, so unknown if formaldehyde was present at site.
	Metric 4:	Temporal Representativeness	Low	more than 20 years old.
	Metric 5:	Sample Size	High	Samples are fully characterized and the sample size is sufficient (n=4; ND).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, but lacks additional information on basis for formaldehyde testing, employee duration of tasks and frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study considers variability in testing the copy machine while on and off as well as conditions expected during maintenance. Uncertainty is assumed to be considered in the sampling and analytical method.
Overall Quality Determination		Uninformative		

Study Citation:	Whitmyre, G. K., Driver, J. H., Ginevan, M. E., Tardiff, R. G., Baker, S. R. (1992). Human exposure assessment I: understanding the uncertainties. Toxicology and Industrial Health 8(5):297-320.		
HERO ID:	4635		
Conditions of Use:	Use of fabric, textile and leather products		
EXTRACTION			
Parameter	Data		
Worker activity description:	There are ten employees in the cutting department where the fabric is taken to either automatic spreading machines or to tables on which the fabric is hand-laid to match stripes. The sewing department employs about 50 individuals, who work in teams to make the clothing. The completed garments are taken to the finishing department, which has ten employees. Four employees inspect the garments for stitching, loose threads, matching stripes, spots, and stains. The maintenance department is staffed by two persons who do a wide variety of activities including machine repair and maintaining the ventilation systems.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	Sewer trace (0.03 ppm)Sewer/Dodge City trace (0.03 ppm)Supervisor/Cutting Room trace (0.04 ppm)Sewer/Musical Chairs trace (0.04 ppm)Bundler trace (0.06 ppm)Inspector trace (0.05 ppm)Sewer/Looney Tunes trace (0.03 ppm)Cutter trace (0.05 ppm)Sewer/Looney Tunes trace (0.04 ppm)Formaldehyde on Dust-Sewer/Musical Chairs 1.2 ug/sample 0.17 mg/m3Sewer/Mash ND 0.11 – 0.1 mg/m3Sewer/Little Haiti 0.9 ug/sample 0.06 mg/m3Sewer/Looney Tunes 0.69 ug/sample 0.08 mg/m3Sewer 6:50 a.m. - 2.1 ug/sample 0.19 mg/m3		
Area sampling data:	Sewing - Adjacent to Cleaning Station trace (0.04 ppm)		
Exposure duration:	up to 10 hours per day - 6 days per week.		
Exposure frequency:	40 hours per week		
Number of workers:	85		
Engineering control:	To further reduce the employees’ exposure to the organic solvents used at this facility, the local exhaust ventilation for the spotting stations could be modified to provide the appropriate capture velocity. The portable welding station should have local exhaust ventilation (OSHA Part 1910 Subpart Q Welding, Cutting, Brazing). ⁴⁶		
Comments:	This is a general methodology for exposure via ingesting contaminants. Formaldehyde is not discussed.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH study - Methods 2541 & 5700
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	High	The data are for an occupational scenario (garment fabrication) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Medium	1996 - after PEL (1992) but more than 20 years old
	Metric 5: Sample Size	High	Results from individual sampling events were provided which could be used to develop statistics. Uncertainty was not discussed but assumed that it was addressed in the NIOSH methods used.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.

Study Citation:	Wieslander, G., Norback, D. (1998). Asthma, respiratory symptoms, and nasal inflammation in house painters mainly exposed to water-based paints. International Congress Series 1153:408-412.			
HERO ID:	1319564			
Conditions of Use:	Use of Paints/Coatings			
EXTRACTION				
Parameter	Data			
Worker activity description:	Painting			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	probably area sampling - <0.03-0.14 mg/m3			
Number of workers:	236 painters			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Sweden - and OECD country
	Metric 3:	Applicability	High	The data are for painters which is an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The study was published in 1998 using data from 1989-1992 & 1997, after the most recent PEL (1992) but more than 20 years old.
	Metric 5:	Sample Size	Medium	Only range data were provided
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include exposure type, but lacks additional metadata, such as sample type, sample durations, exposure durations, exposure frequency, and/or worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study provided range data that can be used to evaluate variability. Information about uncertainty was not provided.
Overall Quality Determination		Low		

Study Citation:	Wieslander, G., Norbäck, D., Edling, C. (1994). Occupational exposure to water based paint and symptoms from the skin and eyes. Occupational and Environmental Medicine 51(3):181-186.		
HERO ID:	994035		
Conditions of Use:	Use of Paints/Coatings		
EXTRACTION			
Parameter	Data		
Worker activity description:	Painting, removal of old wall paper, manual sanding of walls with abrasive paper, manual filling, and sizing of wet room wall papers		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	0.05 mg/m3 mean (8 hours exposure) 0.04 mg/m3 geometric mean, 1.9 Geometric SD (range <0.03-0.1 mg/m3)		
Particle size characterization:	dust exposure for renovation: old building 2.1 mg/m3, new building 0.7 mg/m3		
Number of workers:	12		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Long term exposure to formaldehyde was measured by diffusion sampling, with chemosorption on 2,4-dinitrophenyl hydrazine (2,4- DNF) coated glass fiber filters. 12 Peak exposure to formaldehyde was measured with glass fiber filters impregnated with 2,4-DNF, with the air rate at 1 l/min for 15 minutes. The filters were analyzed by liquid chromatography.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Sweden - OECD member
	Metric 3: Applicability	High	The data are for painters which is an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1993 and the data collection occurred in April of 1989, prior to the most recent PEL (1992) but more than 20 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized with a average, geometric average, geometric SD and range data.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Some metadata were provided but sample durations, exposure durations, and exposure frequency was not included.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Range and geometric SD data were provided, but uncertainty was not dicussed.
Overall Quality Determination	Medium

Study Citation:	Wilhelmsson, B., Holmstrom, M. (1992). Possible mechanisms of formaldehyde-induced discomfort in the upper airways. Scandinavian Journal of Work, Environment and Health 18(6):403-407.			
HERO ID:	180138			
Conditions of Use:	Manufacture			
EXTRACTION				
Parameter	Data			
Personal sampling data:	0.05-0.6 (mean 0.26) mg/m3; Ref. group: mean 0.09 mg/m3			
Number of workers:	66 employees; 36 control community clerks			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	Medium	Sampling/analytical methodology is not an approved OSHA/NIOSH method but is an acceptable methodology.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country (Sweden).	
	Metric 3: Applicability	High	Data are for manufacturing, an in-scope occupational scenario.	
	Metric 4: Temporal Representativeness	Low	Data collected before the most recent PEL (1992). Published in 1992. Sample collection before then.	
	Metric 5: Sample Size	Medium	Data characterized by mean and range, but full statistical distribution not provided.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Monitoring data include sample type (e.g., personal breathing zone) but no other meta-data.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	Variability and uncertainty not addressed.	
Overall Quality Determination		Low		

Study Citation:	Williams, T.M., Levine, R.J., Blunden, P.B. (1984). Exposure of embalmers to formaldehyde and other chemicals. American Industrial Hygiene Association Journal 45(3):172-176.		
HERO ID:	1317520		
Conditions of Use:	Embalming		
EXTRACTION			
Parameter	Data		
Worker activity description:	Embalming fluid applied to femoral artery, blood drained form the formal vein. Insert trocar to the thoracic and abdominal cavities. Embalm the viscera by attaching hose to the trocar, and instill content. Seal the abdominal puncture wound using a screw-in plastic button. For autopsied bodies the process is repeated for each body section. Cauerize the Skull, thorax and abdomen, add viscera into abdomen and close the body.		
Exposure route:	inhalation		
Physical form:	vapor		
Personal sampling data:	Intact bodies: 0.27 ppm TWA mean (Range 0.18 - 0.43 ppm); Autopsied bodies: 0.88 ppm TWA mean (Range 0.0 - 2.11 ppm TWA)		
Area sampling data:	Intact bodies 0.26 ppm TWA mean (range 0.15 - 0.5 ppm TWA); Autopsied bodies 0.65 ppm TWA mean (range 0.15 - 0.92 ppm TWA)		
Particle size characterization:	Area source sampling: average 0.19 mg/m3 (range 0.06 - 0.40 mg/m3) Personal 1.8 mg/m3 during application of hardening compound.		
Personal protective equipment:	All wore rubber gloves and all but one wore laboratory jacket or apron.		
Engineering control:	ventilation systems were evaluated for this study.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Sampling and Analytical Methodology	High	NIOSH methods were referenced for this study. Midget impinger containing bisulfide in distilled water were used to collect the samples. two impingers were used in series to obtain 95% collection efficiency. Chrmotrophic acid method.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	US
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4: Temporal Representativeness	Low	The study was derived from data collected in 1980, before the most recent PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	High	results from individual sampling events were provided along with Mean and range data for area and personal sampling.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Monitoring data include most critical metadata, such as sample type, exposure type, sample durations, exposure durations, exposure frequency, and worker activities.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	As the actual results for each sampling event are provided for intact and autopsied bod-ies it is possible to evaluate the data variability. The NIOSH method addresses uncer-tainty.

Physical form:	vapor
Personal sampling data:	PBZ STEL Data: Table 1, pg 5 presents data for various control types, including sample size and maximum values in ppm. Table 2, pg 5 presents data (median, mean, SD, geometric mean, geometric standard deviation, 95th %, and UCL of 95th%) for various control types as well.
Engineering control:	"General ventilation systems are often used in these situations and personal formaldehyde exposure levels in the air were reported to be as high as 3.8 parts formaldehyde per million parts air (ppm).[12] Local exhaust ventilation systems have been demonstrated to reduce the exposure levels for students (pg 2) See exposure results tables, data is grouped by control type. "
Comments:	After scrubbing out the 2,163 STEL samples with the sample type and sampling method criteria, 307 data points were left, with 294 of them collected with OSHA 52 method, and 13 with NIOSH 2541 method. Overall, 117 samples were censored and only 190 samples were above their corresponding reporting limits. These data were collected from 163 surveys at a total of 36 anatomic pathology laboratories in nine states across the organization from 1990–2014. (pg 4)Only samples collected and analyzed with OSHA Method 52 and NIOSH Method 2541 were used in this analysis (pg 3)

EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for lab chemical, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (median, mean, SD, geometric mean, geometric standard deviation, 95th %, and UCL of 95th%, max) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Sample type and exposure type provided but missing metadata such as exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in analysis of collected sampling points (dealing with LODs etc.). Variability addressed by evaluating exposure by control type.

Overall Quality Determination

EXTRACTION				
Parameter	Data			
Worker activity description:	student			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	1.5 mg/m3 average, 0.99 variance (range 0.9-2.4 mg/m3). See Table 2 for individual data			
Area sampling data:	0.4 mg/m3 average; 0.21 variance (Range 0.1-0.72 mg/m3). See Table 2 for individual data.			
Exposure duration:	”The class met for two afternoons a week”			
Exposure frequency:	twice a week during a 10 week anatomy class			
Number of workers:	number of monitored subjects: 8			
Personal protective equipment:	gloves were worn			
Engineering control:	windows on one side of the room were opened during class but active general or local exhaust ventilation was not evident.			
Comments:	”Area-air samplers were randomly distributed throughout the room. Breathing-zone air samples were collected on 30 individuals at 15 tables over the course of 10 weeks. The average sampling duration was 18 min.”			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	The sampling collection method correlates well (0.97) with the NIOSH impinger method. Analysis using the NIOSH standard chromotropic acid method. Back-up filters were analyzed separately to check for break-through.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Provided data may represent outdated operations, equipment, and activities compared to current operations, equipment, and worker activities. The data were published in 1986, before the most recent PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized including weekly values, averages and ranges.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Monitoring data include all associated metadata, including sample types, exposure types, sample durations, exposure durations worker activities, and exposure frequency.
Domain 4: Variability and Uncertainty

Conditions of Use:	Laboratory Chemical			
EXTRACTION				
Parameter	Data			
Worker activity description:	Embalmers, FA production workers, pathologists, particle board and plywood makers, and textile workers.			
Exposure route:	inhalation			
Physical form:	vapor, gas			
Area sampling data:	Airborne concentrations of FA in anatomy labs range between 1-3 ppm and where cadavers are stored 14 ppm and 31 ppm have been measured. Pathologists were exposed up to 3 ppm while autopsy technicians were exposed up to 1 ppm while performing general autopsy duties.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Data is TSCA submission overseen and conducted by Yale University and published by US Department of Health and Human Services so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data is for US.
	Metric 3:	Applicability	High	Data is applicable to lab and anatomy uses of FA.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old (1984)
	Metric 5:	Sample Size	Medium	Characterized by range of data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type and exposure type, but lacks additional metadata, such as sample durations, exposure durations, and/or exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by comparing different areas but uncertainty is not addressed.
Overall Quality Determination		Medium		

Study Citation:	Yamato, H., Nakashima, T., Kikuta, A., Kunugita, N., Arashidani, K., Nagafuchi, Y., Tanaka, I. (2005). A novel local ventilation system to reduce the levels of formaldehyde exposure during a gross anatomy dissection course and its evaluation using real-time monitoring. Journal of Occupational Health 47(5):450-453.			
HERO ID:	1513951			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Personal sampling data:	50 (ppb)			
Area sampling data:	405 (ppb)			
Engineering control:	Local exhaust ventilation operating at a rate of 14,800 m^3/hr (10.6 air changes/hr)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Japan is an OECD member country.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Medium	Data published in 2005. More than 10 but less than 20 years old.
	Metric 5:	Sample Size	High	Real time monitoring results provided.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Description of activities and durations indicated on real-time monitoring results.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.

HERO ID:	6183103			
Conditions of Use:	commercial use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Office workers in a 10-year-old 55-stories skyscraper office tower in Malaysia. Floors studied were 33, 34, and 35.			
Exposure route:	Inhalation			
Area sampling data:	Formaldehyde concentrations (in ppm) measured in the office spaces in different floors were: Level 33N – max - 0.30, min - 0.21, average - 0.26; Level 33S – max - 0.29, min - 0.23, average - 0.27; Level 34N – max - 0.37, min - 0.32, average - 0.34; Level 34S – max - 0.18, min - 0.13, average - 0.15; Level 35S – max - 0.28, min - 0.24, average - 0.25. In all cases, formaldehyde concentrations exceeded the threshold limit of 0.1 ppm. The bias uncertainty for formaldehyde concentrations are in the ranges of 7–17%. These results suggested that non-uniform formaldehyde distributions were present during the field work testing. Again, this can be traced to the fact that uneven air distributions were present for all zones examined.			
Engineering control:	It was recommended that HVAC systems should be turned off during the air flushing as a higher temperature can effectively enhance the formaldehyde emission and remove it from the office space.			
EVALUATION

HERO ID:	1317844			
Conditions of Use:	Unknown			
EXTRACTION				
Parameter	Data			
Worker activity description:	Air traffic control specialists are given responsibility for aircraft that enter their sector. This action is called "handing off". The pilot identifies his aircraft to the TRACON controller who monitors it via a flash of light (blip) on his radar screen. Each blip is accompanied across the radar screen by an alpha-numeric tag supplied by a central computer which contains the plane identification, altitude and speed. The controller monitors the aircraft's relationship to other aircraft and issues instructions to the pilot concerning direction of flight and clearance for altitude changes.			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Philadelphia International AirportAll below limit of detection, therefore at minimumTower cab <0.5 ppmTRACON room <0.5 ppmLaGuardia Station >0.5 ppm			
Number of workers:	Philadelphia 140 (5-6 Tower Cab and 10-12 in the RACON room at any given time)NY TRACON 400 (35-40 air traffic control room)			
Engineering control:	Modify HVAC system to allow for outdoor air supply all year round			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Methodology is assumed to be an approved NIOSH method based on use by NIOSH IH.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Low	The data are for an occupational scenario (air traffic controller) but the source of formaldehyde or whether there is a source of formaldehyde is unclear. The report does indicate the use of lit cigarettes in table 3 and 4, which is outside of the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1984 - prior to the PEL (1992) and more than 20 years old
	Metric 5:	Sample Size	Medium	Multiple samples taken but samples are reported below limit of detection.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include most critical metadata, such as sample type and exposure type, and worker activities, but lacks additional metadata, such as sample durations, exposure durations, and exposure frequency. In addition, there is an inconsistency between the report where it indicates all samples were below the limit of detection (0.5ppm) but table 2 reports >0.5ppm
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Results from individual sampling events were provided which could be used to evaluate variability between locations. As this is a NIOSH study, it is assumed that uncertainty was considered in the Methods.

Occupational Exposure

HERO ID: 4038955 Table: 1 of 1

Study Citation:	Zey, J. N., Todd, W. F. (1987). Health Hazard Evaluation Report HETA 85-308-1829, Kardon Industries, St. Paris, Ohio, September 1987.			
HERO ID:	4038955			
Conditions of Use:	Thermal decomposition product- Packaging			
EXTRACTION				
Parameter	Data			
Worker activity description:	Some worker activities noted are operators filling melt tanks, and maintenance and cleaning of the machines (11/19)			
Exposure route:	inhalation (11/19)			
Physical form:	gas/vapor (11/19)			
Area sampling data:	Formaldehyde was found on all field samples in the 1-5 ug range which correlated to 0.08 to 0.5 mg/m3.			
Exposure duration:	3 shifts per day			
Number of workers:	100 hourly			
Engineering control:	Site Engineering Controls: Local ventilation hoods located adjacent to the two duplex spray head operations. Another local ventilation hood is located near the top of a conveyor which carries tubes to the inspection table. Total exhaust flow is 1270 CFM.NIOSH recommendations: Improve ventilation systems install wax filter to control wax build up straight blade or backwards curved blade fan would be less susceptible to wax build upreduce the number of sharp bends in the ventilation systemextend the wax spraying hood to better loss from convection of hot wax.Install a slot hood over the inspection table and increase air flow.Automate the wax transfer process.Safety interlocks should be installed on the plexiglass shields located on each side of the auto wax machine.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	NIOSH Study, so therefore method is an approved NIOSH method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The data are for an occupational scenario (cardboard tube manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	1986 - prior to the PEL (1992) and more than 20 years old.
	Metric 5:	Sample Size	Medium	The distribution of samples is characterized by a range. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data include sample type, exposure duration but no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study does not address variability. Uncertainty was not discussed but assumed that it was addressed in the NIOSH method used.
Overall Quality Determination		Medium		

Study Citation:	Zhang, L., Chung, F.L., Boccia, L., Colosimo, S., Liu, W.L., Zhang, J.F. (2003). Effects of garage employment and tobacco smoking on breathing-zone concentrations of carbonyl compounds. AIHA Journal 64(3):388-393.			
HERO ID:	2814079			
Conditions of Use:	Automobile Exhaust			
EXTRACTION				
Parameter	Data			
Worker activity description:	The garage workers included mechanics, garage managers and owners, and other technical staff working in automobile garages.			
Exposure route:	inhalation			
Personal sampling data:	Average formaldehyde breathing zone concentrations (ug/m3): garage worker smoker – 40.6 +/- 13.4; garage worker nonsmoker – 41.1 +/- 13.7; non-garage worker smoker – 34.6 +/- 8.65; non-garage worker nonsmoker – 30.2 +/- 9.48. The concentrations ranged from 14.1 to 80.1 ug/m3 for formaldehyde. In comparing the garage workers and the controls, it was found that the formaldehyde concentrations for the garage workers were 17 and 36% higher than for the controls in the smokers and nonsmokers, respectively.			
Number of workers:	37 subjects including 22 garage workers (9 smokers and 13 nonsmokers) and 15 nongarage workers or so-called controls (4 smokers and 11 nonsmokers).			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	Sampling or analytical methodology is not equivalent to an approved OSHA or NIOSH method and EPA review of information indicates the methodology is acceptable.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	Medium	The data are for an occupational scenario within the scope but exposures may be aggregated with conditions outside of the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	data between 10 and 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The monitoring study addresses variability in the determinants of exposure but no discussion on uncertainties
Overall Quality Determination		Medium		

Formaldehyde

EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Area sampling data:	Katrina trailers up to 1.2 ppm; Testing from Dec 2007-Jan 2008 average 0.077 ppm, peaking at 0.59 ppm			
Comments:	HUD limits the use of plywood particleboard that conforms to the 0.4 ppm formaldehyde emission limit in the construction of prefabricated and mobile homes (pg. 4)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Low	Sampling or analytical methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	Operations, equipment, and worker activities are expected to be reasonably representative of current conditions. The monitoring data were collected (report published 2009) after the most recent PEL (1992) establishment and is more than 10 but less than 20 years old.
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Monitoring data did not include critical metadata, such as sample type, sample durations, exposure durations, exposure frequency, and worker activities.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The monitoring study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	Zhang, L., Tang, X., Rothman, N., Vermeulen, R., Ji, Z., Shen, M., Qiu, C., Guo, W., Liu, S., Reiss, B., Freeman, L.B., Ge, Y., Hubbard, A.E., Hua, M., Blair, A., Galvan, N., Ruan, X., Alter, B.P., Xin, K.X., Li, S., Moore, L.E., Kim, S., Xie, Y., Hayes, R.B., Azuma, M., Hauptmann, M., Xiong, J., Stewart, P., Li, L., Rappaport, S.M., Huang, H., Fraumeni, J.F., Smith, M.T., Lan, Q. (2010). Occupational exposure to formaldehyde, hematotoxicity, and leukemia-specific chromosome changes in cultured myeloid progenitor cells. Cancer Epidemiology Biomarkers and Prevention 19(1):80-88.
HERO ID:	626137
Conditions of Use:	Processing

EXTRACTION	
Parameter	Data
Exposure route:	inhalation
Physical form:	Vapor
Personal sampling data:	1.28 ppm 8 hr TWA median (10th percentile 0.63 / 90th percentile 2.51)
Exposure duration:	a full shift for 3 days over a 3 week period
Number of workers:	43 exposed workers and 51 unexposed workers (controls)

		EVALUATION	
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium
			Sampling/analytical methodology is not specified though it was noted that UME 100 diffusion samplers ; analysis using gas chromatography–mass spectroscopy methods were used.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low
	Metric 3:	Applicability	Medium
			Data are for formaldehyde resin production and plastic manufacture, are in-scope occupational scenarios. Unfortunately the data were merged so the different uses could not be differentiated
	Metric 4:	Temporal Representativeness	Medium
			Monitoring data are greater than 10 years old but no more than 20 years old - Article published in 2010 but the monitoring data were from 2006
	Metric 5:	Sample Size	Medium
			Sample distribution characterized by limited statistics (mean, 10th and 90th percentile of the median values) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium
			Sample type and exposure type provided but data for the two different facilities not reported separately. Missing: sampling/ analysis methods, number of samples, worker activities, exposure frequency, and sampling location.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low
			The monitoring study does not address the variability or uncertainty of the exposure measurements.

Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	Medium	EPA review of information indicates the methodology is acceptable. Differences in methods are not expected to lead to lower quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US Data
	Metric 3:	Applicability	High	The data are for an occupational scenario (commercial use of building/construction materials – wood and engineered wood) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Article was published in 2012 and is less than 10 years old.
	Metric 5:	Sample Size	High	Real time data is presented in one-minute time series.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data indicate sample type and sample duration, but no other meta data is included.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The study discusses seasonal differences as a source of variability, but does not address uncertainty.
Overall Quality Determination			High	

Study Citation:	Zimmer, A. T., Hadwen, G. (1993). HETA 92-287-2294 March 1993 Federal Records Center, Dayton, Ohio.			
HERO ID:	8095556			
Conditions of Use:	Chemical substances in packaging, paper, plastic, and hobby products			
EXTRACTION				
Parameter	Data			
Worker activity description:	office workers at a records storage center; NIOSH believed most likely source of formaldehyde was carbonless copy paper			
Exposure route:	inhalation			
Physical form:	offgas			
Area sampling data:	Outside: 0.006 mg/m3Admin Area:0.011 mg/m3Archives Area:0.024 mg/m3Bay area D:0.034 mg/m3Valut Area:0.023 mg/m3*Outside: 0.006 mg/m3			
Number of workers:	70			
Engineering control:	NIOSH recommended increasing ventilation exchange rate (via HVAC system) and exhaust fans.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling and analytical is approved by NIOSH (NIOSH Method 3500).
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States.
	Metric 3:	Applicability	High	The data are for an occupational scenario (Use of Paper Products) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data measured in 1992, more than 20 years ago and around the time of the most recent PEL establishment(~May 1992).
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Monitoring data include most critical metadata, such as sample type, worker activities, and exposure type, but lacks additional metadata, such as exposure durations and exposure frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The monitoring study addresses variability in the determinants of exposure for the sampled site by measuring different locations. The monitoring study addresses uncertainty in the exposure estimates in the 'results and discussion' section and additional uncertainty can be determined from the sampling and analytical method.
Overall Quality Determination			High	

Study Citation:	Zwack, L. M., Chiu, S., LeBouf, R. F. (2018). Evaluation of chemical exposures at two vape shops in texas.			
HERO ID:	8683492			
Conditions of Use:	Electronic cigarettes			
EXTRACTION				
Parameter	Data			
Worker activity description:	Employees hand-mixed custom e-liquid blends according to customer taste. They also refilled small bottles of nicotine, propylene glycol, and vegetable glycerin. (8/34) Employees and customers vaped inside the shop. (10/34) Employees reported that they cleaned floors, counters, displays, and the counter with cleaning agents including Clorox® wipes and sprays, Pine-Sol® surface cleaner, and glass cleaners.			
Exposure route:	inhalation (7/34)			
Physical form:	vapor (7/34)			
Personal sampling data:	Personal samples for formaldehyde ranged from 3.3-17 ppb. (Table 3) (14/34)			
Area sampling data:	Area samples for formaldehyde ranged from 3.4-17 ppb. (Table 4, specific locations are reported in the table) (14/34)			
Exposure duration:	Shift lengths were variable, with most employees working up to 10 hours, depending upon the day (7/34); Employees reported working a median of 42.5 hours per week (range: 36–50 hours). (16/34)			
Exposure frequency:	The shops were open from 10 a.m. to 8 p.m. Monday through Saturday. On Sunday, they were open from 12 p.m. to 5 p.m.			
Number of workers:	17 employees (7/34)			
Personal protective equipment:	The company provided employees with nitrile gloves for use when mixing e-liquids and when working with chemicals. (11/34) Closed toed shoes and long pants were also reported by employees. (17/34)			
Engineering control:	Ventilation in shop A was provided by two air handling units attached to the ceiling that delivered ducted supply air to the entire shop. Employees in the shop reported that they periodically changed the air handling unit filters. In shop B, supply air vents in the ceiling provided conditioned air. At both shops, we observed that the flavoring chemicals and nicotine used at the mixing counters were stored in secondary containers. (11/34)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Sampling and Analytical Methodology	High	Sampling/analytical methodology is an approved OSHA method.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	Uninformative	Data are for electronic cigarettes, which isn’t in the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Monitoring data were collected after the most recent PEL and no more than 10 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All metadata provided
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed in sampling/analytical methodology. Variability addressed by sampling at multiple vape shops.

Overall Quality Determination		High		

Study Citation:	Chan, W.R., Parthasarathy, S., Fisk, W.J., Mckone, T.E. (2015). Estimated effect of ventilation and filtration on chronic health risks in U.S. offices, schools, and retail stores. Indoor Air 26(2):331-343.		
HERO ID:	2964715		
Conditions of Use:	Office Environment		
EXTRACTION			
Parameter	Data		
Exposure route:	inhalation		
Area sampling data:	Table 4 provides predicted mean indoor concentrations of various VOCs: Formaldehyde (ug/m^3) - current VR: office - 12.6, school - 11.8, retail store - 25.0, grocery store - 9.6; VR/2: office - 22.3, school - 20.5, retail store - 47.1, grocery store - 16.0; VR 2x: office - 7.8, school - 7.4, retail store - 14.1, grocery store - 6.3. Figure 3 shows graphs of the percentage of building that would be above RfC guidelines.		
Exposure duration:	Office workers: 10 hrs/day; Teachers: 7 hrs/day; retail and grocery store workers: 10 hrs/day.		
Exposure frequency:	Office workers: 250 days, Teachers: 170 days; retail and grocery store workers: 250 days.		
Number of workers:	Workers in Offices: 41 million; Teachers in Schools: 4 million; Workers in Grocery: 2.5 million, Workers in Retail: 7.5 million workers.		
Engineering control:	Figure 2 provides measured air exchange rates (1/h) in offices, schools, retail stores and grocery stores. Offices range between ~0.5-1.0, mean ~0.8 median ~0.7. Schools had range ~0.25-0.5, mean & median ~0.45; Retail had range ~0.4-0.75, mean ~0.75, median ~0.5; Grocery stores had range ~0.8-1.2, mean ~1.0, median~0.9. Air exchange rates were calculated from ventilation rates however those numbers are not specifically listed. Model used assumed filter efficiencies between 20 to 80%."Minimum ventilation standards, for example, ASHRAE(2013) Standard 62.1 and the California Energy Com-mission Building Energy Efficiency Standards Title 24(CEC, 2013), specify VRs with the intention to main-tain acceptable IAQ in buildings(p.2)"		
Comments:	Contains supplemental document; Provides ventilation rates for commercial buildings		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	Source is peer reviewed so model calculations are likely sound as well as appropriate parameters.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data is for US
	Metric 3: Applicability	Medium	Data is for commercial/consumer uses in offices, schools, retail and grocery stores. Could be applied to commercial scenarios or other buildings with similar ventilation or air exchange rates.
	Metric 4: Temporal Representativeness	High	Data is from 2015, so less than 10 years old.
Domain 3: Accessibility/ Clarity	Metric 5: Metadata Completeness	High	Model approach, equations and parameter values are transparent and clear and can be evaluated. Rationale is provided for approach, equations and parameters.
Domain 4: Variability and Uncertainty	Metric 6: Metadata Completeness	Medium	Variability is addressed by testing across different indoor environments and at different ventilation rates. Does not address uncertainty. (Uncertainty is addressed in health risk in terms of years of life lost due to exposure but does not address uncertainty in model for airborne exposure.)

HERO ID:	2993418			
Conditions of Use:	Use of Cleaning and Furniture Care Products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Only worker listed is a housekeeper.			
Exposure route:	inhalation			
Area sampling data:	[Modeled area concentration based on other cited study of emissions from chamber testing] Background exposure levels in private homes across Europe (ug/m^3): Northern Europe: min - 11, max - 45; Western Europe: min - 4, max - 57; Eastern Europe: min - 11, max - 41; Southern Europe: min - 7, max - 52; EU mean - 22. Table 6 provides exposure levels for housekeepers using products such as all purpose cleaners, electric air fresheners, and perfumes (ug/m^3): 24-h mean conc - 10, <1, <1 (0.5 ach), max 30-min conc - 33, <1, 16 (0.5 ach); 24-h mean conc - 19, <1, 1 (0.1 ach); max-30 min conc - 60, <1, 28 (0.1 ach). Figures 3A and 4A provides graphical data of 24 h exposure stated in the tables.			
Exposure duration:	6			
Exposure frequency:	250			
Engineering control:	Ventilation rates of 0.3, 0.35, 0.5 and 0.75 ach were used depending on the regional data in Europe.			
Comments:	Exposure duration listed in Table 3. Frequency is assumed to be daily. Table 7 provides the same data but prioritizes exposure to retirees: 24 hour mean conc (0.5 ach) - 3, 1, 2, 2, <1; Max 30-min conc - 20, 6, 16, 11, 6; 24-h mean conc (0.1 ach) - 7, 2, 6, 4, 2; Max 30-min conc (0.1 ach) - 21, 7, 16, 11, 12 (consumer exposure)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Model is published an peer-reviewed journal, and appears scientifically sound.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data is for EU and various OECD countries such as Sweden, Germany, Denmark, France, UK, Spain, Greece and Czech Republic.	
	Metric 3: Applicability	High	The model, CONC-CPM, can be used for occupational exposure scenarios within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	High	The model is based on operations, equipment, and worker activities expected to be representative of current conditions. The model is based on data that are generally no more than 10 years old.	
Domain 3: Accessibility/ Clarity	Metric 5: Metadata Completeness	Medium	Includes exposure type, exposure route, ventilation rates, worker activity, exposure duration and frequency.	
Domain 4: Variability and Uncertainty	Metric 6: Metadata Completeness	High	Addresses variability by looking at ventilation rates and data across multiple European countries. Addresses uncertainty by comparing with alternative model.

Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	Medium	Model is free of mathematical errors and based on sound approaches/methods; however, choice of equations and parameters are not described.	
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from France, an OECD country.	
	Metric 3: Applicability	High	Model can be applied to fabric, textile and leather products not covered elsewhere, an in-scope occupational scenario.	
	Metric 4: Temporal Representativeness	High	Model is based on current industry conditions and based on data no more than 10 years old.	
Domain 3: Accessibility/ Clarity	Metric 5: Metadata Completeness	Low	Model approach and parameters described but the underlying equations and parameter values are not provided. Rationales for choice of approach and parameters are not provided.	
Domain 4: Variability and Uncertainty	Metric 6: Metadata Completeness	Medium	Variability addressed by testing two different models, but uncertainty is not addressed	
Overall Quality Determination		Medium		

Study Citation:	Ng, M. G., Tongeren, van, M., Semple, S. (2014). Simulated Transfer of Liquids and Powders from Hands and Clothing to the Mouth. Journal of Occupational and Environmental Hygiene 11(10):633-644.		
HERO ID:	3222353		
Conditions of Use:	Multiple		
EXTRACTION			
Parameter	Data		
Exposure route:	hand/object to mouth (inadvertent ingestion)		
Physical form:	liquid and powder		
Dermal exposure data:	Dermal exposure data		
Exposure frequency:	pg. 2/13: Observational studies of adults have shown average hand-to-mouth contact frequencies of 2–5 contacts per hour		
Comments:	This data source contains data that are the values of a variable in an equation for calculating oral exposure resulting from inadvertent ingestion. This inadvertent ingestion results from hand/object -to-mouth transfer. The variable is transfer efficiency pertaining to hand/object -to-mouth transfer. The data are laboratory measurements of transfer efficiency. pg. 12/13: "This study has provided evidence that transfer of chemicals from the hands or objects to the mouth is influenced by parameters including physical state, chemical/physical properties, and use of protective clothing. These findings may have implications for exposure modeling and exposure control. This work was preliminary in nature and additional study is required to obtain a greater understanding of the parameters that can affect transfer and the possible interactions between them."		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	The model is based on scientifically sound approaches, however, the model does not take into account evaporation or absorption. The experimentally determined TEs may be useful and the model may be adapted to account for those factors.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The geographic attribute is not relevant in the case of a mathematical model and data obtained via laboratory experiments.
	Metric 3: Applicability	High	Model can be applied to occupational scenarios where inadvertent oral exposure is likely.
	Metric 4: Temporal Representativeness	High	Data was published in 2014, so generally no more than 10 years old.
Domain 3: Accessibility/ Clarity	Metric 5: Metadata Completeness	High	Model approach, equations, and choice of parameter values are transparent and clear and can be evaluated. Rationale for selection of approach, equations, and parameter values (where given) is provided.
Domain 4: Variability and Uncertainty	Metric 6: Metadata Completeness	High	The model characterizes variability (e.g., study tests several different factors in varying transfer efficiencies) and uncertainty in the results(contains a limitation section).
Overall Quality Determination		High	

Study Citation:	Offermann, F.J. (2017). Formaldehyde emissions from laminate flooring. ASHRAE Journal 59(3):102-105.

HERO ID:	95691			
Conditions of Use:	Office Environment			
EXTRACTION				
Parameter	Data			
Area sampling data:	Modeled exposure (Indoor air quality (IAQ) model) separate equations are provided for each exposure source (painting, waxing, and installing furniture/cabinets), sinks (carpet and other absorbent surfaces) and decay rate. The article notes that exposure concentrations are specific for each situation and can vary by office configuration, occupant activity (client/receptionist/janitor), day of the week (weekday/weekend), shift (normal day / night), air exchange rates, activity (waxing, painting, installation of new furniture/ cabinets)			
Exposure duration:	Exposures durations are hypothetical and vary by occupation and shift			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Modeled exposure (Indoor air quality (IAQ) model) separate equations are provided for each exposure source (painting, waxing, and installing furniture/cabinets), sinks (carpet and other absorbent surfaces) and decay rate.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evalu-ated.	
	Metric 3: Applicability	High	The model can be appropriately applied to an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Low	Monitoring data are greater than 20 years old but after the PEL- published 1996	
Domain 3: Accessibility/ Clarity	Metric 5: Metadata Completeness	High	Model approach, equations, and choice of parameter values are transparent and clear and can be evaluated. Rationale for selection of approach, equations, and parameter values is provided.	
Domain 4: Variability and Uncertainty	Metric 6: Metadata Completeness	Low	model results are not validated therefore variance and uncertainty is not quantified.

Study Citation:	[Redacted] (2014). [Redacted] Formaldehyde exposure risk assessment for XXX.			
HERO ID:	10605383			
Conditions of Use:	Textile finishing			
EXTRACTION				
Parameter		Data		
Exposure route:		inhalation, dermal		
Area sampling data:		0.014 - 0.11 mg/m3 (Table 1-2) (pg 2)Measured data from three production facilities performing steam pressing, cutting and sewing with fabrics having 60-80 ppm formaldehyde from the wet extraction method (Japanese Law Test) was reported. There were 5 measurements and the range offormaldehyde concentration in the air was 0.05 – 0.11 mg/m3 (Priha, 1995). Therefore based on this publication, when the Oeko-Tex results for formaldehyde are below 75 ppm, air concentrations in the workplace are not anticipated to exceed 0.11 mg/m3. (pg 4)		
Dermal exposure data:		Dermal exposure data		
Exposure duration:		8 hour		
EVALUATION

Occupational Exposure

HERO ID: 1511770 Table: 1 of 1

Study Citation:		Coleman, R. (1995). Reducing the levels of formaldehyde exposure in gross anatomy laboratories. Anatomical Record 243(4):531-533.		
HERO ID:		1511770		
Conditions of Use:		Laboratory Use		
EXTRACTION				
Parameter		Data		
Worker activity description:		Lab students and staff performing dissections and embalming operations		
Exposure route:		Inhalation		
Area sampling data:		0.03-0.09 (ppm)		
Engineering control:		dissection “beds” in which there was a motor to create a downflow to suck all the formaldehyde fumes from the cadaver into the bed, where they would be absorbed by special active carbon filters. The air exiting the beds and recycled into the laboratory would be virtually formaldehyde-free (Fig. 1)		
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability				
	Metric 1:	Methodology	Medium	Assessment uses high quality data that are not from frequently-used sources and there are no known quality issues.
Domain 2: Representativeness				
	Metric 2:	Geographic Scope	Medium	Data are from Israel, an OECD country.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	Assessment is based on data greater than 20 years old and industry conditions that are expected to be outdated. (1995)
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity				
	Metric 6:	Metadata Completeness	Medium	Assessment or report provides results, but the underlying methods, data sources, and assumptions are not fully transparent.
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination			Low

HERO ID:	5965207		
Conditions of Use:	Laboratory Chemicals (e.g., specimen preservation, medical samples, mortuary science)		
EXTRACTION			
Parameter	Data		
Worker activity description:	macroscopic examination of surgical pieces or biopsy, tissue processing and chemical waste disposal		
Exposure route:	inhalation		
Physical form:	liquid		
Personal sampling data:	0.3-7.3 ppm		
Exposure duration:	Based on tabular presentation of the exposure values, it could be assumed that the exposures were for 8 hours per day.		
Exposure frequency:	nan		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country other than the U.S., and locality-specific factors may impact exposures or releases relative to the U.S.
	Metric 3: Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	The assessment captures operations, equipment, and worker activities expected to be representative of current conditions. EPA has no reason to believe exposures have changed. The completed exposure or risk assessment is generally no more than 10 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The assessment addresses variability and uncertainty in the results. Uncertainty is well characterized.
Overall Quality Determination		High	

Formaldehyde

Occupational Exposure

HERO ID: 10602388 Table: 1 of 1

Study Citation: Dow Chemical, (2017). [Redacted] 2016 Personal exposure monitoring for XXX formaldehyde XXX at the Kankakee Site, Kankakee, Illinois, USA.
HERO ID: 10602388
Conditions of Use: Processing: byproduct (Accidental formation)

EXTRACTION

Parameter	Data
Exposure route:	inhalation (p. 2)
Personal sampling data:	0.00667 ppm, <0.0053 ppm (p. 10), 0.0071 ppm, 0.0071 ppm (p.14)
Personal protective equipment:	SCBA respiratory protection was worn during all sampling tasks associated with formaldehyde. (p. 2)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	Used known method, NIOSH 2016.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	Uninformative	The assessment is from an occupational scenario that involves the chemical being produced accidentally as a byproduct, not within the scope of risk evaluation.
	Metric 4: Temporal Representativeness	High	The assessment captures operations, equipment, and worker activities expected to be representative of current conditions. EPA has no reason to believe exposures have changed. The completed exposure or risk assessment is generally no more than 10 years old.
	Metric 5: Sample Size	Medium	Statistical distribution of samples is fully characterized. However, the small sample size is insufficiently representative
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The assessment addresses variability and uncertainty in the results. Uncertainty is well characterized.

Overall Quality Determination **Uninformative**

Conditions of Use:	Other (chemical substances in products not described by other codes): Laboratory Chemicals (e.g., specimen preservation, medical samples, mortuary science)		
EXTRACTION			
Parameter	Data		
Exposure route:	Embalmers are likely to be exposed by skin contact through spills or splashes onto skin or eyes during handling processes, such as dilution, arterial and cavity embalming, cleansing and disinfections of body surfaces and orifices, and equipment cleaning by hosing. Spills and splashes during embalming were observed at the site visited (IRSST, 2006c).The likelihood of exposure by inhalation is also high during embalming, such as during dilution of concentrated formalin solutions, application of the solution by spraying, and WORKER EXPOSURE TO FORMALDEHYDE AND FORMALDEHYDE RELEASERS 10 handling viscera covered with paraformaldehyde powder. The duration of embalming a body varies depending on body conditions and customers’ requirements, but usually takes 1-3 hours. The majority of the embalmers operate on a daily basis and exposure durations vary from 1-10 hours a day. Other staff involved in handling embalmed bodies, such as body dressing up and body lifting, may also be exposed to formaldehyde(NICNAS, 2006).

Study Citation:		ECHA, (2019). Worker exposure to formaldehyde and formaldehyde releasers.		
HERO ID:		6302987		
Conditions of Use:		Processing as a reactant		
EXTRACTION				
Parameter		Data		
Exposure route:		Inhalation (pg. 12)		
Personal sampling data:		PBZPersonal Long-term (90th): 0.37(n=116)Personal Short-term (95th): 0.64(n=17)		
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	Monitoring data from French registrants and COLCHIC, report uses sound methods that are from a frequently used source (e.g., European Union or OECD reports, NIOSH HHEs, journalarticles, Kirk-Othmer) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S.(EU).
	Metric 3:	Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The completed exposure or risk assessment is generally no more than 10 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by percentiles with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Data sources are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The assessment provides only limited discussion of the variability and uncertainty in the results.
Overall Quality Determination			High	

Study Citation:	ECHA, (2019). Worker exposure to formaldehyde and formaldehyde releasers.		
HERO ID:	6302987		
Conditions of Use:	Processing- Incorporation into Article-Adhesives and sealant chemicals in wood product manufacturing

Comparison between active (pumped) and passive (diffusive) sampling methods for formaldehyde in pathology and histology laboratories. Journal of Occupational and Environmental Hygiene 14(1):31-39.
HERO ID:	4453119
Conditions of Use:	Chemical substances in products not described by other codes:Laboratory Chemicals (e.g., specimen preservation, medical samples, mortuary science)

EXTRACTION

Parameter	Data
Worker activity description:	After receiving organs, the autopsy technician filled the containers with a 20% buffered formalin solution, covered each with a lid, and placed them on a cart. The technician also cleaned the fume hoods for the residents' dissecting work. For the rest of the shift, the technician delivered the filled containers to other laboratories, brought organs to the histology laboratory, and printed and placed labels on small cassettes. The two laboratory technicians made sample slides by imbedding tissue samples in wax, placing the sliced samples on slides, putting the slides through automatic staining and cover-slipping machines, and then labelling and storing them for the doctors to examine. (p.4)
Exposure route:	Inhalation (p.4)
Physical form:	liquid (p. 4)
Personal sampling data:	At the pathology laboratory, samples were collected in two campaigns: 15 personal and 10 area sample pairs (one active sampler and one passive badge) in one and 21 personal and 4 area sample pairs in the other (Figure 2). At the histology laboratory, 13 personal and 3 area sample pairs were collected. (p.4)
Area sampling data:	At the pathology laboratory, samples were collected in two campaigns: 15 personal and 10 area sample pairs (one active sampler and one passive badge) in one and 21 personal and 4 area sample pairs in the other (Figure 2). At the histology laboratory, 13 personal and 3 area sample pairs were collected. (p.4)
Number of workers:	The laboratory personnel included five full-time employees (three laboratory coordinators and two pathologist assistants [PAs]) and a few residents and doctors performing dissecting work. One laboratory coordinator and the two PAs voluntarily participated in our study. (p. 3)
Engineering control:	fume hood (p. 3)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source (NIOSH).
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	The assessment captures operations, equipment, and worker activities expected to be representative of current conditions. EPA has no reason to believe exposures have changed.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.

EXTRACTION			
Parameter	Data		
Worker activity description:	In general the formaldehyde unit operators perform a wide variety of operations, including monitoring and control of the process, the taking and analysis of process samples, blending and loading the formaldehyde, and the unloading of methanol. [additional info on PDF Pg. 11]. One chief operator is assigned per shift to operate the controls for the formaldehyde unit and for another chemical manufacturing unit. The controls for both units were located within the same building. This control building was located across the street from the formaldehyde unit in the blending/control laboratory building where the unit operator worked. One of the plants visited employed blender operators who operate the controls from a blending control building. It was their job to transfer formaldehyde solutions between tanks within a central tank farm and to load rail cars or tank car trucks while using inline blending to insure uniformity of product. One of the plants employed loading operators, whose job it was to load formaldehyde and other chemicals manufactured by that same plant. These operators were assigned at the central loading location for the plant and were assigned to either load the tank trucks or rail cars. At one of the plants, production supervisors supervised the formaldehyde operation during the day shift. Their office is across the street from the formaldehyde unit and is next to the unit control building where the chief operator works. Each plant provides maintenance personnel for upkeep of the formaldehyde unit. At most of the plants the maintenance personnel are responsible for maintenance of the entire plant in addition to the formaldehyde unit itself. At one of the plants the maintenance personnel were responsible for maintenance for the entire plant complex. [additional info on PDF Pg. 13]		
Exposure route:	Inhalation		
Physical form:	Gas/Vapor		
Personal sampling data:	Long-Term Personal Samples Operator Plant A: 0.38-0.68 (ppm); mean - 0.55 (ppm) Plant B: 0.09-0.36 (ppm); mean - 0.23 (ppm) Plant C: 0.11-0.56 (ppm); mean - 0.31 (ppm) Chief Operator Plant C: <0.13-0.24 (ppm); mean - <0.19 (ppm) Production Supervisor Plant C: 0.30-0.32 (ppm); mean - 0.30 (ppm) Maintenance Worker Plant A: <0.05-0.32 (ppm); mean - <0.15 (ppm) Plant B: 0.09-2.22 (ppm); mean - 0.61 (ppm) Short-Term Personal Samples Process Sampling and Analysis Plant A: 0.31-1.89 (ppm); mean - 0.87 (ppm) Plant B: <0.05-0.64 (ppm); mean - <0.27 (ppm) Plant C: <0.05-1.76 (ppm); mean - <1.02 (ppm) Product Loading Plant A: 0.19-0.55 (ppm); mean - 0.32 (ppm) Plant B: 0.86-1.07 (ppm); mean - 1.00 (ppm) Plant C: 0.96-1.79 (ppm); mean - 1.22 (ppm) Aftercooler Sampling Plant B: mean - 1.34 (ppm)		
Area sampling data:	Long-Term Area Samples Production Area Plant A: 0.05-1.38 (ppm); mean - 0.27 (ppm) Plant B: 0.01-0.64 (ppm); mean - <0.18 (ppm) Plant C: <0.06 - 3.63 (ppm); mean - <0.61 (ppm) Formaldehyde Storage Plant B: 0.56-1.06 (ppm); mean - 0.78 (ppm) Plant C: 0.17-0.35 (ppm); mean - 0.24 (ppm) Formaldehyde Blending Plant A: 0.27-1.02 (ppm); mean - 0.69 (ppm) Plant C: 0.11-0.16 (ppm); mean - 0.13 (ppm) Formaldehyde Loading Plant A: 0.28-8.62 (ppm); mean - 4.32 (ppm) Plant C: <0.05-1.55 (ppm); mean Control Lab - General Plant A: 0.38-0.69 (ppm); mean - 0.50 (ppm) Plant C: 0.13-0.69 (ppm); mean - 0.39 (ppm) Control Lab - Hood Area Plant A: <0.01-1.14 (ppm); mean - <0.58 (ppm) Plant C: 0.53-2.60 (ppm); mean - 1.46 (ppm)		
Exposure duration:	Unloading takes between 8-10 hours at one plant and 8 hours at another.		
Personal protective equipment:	Most plants surveyed require workers to wear hardhats and safety glasses on the premises. During formaldehyde loading, most plants require employees to wear gloves. Half (5 out of 9) of the plants required respiratory protection in the form of a half or full-face organic vapor cartridge respirator. Respirators are also required at most plants during formaldehyde gas sampling. Fit testing was only done at one of the plants. During process sampling and analysis, most plants require gloves. Only one plant required the wearing of a full-face acid gas cartridge respirator during sample collection. No PPE is required during sample analysis. Formaldehyde gas sample required gloves and either half or full-face organic vapor cartridge respirator. During formaldehyde tank storage entry, workers are required to wear a full-protective suit, gloves, and boots along with respiratory protection. Maintenance usually wore gloves and respirators. (pg. 14-15)		
Engineering control:	One plant surveyed used a modified closed dome system and a passive ventilation system to remove gaseous emissions during tank loading and unloading. Another plant had an active ventilation system without a closed dome. This system was not as effective as the closed dome system because vapors can escape along the edge of the hatch where the ventilation duct is inserted. All of the plants visited had automatic delivery systems that should allow the operator to set the required load then leave the area, thus preventing exposure during loading. This system also prevents overfilling, which often results in spills; Scrubbers

HERO ID:	8728037
Conditions of Use:	Manufacture

EXTRACTION	
Parameter	Data
Worker activity description:	Operators’ responsibilities include unloading the methanol, operation of the formaldehyde and resin units, transferring the formaldehyde to blending and storage tanks, and sampling and analyzing the formaldehyde solution.
Exposure route:	Inhalation
Physical form:	Vapor
Personal sampling data:	Chief operator - formaldehyde and resin units: 0.11 (ppm)Operator - formaldehyde and resin units: 0.27 (ppm)Maintenance worker: 0.24 (ppm)Operator loading formaldehyde into a tank truck: 0.05 (ppm)
Exposure duration:	8 hour shifts/day
Number of workers:	The plant employs 29 workers including 14 workers that are involved with -formaldehyde and resin production.
Personal protective equipment:	All employees are required to wear safety shoes and hard hats inthe operating area. Workers performing formaldehyde loading also wear splash proof goggles and rubber gloves. Other PPE available for use at the worker discretion includes earplugs, face shields, supplied air respirators, self-contained breathing apparatus, and cartridge gas masks. The plant has a written respiratory program that is currently being revised to accommodate the new OSHA workplace air standards applicable to the plant.
Engineering control:	Vaporizer and Converter: The operations are located in the open air structure which allows adequate ventilation of the area. Flanges and high temperature gaskets are used on all connective piping and fittings from the vaporizer to the reactor.Aftercooler: The hot formaldehyde gases from the converter are cooled in an aftercooler before entering the absorber. The aftercooler is completely enclosed with limited worker exposure hazard.Absorber: This Gould centrifugal, single mechanical seal transfer pump showed evidence of minimal formaldehyde leakage. The seal worked well, but still allowed some leakage as evidenced by small paraformaldehyde deposits.Truck loading area: The loading area is equipped with a blower that blows the vapors from the open truck port away from the operator.Control Room and Laboratory Area: Ventilation consists of an air conditioning vent in the ceiling as well as an exhaust/ventilation fan unit in the ceiling.

Study Citation:	Monsanto Research Corp, (1981). Preliminary plant visit industrial hygiene report: Formaldehyde production facility, Monsanto Plastics and Resins Company, Eugene, Oregon.			
HERO ID:	8728039			
Conditions of Use:	Manufacture			
EXTRACTION				
Parameter	Data			
Worker activity description:	Operators handle all aspects of formaldehyde production including unloading methanol from railroad tank cars, sampling and analysis of the process streams at several points, and operating and monitoring the process from the control room.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	(1977) 0.7-1.98ppm; (1980) 0.09-0.19ppm, Two short-term personal samples (38 and 30 minutes duration) were taken by the production supervisor on formalin operators while they were drawing product samples for analysis in the production lab. Results were 0.12 and 0.14 ppm; (1981) 0.21ppm short term sample done by OSHA			
Area sampling data:	An area sample was taken in the production lab (Tenex sample tube, 427 minute sample duration) with results of 0.25 ppm.			
Exposure duration:	Each crew works an 8-hour shift.			
Number of workers:	The entire plant, including formaldehyde and resin productionoperations, laboratory research, and a sales group, totals 31 nonunion employees.			
Personal protective equipment:	Safety glasses and hard hats are required for anyone working in orobserving any of the production facilities. All production workers are furnished safety glasses, safety shoes, and hard hats, as well as work clothes, which are laundered weekly by the plant. Chemical goggles, a face shield, and protective gloves are provided for routine operations, such as unloading of methanol or formalin. Cabinets of protective clothes are located throughout the facilities for easy use. Entry into the formalin bulk storage tank for the purpose of cleaning and removal of paraformaldehyde requires that the operator wear a complete protective suit, boots, and a self-contained breathing apparatus.			
Engineering control:	Ventilation in the reactor room is provided by two roof vents in theceiling. The control room/laboratory is located directly adjacent to the reactor room. Here, the operator tests the solutions for formaldehyde concentration and monitors the process. The area isequipped with chemical hoods, which vent to the outside, as wellas a 12-15 inch diameter fan in a side wall. All sample preparationand analysis work is done inside the hoods except for determiningthe refractive index.

Conditions of Use:	Plastic Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	The formation of circuit breaker cases are formed by compression molding presses using styrene and vinyl toluene-based molding compounds.			
Exposure route:	inhalation, ingestion			
Physical form:	liquid, dust			
Personal sampling data:	«0.45 micrograms per cubic meter to 2.6 ug/m3			
Area sampling data:	0.025 and 0.018 (ppm)			
Engineering control:	Local exhaust ventilation			
Comments:	see table 3			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Assessment uses high quality data/techniques/methods from frequently-used sources.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data are from the U.S.	
	Metric 3: Applicability	High	Data are for plastic material and resin production, an in-scope occupational scenario.	
	Metric 4: Temporal Representativeness	Low	Assessment is based on data greater than 20 years old and industry conditions that are expected to be outdated. (1998)	
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	Uncertainty is addressed by sampling methods. Variability addressed by personal and area sampling.	
Overall Quality Determination		High		

Study Citation:	National Toxicology Program (NTP), (2016). Report on carcinogens, fourteenth edition: Formaldehyde.			
HERO ID:	5160139			
Conditions of Use:	Processing			
EXTRACTION				
Parameter	Data			
Worker activity description:	"Occupational exposure to formaldehyde is highly variable and can occur in numerous industries... In the past, the highest continuous exposure levels were measured during the varnishing of furniture and wooden floors, during the finishing of textiles, in the garment industry, during the treatment of furs, and in certain jobs in manufactured board mills and foundries. Short-term exposure to high levels of formaldehyde has been reported for embalmers, pathologists, and paper workers. Lower levels of exposure have usually been reported for the manufacture of synthetic vitreous fibers, abrasives, and rubber, and in formaldehyde production (IARC 2006)." (7/11)			
Exposure route:	inhalation, dermal, ingestion (6/11)			
Physical form:	Gas & particulates, liquid resins (7/11)			
Personal sampling data:	"In the United States, high exposure levels were reported for formaldehyde-based resin production (mean concentrations of up to 14.2 ppm), plastic product production (up to 38.2 ppm) (Stewart et al. 1987), embalming (up to 2.6 ppm) (Stewart et al. 1992), biology teaching laboratories (up to 8.3 ppm) (EPA 1981), and pathology autopsy laboratories (up to 4.35 ppm)" (7/11)			
Number of workers:	""In the late 1980s, OSHA estimated that over 2 million U.S. workers were exposed to formaldehyde, about 45% of whom worked in the garment industry (USDL 2009)."" (7/11)"			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	Assessment uses high quality data from frequently-used sources.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are from numerous different industries and situations, all of which are in-scope occupational scenarios.
	Metric 4:	Temporal Representativeness	Medium	Assessment is based on current industry conditions but data is generally between 10 and 20 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by limited statistics (means, ranges) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The assessment provides only limited discussion of the variability and uncertainty in the results.
Overall Quality Determination			High	

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.			
HERO ID:	192040			
Conditions of Use:	Processing as a reactant			
EXTRACTION				
Parameter	Data			
Worker activity description:	operators could be exposed to formaldehyde during abnormal operations, such as mechanical failure of hoses or seals and failure to ensure all hatches and chutes are closed. Exposure could also occur during the following activities or events: sample collection and testing, truck loading and unloading, filling of drums, equipment cleaning and maintenance, opening of tanks and equipment, and spills.			
Exposure route:	Inhalation, Dermal			
Physical form:	Vapor, liquid			
Personal sampling data:	Almost all long-term personal monitoring results (except at site number 7 in Table 15.2a) were 0.5 ppm, with the majority of them (88 out of 95) 0.2 ppm. One high reading (1.96 ppm) was measured when formaldehyde vapours were released during flushing of the formaldehyde pump and opening of tanker hatches by a driver. The data from site number 7, which has the most number of samples (176), showed a similar pattern, with 76 out of 89 showing readings 0.5ppm , in which 63 readings were 0.2ppm. The company claimed that exposures in the plant operating environment and laboratory were typically less than 0.1 ppm for the duration of 12 hour (operators) and 8 hour (laboratory staff) shifts. Similarly, most of the short-term measurement results were less than 0.5 ppm (66 out of 87).			
Area sampling data:	out of 50 sample results are 0.2 ppm (Table 15.2b). The majority of short-term static measurements were also 0.2 ppm, with 11 out of 74 samples in the result band of > 0.5 ppm to 2 ppm. Weekly static monitoring (100 samples in total between year 2001 and April 2003) was undertaken at site number 9 and most of readings were < 0.2 ppm. The company reported that the highest routine exposures are 0.5 ppm to 1 ppm during sampling and testing.			
Exposure duration:	At large resin manufacturing sites, typically 10 to 20 samples per shift are taken manually from sample ports of the reactors and tested for viscosity and pH. Sampling takes less than 5 minutes. Small amounts of resin (as samples) are also made in the laboratory approximately 2 times per shift and take 4 to 5 hours to test each time.			
Exposure frequency:	The frequency of the reaction tower cleaning varies from site to site and ranges from once every 6 months to 3 years.			
Personal protective equipment:	workers are required to wear safety glasses, gloves, overalls and safety footwear when handling formaldehyde or formaldehyde resins at all sites. Full-face air supplied respirators or breathing masks are worn during truck loading at two companies. Local exhaust ventilation and general ventilation are used for loading and packaging areas at the majority of workplaces. Equipment cleaning: the tasks are conducted by specially trained personnel while the manufacturing operation is shut down. The required personal protective equipment (PPE), such as air- supplied breathing apparatus for working in confined spaces, is used.			
Engineering control:	All laboratories have fume hoods. Local exhaust ventilation is also available in a laboratory which houses experimental resin reactors.

Domain 4: Variability and Uncertainty			
Metric 7:	Metadata Completeness	Medium	The report provides limited discussion on variability but no discussion of uncertainty.
Overall Quality Determination		High	

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.		
HERO ID:	192040		
Conditions of Use:	Manufacture		
EXTRACTION			
Parameter	Data		
Worker activity description:	production and maintenance, quality control, laboratory and storage; includes workers in the resin manufacturing plants as workers have dual roles in formaldehyde and resin production at most sites; workers’ exposure could result from truck loading and/or drum filling and from situations where there is a need to break open or enter the enclosed system, such as sample collecting and testing, equipment cleaning and maintenance.		
Exposure route:	Inhalation, Dermal		
Physical form:	Vapor, liquid		
Personal sampling data:	”The majority of the personal sample results (40 out of 41) were less than or equal to 0.2 ppm during 8 to 12 hours shifts. A result of 0.5 ppm (measured for about half an hour) was found during formaldehyde drum filling.”		
Area sampling data:	”The majority of 8h TWA static samples (13/16) and short-term (15 minutes) static samples (24/28) were less than or equal to 0.2 ppm. Four out of 16 peak static samples had readings above 0.5 ppm and up to 2 ppm. There were two high peak static readings (2.67 and 6.08 ppm) measured at a formaldehyde plant bund and a storage area. No information on the interpretation of these high readings is available.” ”In the 1980s, the mean levels of formaldehyde in workroom air at formaldehyde manufacture plants ranged from 0.2 ppm to 0.7 ppm (IARC, 1995).”		
Exposure frequency:	Sampling: 3 to 4 times per shift; maintenance is about once every one to three years		
Number of workers:	120		
Personal protective equipment:	Operators wear overalls, helmet, gloves, safety glasses and boots during normal duties at production plants. Respiratory protection equipment is available and used where exposures are likely to be high, such as reaction chamber/absorber tower cleaning (confined spaces) and dealing with major spills.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The report provides sampling method and is from a frequently used source, which is generally accepted by the scientific community (NICNAS)
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country other than the U.S
	Metric 3: Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data used is from (1998-2002) and 1980s, therefore more than 20 years old.
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	report clearly documents its data sources
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The report provides limited discussion on variability but no discussion of uncertainty.

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.		
HERO ID:	192040		
Conditions of Use:	Distribution in Commerce		
EXTRACTION			
Parameter	Data		
Worker activity description:	Due to off-gassing of formaldehyde resin products, such as from furniture and pressed wood panels, the levels of formaldehyde in transport containers can build up.		
Exposure route:	inhalation		
Physical form:	gas		
Area sampling data:	An incident was reported when workers opened a truck container of trestle tables imported from overseas and immediately fell sick and vomited. Air monitoring of the container (using NIOSH Method 2016) was conducted for a number of substances and found only formaldehyde levels (3.1 mg/m ³) exceeded the current occupational exposure standard (Personal communication, 2004).		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source (NICNAS report) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country (Australia) other than the U.S.
	Metric 3: Applicability	High	The assessment is for an occupational scenario (unloading) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Medium	The completed exposure or risk assessment is generally, more than 10 years but no more than 20 years old.
	Metric 5: Sample Size	Low	characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Data sources are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The assessment does not address variability or uncertainty on the extracted data.
Overall Quality Determination		Medium	

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.			
HERO ID:	192040			
Conditions of Use:	Incorporation into formulations, mixture, or reaction product			
EXTRACTION				
Parameter	Data			
Worker activity description:	Dermal: manual charging of mixing vessels, mixing and inspection, filling of product containers and equipment cleaning. Inhalation:especially during charging of formalin into open vessels, heated blending processes and high-speed mechanical stirring in open tanks. Sampling is usually conducted at the end of mixing and samples are taken through a sampling tap at the bottom of the mixing vessel. Equipment is cleaned between different productsby hosing with pressured water or using cleaning solvents.			
Exposure route:	Inhalation, Dermal			
Physical form:	Liquid, Vapor			
Personal sampling data:	There were few long-term personal samples, and mostof those reported were < 0.2 ppm. Short-term sampling results ranging from 0.3 ppm to 2 ppm were measured during raw material weigh-up, equipment cleaning and maintenance.Full data is provided in Table 15.3 (pg. 194)			
Area sampling data:	Static results measured at a blending platform, mixingtank opening and filling line range from 0.5 ppm to 1.5 ppm, with measurement duration of 10 minutes. One static reading of 2.24 ppm was found during bulky box tank filling.Full data is provided in Table 15.3 (pg. 194)			
Exposure duration:	usually an intermittent process of a few hours			
Exposure frequency:	varies, formaldehyde products may not always be used.			
Personal protective equipment:	The majority of formulators reported that workers wear safety glasses and gloves when handling formalin and products containing formaldehyde. At some workplaces workers are required to wear overalls, safety footwear and aprons.Respiratory protection equipment, such as half-face masks, full-face visors and full-face powered air respirators, are available at most of the workplaces, and are worn when exposure is likely to be high, such as manual loading and open mixing.			
Engineering control:	Exhaust ventilation above the mixing tank is used at the majority of the workplaces. Some sites have roof exhaust ventilation and industrial fans. Six formulators reported that the workplace relies on natural ventilation only and four did not provide any information on engineering controls.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	The report provides sampling method and is from a frequently used source, which is generally accepted by the scientific community (NICNAS)
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S
	Metric 3:	Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.

Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	report clearly documents its data sources
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The report provides limited discussion on variability but no discussion of uncertainty.
Overall Quality Determination		High		

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.		
HERO ID:	192040		
Conditions of Use:	Repackaging		
EXTRACTION			
Parameter	Data		
Worker activity description:	Exposure of workers to formaldehyde is limited to accidental spills or leakages during repackaging as the processes are usually fully or partially enclosed, of relatively short duration and usually infrequent. Both skin and inhalation exposures to formaldehyde are likely during the manual repackaging of paraformaldehyde powder because formaldehyde-containing dusts can be generated during the process		
Exposure route:	dermal and inhalation		
Physical form:	liquid, dust		
Personal protective equipment:	PPE (such as gloves, overalls, safety glasses or goggles) is reportedly used at five repackaging companies. One company reported that all activities are conducted in a booth fitted with an extraction fan system and all workers wear respirators with gas and particle cartridges, rubber gloves, goggles, hair cover and dust coat.		
Engineering control:	Of 5 reported repackaging sites: 3 had exhaust ventilation while 2 had general ventilation and use of industrial fans.		
EVALUATION			
Domain	Metric	Rating	Comments

Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment clearly documents its data sources, assessment methods, results, and assumptions.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The report provides discussion on variability between sites but no discussion of uncertainty.
Overall Quality Determination		High	

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.		
HERO ID:	192040		
Conditions of Use:	Laboratory Use		
EXTRACTION			
Parameter	Data		
Worker activity description:	Formalin solutions containing 4% formaldehyde are commonly used in the forensic /hospital mortuaries and pathology laboratories including histopathology and anatomical laboratories. However, solutions containing higher levels of formaldehyde (up to 32%) are also handled during dilution. There is a potential for dermal exposure to formalin products through spills or splashes onto skin or eyes during some processes, such as manual dilution of the concentrated formalin solutions and dispensing solutions from storage tanks to specimen jars. There is also potential for inhalational exposure to formaldehyde fumes during fixing and accessioning human tissues and organs.		
Exposure route:	inhalation, dermal		
Physical form:	liquid		
Personal sampling data:	Personal sampling results ranged from 0.02 ppm to 3.15 ppm. Full data provided in Table 15.6a (pg. 202)		
Area sampling data:	Static monitoring results ranged from <0.1 to >4 ppm. Full data provided in Table 15.6b (pg. 203-204) and Table 15.7 (pg. 205)		
Exposure duration:	varies depends on role		
Exposure frequency:	Usually daily for staff at forensic/hospital mortuaries and pathology but other staff varies		
Personal protective equipment:	Examination gloves, safety glasses and laboratory gowns are worn at the majority of laboratories/mortuaries. It was reported that respirators are also used when preparing large amounts of formalin solutions used in forensic medicine areas or anatomy laboratories.		
Engineering control:	The majority of laboratories/mortuaries are equipped with local exhaust systems and some also have an exhaust system for the whole area.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	Sampling methods are provided but vary from NIOSH methods to formaldehyde meters, the assessment is from a frequently used source (NICNAS report) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.		
HERO ID:	192040		
Conditions of Use:	incorporation into the article: Wood Products		
EXTRACTION			
Parameter	Data		
Worker activity description:	During particleboard and MDF manufacture, operators are likely to be exposed to formaldehyde from the hot press procedure and onwards (see Figure 7.5), as the formaldehyde resins are handled in enclosed systems in the processes before the hot press. However, potential exposure could occur in situations where there is a need to break open or enter the enclosed system, such as equipment cleaning and maintenance. Typically, filters in the resin storage tanks are cleaned manually 1 to 2 times per shift and the task takes about 10 minutes each time. The storage tanks are cleaned yearly for melamine urea formaldehyde resin and once in 3 to 4 years for urea formaldehyde resin.		
Exposure route:	inhalation, dermal		
Physical form:	liquid, solid		
Personal sampling data:	In plywood mills, most long-term personal monitoring results (61/71) were < 0.3 ppm. No short-term personal monitoring data was provided. It appears that formaldehyde levels are higher at mills using urea formaldehyde resin. In particleboard and MDF mills, limited data showed that most of long-term samples were < 0.3 ppm (5/8 for personal samples, 12/17 for static samples). No short-term data was available.Full monitoring data provided in Table 15.4 and Table 15.5 (pg. 197-199).		
Area sampling data:	Most of the long- term static data (31/34) showed levels < 0.3 ppm.Full monitoring data provided in Table 15.4 and Table 15.5 (pg. 197-199).		
Number of workers:	500 operative staff work in the processes of glue mixing, glue spreading, panel lay-up and pressing for plywood manufacturing(Australia).		
Personal protective equipment:	Basic PPE (gloves, safety glasses and clothing) is worn at most sites during handling of formaldehyde resin products. Some reported use of respiratory protection during glue mixing. One company using formaldehyde resin in making hardboards reported that it does not use any PPE.		
Engineering control:	Half the number of companies using formaldehyde resins or products containing formaldehyde resins have local or roof exhaust ventilation in place. Others rely on general ventilation.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	Most of the monitoring data cites NIOSH studies, the assessment is from a frequently used source, and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country other than the U.S., and locality-specific factors (e.g., potential differences in regulatory occupational exposure or emission limits, industry/ processtechnologies) may impact exposures or releases relative to the U.S.
	Metric 3: Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Most of the data is from more than 20 years old.
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a ranges or maximums with uncertain statistics.

EXTRACTION			
Parameter	Data		
Worker activity description:	Pressed wood products are used industrially in furniture and cabinet making and also have do-it-yourself (DIY) applications. The atmosphere created by machining the products, such as fitting, sawing/cutting and sanding, contains a mixture of wood dusts, free formaldehyde, dust particles onto which formaldehyde is absorbed and, potentially, the resin binder itself and derivatives. Therefore, workers are likely to inhale airborne formaldehyde.		
Exposure route:	inhalation		
Physical form:	gas, dust		
Personal sampling data:	The data in 2001-2003 were provided and are summarised in Table15.4 (pg. 197-199). The majority of personal samples (154 out of 159) showed formaldehyde levels < 0.2 ppm in workers’ breathing zones.Full monitoring data provided in Table 15.4 and Table 15.5 (pg. 197-199).		
Personal protective equipment:	Basic PPE (gloves, safety glasses and clothing) is worn at most sites during handling of formaldehyde resin products. Some reported use of respiratory protection during glue mixing. One company using formaldehyde resin in making hardboards reported that it does not use any PPE.		
Engineering control:	Half the number of companies using formaldehyde resins or products containing formaldehyde resins have local or roof exhaust ventilation in place. Others rely on general ventilation.

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.			
HERO ID:	192040			
Conditions of Use:	Use of paints/coating			
EXTRACTION				
Parameter	Data			
Worker activity description:	The use process of formaldehyde resins in other industries (Section 7.3.3) involves basically dilution and/or mixing with other ingredients and then a drying process to make the resin set. Some uses, such as paper treating and coating, also involve hot pressing after drying. The methods of application of the resin product vary largely and include dipping/bathing (paper treating and coating, textile finishing and leather tanning), brushing (composite construction), spraying (fibreglass industry and anti-graffiti wall sealer manufacture), use of mop/bristle rollers, and use of mechanical equipment, such as print screen and dyeing machines in textile printing and dyeing.			
Exposure route:	inhalation, dermal			
Physical form:	liquid			
Area sampling data:	Static levels of up to 0.5 ppm were measured in coater rooms using paints containing formaldehyde.Full data provided in Table 15.4 and Table 15.5 (pg. 197-199)			
Exposure duration:	ranges from couple of minutes to continuous use.			
Personal protective equipment:	Basic PPE (gloves, safety glasses and clothing) is worn at most sites during handling of formaldehyde resin products. Some reported use of respiratory protection during glue mixing.			
Engineering control:	half the number of companies using formaldehyde resins or products containing formaldehyde resins have local or roof exhaust ventilation in place. Others rely on general ventilation.

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.			
HERO ID:	192040			
Conditions of Use:	Core-making			
EXTRACTION				
Parameter	Data			
Worker activity description:	The use process of formaldehyde resins in other industries (Section 7.3.3) involves basically dilution and/or mixing with other ingredients and then a drying process to make the resin set. Some uses, such as paper treating and coating, also involve hot pressing after drying. The methods of application of the resin product vary largely and include dipping/bathing (paper treating and coating, textile finishing and leather tanning), brushing (composite construction), spraying (fibreglass industry and anti-graffiti wall sealer manufacture), use of mop/bristle rollers, and use of mechanical equipment, such as print screen and dyeing machines in textile printing and dyeing.			
Exposure route:	inhalation, dermal			
Physical form:	liquid, solid			
Personal sampling data:	Long-term personal sampling during core making indicated that most samples (13/17) were >0.3 ppm. It was noted that the formaldehyde levels reduced significantly after process modification.Full data provided in Table 15.4 and Table 15.5 (pg. 197-199)			
Personal protective equipment:	Basic PPE (gloves, safety glasses and clothing) is worn at most sites during handling of formaldehyde resin products. Some reported use of respiratory protection during glue mixing.			
Engineering control:	half the number of companies using formaldehyde resins or products containing formaldehyde resins have local or roof exhaust ventilation in place. Others rely on general ventilation.			
EVALUATION

Overall Quality Determination		Medium	

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.		
HERO ID:	192040		
Conditions of Use:	Photographic film processing		
EXTRACTION			
Parameter	Data		
Worker activity description:	Aerial and commercial film processing use products containing formaldehyde. Although the formaldehyde concentrations in the products used in aerial film processing are high (20% to 35%), the potential for workers’ exposure to formaldehyde is limited as the film processing is conducted in an enclosed machine. Short exposures are possible during the connection of the drum to the machine and during drum changeover. There is a potential for exposure during manual film processing when handling solutions containing 10% formaldehyde, as this operation is usually conducted in open trays in a dark room. However, the operation occurs only occasionally as trials in aerial film processing.		
Exposure route:	inhalation, dermal		
Physical form:	liquid		
Personal sampling data:	Measured data: range of formaldehyde levels from < 0.01 ppm to 0.9 ppm in film processing plants. (cited data from IARC,1999)Modeled data: The predicted inhalational exposure to formaldehyde during film processing is 0 to 0.1 ppm (0-0.12 mg/m3). (EASE model)		
Number of workers:	The number of workers involved in aerial film processing is unknown, but is limited as the number of specialised film processing companies is small. However, there are more than 1000 commercial film processing machine operators in Australia using final baths and stabilisers containing formaldehyde.		
Personal protective equipment:	At aerial film processing sites- besides the basic PPE (gloves, goggles and protective clothing), respiratory protection is also used during changing of drums at some workplaces. Commerical- Workers wear gloves during handling formaldehyde products.		
Engineering control:	Exhaust systems inside the processing machines and floor level exhaust systems are available at aerial film processing sites. At the commercial film site visited, roof exhaust fans, industrial fans and general ventilation were used for ventilation

HERO ID:	192040			
Conditions of Use:	non-TSCA			
EXTRACTION				
Parameter	Data			
Worker activity description:	Although formalin (containing 37% to 40% formaldehyde) is used as an additive to sanitise water treatment plants, this operation is only undertaken occasionally (about once a year). Workers may be exposed to formalin solutions during sanitisation of bins and portable toilets, especially exposure by the skin through spills and splashes. The concentrated formalin solutions are diluted to 1% before end use.It is unlikely that workers are exposed to formaldehyde gas during workplace fumigation, as access to the area is restricted and activation of the fumigation generators and air conditioning is remote controlled. The levels of formaldehyde are monitored and must be less than 0.2 ppm before access is allowed. Workers may be exposed to formaldehyde during transfer of the paraformaldehyde granules into gas generators and during disposal of the residue, but the durations are short for these activities.			
Exposure route:	inhalation, dermal			
Physical form:	liquid			
Exposure frequency:	once a year (sanitizing)			
Personal protective equipment:	It was reported that rubber gloves, face shield and apron are used during the operation. Respirators are available for use in situations when high levels of formaldehyde fumes may occur, for example, cleaning up spills.Fumigation: latex gloves, overalls and airflow helmet with cartridge filter are used by operators			
Engineering control:	Local exhaust ventilation is available for dilution and dispensing of the solutions. It

Overall Quality Determination			Medium	

Study Citation:	NICNAS, (2006). Priority existing chemical assessment report no. 28 formaldehyde.			
HERO ID:	192040			
Conditions of Use:	Embalming			
EXTRACTION				
Parameter	Data			
Worker activity description:	Embalmers are likely to be exposed by skin contact through spills or splashes onto skin or eyes during handling processes, such as dilution, arterial and cavity embalming, cleansing and disinfections of body surfaces and orifices, and equipment cleaning by hosing. Spills and splashes during embalming were observed at the site visited. The likelihood of exposure by inhalation is also high during embalming, such as during dilution of concentrated formalin solutions, application of the solution by spraying, and handling viscera covered with paraformaldehyde powder. Other staff involved in handling embalmed bodies, such as body dressing up and body lifting, may also be exposed to formaldehyde.			
Exposure route:	inhalation, dermal			
Physical form:	liquid			
Personal sampling data:	Ranges from <0.1 to 3.9 ppm Monitoring data during embalming in funeral homes and anatomy dissection laboratories were provided and are summarized in Table 15.8a and 15.8b, respectively (pg. 207-208).			
Area sampling data:	Ranges from 0.21 to 1.1 ppmMonitoring data during embalming in funeral homes and anatomy dissection laboratories were provided and are summarized in Table 15.8a and 15.8b, respectively (pg. 207-208).			
Exposure duration:	The duration of embalming a body varies depending on body conditions and customers’ requirements, but usually takes 1 to 3 hours. The majority of the embalmers operate on a daily basis and exposure durations vary from 1 to 10 hours a day.			
Number of workers:	approximately 350 embalmers in Australia.			
Personal protective equipment:	Embalmers wear PPE during embalming including safety goggles, surgical gloves, theatre gown, disposable apron and rubber boots. Respiratory protection equipment is not usually used, although half masks and air-supplied respirators are available at some funeral homes.			
Engineering control:	Ventilation systems installed in embalming rooms vary at different funeral homes. In general, new premises are fitted with an airflow system that blows fumes away from embalmers, together with an exhaust fan to extract the fumes. Whereas, in old buildings, usually only an exhaust fan is available. It was reported that some mortuaries do not have exhaust ventilation.

Study Citation:	NIOSH, (1983). Preliminary survey report: Control technology for formaldehyde emissions at Baker Furniture Company, Mocksville, North Carolina.			
HERO ID:	8728029			
Conditions of Use:	Adhesive and sealant chemicals in wood product manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Loading the feed-through press; stacking boards on a filter press.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	With this arrangement and under the condition on the day of the survey, half-shift time-weighted-average formaldehyde concentrations were all less than 0.5 ppm. Some peak concentrations were measured to be greater than 1 ppm around both the feed-through press and the glue-mixing area, but none were greater than 3 ppm.			
Exposure duration:	There is one shift, running from 7:00 in the morning until 3:30, with a half-hour lunch break at 11 : 30. [8 hours/day]			
Number of workers:	The total plant employment of 150 included 15 administrative and 2 maintenance employees.			
Engineering control:	A canopy hood, measuring approximately 13 by 7 1/2 feet, is installed over the feed-through press. This hood has a center baffle blocking about a fourth of the opening. The baffle was inserted to reduce rollout around the outer margin of the canopy. There is also a canopy hood over the shuttle press. Each hood is vented through a 14- or 16-inch circular duct to a separate fan on the roof. These hoods have been in place for about 1 year.General ventilation is provided mainly by open doors at the north end of the building and the extensive local exhaust ventilation for controlling sawdust from the wood-working operations elsewhere in the plant. The general airflow around the feed-through press is from north to south, although the velocity is low (less than 100 ft/min) and variable.Auxiliary fans are used to provide additional cooling air. Some of these are attached to roof-support columns; the others are floor models, which may be positioned by the workers.			
EVALUATION

Worker activity description:	unloading, container cleaning, dyeing machine operation			
Exposure route:	Dermal: Provides methods for modeling exposures to non-volatile liquids and solids Inhalation: Provides methods for modeling exposures to solids			
Exposure frequency:	Exposure Frequency: 31-250 days/yr			
Number of workers:	1-6 workers/site/day			
Personal protective equipment:	safety glasses, goggles, aprons, respirators, and/or masks			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Assessment uses high quality data/techniques/methods from frequently-used sources.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	This ESD was developed by EPA based on U.S. data	
	Metric 3: Applicability	Medium	Data is for an in-scope occupational scenario; however, data is general and not specific to a chemical.	
	Metric 4: Temporal Representativeness	Low	Assessment from 2015 but uses lot of data that is greater than 20 years old.	
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics. It is unclear if analysis is representative.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Uncertainty not addressed. Variability addressed by considering multiple chemical functions	
Overall Quality Determination		Medium		

Study Citation:	OECD, (2010). Emission scenario document on formulation of radiation curable coatings, inks and adhesives.			
HERO ID:	3840003			
Conditions of Use:	Adhesives and Sealants; Paint and coatings			
EXTRACTION				
Parameter	Data			
Worker activity description:	6 Activity descriptions provided			
Exposure route:	inhalation, dermal			
Physical form:	liquids, solids			
Exposure duration:	varies by activity, see Table B-2			
Exposure frequency:	250 max			
Number of workers:	Coatings formulators avg of 76 workers/facility, with 51% (39 employees) being production workers with possible exposure. Ink/adhesive formulators avg 20-32 production workers/facility.			
Personal protective equipment:	fabric or non-woven long sleeved shirts and pants, coveralls, and neoprene or rubber gloves. Barrier creams may be used to facilitate hand washing when materials or products penetrate gloves or other PPE. A rubber apron or rubber suit and rubber boots may also be worn in cases where there is potential for splashing on or penetration through clothing			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source (e.g., European Union or OECD reports, NIOSH HHEs, journal articles, Kirk-Othmer) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The assessment captures operations, equipment, and worker activities that are expected to be reasonably representative of current conditions. The completed exposure or risk assessment is generally, more than 10 years but no more than 20 years old.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The assessment addresses variability and uncertainty in the results. Uncertainty is well characterized

Domain 1: Reliability	Metric 1: Methodology	High	Assessment uses high quality data/techniques/methods from frequently-used sources.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	This ESD was developed by EPA based on U.S. data
	Metric 3: Applicability	Medium	Data is for multiple in-scope occupational scenarios; however, data is general and not specific to a chemical.
	Metric 4: Temporal Representativeness	High	Assessment is based on current industry conditions and data no more than 10 years old.
	Metric 5: Sample Size	Medium	Model results characterized by no statistics, however some of the model input parameters can be varied based on the scenario.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Uncertainty not addressed. Variability addressed by considering multiple additive types.
Overall Quality Determination		High	

Study Citation:	OECD, (2012). Emission scenario document on chemicals used in oil well production.			
HERO ID:	6387322			
Conditions of Use:	Processing: Petroleum Production			
EXTRACTION				
Parameter	Data			
Worker activity description:	More specific industry data on worker exposure from 1983 estimated that 3-4 workers handle chemicals used as corrosion or scale inhibitors, 6-7 workers handle chemicals used for fracturing and acid treatment, and 5 workers handle chemicals used for enhanced oil recovery (EPA, 1983).Work activity include Unloading Transport Containers, Transport Container Cleaning, Equipment or Storage Tank Cleaning.			
Exposure route:	There is potential for dermal exposure during both pumping and manual loading. Exposure to liquid may occur during container cleaning. Exposure to oil well chemical may occur periodically during equipment cleaning.			
Dermal exposure data:	nan			
Number of workers:	Recent industry data estimates one to a dozen production workers per site may be exposed to oil well chemicals; this estimate is consistent with figures provided by the U.S. Census (Industry, 2008). More specific industry data on worker exposure from 1983 estimated that 3-4 workers handle chemicals used as corrosion or scale inhibitors, 6-7 workers handle chemicals used for fracturing and acid treatment, and 5 workers handle chemicals used for enhanced oil recovery (EPA, 1983).			
Personal protective equipment:	One reference from 1983 indicates that workers may minimize exposure to oil well chemicals by wearing impervious gloves, clothing, safety glasses, masks or respirators (EPA, 1983). Recentindustry data also provides similar information. In cases where the Material Safety Data Sheet (MSDS) identifies specific hazards, full chemical suits with breathing apparatus may also be required(Clariant, 2008).

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability		Metric 1: Methodology	Medium	Assessment uses high quality data that are not from frequently-used sources and there are no known quality issues.
Domain 2: Representativeness		Metric 2: Geographic Scope	Medium	Data are from Australia, an OECD country.
		Metric 3: Applicability	Medium	Data are for bush fires (firefighters), which is similar to the in-scope occupational scenario agriculture, forestry, hunting and fishing.
		Metric 4: Temporal Representativeness	High	Assessment is based on current industry conditions and data no more than 10 years old.
		Metric 5: Sample Size	Medium	Sample distribution characterized by limited statistics (mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity		Metric 6: Metadata Completeness	Medium	Methods, results, and assumptions are clearly documented, but underlying data sources are not fully transparent.
Domain 4: Variability and Uncertainty		Metric 7: Metadata Completeness	Medium	Variability addressed by sampling multiple types of fires but uncertainty is not addressed.

Overall Quality Determination		Medium		

Study Citation:	Rodriguez, M., West, C., Brueck, S. E. (2012). Air contaminant, noise, and dermal hazards during aluminum beverage can manufacturing – Texas.			
HERO ID:	8684526			
Conditions of Use:	Use of printing ink, toner and colorant products containing formaldehyde			
EXTRACTION				
Parameter	Data			
Worker activity description:	Printer operators; chemical press operators; forklift operators.			
Exposure route:	Inhalation			
Physical form:	Vapor			
Personal sampling data:	Front end: 0.044 (ppm); 0.023-0.090 (ppm)Printer: 0.098 (ppm); 0.071-0.13 (ppm)Chemical process operator: 0.026 (ppm); 0.020-0.031 (ppm)Millwright: 0.040 (ppm)Forklift operator: 0.080 (ppm)Lacquer spray: 0.042 (ppm)			
Area sampling data:	Conference Room: 0.040 (ppm)			
Exposure duration:	Production employees work 12-hour shifts and non-production employees work 8-hour shifts.			
Number of workers:	At the time of the evaluation the plant had 148 production employees working 12-hour shifts and 19 non-production employees working 8-hour shifts.			
Personal protective equipment:	All employees were required to wear safety glasses, safety shoes, and hearing protection. The company provided work uniforms (short or long sleeve shirts and pants), which some employees wore.Some employees voluntarily wore nitrile gloves (Flexshield®) while changing tools on the ironer/trimmers or when handling chemicals. A concern noted by employees was the limited selection of glove sizes. The employees maintaining the can washers wore polyvinyl chloride gloves, a Tychem® suit, and steel-toe rubber boots because they could contact hydrofluoric and sulfuric acid. Employees adding chemicals to the water treatment tank or adding biocide to the MWF sump wore a rubber apron and rubber or nitrile gloves. Durapro® barrier cream was available for employees at their workstations and from the storage room.			
EVALUATION				
Domain	Metric	Rating	Comments

Study Citation:	Rodriguez, M., West, C., Brueck, S. E. (2012). Air contaminant, noise, and dermal hazards during aluminum beverage can manufacturing – Texas.		
HERO ID:	8684526		
Conditions of Use:	Use of printing ink, toner and colorant products containing formaldehyde		
Domain	Metric	EVALUATION Rating	Comments
Overall Quality Determination		High	

Study Citation:	Rodriguez, Manuel, M., Aristeguieta, C. (2009). Evaluation of employees’ chemical exposures while blending and repackaging glass beads for road markings.
HERO ID:	8684530
Conditions of Use:	Paints and coatings

EXTRACTION	
Parameter	Data
Worker activity description:	Employees blend and repackage the beads in smaller paper sacks or boxes for distribution to state transportation departments and other customers.
Exposure route:	Inhalation.
Physical form:	Colorless gas.
Personal sampling data:	Packer/forklift operator: 0.0073 (ppm)Warehouseman: 0.0090 (ppm)Bagger/forklift operator: trace amountsManager: 0.0065 (ppm)Lab technician: 0.0073 (ppm)Packer: trace amounts
Area sampling data:	Outside: not detectedConference room: 0.0098 (ppm)Bagging Machine: trace amountsLaboratory: trace amounts
Exposure duration:	Employees work an 8-hour shift.
Number of workers:	Six employees worked at the time of the evaluation.
Personal protective equipment:	Weissker management provided employees safety glasses, foot protection, leather gloves, and a NIOSH-approved 3M model 8210 N95 filtering-facepiece respirator. Weissker required employees to wear respirators because of potential dust exposure from handling the glass beads. During this evaluation we observed all employees (with the exception of the supervisor) wearing filtering-facepiece respirators. None of the employees wore safety glasses or gloves.

EXTRACTION				
Parameter	Data			
Exposure route:	dermal			
Area sampling data:	Non-detect			
Personal protective equipment:	Protective clothing, gloves			
Engineering control:	Fans pulling 40 and 43 cfm above photo processing lab. Suggested replacement with units pulling 250 cfm.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source (NIOSH HHEs) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.	
	Metric 3: Applicability	High	The assessment is for an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Low	The completed exposure or risk assessment is more than 20 years old. The assessment captures operations, equipment, and worker activities that are expected to be outdated.	
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The assessment provides only limited discussion of the variability and uncertainty in the results.	
Overall Quality Determination		High

Rating	Comments
Domain 1: Reliability	
Metric 1:	Methodology
Medium	Assessment uses high quality data that are not from frequently-used sources and there are no known quality issues.
Domain 2: Representativeness	
Metric 2:	Geographic Scope
High	Data are from the U.S.
Metric 3:	Applicability
High	Data are for plastic material and resin manufacture, an in-scope occupational scenario.
Metric 4:	Temporal Representativeness
Low	Assessment is based on data greater than 20 years old and industry conditions that are expected to be outdated. (1983)
Metric 5:	Sample Size
Medium	Sample distribution characterized by limited statistics (mean) but discrete samples not provided and distribution not fully characterized.
Domain 3: Accessibility/ Clarity	
Metric 6:	Metadata Completeness
Medium	Methods, results, and assumptions are clearly documented, but underlying data sources are not fully transparent.
Domain 4: Variability and Uncertainty	
Metric 7:	Metadata Completeness
Low	Variability and uncertainty are not addressed.
Overall Quality Determination	Medium

Study Citation:	Sylvain, D. C. (1999). Health hazard evaluation report 97-0113-2720, U. S. Fish and Wildlife Service, Hadley, Massachusetts, January 1999.			
HERO ID:	8016870			
Conditions of Use:	Disinfectants			
EXTRACTION				
Parameter	Data			
Worker activity description:	Employees prepare and administer prophylactic salmon egg treatments. (9/20)			
Exposure route:	inhalation, dermal (10/20)			
Physical form:	solution (6/20)			
Personal sampling data:	For manual treatment, full shift samples revealed TWA concentrations ranging from approximately 0.6 ppm to >3.8 ppm during 21 to 33-minute sampling periods. For automated treatment, formaldehyde concentrations, determined by PBZ sampling , ranged from <0.07 ppm during a 9-minute period at Craig Brook, to 0.3 ppm during a 44-minute period at Green Lake. (12/20)			
Area sampling data:	Area samples were collected in egg incubation rooms during the actual treatment of the eggs, and for an additional 40-70 minutes thereafter. Formaldehyde concentrations in incubation rooms ranged from 0.08 to 0.59 ppm.. (11/20)			
Exposure duration:	up to 10 hours/day (9/20)			
Personal protective equipment:	Full-face respirators, latex gloves, rubber boots, full rain gear, and Viton gloves. (13/20)			
Engineering control:	Automated egg treatment systems reduce routine employee exposure by eliminating manual handling of formalin, and by containing formalin within an enclosed system during transfer and dilution. (13/20)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from a frequently used source.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States.
	Metric 3:	Applicability	Medium	The assessment is for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The completed exposure or risk assessment is more than 20 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The assessment provides only limited discussion of the variability and uncertainty in the results.

Exposure route:	Dermal, inhalation		
Physical form:	Liquid, vapor		
Area sampling data:	<0.05 (ppm)		
Exposure duration:	7-9 hours		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	Assessment uses high quality data/techniques/methods that are not from frequently-used sources and there are no known quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from Greece, an OECD country.
	Metric 3: Applicability	High	Data are for personal care products, an in-scope occupational scenario.
	Metric 4: Temporal Representativeness	Medium	Assessment is based on data greater than 10 years old but no more than 20 years old and industry conditions that are expected to be representative of current industry conditions. (2009)
	Metric 5: Sample Size	Low	Sample distribution is characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Methods, results, and assumptions are clearly documented, but underlying data sources are not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability addressed by testing 4 nail salons but uncertainty is not addressed.
Overall Quality Determination		Medium	

Study Citation:	U.S. EPA, (2002). Flexographic ink options: A cleaner technologies substitutes assessment. Volume 1.		
HERO ID:	10293388		
Conditions of Use:	Ink, toner, and colorant products		
EXTRACTION			
Parameter	Data		
Worker activity description:	Pumping ink from a 55-gallon drum into 5-gallon cans, operating the printing press, adjusting inks in the five-gallon cans.		
Exposure route:	Inhalation and dermal.		
Physical form:	Liquid		
Exposure duration:	Ink pumping lasts 48-minutes per formulation shift. Operating the printing press occurs for 7.5 hours/day. Adjusting inks in the 5-gallon cans lasts 1-2.5 hours/day.		
Exposure frequency:	250 days/year.		
Number of workers:	14,000 workers.		
Personal protective equipment:	For many chemicals, appropriate equipment includes goggles, aprons or other impervious clothing, and gloves. In some printing facilities with loud presses, hearing protection may be recommended or required.		
Engineering control:	Pre-PressUse Computers for Proofs and Plates: By using computers to generate all proofs and plates, printers can skip photographic development and eliminate the use of darkroom chemicals.Switch from Rubber to Photopolymer Plates: Use of traditional nitric acid baths to etch designs into metal plates may generate wastewater that is low in pH and high in metal content, requiring regulation under the Clean Water Act. Photopolymer plates eliminate this waste stream as well as the metal engravingsand wastes generated from the production of conventional molded rubber plates.PrintingInstall Enclosed Doctor Blade Chambers: Enclosed doctor blade chambers reduce ink evaporation, which results in better control of ink usage, more consistent color, and improved performance of the inks on press.Use Higher Linecount Anilox Rolls: This enables printers to apply smaller ink droplets closer together, to achieve much finer ink distribution, easier drying, and potentially faster press speeds.Use Computerized Ink Blending: Software and specialized equipment help printers blend ink, reduce surplus ink, and reuse press return ink.		
Comments:	Area and dermal sampling are included in Appendix 3-F which is not in the documents (ends after chapter 8).		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	Assessment uses high quality data/techniques/methods from frequently-used sources.

Study Citation:	U.S. EPA, (2022). Commercial use of automotive detailing products - Generic scenario for estimating occupational exposures and environmental releases (Methodology review draft).			
HERO ID:	10480464			
Conditions of Use:	Automotive detailing products			
EXTRACTION				
Parameter	Data			
Number of sites:	Provides method to calculate - 147,152 total establishments.			
Worker activity description:	Container unloading (liquids and solids), application and use of automotive detailing products.			
Exposure route:	Dermal, Inhalation			
Physical form:	liquids, pastes, or clays/waxes			
Area sampling data:	Inhalation: Provides methods for modeling exposures to non-volatile and volatile liquids and solids.			
Dermal exposure data:	nan			
Exposure duration:	8 hr/day.			
Exposure frequency:	260 days/yr.			
Number of workers:	3-4 workers/detailing facility.			
Personal protective equipment:	Particle respirators, ear plugs, safety glasses, aprons, knee pads, nitrile gloves, cooling towels, and face masks (page 37).			
Engineering control:	Miscellaneous control technologies include performing vehicle detailing in areas where there are no floor drains, keeping container lids closed, avoiding the use of detergents, using sloping pavement around drains, using high-pressure and low-volume sprays, and labeling all containers. Industrial and commercial facilities often collect dust emissions in ventilation filters.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Assessment uses high quality information/data from frequently-used sources.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	This GS is based on U.S. data.	
	Metric 3: Applicability	Medium	Data is for an in-scope occupational scenario; however, data is general and not specific to a chemical.	
	Metric 4: Temporal Representativeness	High	Assessment is based on current industry conditions and data no more than 10 years old.	
	Metric 5: Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	Variability and uncertainty are not addressed.	
Overall Quality Determination		High

Domain 1: Reliability	Metric 1:	Methodology	High	Assessment uses high quality information/data from frequently-used sources.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	This GS is based on U.S. data
	Metric 3:	Applicability	Medium	Data is for an in-scope occupational scenario; however, data is general and not specific to a chemical.
	Metric 4:	Temporal Representativeness	High	Assessment is based on current industry conditions and data no more than 10 years old.
	Metric 5:	Sample Size	Medium	Sample distribution characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination		High		

Study Citation:	U.S. EPA, (2022). Chemical repackaging - Generic scenario for estimating occupational exposures and environmental releases (revised draft).			
HERO ID:	11182966			
Conditions of Use:	Repackaging			
EXTRACTION				
Parameter	Data			
Worker activity description:	Unloading transport containers, container cleaning, equipment cleaning, loading of transport containers.			
Exposure route:	Dermal, Inhalation			
Physical form:	Liquid or solid			
Personal sampling data:	”dermal: Provides methods for modeling exposures to non-volatile and volatile liquids and solidsInhalation: Provides methods for modeling exposures to non-volatile and volatile liquids and solids”			
Dermal exposure data:	Dermal exposure data			
Exposure duration:	8-12 hr/day			
Exposure frequency:	The number of operating days is given in a range of 174-260 days/yr with an EPA default of 260 days/yr.			
Number of workers:	3 workers/facility and 1 ONUs/facility (total number of employees and facilities given in Table 5-3)			
Personal protective equipment:	Commonly used PPE includes safety glasses, face shields, aprons, and gloves.			
Engineering control:	Local exhaust ventilation

Study Citation:	U.S. EPA, (2000). Leather dyeing - Generic scenario for estimating occupational exposures and environmental releases (draft).			
HERO ID:	6311220			
Conditions of Use:	Leather dyeing			
EXTRACTION				
Parameter	Data			
Number of sites:	315 tanneries in the United States, and 80% perform dyeing operations. Number of sites calculated based on PV and should not exceed 252 tanneries.			
Worker activity description:	Worker activities include weighing, mixing, dyeing, drying, and buffing.			
Exposure route:	Dermal, Inhalation			
Physical form:	Liquid or solid			
Personal sampling data:	”Inhalation: Exposures estimated in weighing, mixing, and buffing; exposure during dyeing and drying considered negligible. Inhalation exposures based on dye concentration in mixture and concentration of mixture in air. Dermal: If a solid, estimated dermal exposure in mg/day from weighing the dye is 3,100*concentration of chemical. If a liquid, estimated dermal exposure in mg/day from mixing and filling operations is 1,800*concentration of chemical.”			
Exposure duration:	Exposure duration ranges between 1.5-8 hrs/day based on worker activity.			
Exposure frequency:	Calculation for days of operation			
Number of workers:	<7 workers exposed per site			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	Assessment uses high quality information/data from frequently-used sources.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	This GS is based on U.S. data

Study Citation:	U.S. EPA, (2001). Manufacture and use of printing ink - Generic scenario for estimating occupational exposures and environmental releases (revised draft).			
HERO ID:	6311221			
Conditions of Use:	Formulation and Use of Printing Ink			
EXTRACTION				
Parameter	Data			
Worker activity description:	PROC: unloading, cleaning, packagingUSE: Printing operations, unloading			
Exposure route:	Inhalation, Dermal			
Physical form:	Vapor, Particulate, Liquid, Solid			
Personal sampling data:	Model equations to estimate inhalation exposure are provided on pg. 31-32(formulation), 39-40 (use)			
Dermal exposure data:	Dermal exposure data			
Exposure frequency:	250 days (pdf pg. 31, 39)			
Number of workers:	PROC: 13-22 workers/siteUSE: 16-43 workers/site (pdf pg. 30, 38)			
Comments:	Model uses measured monitoring data(not specific to formaldehyde) from NIOSH, which is explained in the Appendix.			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	Report uses sound methods from a frequently used source, EPA, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States.
	Metric 3:	Applicability	Medium	The assessment is for an occupational scenario within the scope of the risk evaluation but is not specific to chemical.
	Metric 4:	Temporal Representativeness	Low	The completed exposure or risk assessment is more than 20 years old (2001). The assessment captures operations, equipment, and worker activities that are expected to be outdated.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics. It is unclear if analysis is representative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, andassumptions
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty not addressed. Variability is addressed in different ink classes and types of additives considered.
Overall Quality Determination			High

Overall Quality Determination		Medium		

Study Citation:	U.S. EPA, (1994). Water treatment coagulants application - generic scenario for estimating occupational exposures and environmental releases: Draft.			
HERO ID:	6385760			
Conditions of Use:	Use of Water Treatment Products			
EXTRACTION				
Parameter	Data			
Worker activity description:	Opening transport containers, during transfers of the chemical (pdf pg. 4)			
Exposure route:	Inhalation, Dermal			
Physical form:	Dry coagulents- fine powder, granules, flakes, pellets, rocks, and crystals. Liquid coagulents. (pdf pg. 3)			
Personal sampling data:	Source contains model for inhalation from powder handling (pdf pg. 6)			
Dermal exposure data:	Dermal exposure data			
Number of workers:	<10 MGD: Average of 9 staff workers, of which 4 are operators20-50 MGD: Average of 40 staff workers, of which 14 are operators.			
Comments:	Report is specific coagulents used in water treatment. The function of formaldehyde in the COU- Water Treatment Products, is unknown. Therefore, general information on coagulents is extracted and evaluated.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	Report uses sound methods that are from frequently used sources, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States
	Metric 3:	Applicability	Medium	The assessment is for an occupational scenario (use of water treatment products) within the scope of the risk evaluation but is not data specific to formaldehyde.
	Metric 4:	Temporal Representativeness	Low	More than 20 years old.
	Metric 5:	Sample Size	Medium	characterized by uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Data sources are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Uncertainty is not addressed. Variability is considered with different physical forms of the coagulents considered and different sizes of operation.
Overall Quality Determination		Medium		

Study Citation:	U.S. EPA, (2004). Additives in plastics processing (converting) - Generic scenario for estimating occupational exposures and environmental releases - Draft.			
HERO ID:	6549571			
Conditions of Use:	Additives in Plastics Processing (Converting into Finished Products)			
EXTRACTION				
Parameter	Data			
Worker activity description:	Receipt of compounded resin, Forming (Heating), Molding/Shaping, Trimming, Finishing (including coating)			
Exposure route:	Inhalation and Dermal			
Physical form:	Exposure to solids during unloading of compounded resin from transport containers and charging to forming operation; Exposure to dusts generated from converting processes; Exposure to liquids during equipment cleaning of equipment; Exposure to solids during trimming activities.			
Personal sampling data:	Exposure from Unloading and Charging Compounded Resin; Exposure from Converting Processes; Exposure from Trimming Processes: Inhalation exposure = OSHA PEL x breathing rate x hours x fraction of additive in resin x fraction of chemical in additive (if applicable)Exposure from Converting Equipment Cleaning: Not expected, particles are expected to be contained in water.			
Dermal exposure data:	Dermal exposure data			
Exposure duration:	8 hours/day assumed for inhalation calculations			
Exposure frequency:	CEB standard assumption, 250 days per year based on 5 day work week and two weeks per year of operation shut down.			
Number of workers:	Overall, there were 736,698 workers employed in the Plastic Product Manufacturing industry in 2001. Table 1 provides Number of Workers for subcategories of NAICS 3261 Plastic Product Manufacturing.			
Engineering control:	Water: According to the Development Document for Effluent Limitation Guidelines for the Plastics Molding and Forming Point Source Category (1984), approximately 31% of surveyed sites that use process water directly discharged their process water; 44% indirectly discharged (POTW); and 25% had a zero discharge. Zero discharge methods include recycling, evaporation pond, septic tank with leach field, evaporation from equipment, land application, and contract haul. Types of on-site treatment include settling, pH adjustment, activated sludge, activated carbon adsorption, filtration, and vacuum filtration.Air: The Emissions Scenario Document on Plastic Additives suggests that bag filters used to collect particulate emissions are 99% efficient. However, the prevalence of bag filter use was not available.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	The assessment uses high quality data that are from a frequently used source and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Medium	The assessment is for an occupational scenario within the scope of the risk evaluation. However, data are not chemical specific.
	Metric 4:	Temporal Representativeness	Low	Data are greater than 20 years old.
	Metric 5:	Sample Size	N/A	Sample size criteria are not applicable to data extracted.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.

EXTRACTION			
Parameter	Data		
Worker activity description:	cleaning surfaces, sterilizing instruments, using products on patients, and using cleaning and disinfecting products such as general-purpose cleaners (e.g. bleach), high-level disinfectants (HLD, e.g. glutaraldehyde), and spray products		
Exposure route:	inhalation		
Area sampling data:	387 ppb		
Comments:	Measurement is for total VOC, not specifically formaldehyde.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	The assessment or report uses high quality data and/or techniques or sound methods that are not from a frequently used source, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country other than the U.S., and locality-specific factors may impact exposures or releases relative to the U.S.
	Metric 3: Applicability	Low	The assessment is for an occupational scenario within the scope of the risk evaluation but the measurement is in total VOC not specific to formaldehyde.
	Metric 4: Temporal Representativeness	High	The assessment captures operations, equipment, and worker activities expected to be representative of current conditions. EPA has no reason to believe exposures have changed.The completed exposure or risk assessment is generally no more than 10 years old.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Associated meta-data are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The assessment addresses variability and uncertainty in the results. Uncertainty is well characterized.

Personal protective equipment:	Plastic aprons and eye shields			
Engineering control:	Closed transfer system using pumps.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Medium	The assessment or report uses high quality data and/or techniques or sound methods that are not from a frequently used source and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	More than 20 years old.
	Metric 5:	Sample Size	N/A	Not applicable - no sample data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Assessment or report provides results, but the underlying methods, data sources, and assumptions are not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	N/A	Not applicable - no sample data.
Overall Quality Determination			Low	

Study Citation:	Anonymous, (1991). Update: Formaldehyde. Healthcare Hazardous Materials Management 4(6):7-9.			
HERO ID:	6115002			
Conditions of Use:	Processing			
EXTRACTION				
Parameter	Data			
Worker activity description:	”Morgue staff, anatomy laboratory staff, dialysis clinic staff, pathology laboratory staff, and possibly staff from other laboratories who are also at risk. There is also a risk of exposure to maintenance personnel who handle bulk shipments and wastes, as well as those who might use formaldehyde-containing products in enclosed spaces. ”			
Exposure route:	inhalation, dermal			
Personal protective equipment:	Employers must provide protection against contact with any solution containing more than 1 % formaldehyde. The equipment must be maintained free of formaldehyde contamination. At concentrations that would be immediately threatening to life and health, whole-body protection is required. Butyl and nitrile gloves provide the greatest protection. Thicker gloves of other materials (rubber, PVC, etc.) are satisfactory only for short-term exposure.			
Engineering control:	”Employers must provide quick-drench showers for employees who become splashed with solutions of 1 % or more formaldehyde. The showers must be provided even for employees who wear protective clothing. Eyewash facilities within the immediate work area must also be provided for use by any employee whose eyes are splashed by solutions containing 0.1 % formaldehyde or more. Any employee who must wear a respirator to avoid formaldehyde exposure must fill out a medical disease questionnaire that is administered by a licensed physician. All persons exposed to formaldehyde at concentrations between the action level (0.5 ppm) and the PEL (1 ppm) must be given the opportunity to participate in an annual medical surveillance program by filling out a medical disease questionnaire. ”

Study Citation:	Bello, A., Xue, Y., Gore, R., Woskie, S., Bello, D. (2019). Assessment and control of exposures to polymeric methylene diphenyl diisocyanate (pMDI) in spray polyurethane foam applicators. International Journal of Hygiene and Environmental Health 222(5):804-815.
HERO ID:	6134670
Conditions of Use:	Spray polyurethane foam

EXTRACTION

Parameter	Data
Worker activity description:	The main SPF insulation tasks consisted of site preparation (establishing a tarp containment, sealing windows, doors, establishing active space ventilation, setting up the compressed air lines for SARs and SPF hoses, assembling spray guns), spraying of SPF, shaving/cutting of excess foam, and site cleanup, including removal of foam debris. Sprayers performed spraying of the product using spray guns, often stopping to re-position the hoses or unclog and clean the gun. Helpers were responsible for cutting the excess foam flat against the studs using saw blades and assisting the sprayer in a variety of ways (checking drums of raw materials, relocating supply foam lines and supplied air hoses, repositioning the ladder, etc.).
Number of workers:	Insulation at each site was performed mostly by a crew of 2 workers (a sprayer and a helper). Bigger spray jobs sometimes involved a second crew. 54 study participants, 41 of whom were sprayers, 9 helpers, and 4 bystanders
Personal protective equipment:	Supplied air respirator, 3mil thin nitrile gloves, Disposable coveralls, full face organic vapor cartridge without particulate filters, nitrile covered in cotton, latex gloves. Field observation data summarized in Table 1 indicate that during spraying insulation tasks 53% of SPF applicators (the large contractors) wore air purifying supplied air respirators (SARs); 45% (the small contractors) wore full-face and half-face OVC respirators without particulate filters. The bystanders, including on site safety engineers and EHS personnel, would occasionally wear an OVC respirator without particulate filters when entering the site. All workers removed the respirators during lunch breaks and at the end of spraying, while still inside the spray space. Among all participants, 82% wore disposable thin blue nitrile gloves, 12% wore nitrile coated cotton gloves and 4% used latex gloves. One helper did not wear a respirator and another one did not wear gloves at the retrofitting sites. All but one wore disposable coveralls and all wore goggles to protect against SPF overspray particles and dust.
Comments:	Study does not mention formaldehyde but has information on the condition of use for spray polyurethane foam application.

EVALUATION

Study Citation:	Breyse, P. A. (1980). Small plants and their medical problems – the furniture industry: The environmental problems of urea-formaldehyde structures – formaldehyde exposure in mobile homes. NIOSH(NIOSH):56-64.			
HERO ID:	1322359			
Conditions of Use:	Furniture Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	Formaldehyde emissions from UF-bonded chipboard and particle board stem from unreacted formaldehyde that remains in the product after manufacture, as well as from the subsequent breakdown of the urea-formaldehyde resin by their reaction withmoisture and heat (7). Some gaseous formaldehyde escapes from plywood during itspressing; small amounts are, however, given off afterwards during subsequent storage, sanding, trimming, etc, of the material (8). The extent of emissions and degree of concentration build-up of formaldehyde from both particle board and plywood dependupon a number of factors; for example,the amount of free formaldehyde remaining in the panels,the volume of panels in an enclosed space relative to the volume of that space,the area of exposed surface of the panels,the temperature and humidity and rate of diffusion of formaldehyde from the panel andthe amount of ventilation available to the enclosed space.			
Exposure route:	inhalation			
Physical form:	off-gas from particleboard and plywood			
Comments:	Note: Report contains monitoring data but that data is not extracted as the data is air monitoring inside mobile homes, a consumer/general population exposure data need.

Study Citation:	CalEPA, (2012). Air Toxics Hot Spots Program Risk Assessment Guidelines: Technical support document for exposure assessment and stochastic analysis.			
HERO ID:	10217809			
Conditions of Use:	General			
EXTRACTION				
Parameter	Data			
Comments:	This data source is about exposure of people who are located near sites at which chemicals are emitted. This data source contains information pertaining to the exposure of "offsite workers" to various chemicals including formaldehyde. Offsite workers are all workers who work near a site that emits a specified chemical. The exposure routes discussed are inhalation and dermal exposure as a result of contact with soil. This data source contains information about assessment methods for assessing such exposures. Offsite workers are not ONUs because they are not located within a site associated with a COU of the RE, and, instead, they are a part of the general population. Therefore, this data source is not relevant to the assessment of occupational exposure to formaldehyde (although it may be relevant in the case of general population exposure.)			
EVALUATION				
Domain	Metric	Rating	Comments

	Metric 3:	Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The report is generally no more than 10 years old.
	Metric 5:	Sample Size	N/A	N/A- qualitative information.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Data sources are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Site-specific PPE and EC information is not applicable for variability or uncertainty. For the information on customers, the report does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	Chin, J. Y. (2011). Characterization of biofuels blends: Emissions, permeation and apportionment of volatile organic compounds.			
HERO ID:	6026451			
Conditions of Use:	Use of fuels			
EXTRACTION				
Parameter	Data			
Worker activity description:	Fuel delivery represents an individual who loads, drives and delivers fuel to retail gasoline stations. Dermal exposure may occur during refueling events due to contact with wet or leaky fuel caps, nozzles, fuel splashes, etc. a full-time technician analyzes fuel properties in the laboratory.			
Exposure route:	Dermal and inhalation			
Personal protective equipment:	measured breakthrough times (BTs), permeation rates(PRs), and the VOC composition of permeants for four fuels (gasoline, E85, ULSD and B20) through three types of gloves (neoprene, nitrile Sol-Vex and Viton) commonly usedas PPE, three types of gloves (latex, nitrile and vinyl) used in laboratory settings, and a reference material (neoprene sheet). Gasoline tended to have the highest PR among the four fuels, and only the Viton glove gave excellent protection (BT > 8 hr). Diesel and B20 had low PRs, and both Viton and nitrile Sol-Vex materials gave good protection; neoprene also could give acceptable protection.			
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from frequently used sources (e.g., ATSM) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evalu- ated.
	Metric 3:	Applicability	High	The data relates to an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	The report captures operations, equipment, and worker activities expected to be repre- sentative of current conditions. The report is generally no more than 10 years old.
	Metric 5:	Sample Size	N/A	Data is qualitative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Data sources are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The report addresses variability and uncertainty in the results. Uncertainty is well char- acterized.
Overall Quality Determination			High	

Study Citation:	Cleary, W. M. (1970). Thermoplastic resins decomposition. Industrial Medicine and Surgery 39(3):129-131.
HERO ID:	1321064
Conditions of Use:	Other Byproduct

EXTRACTION	
Parameter	Data
Worker activity description:	Manufacturing establishments where thermal decomposition of resin occurs, such as a plastic molding plant, injection molding company.
Exposure route:	inhalation
Personal protective equipment:	Compressed air supply under emergency condition
Engineering control:	The following controls are: 1) All feed screws must be of the vented type. 2) Heat regulation must be automatically controlled and overtemperature conditions monitored by an audible alarm or warning device in direct view of the operator. 3) All employees involved in handling or processing of these resins should be instructed as to the potential hazards involved. 4) A standby cooling water source must be available which is not dependent upon the main electrical system. Where municipal water is not available, a gravity cooling arrangement is acceptable providing adequate flow can be maintained for approximately a ten minute period. 5) Should decomposition of the resin occur while a machine is in operation, as a result of overheating or other machine failure, the gassing action can be stopped by immediately disconnecting the electrical or steam heating source from the feed cylinder and air ejecting and/or purging (with polyethylene) the hot material into water. Following this the area should be cleared of personnel and fully ventilated to remove all traces of decomposition gases. 6) All machines using Delrin or similar thermoplastic resins must be so identified, and emergency shutdown instructions posted in a location readily available to operating personnel. A variety of metal and decal type signs are available through most major resin suppliers. General ventilation is extremely important as a means of emergency control for molding operations. In addition, a properly designed system will prevent the accumulation of toxic combustion products from lift trucks as well as minimizing solvent exposure which may arise from component assembly operations.

Study Citation:	D’Ettorre, G., Criscuolo, M., Mazzotta, M. (2017). Managing formaldehyde indoor pollution in anatomy pathology departments. Work 56(3):397-402.		
HERO ID:	4571619		
Conditions of Use:	Laboratory Uses		
EXTRACTION			
Parameter	Data		
Worker activity description:	During the dissection of cadavers, FA vapors are emitted, exposing the workers; “sampling” step where workers handle the anatomic piece from the container filled with formalin and, before slicing, rinse it under running water for 10–15 minutes.		
Personal sampling data:	Five papers showed personal exposures to FA and indoor concentrations lower than the ACGIH TLV ceiling level. In gross anatomy laboratories, the personal exposure levels are frequently 2–3-fold higher than the mean indoor FA level.		
Personal protective equipment:	Aprons, lab coats, gloves, protective eyewear and face masks, and respirators		
Engineering control:	Local exhaust ventilation systems; ventilation systems demonstrated the consequent reduction of FA air pollution in gross anatomy laboratories below the ceiling standard of 0.3 ppm; FA indoor levels were successfully decreased by using a dissection table equipped with a photocatalyst device that reduced FA concentrations by about 80%; vacuum sealing systems		
Comments:	Source has some qualitative exposure information (such as how exposure compares to PELs).		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from frequently used sources (e.g., European Union or OECD reports, NIOSH HHEs, journal articles, Kirk-Othmer) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from an OECD country other than the U.S., and locality-specific factors (e.g., potential differences in regulatory occupational exposure or emission limits, industry/ process technologies) may impact exposures or releases relative to the U.S.
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4: Temporal Representativeness	High	The report captures operations, equipment, and worker activities expected to be representative of current conditions. The report is generally no more than 10 years old.
	Metric 5: Sample Size	N/A	Information is generally qualitative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	N/A	Information is generally qualitative.
Overall Quality Determination		High

Metric 7:	Metadata Completeness
	Low
	Does not address variability or uncertainty.
Overall Quality Determination	
Low	

Study Citation:	Dow Chemical, (2016). [Redacted] Industrial hygiene assessment of employee exposures to formaldehyde during manufacturing of Dow Corning® MB40-006 Masterbatch on Line 7 at the Copley, OH Multibase Site.
HERO ID:	10602470
Conditions of Use:	Incorporation into a formulation, mixture, or reaction product: Paint additives and coating additives not described by other categories in: paint and coating manufacturing and plastic material and resin manufacturing

EXTRACTION

Parameter	Data
Exposure route:	inhalation (p. 4)
Physical form:	vapor (p.4)
Personal sampling data:	Two personal samples were collected for formaldehyde. The two personal samples ranged from 0.064 to 0.16 ppm. (p.5)
Area sampling data:	The area sample collected was 0.042 ppm. (p.6)
Exposure frequency:	This masterbatch material is produced only a few times each year.
Personal protective equipment:	However it is recommended operators on line 7 continue to wear full face elastomeric respirators with multigas cartridges during production of the Dow Corning® MB40-006 MASTERBATCH product until the second sampling event is completed. (p. 5)
Engineering control:	The line 7 extruder portion has two local exhaust ventilation units. One is a repositionable arm, located along the water bath, which has been certified for employee exposure control under the provisions of pd.std.00121. The other unit is a canopy hood located above the line 7 extruder which, due to inadequate flow, has not been certified for employee exposure control but serves to provide heat and odor control. Both ventilation units were running during the time of the survey and the repositionable arm unit was working within established performance specifications. (p.5)

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from frequently used sources (OSHA FA Standard 1910.1048)
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	The report captures operations, equipment, and worker activities expected to be representative of current conditions. The report is generally no more than 10 years old.
	Metric 5: Sample Size	Medium	Statistical distribution of samples is fully characterized. However, samples size is small.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The report addresses variability and uncertainty in the results. Uncertainty is well characterized.

Study Citation:	Halm, P. E. (1989). Controlling indoor air quality. Consulting Specifying Engineer 5(1):42.			
HERO ID:	6024376			
Conditions of Use:	emission			
EXTRACTION				
Parameter	Data			
Engineering control:	The following engineering controls are recommended during designing new buildings or rehabilitating existing buildings: provide adequate controlled ventilation (outdoor air); provide adequate and easily maintainable filtration systems; be balanced to ensure proper operation in all areas; control operational costs by storing energy, rather than by reducing ventilation rates. In particular, designers must allow sufficient space around the HVAC systems to facilitate preventive maintenance programs. NASA’s environmental specialists also found that house plants such as philodendrons, chrysanthemums and aloe vera are quite effective in removing harmful gases such as formaldehyde from indoor air. However, while house plants may be effective in reducing indoor air pollution in small, completely enclosed spaces they are likely to be less effective in larger, ventilated spaces such as offices.

Overall Quality Determination		High		

Study Citation:	Heiden Associates, (1984). A survey of occupational exposure to uncured UF resins in seven industries.			
HERO ID:	6574574			
Conditions of Use:	Processing/Use			
EXTRACTION				
Parameter	Data			
Worker activity description:	Workers related to UF resin production and use. Workers performed the following operations: (a) handling; (b) resin manufacture; (c) resin mixing; (d) resin application or use;(e) equipment cleaning and washdown; (f) product recycling; (g) testing and quality control sampling; and (h) other.			
Exposure route:	Dermal exposure was the most significant type of exposure for three of seven industries surveyed-UF resin manufacturers, fertilizers, and wood furniture. An average of 23.24, 40, and 6.23 workers per plant respectively were reported as experiencing dermal exposure (unadjusted basis). Inhalation exposure tended to be more significant for two industries-particleboard and glass mats with 17.36 and 26.50 workers exposed (unadjusted) respectively. Dermal and inhalation exposure tended to be about equally significant as actual exposure sources for the remaining two industries-averaging about 10.1 workers for hardwood plywood and 3.33 workers for corrugated converters (both unadjusted).			
Physical form:	All seven industries reported that the liquid form of uncured UF resin was used more frequently than any other form. Only a minority of plants in four industries reported regular use of the powdered form.			
Exposure duration:	40-hour per week			
Number of workers:	The total number of workers actually exposed (unadjusted for the number of hours per week that such exposure occurred) in all seven industries ranged between 13,040 and 14,076. The percent of total employees (per average plant) who were actually exposed ranges from 2% for wood furniture to 26% for glass mats. Those potentially exposed range from 3% of total employees (wood furniture) to 30% (glass mats and particleboard). On the average, over all seven industries, 75% of workers who were reported to be in the path of potential exposure experienced actual exposure.			
Personal protective equipment:	Five of seven industries reported that over 50 percent of their workers wore some form of protective clothing or used some kind of protective equipment. Reported use ranged from 100 percent in the fertilizer industry (two plants) to 26 percent for the particle board industry.

Study Citation:	Heitbrink, W., Cooper, T., Edmonds, M., Bryant, C., Ruch, W. (1993). In-depth survey report: control technology for autobody repair and painting shops at Valley Paint and Body Shop, Amelia, Ohio.		
HERO ID:	6558536		
Conditions of Use:	Autobody repair and painting		
EXTRACTION			
Parameter	Data		
Worker activity description:	During repair activities, the workers may be exposed to aerosols from sanding, grinding, and welding. Workers who paint cars can be exposed to organic solvents, hardeners that may contain isocyanate resins, and pigments that may contain toxic components.		
Number of workers:	This autobody shop employs seven technicians, five of which repair cars, and two of which paint cars.		
Personal protective equipment:	Three types of respirators were used in this autobody shop. Half-facepiece, air purifying respirators that were equipped with organic vapor cartridges and spray painting prefilters were issued to all of the workers. This respirator was used for some primer painting, sanding, and welding. During abrasive blasting, a constant flow air line respirator with a half-facepiece was used. The air was supplied to this respirator through an oil-less pump equipped with a HEPA cartridge. In the spray painting area, an air-supplied hood was used to control worker exposure to paint overspray. The air for this respirator was supplied by the shop air compressor. This compressor did not have a high temperature alarm or a carbon monoxide alarm. Before flowing into the respirator, the air passes through filters and absorbent. According to shop personnel, this absorbent removes carbon monoxide, oil mist, and particulate. In addition, the air passes through a refrigeration unit. Respirator fit testing results in Table 7. Respirator defects in Table 8.		
Engineering control:	Each vehicle preparation bay exhausts air through three filters in the back of the vehicle preparation station. Bays have 5000 cfm of air exhausted from each bay. // The paint booth has a downdraft ventilation system to remove the paint vapors. During the painting cycle, outside air is passed through a series of filters. The final set of filters cover the entire ceiling of the spray painting booth. A nominal 12,000 cubic feet per minute of air flows out of the ceiling around the car or object being painted and out of the booth through exhaust grates located in the floor of the booth. // During drying, airflow in the booth is reduced about 80% of the air flow during spraying. Airflows listed in Table 2. Static pressures listed in Table 3. Air velocities in Table 6.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from frequently used sources (e.g., European Union or OECD reports, NIOSH HHEs, journal articles, Kirk-Othmer) and are generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The report is more than 20 years old. The report captures operations, equipment, and worker activities that are expected to be outdated.
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.

Domain 1: Reliability	Metric 1:	Methodology	High	Report uses high quality data from frequently-used sources.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data are from Germany, an OECD country.
	Metric 3:	Applicability	Low	The article applies to exposure in homes, which may be similar to exposure at commercial places.
	Metric 4:	Temporal Representativeness	High	Report is based on current industry conditions and data no more than 10 years old.
	Metric 5:	Sample Size	N/A	No sample data.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Assessment or report clearly documents results, methods, and assumptions. Data sources are generally described but not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination			Medium	

Study Citation:	ICFI, (1985). Production and use of formaldehyde containing resins and options for controlling formaldehyde release from durable-press fabrics.			
HERO ID:	5901058			
Conditions of Use:	commercial use			
EXTRACTION				
Parameter	Data			
Engineering control:	Several control options are available to reduce the level of formaldehyde release from fabrics treated with resins that impart durable properties: using a different resin; changing the catalyst or the time and temperature of the reaction which cures the resin in place on the fabric; altering the concentration of the resin and impurities therein; introducing other additive during the "padding" step in which the fabric is impregnated with resin; altering fabric condition; changing the method of storage; and afterwashing and aftertreating the fabric.

Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	report uses high quality data	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	data are from the United States	
	Metric 3: Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Low	The report is more than 20 years old.	
	Metric 5: Sample Size	N/A	N/A - This metric is not applicable to the data being extracted	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Data sources are generally described but not fully transparent.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	N/A	N/A - This metric is not applicable to the data being extracted	
Overall Quality Determination		High		

Study Citation:	ICFI, (1984). Formaldehyde emissions from building products: cost-effectiveness of reduction strategies. Chapter II: formaldehyde-emitting wood products and alternatives for controlling emissions.			
HERO ID:	5901065			
Conditions of Use:	Surface coatings using resins			
EXTRACTION				
Parameter	Data			
Worker activity description:	workers involved in surface coatings using resins			
Area sampling data:	Formaldehyde concentrations can range from 1.2 to 13.2 ppm			
Engineering control:	Controlling formaldehyde emissions from urea-formaldehyde wood products can be done by: reducing the formaldehyde content in UF resins; use of coatings or scavengers; use of phenol-formaldehyde or other lower emitting formaldehyde resins; use of ammonia treatment; and having longer storage times before sales. Another option is ventilation. Though this does not reduce formaldehyde emission, it will decrease formaldehyde concentration within an area.

Study Citation:	Mortimer, V. (1982). Preliminary survey report: Fiberboard Plant, Medford Corporation, Medford, Oregon.			
HERO ID:	6558530			
Conditions of Use:	Adhesives and sealant chemicals in: Plastic and resin manufacturing; Wood product manufacturing; All other basic organic chemical manufacturing			
EXTRACTION				
Parameter	Data			
Number of workers:	100, including 80 production workers			
Personal protective equipment:	All workers are required to wear hardhats except while in certain specific areas, such as the enclosed control rooms and the break room. Hearing protectors and safety glasses are required for some jobs. Respirators are not mandatory for any worker, except when working above the press. Both a Norton 7500-30M half-face mask and supplied-air resirators are available, but rarely required.			
Engineering control:	Local exhaust ventilation is used over the cooling wheel. A canopy hood covers the boards as they make a 1800 pass over a supply of air from a plenum on the lower left side. The unit is also enclosed on the sides, and air is extracted into a plenum on the right side as well as through the top of the hood. Four roof fans located above the press remove much of the heated air from the press, although there is not much air flow observable at floor level or on the platform which provides worker access to all points of the production line. Control rooms have been built for the operators who control the press and the layering of wood fibers. Now only a few workers involved in maintenance and clean-up regularly work outside this booth. An air conditioner has been installed for cooling during hot weather. The unit is a small, central-air type model which does have the provision to draw air from outside the building. It was not operating on the day of the survey, and it is not known what effect, if any, air-conditioning would have on formaldehyde levels in the control room. The area where the resin is pumped and blended into the wood fibers is ventilated by a 40,000 cubic-feet-per-minute exhaust fan. There is approximately 100,000 cfm of air pulled through the finish-shipping area and evacuated by the vacuum-cleaning fans of the sanding machine and the cut-up saw. No appreciable odor of formaldehyde was noticed in either location. The spray nozzles are cleaned by pressing a built-in rod through the orifice.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data directly from industry, and associated information does not indicate flaws or quality issues.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.	
	Metric 3: Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	Low	The report is more than 20 years old. The report captures operations, equipment, and worker activities that are expected to be outdated.	
	Metric 5: Sample Size	N/A	N/A - This metric is not applicable to the data being extracted	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions

Formaldehyde

Occupational Exposure

HERO ID: 57058 Table: 1 of 1

Study Citation:	Nazaroff, W. W., Weschler, C. J. (2004). Cleaning products and air fresheners: exposure to primary and secondary air pollutants. Atmospheric Environment 38(18):2841-2865.			
HERO ID:	57058			
Conditions of Use:	Use of Cleaning and Furniture Care Products			
EXTRACTION				
Parameter	Data			
Number of workers:	3 million janitors and cleaners			
Comments:	This is an interesting article that considers the secondary formation of formaldehyde from chemicals from cleaning products and other indoor air contaminants such as OH and O3. But there are few specifics about formaldehyde.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Medium	The assessment or report uses high quality data and/or techniques or sound methods that are not from a frequently used source and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	High	The report is for an occupational scenario (janitors and cleaners) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	2001 - 20 years old
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Department of labor
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The report does not address variability or uncertainty.
Overall Quality Determination		Medium		

Study Citation:	NFDA, (2020). Comments of the National Funeral Directors Association (NFDA) requesting that EPA remove funeral service, including embalming and mortuary science, as a condition of use from EPA’s proposed scope for its formaldehyde risk assessment (submitted by Lesley Witter).			
HERO ID:	10370214			
Conditions of Use:	Commercial Use - Embalming			
EXTRACTION				
Parameter	Data			
Worker activity description:	Formaldehyde-based products are the leading products used for embalming in the United States as there is no substitute for the dual preservative and antimicrobial properties that these products possess. (page 1 of 4)			
Exposure route:	inhalation and dermal exposure (page 3 of 4)			
Exposure duration:	A typical embalming lasts from 45 to 90 minutes with an average time of one hour. (page 3 of 4)			
Exposure frequency:	Funeral directors do not embalm daily and with the increase in the cremation rate, funeral directors may conduct embalmings only several times a week. (page 3 of 4)			
Engineering control:	room ventilation (page 3 of 4 and throughout. Only vaguely discussed, refers to OSHA guidelines as the controls and PPE they implement)			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Medium	From the National Funeral Directors Association, they do not site sources, but it can be assumed they are knowledgably about their practices
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	From USA
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	2020
	Metric 5:	Sample Size	N/A	N/A - This metric is not applicable to the data being extracted
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Assessment or report provides results, but the underlying methods, data sources, and assumptions are not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	The report provides only limited discussion of the variability and uncertainty in the results.
Overall Quality Determination		Medium		

Study Citation:	NIOSH (2001). Controlling formaldehyde exposures during embalming. Applied Occupational and Environmental Hygiene 16(4):438-438.			
HERO ID:	1986847			
Conditions of Use:	Laboratory Use			
EXTRACTION				
Parameter	Data			
Engineering control:	The LEV system consists of a pair of six-foot long slot hoods placed on each side of the embalming table. These slot hoods capture formaldehyde by means of an exhaust fan, which is placed outside the embalming room. The exhaust fan maintains an optimum air flow of 700 cubic feet per minute. For a slot width of one inch, the slot velocity is 720 feet per minute. Embalming equipment manufacturers and distributors can provide LEV systems for existing tables, or a sheet metal contractor can custom build the LEV system (see Figure 1). General room (dilution) ventilation is another way to exhaust formaldehyde from the embalming room. Depending on how well the air in a room is mixed, 4 to 13 times more exhaust air is needed to achieve the same control as from the LEV system. Make-up air costs for heating or cooling are considerably less for the LEV system than for dilution ventilation. Therefore, NIOSH recommends that the primary control be the LEV system.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Report uses high quality data from frequently-used sources.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data are from the U.S.	
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation	
	Metric 4: Temporal Representativeness	Medium	Report is based on data greater than 10 years old but no more than 20 years old and industry conditions that are expected to be representative of current industry conditions. (2001)	
	Metric 5: Sample Size	N/A	Not applicable - no sample data.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All data sources, methods, results, and assumptions are clearly documented.

EXTRACTION				
Parameter	Data			
Exposure route:	inhalation			
Physical form:	vapor			
Personal protective equipment:	recommend using goggles, gloves and protective clothing.For emergencies full-face respirators or canister type gas masks are recommended.			
Engineering control:	adequate ventilation			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Methodology	High	US Public Health Service/NIOSH
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US
	Metric 3:	Applicability	Medium	does not focus on any specific COU
	Metric 4:	Temporal Representativeness	Low	1975 more than 20 years old
	Metric 5:	Sample Size	N/A	information provides is qualitative rather than quantitative
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Basis of the information provided is the US Public Health Service/CDC/ NIOSHA
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	N/A	information provides is qualitative rather than quantitative
Overall Quality Determination		High		

Study Citation:	NIOSH, (2007). NIOSH pocket guide to chemical hazards.			
HERO ID:	192177			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Exposure route:	Toxicologically important entry routs (i.e., not potential routes associated with an exposure scenario):inhalation, skin and/or eye contact.			
Physical form:	Nearly colorless gas with a pungent, suffocating odor. [Note: Often used in an aqueous solution] This is not the physical form in the case of a specific occupational exposure scenario of the risk evaluation.			
Personal protective equipment:	NIOSH recommends two types of respirators if the exposure concentration equals or exceeds the NIOSH REL and the APF of each of these types is 10,000. These two types are any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode and Any supplied-air respirator that has a full-facepiece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in pressure-demand or other positive-pressure mode. A respirator is also recommended for escape (Pg. 178/454)Pg. 357 contains OSHA's respiratory protection standard pertaining to formaldehyde. This standard consist of specified respirators that must be used if exposure concentration exceeds certain limits. Three different limits are specified. Additionally, respirators are specified in the case of firefighting and escape.			
Comments:	Formaldehyde was found under other chemicals in 'incompatibilities and reactivities': bis-chloromethyl ether [CAS No. 542-88-1], chloromethyl methyl ether [CAS No. 107-30-2], rosin flux pyrolysis product [pg. 305]

Overall Quality Determination		Medium	

Study Citation:	NIOSH, (1976). Criteria for a recommended standard: Occupational exposure to formaldehyde.		
HERO ID:	192344		
Conditions of Use:	Manufacture		
EXTRACTION			
Parameter	Data		
Exposure route:	inhalation and ingestion		
Physical form:	vapor and liquid		
Exposure duration:	up to 10 hours per day		
Exposure frequency:	40 hours per week		
Number of workers:	8,000 directly involved in production of formaldehyde monomer		
Personal protective equipment:	Protective Clothing(1) Employees shall wear gloves made of rubber or of other impervious material when working with formaldehyde and when contact with the hands is likely.(2) Employees shall wear protective sleeves, aprons, jackets, trousers, and caps as needed to protect them from skin contact with formaldehyde. Protective garments shall be made of a material impervious to formaldehyde. In emergencies or other circumstances involving exposure to formaldehyde at high concentrations of vapor, mists, or dusts in the air, full body protection shall be worn. Emergency garments shall be of an impervious material, and shall fit snugly about the wrists, neck, waist, and ankles.(3) Employees handling drums, cans, or other containers of formaldehyde shall wear leather or rubber safety shoes. Rubbers may be worn over leather safety shoes as protection from splashes or spills of formaldehyde.(4) Protective garments shall be cleaned inside and out and well ventilated after each use~ and particularly after contamination has occurred.(b) Eye and Face Protection(1) Cup-type or rubber-framed chemical safety goggles shall be worn by employees when there is any possibility of eye or facial contact with formaldehyde solutions. Goggles also protect eyes from contact with gas. In cases of excessive vapor concentrations, a full face mask respiratory protective device shall be required; this device may be substituted for cup-type or rubber-framed chemical safety goggles.(2) Full-length, plastic face shields shall be required in addition to safety goggles for face protection when the work process involves risks of exposure to splashes of formaldehyde. Chemical safety goggles are required in addition to the face shield when there is danger of formaldehyde entering underneath or around the sides of the shield.(3) The safety goggles, full-face masks, and shields shall be thoroughly decontaminated after each use.(4) Eye-protective measures and equipment shall conform with the provisions under 29 CFR 1910.133.(c) Respiratory ProtectionRespirators may be used for nonroutine operations, evacuation, or emergencies which may involve occasional brief exposures to formaldehyde at concentrations in excess of 1.2 mg/cum. Such exposures may occur during the period necessary to install or test required engineering controls, or to take protective actions.Appropriate respirators may only be used pursuant to the following requirements:(1) For the purpose of determining the type of respirator to be used, the employer shall measure the airborne formaldehyde concentration in the workplace initially, and thereafter whenever process, operations, worksite, climate, control, or other changes may occur which are likely to increase the airborne concentration of formaldehyde. This requirement does not apply when only positive pressure supplied-air respirators are used.(2) The respirator and cartridge or canister used shall be of the appropriate class, as determined on the basis of the airborne concentration of formaldehyde. The employer shall ensure that no employee is exposed to formaldehyde in excess of 1.2 mg/cu m for any 30-minute period because of improper respirator selection, fit, use, or maintenance.(3) A respiratory protective program meeting the requirements of 29 CFR 1910.134 shall be established and enforced by the employer.(4) The employer shall provide respirators and shall ensure that the employee uses the respirator properly.(5) Respiratory protective devices shall be approved under provisions of 30 CFR 11(6) Respirators specified for use at greater airborne concentrations of formaldehyde may be used in lesser airborne concentrations of formaldehyde.(7) Use of chemical cartridges and canisters more than once for a period greater than that indicated in Table I-1 shall be prohibited.(8) The employer shall ensure that respirators are adequately cleaned, maintained, and stored when not in use, and that employees are instructed on the use of respirators assigned to them and on how to test for leakage. Note table I-1 provides even more details about approved respirators.		
Engineering control:	Engineering controls shall be used to maintain the concentration of airborne formaldehyde at or below the ceiling concentration of 1.2 mg/m3.

HERO ID:	8408529			
Conditions of Use:	Incorporation into an artilce textiles, apparel and Leather manufacture			
EXTRACTION				
Parameter	Data			
Exposure route:	inhalation and dermal			
Physical form:	vapor and liquid			
Personal protective equipment:	Chemical protective clothing (CPC) should be selected after utilizing available performance data, consulting with the manufacturer, and then evaluating the clothing under actual use conditions. Workers should be provided with and required to use CPC, gloves, and other appropriate protective clothing necessary to prevent skin contact with formaldehyde.Respiratory ProtectionIt must be stressed that the use of respirators is the least preferred method of controlling worker exposure and should not normally be used as the only means of preventing or minimizing exposure during routine operations. However, there are some exceptions for which respirators are used to control exposure: when engineering and work practices controls are not technically feasible when engineering controls are in the process of being installed or during emergencies and certain maintenance operations, including those requiring confined-space entry.In addition to respirator selection, a complete respiratory protection program should be instituted which as a minimum complies with the requirements found in the OSHA Safety and Health Standards, 29 CFR 1910.134. A respiratory protection program should include as a minimum an evaluation of the worker’s ability to perform the work while wearing a respirator, the regular training of personnel, fit testing, period environmental monitoring, maintenance, inspection, and cleaning. The implementation of an adequate respiratory protection program, including the selection of the correct respirators, requires that a knowledgeable person is in charge of the program and that the program be evaluated regularly. Only respirators that have been approved by the mine Safety and Health Administration and by NIOSH should be used.			
Engineering control:	During use in textile manufacturing or handling and tanning operations - process enclosure and local exhaust ventilation.

EXTRACTION				
Parameter	Data			
Worker activity description:	Of the workers in Department 205 at the time of the survey, 13 were Machine Operators and 2 Machine Set Up, 14 Coil Molders and 2 Coil Molder Set up, 28 Assemblers, 1 coil impregnator (varnish), and 1 machine repair worker. There were four major subdivisions of Department 205; 9 employees working in the winding area, 17 in the molding area, 12 in the assembly area, and 23 in the finishing and testing area. (pdf pg 4)The nylon core coils are also wound in the winding area and soldered in the assembly area. These coils are then transported to the molding area. The 4 inch wide wire wrapped coils are placed in a press along with preheated epoxy powder in pill form. These epoxy pills are produced in the molding area by compression of powder. Under heat and pressure the epoxy pill is molded around the coil, with local ventilation in place. These presses are regularly cleaned with a formaldehyde based cleaner. (pdf pg 6)			
Exposure route:	inhalation, dermal			
Exposure duration:	These employees worked an 8 hour day, 5 day week. For the past two years, two (previously three) shifts have been operating in the molding area. There were 51 production employees on the 7-3:30 shift and 9 employees working 3:30 to 11:00. (pdf pg 4)			
Number of workers:	13 were Machine Operators and 2 Machine Set Up, 14 Coil Molders and 2 Coil Molder Set up, 28 Assemblers, 1 coil impregnator (varnish), and 1 machine repair worker. There were four major subdivisions of Department 205; 9 employees working in the winding area, 17 in the molding area, 12 in the assembly area, and 23 in the finishing and testing area. (pdf pg 4)			
Engineering control:	a combination of window, local exhaust and general exhaust ventilation. (pdf pg 4)

Domain 1: Reliability	Metric 1: Methodology	High	The assessment or report uses high quality data and/or techniques or sound methods that are from frequently used sources.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.	
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation	
	Metric 4: Temporal Representativeness	Low	The report is more than 20 years old.	
	Metric 5: Sample Size	N/A	No sample data.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Assessment or report clearly documents its data sources, assessment methods, results, and assumptions.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	N/A	No scope to address variability and uncertainty.	
Overall Quality Determination		High		

Study Citation:	OECD, (2015). Emission scenario document on use of adhesives.		
HERO ID:	3833136		
Conditions of Use:	Use of Adhesives		
EXTRACTION			
Parameter	Data		
Worker activity description:	Equipment loading/container unloadingEquipment cleaningApplicationDrying/curing		
Exposure route:	inhalation or dermal		
Physical form:	vapor or liquid		
Area sampling data:	Equations are provided but the supporting values for Phenol-Formaldehyde resins are not included.		
Number of workers:	If we assume that phenol-formaldehyde adhesives are primary related to Automotive and Aerospace applications; the report suggests a potential exposure number for motor vehicle workers to be 90 per facility, but this may include exposure to other adhesives.		
Personal protective equipment:	EPA did not assess the effectiveness of personal protective equipment (PPE) in mitigating occupational exposures in this ESD. The exposure mitigation by PPE is affected by many factors including availability, cost, worker compliance, impact on job performance, chemical and physical properties of the substance and protective clothing, and the use, decontamination, maintenance, storage, and disposal practices applicable to the industrial operation (CEB, 1997b). Therefore, the conservative, screening-level occupational exposure estimates presented in this ESD do not account for PPE. Actual occupational exposure may be significantly less than the estimates presented in this ESD.Chemical PMN submissions recently submitted to EPA by adhesive chemical manufacturers show that, at a minimum, all manufacturers recommended the use of gloves and safety glasses with side shields or goggles. Approximately half of the submissions also recommended the use of some kind of ventilation and respirators if necessary.		
Engineering control:	ventilation		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	OECD report authored by EPA, this report is generally accepted by the scientific community, and associated information does not indicate flaws or quality issues.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States
	Metric 3: Applicability	Medium	The report is for an occupational scenario (use of adhesives) within the scope of the risk evaluation, but information is general for the use scenario and not necessarily specific to formaldehyde.
	Metric 4: Temporal Representativeness	High	The report is generally no more than 10 years old (2015).
	Metric 5: Sample Size	N/A	No sample data were extracted
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	The report aggregates all of the information such that it is not possible to differentiate what processes and application techniques apply to Formaldehyde.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The report addresses variability and uncertainty in the results

	Metric 3:	Applicability	Low	The report is for a non-occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Report is based on data greater than 20 years old and industry conditions that are expected to be outdated. (1984).
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics. It is unclear if analysis is representative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Methods, results, and assumptions are clearly documented, but underlying data sources are not fully transparent.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination			Low	

Study Citation:	Springborn Laboratories, (1981). The formaldehyde industry and industries using formaldehyde (EPA contract #68-01-6075).			
HERO ID:	5901013			
Conditions of Use:	Multiple COUs - Adhesives, particleboard, plywood, textiles, embalming, mobile homes.			
EXTRACTION				
Parameter	Data			
Number of workers:	Typical FA plant employs 2 to 3 persons per shift to operate the system. Figuring 3 persons conservatively, approximately 504 men are employed on a 3 shift bases that are directly involved in producing FA. This is based on the 56 plant sites. FA bond resin industry has 3000-3500 employees with 2200-2500 production workers.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Data is high quality data as a TSCA submission to the EPA.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data is for US.	
	Metric 3: Applicability	High	Data is applicable to multiple COUs. Recommend making multiple sets of data review for each COU as it goes in depth for each one on process description, PVs, number of sites, number of workers, etc.	
	Metric 4: Temporal Representativeness	Low	Data is over 20 years old.	
	Metric 5: Sample Size	Medium	Characterized by a large range of data over multiple years.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Provides production volume, process descriptions, number of workers, number of sites, life cycle description etc.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Addresses variability by looking at multiple COUs and data spanning multiple years.	
Overall Quality Determination		High		

Study Citation:	Srivastava, A.K., Gupta, B.N., Gaur, J.S., Bihari, V. (1992). Clinical evaluation of workers handling melamine formaldehyde resin. Journal of Toxicology. Clinical Toxicology 30(4):677-681.			
HERO ID:	1787036			
Conditions of Use:	Plastic Manufacturing			
EXTRACTION				
Parameter	Data			
Worker activity description:	The work site was a room of 5 x 4.5 x 4.5 m. There was only one door and an exhaust fan for ventilation. Protective devices were provided but the workers did not use them, preferring to cover their faces with a piece of dry cotton cloth. The workers dissolved melamine formaldehyde powder in an open container of water and hydrochloric acid three times per shift with constant stirring for one to one and a half hour. In a single shift 150 kg of melamine formaldehyde powder is dissolved in water using 75 kg of hydrochloric acid. Formaldehyde is released during mixing and ageing. The workers are exposed to high concentrations of formaldehyde for about 30 min three times a day and to a relatively lower concentration for the rest of the time. They are also exposed to melamine resin through skin contact.			
Exposure route:	Inhalation, dermal

HERO ID:	4115766				
Conditions of Use:	Incorporation into Article- Plastic and resin manufacturing- Foam Manufacturing				
EXTRACTION					
Parameter	Data				
Worker activity description:	Production of phenolic foam, product formed from phenolsulfonates and formaldehyde using a laminator. Workers can be exposed to vapor from unreacted starting material. temperature levels can reached 150F				
Exposure route:	inhalation				
Physical form:	gaseous				
Comments:	Report did not monitor for formaldehyde but completed a medical review which includes results of investigating health effects for workers at the plant.				
EVALUATION					
Domain	Metric	Rating	Comments		
Domain 1: Reliability	Metric 1:	Methodology	High	report uses high quality data	
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States	
	Metric 3:	Applicability	High	The report is for an occupational scenario within the scope of the risk evaluation.	
	Metric 4:	Temporal Representativeness	Low	The report is more than 20 years old.	
	Metric 5:	Sample Size	N/A	N/A - This metric is not applicable to the data being extracted	
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Report clearly documents the medical history survey and potential exposures to workers.	
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	N/A	The report does not address variability or uncertainty.	
Overall Quality Determination			High		

Study Citation:	U.S. EPA, (1999). Flexographic printing - generic scenario for estimating occupational exposures and environmental releases: Draft.			
HERO ID:	6385709			
Conditions of Use:	commercial use: chemical substances in packaging, paper, plastics and hobby products.			
EXTRACTION				
Parameter	Data			
Worker activity description:	(i) Ink Preparation Room Inhalation Exposure:Prior to a production run, the potential exists for inhalation exposures for the workers transferring and mixing inks in the ink preparation room due to volatilization of PMN chemicals. (ii) Printing Room Inhalation Exposure:During the production runs, inhalation exposures occur when workers adjust the 5 gallon ink cans at the press and when workers operate the press.Inhalation exposures in the printing room are expected to be substantially higher than those in the ink prep room, primarily because of the higher generation rate (volatilization) associated with the process compared to simple diffusion from an open surface.			
Exposure route:	inhalation			
Physical form:	vapor			
Personal sampling data:	Contains models to estimate inhalation exposures			
Dermal exposure data:	Dermal exposure data			
Exposure duration:	(i) Ink Preparation Room Inhalation Exposure:One worker is exposed for four hours per shift.(ii) Printing Room Inhalation Exposure:Two workers are exposed per press for 7.5 hours per shift and there are typically four presses per site.			
Exposure frequency:	Facilities are expected to operate 300 days per year			
Number of workers:	Typically, one worker per shift will be required in the ink prep room and eight workers per shift will be required in the printing room (two workers per press, four presses per site). Facilities operate an average of three shifts per day; therefore, a typical facility will require a total of 27 workers.			
EVALUATION				
Domain	Metric	Rating	Comments

Study Citation:	Uraz, A., Ramsay, A. (2013). Air purification: Dual filtration approach meets formaldehyde challenge. Filtration and Separation 50(1):38-40.		
HERO ID:	5973301		
Conditions of Use:	Disposal (via thermocatalytic air filtration)		
EXTRACTION			
Parameter	Data		
Engineering control:	In indoor workplaces, formaldehyde concentrations in the air can be reduced by photocatalytic oxidation. Titanium dioxide is the catalyst, and when exposed to UV light, it absorbs photons and excites its electrons. These electrons react with VOC’s trapped on a filter to convert them to CO2 and water. A second filter with manganese oxide then traps even more formaldehyde in thermocatalytic oxidation. After 160 days running there was a relative activity of 50-70% with exposure to formaldehyde and VOCs over time. Also, it is theorised that it may be possible to reduce outdoor air supply rates by 50% or more, while simultaneously maintaining indoor air quality and saving energy.

Parameter	Data			
Worker activity description:	Drivers and occupants in motor vehicle cabin			
Exposure route:	Inhalation			
Physical form:	Vapor			
Area sampling data:	In one study, carbonyl concentrations in the cabin of a new Japanese estate car (station wagon in American English) were measured. On the day after the delivery (about two weeks after manufacture), the in-cabin concentrations of formaldehyde were 46.4 ug/m3. The in-cabin formaldehyde concentration was reported to decline from a higher concentration in summer to a lower concentration in winter and the concentration was reported to increase from winter to summer. Another study tested the pollutant concentrations in 50 new cars and observed that the in-cabin formaldehyde concentration was in the range of 17–67 ug/m3. Another study tested 12 taxis and mean concentration of in-cabin formaldehyde was 26 ug/m3. Another study examined the air pollution in the microenvironment of 802 parked new cars and found that the formaldehyde concentration was within 20-1110 ug/m3, with the average value of 80 ug/m3. Other references were cited also.			
Engineering control:	Ventilation with filtration unit is a most efficient method to avoid outside pollutants entering into vehicles’ cabins and capture air pollutants, emitted from combusted fuel and interior materials into the cabin air.			
EVALUATION				
Domain	Metric	Rating		Comments
Domain 1: Reliability	Metric 1:	Methodology	High	report uses high quality data
Domain 2: Representativeness	Metric 2:	Geographic Scope	Low	The report was from a non-OECD country
	Metric 3:	Applicability	High	report is for an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	High	report is generally no more than 10 years old
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Assessment or report clearly documents its data sources
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The report does not address variability or uncertainty

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	The release data methodology is known or expected to be accurate and is known to cover all release sources in the scenario.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S., and locality-specific factors may impact releases relative to the U.S.
	Metric 3:	Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	The data are more than 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Release data include most critical metadata, including release media and release frequency, but lacks additional metadata, such as process, unit operation, and/or activity that is the source of the release.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The release data study addresses variability in the determinants of release. The release data study addresses uncertainty in the release results.
Overall Quality Determination			High	

Study Citation:	Buyuksari, U., Ayilmis, N., Avci, E., Koc, E. (2010). Evaluation of the physical, mechanical properties and formaldehyde emission of particleboard manufactured from waste stone pine (<i>Pinus pinea</i> L.) cones. <i>Bioresource Technology</i> 101(1):255-259.
HERO ID:	1940934
Conditions of Use:	Compressed Wood Product Manufacturing

EXTRACTION	
Parameter	Data
Description of release source:	Wood particles (a 50:50 blend) consisting of pine (<i>Pinus nigra</i> Arnold var. <i>pallasiana</i>) and beech (<i>Fagus orientalis</i> Lipsky) species were obtained from a commercial particleboard plant in Gebze, Turkey. The fresh cones were collected from stone pine (<i>Pinus pinea</i> L.) trees. The cones were placed on a plastic cover under the sun. After drying, the cones opened up and the nuts fell out. The pine cones without nuts were soaked in hot water for four hours at 80 C. This treatment was believed to partially remove gum on the surface of the cones and improve the grinding process and bonding properties of cone particles. After this treatment, the wet pine cones were dried in an oven up to 20–25% moisture content (based on the oven-dry cone weight) at 60 C. The pine cones were coarsely chipped and then were classified using a horizontal screen shaker. The particles that remained between 3–1.5 mm sieves and between 1.5–0.8 mm sieves were utilized in the core and middle sections of the panels, respectively. The particles used in particleboard production were dried at 100–110 C in an oven to reach target moisture content (3%). The panels were designed to consist of 35% chips at the face layer and 65% at the core layer and the target density of the panels was 0.65 g/cm ³ . The boards were pressed under 2.6 N/mm ² pressure, at 150 C, for 7 min. Urea–formaldehyde (UF) resin at 10% adhesive level was used for the core and outer layers based on oven-dry weight. One-percent ammonium chloride (NH ₄ CL) was added to resin as a hardener. The chips were placed in a drum blender and sprayed with urea formaldehyde and ammonium chloride for 5 min to obtain a homogenized mixture.
Release or emission factors:	Release or emission factors
Waste treatment methods and pollution control:	nan

EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability				
	Metric 1:	Methodology	Low	The release data methodology is not specified.
Domain 2: Representativeness				
	Metric 2:	Geographic Scope	Medium	Turkey - an OECD member
	Metric 3:	Applicability	Medium	The data used in this study are for pine cones found in Europe which would be similar to an occupational scenariowithin the scope of the risk evaluation, in terms of the type of industry, operations, and work activities.
	Metric 4:	Temporal Representativeness	Medium	The data were published in 2009, after the most recent PEL (1992) and more than 10 but less than 20 years old.
	Metric 5:	Sample Size	Medium	Emission factors were obtained from a figure in the document of 8 different variants of pine cone particleboard combinations.
Domain 3: Accessibility/ Clarity				
	Metric 6:	Metadata Completeness	Low	no metadata were provided.
Domain 4: Variability and Uncertainty				
	Metric 7:	Metadata Completeness	Medium	The study provided values for different pine cone/wood chip combinations that can be used to evaluate variability. Information about uncertainty was not provided.

Conditions of Use:	Disposal

EXTRACTION	
Parameter	Data
Description of release source:	LIQUID INCINERATOR - The organic liquids are segregated in the storage tanks according to their heating value, including: a liquid organics tank with a 15,500 gallon capacity holding wastes of high to moderate heating value (approximately 8,000 Btu/lb.); a liquid organics tank with a 17,500 gallon working capacity that stores wastes of low heating value (less than 3,000 Btu/lb.); and ten 20,000 gallon tanks that store aqueous waste. The liquid incinerator itself, is a vertically oriented, down fired, refractory-lined unit. The incinerator must be operated in a temperature range of 1,730 to 1,850°F in order to assure both efficiency and safety. In order to bring the incinerator temperature within this range, natural gas is used as an auxiliary fuel. Depending on the heating value of the waste feeds, the natural gas flowrate can be adjusted in order to maintain the required temperature during incineration. The burner is designed to provide maximum combustion efficiency of all three feeds. The natural gas fuel enters the incinerator via a ring at the top of the chamber. The liquid organic waste is injected through a gun located at the center of the natural gas ring. The aqueous waste is injected through a series of six guns located at the periphery of the center gun. Once the combustion is complete, the hot gases leave the thermal oxidizer at the bottom of the chamber and enter the contactor tube/quench pot system that cools the combustion gases to approximately 200 °F through direct contact with a water spray. The hot gases are cooled by direct contact with water sprayed from twelve nozzles directly into the gas stream. The cooled gases exit to the secondary quench tower. The gas leaving the secondary quench is thus cooled and saturated with water. This waste stream is scrubbed using a venturi-type scrubber to remove both HCl and particulates. Leaving the scrubber is a mixture of scrubbed gas and liquid droplets that must be separated which is done in the cyclone separators. The gases leaving the separators and enter the base of the vent stack, where they will be discharged to the atmosphere. Before being discharged, however, the gases must flow through a demister pad which removes most of the remaining particulates and liquid droplets. The conditioned gases are discharged from the top of the stack 145 feet above the ground. ROTARY KILN INCINERATOR - The proposed rotary kiln is a large, rotating refractory shell slanted downward at a 4° angle. The rotation of the shell moves the waste through the combustion chamber, exiting at the end of the kiln. Residence time in the combustion chamber can varied by changing the speed of the rotation. A natural gas feed is used as an auxiliary fuel feed which is applied to the outer barrel of this burner to maintain the operating temperature at approximately 1,600 °F. Organic liquid wastes is fed directly into the organic burner portion of the kiln. Aqueous wastes is fed directly into the kiln from the aqueous waste storage tanks. Waste in slurry form is fed into the kiln through the slurry lance and into the combustion zone. Waste sludge is fed into the kiln from the sludge feed hopper. Bulk solid wastes is shredded before being introduced into the kiln by the solids feed conveyor. The amount of combustion air entering the kiln is carefully regulated. Ash drops from the kiln into a water filled trough where the hot ash is quenched and moved by a conveyor to hydroclones that separate the ash from the water. Because of the variety of wastes are combusted in the rotary kilns, it is conceivable that the flue gas leaving the kiln will contain some uncombusted materials that goes through a secondary combustion chamber/afterburner. Natural gas, and a portion of organic liquids and liquid waste are fired into this second burner instead of travelling first through the rotary kiln. Residence time of the flue gases in the afterburner is approximately two seconds at an operating temperature of 1,800 °F. Hot flue gases from the rotary kiln and afterburner rise out of the upper section of the afterburner and move to the quenching unit that cools the hot flue gas and partially saturates it with water in preparation for scrubbing. Next the flue gas proceeds to the particle conditioner which a secondary quenching unit. The fully saturated and cooled flue gas leaves the top of the particle conditioner entering the scrubber system, where particulates, HCl, and other acid gases and chemicals are removed. The particulate-laden scrubbing water flows by gravity down to the entrainment separator tank, where the solids are removed and the water recirculated. Once the flue gas leave the scrubbers, it is release into the atmosphere via a vent stack 130 feet above ground.

HERO ID:	8016652			
Conditions of Use:	Other- Byproduct of Biocide in MWF			
EXTRACTION				
Parameter	Data			
Description of release source:		The triazine compound acts as a biocide by decomposing into formaldehyde. The absence of and/or presence of only trace amounts of triazine in the emulsion is an indicator that contact with acidic microbial waste products in the emulsion result in the decomposition of triazine and the release of formaldehyde. Most of emulsion used in the hydraulic system ends up as leakage into the mine environment. Sources of leakage include hydraulic line couplings, shield control boxes, pistons used to move shields, hydraulic line breaks, hydraulic line maintenance, and shield teardown and setup activities. (pg. 9)		
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Low	The release quantity was not provided, a qualitative statement is made on the release but methodology or source/support is unknown. Release is expected to cover the source of formaldehyde.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3:	Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	The data were collected before the most recent federal regulatory action or update or are more than 20 years old if no federal regulation is established. The operations, equipment, and worker activities are not available or indicate that the associated data are expected to be outdated.
	Metric 5:	Sample Size	N/A	Qualitative information.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Release data include all associated metadata, including release media; process, unit operation, oractivity that is the source of the release; and release frequency
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The release data study does not address variability or uncertainty.

Conditions of Use:	emission

EXTRACTION				
Parameter		Data		
Description of release source:		Formaldehyde release from durable press fabrics treated with formaldehyde reactants		
Release quantity:		A study on the effect of the catalyst on formaldehyde release with buffered and unbuffered DMDHEU showed that "catalysts of predominantly Lewis acid activity (zinc nitrate, magnesium chloride, aluminum hydroxychloride) produce fabrics with lower formaldehyde release (ranging between 2 and 4.6) than do those of predominantly Brifosted activity (aluminum sulfate, magnesium chloride-citric acid, sodium hydrogen sulfate, magnesium hydrogen phosphate) (ranging between 4.8 and 12.7). The amounts of formaldehyde determined by the AATCC method generally are greater than those from the Japanese method. The standard deviation for the AATCC test is 14 ppm and for the Japanese test is 11 ppm.

Study Citation:	Crouch, C.J., Melancon, T.A., Reeves, W.A. (1985). Fire resistant-durable press fabrics with low formaldehyde release. Journal of Fire Sciences 3(6):450-460.		
HERO ID:	5965968		
Conditions of Use:	Commercial use: Fabric products		
EXTRACTION			
Parameter	Data		
Description of release source:	Chemically treated fire-resistant fabrics - fire resistant-durable press (FR-DP) fabrics produced by combining decabromodiphenyl oxide, antimony oxide, Dur-O-Cote and 1,3-dimethylol 4,5-dihydroxyethyleneurea (DMDHEU) with the addition of three polyols (1,2-propanediol, ethylene glycol and glycerol).		
Release quantity:	Comparing mean formaldehyde release data for fabrics treated with only the FR-DP agent and for fabrics treated with the FR-DP agent plus each of the three polyols at 2% and 4% concentrations and cured for 3.5 and 5.0 minutes at 160 °C, it was found that the least effective polyol for reducing formaldehyde release was ethylene glycol. Control fabric treated only with FR-DP finish had a mean formaldehyde release value of 950 ug/g of treated fabric, whereas 2% propanediol reduced formaldehyde release to about 700 ug/g of treated fabric and 4% reduced the release value to about 540 ug/g of treated fabric. The most effective polyol was glycerol; 2% reduced formaldehyde release to about 680 ug/g and 4% reduced the release value to about 490 ug/g of treated fabric. Curing time also produced significant effects on formaldehyde release from treated fabrics. Curing control fabrics and fabrics with FR-DP plus ethylene glycol for 5 minutes rather than 3.5 minutes produced modest reductions in mean formaldehyde release, 20 to 30 ug/g of treated fabric. Highly significant differences in formaldehyde release were produced by the longer cure time when treating solutions contained propanediol or glycerol. With these polyols the 5-minute cure produced reductions in formaldehyde release values ranging from 80 to 100 ug/g of treated fabric. The lowest formaldehyde release (442 ug/g) was recorded for fabrics treated with 4% glycerol and cured for 5 minutes. Three sets of conditions produced fabrics with about 500 ug/g or less formaldehyde release. The conditions were: (1) the use of 4% propanediol and a 5 minute cure; (b) the use of 4% glycerol with a 3.5 minute cure; and (c) the use of 4% glycerol and a 5 minute cure.

EXTRACTION				
Parameter	Data			
Description of release source:	Airlay and Hot Oil Press Departments where formaldehyde might possibly be present from the volatilization and reaction of the resin as a result of the high temperatures of the ovens and presses. Emissions from presses have been difficult to characterize due to the wide variety of contaminants which can be present at relatively low concentrations. The chemistry surrounding the reactions of phenol-formaldehyde resins are complex, and even today, not completely understood. Contaminants can not only evolve from the resin material and release agents used at the presses, but also from the oils and other contaminants present in the cotton blanket which may vary from batch to batch.

Study Citation:	Duffy, B.L., Nelson, P.F., Ye, Y., Weeks, I.A. (1999). Speciated hydrocarbon profiles and calculated reactivities of exhaust and evaporative emissions from 82 in-use light-duty Australian vehicles. Atmospheric Environment 33(2):291-307.			
HERO ID:	1952206			
Conditions of Use:	Automobile Exhaust			
EXTRACTION				
Parameter	Data			
Description of release source:	car exhaust emissions			
Release quantity:	Formaldehyde can account for as much as 2% w/w of the non-methane organic compounds emitted from cars.			
Release or emission factors:	Release or emission factors			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Medium	The release data methodology is known or expected to be accurate but may not cover all release sources at the site.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	data are from an OECD country. other than the U.S.
	Metric 3:	Applicability	Medium	data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	data is greater than 20 years
	Metric 5:	Sample Size	Low	no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	no metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Does not address variability or uncertainty
Overall Quality Determination			Low	

Study Citation:	Dunky, M. (1998). Urea-formaldehyde (UF) adhesive resins for wood. International Journal of Adhesion and Adhesives 18(2):95-107.			
HERO ID:	5968910			
Conditions of Use:	Urea formaldehyde resin for wood based panels			
EXTRACTION				
Parameter	Data			
Description of release source:	Release comes from emission due to UF bonded to wood panels			
Release quantity:	Fig 2 gives emission over time of FA from 1 ppm down to about 0.15 ppm after 1000 hrs.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	Source is peer reviewed so likely contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Data is for Austria, an OECD country.
	Metric 3:	Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	Data is over 20 years old.
	Metric 5:	Sample Size	Medium	Distribution is characterized by a range of degrees of hydrolysis. It is only intended to show a trend.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Release data include release media but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Variability is addressed by using multiple hydrolysis constants, uncertainty is not addressed.
Overall Quality Determination			Medium	

Study Citation:	Durbin, T.D., Miller, J.W., Younglove, T., Huai, T., Cocker, K. (2007). Effects of fuel ethanol content and volatility on regulated and unregulated exhaust emissions for the latest technology gasoline vehicles. Environmental Science and Technology 41(11):4059-4064.			
HERO ID:	90901			
Conditions of Use:	Automobile Exhaust			
EXTRACTION				
Parameter	Data			
Release or emission factors:	Release or emission factors			
Comments:	Study provides results in total hydrocarbons, supplemental information provides regression model for formaldehyde . Study does state "Relative comparison of ethanol and two gasoline blends with different distillation temperatures (T50 & T90). The formaldehyde data presented noted that the difference between ethanol and T50 was marginally significant;. but as T50 increased formaldehyde increased by 23%."			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	Each vehicle was tested over two light duty Federal Test Procedure (FTP)s; sampling on cartridges coated with dinitrophenyl-hydrazine (DNPH) followed by high performance liquid chromatography (HPLC) analysis for carbonyls.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	Uninformative	The release data are for vehicle exhaust emissions as a result of combustion byproduct which is not an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Medium	The release data were collected (2007) more than 10 years but no more than 20 years old. However, operations, equipment, and worker activities are expected to be reasonably representative of current conditions.
	Metric 5:	Sample Size	Low	Distribution of samples is qualitative or characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Release data include release media but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The release data study does not address variability or uncertainty for formaldehyde.
Overall Quality Determination		Uninformative

Environmental Releases

HERO ID: 6027211 Table: 1 of 1

Study Citation: Earhart, J.P., King, C.J., Prausnitz, J.M., Won, K.W. (1976). Extraction of Chemical Pollutants from Industrial Wastewaters with Volatile Solvents.	
HERO ID: 6027211	
Conditions of Use: Disposal	
EXTRACTION	
Parameter	Data
Description of release source:	Wastewater from petrochemical manufacturing facilities, including phenol-formaldehyde resin plants. (21/530)
Waste treatment methods and pollution control:	Waste treatment methods and pollution control
EVALUATION	
Domain	Metric
Domain 1: Reliability	Rating
Metric 1:	Methodology
	High
	Methodology is known and expected to be accurate and cover all release sources at the site.
Domain 2: Representativeness	
Metric 2:	Geographic Scope
Metric 3:	Applicability
	High
	Data are from the U.S.
Metric 4:	Temporal Representativeness
Metric 5:	Sample Size
	High
	Data are for the disposal of formaldehyde to the water, an in-scope occupational scenario.
	Data are greater than 20 years old.
	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	
Metric 6:	Metadata Completeness
	Low
	Release media provided but not release frequency or amounts.
Domain 4: Variability and Uncertainty	
Metric 7:	Metadata Completeness
	Medium
	Variability is addressed by using different solvents in the removal of formaldehyde from water. Uncertainty isn't addressed.
Overall Quality Determination	
Medium	

Study Citation:	Earthjustice, (2020). Exhibit 1 to comments of Rubbertown Emergency ACTion et al., Re: TSCA risk evaluations for High-Priority Substances and substances undergoing Manufacturer-Requested Risk Evaluations.			
HERO ID:	10385015			
Conditions of Use:	Multiple			
EXTRACTION				
Parameter	Data			
Description of release source:	Release information by location			
Release quantity:	Quantity provided per location centers. Original data taken from TRI.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Release data methodology is cited, its is from TRI, which is expected to be accurate and cover all release sources at the site.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	U.S. data.	
	Metric 3: Applicability	High	Releases encompass multiple occupational scenarios within the scope of the risk evaluation.	
	Metric 4: Temporal Representativeness	High	less than 10 years old.	
	Metric 5: Sample Size	High	Appendix contains site specific release amounts.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Release data include most critical metadata, including release media and site locations but lacks additional metadata, such as process, unit operation, and/or activity and frequency that is the source of the release.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The release data study does not address variability or uncertainty.	
Overall Quality Determination		High		

Study Citation:	EC, (2000). Priority substances list assessment report. Formaldehyde. :1-62.		
HERO ID:	1256545		
Conditions of Use:	Use of fuels and related products		
EXTRACTION			
Parameter	Data		
Description of release source:	Motor vehicles, aircraft, marine vessels		
Release quantity:	Automobile: 11,284 (tonnes), Aircraft: 1,730 (tonnes); Marine: 1,175 (tonnes) (pg. 18/111)		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	The release data methodology is known or expected to be accurate but may not cover all release sources at the site.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	The data are from Canada, an OECD country.
	Metric 3: Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	Report is based on data greater than 20 years old and industry conditions that are expected to be outdated. (1999)
	Metric 5: Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics. It is unclear if analysis is representative.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Release data include most critical metadata, including release media and release frequency, but lacks additional metadata, such as process, unit operation, and/or activity that is the source of the release.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The release data study does not address variability or uncertainty.
Overall Quality Determination		Medium	

Study Citation:	ECHA, (2019). Annex XV restriction report, proposal for a restriction: Formaldehyde and formaldehyde releasers.			
HERO ID:	5155562			
Conditions of Use:	Consumer Use- Clothing			
EXTRACTION				
Parameter	Data			
Release quantity:	Study by Aldag et al. (2017) reports that emissions from clothing (e.g., pants, T-shirts and shirts) are in the ppb range (0.4-3.2 ppb) from clothes with 11-75.9 mg/kg extractable formaldehyde. Aalto-Korte et al. (2008); where the authors ; analysed four samples of textiles used in protective clothing and one other textile sample: in three cases, the analysis was negative (< 10 ppm), one sample of protective clothing contained 18 ppm formaldehyde, and the formaldehyde content of a sample of mattress textiles was 19-21 ppm			
EVALUATION				
Domain	Metric		Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	Low	Emission data methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	Report is from an OECD country, EU.
	Metric 3:	Applicability	Medium	Data relates to the consumer use of clothes but could potentially be useful for occupational scenarios
	Metric 4:	Temporal Representativeness	High	No more than 10 years old.
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics. It is unclear if analysis is representative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Release data include most critical metadata,but lacks additional metadata,
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Medium	Limited discussions on variability and uncertainty in results
Overall Quality Determination			Medium	

Formaldehyde

Environmental Releases

HERO ID: 4074779 Table: 1 of 1

Study Citation:	Eichhorn, W., Winters, D. (2007). Environmental compliance testing of fuser and pressure roller products for digital printers. :794-796.			
HERO ID:	4074779			
Conditions of Use:	Commercial Use: Printer Equipment			
EXTRACTION				
Parameter	Data			
Release quantity:	NIOSH Method 2541 used for Formaldehyde analysis. Figure 2 shows FA emissions from different manufacturing of printer rollers with the highest at above 50 nanograms.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	Unclear if source is peer reviewed however the sampling methodology is a NIOSH method so likely high quality data.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data is from US	
	Metric 3: Applicability	High	Data is applicable to manufacture of printer rollers with formaldehyde emissions.	
	Metric 4: Temporal Representativeness	Medium	Data is from 2007, so over 10 years old.	
	Metric 5: Sample Size	Low	Characterized by a range of data in one figure.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Only includes release/emission data.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	FA emissions from different printer roller manufacturing/operation. Does not address uncertainty.	
Overall Quality Determination		Medium		

Study Citation:	ENSR, (1991). Initial submission: AB 2588 health risk assessment for the Texaco refinery areas 1 & 2 (volume I & II) (draft report) with attachments and cover letter dated 030692.			
HERO ID:	1270212			
Conditions of Use:	Combustion Byproduct			
EXTRACTION				
Parameter	Data			
Description of release source:	Boilers, Heaters and coolers at Texaco Inc. Bakersfield Refinery Areas 1 and 2, which produces diesel and gasoline			
Release quantity:	Maximum annual emissions for formaldehyde were from heaters and boilers at 183 lbs/year, and from tanks at 1.75 lbs/yr. Area 3 pp.385 3.6 lbs/year boilers, 4.21-6.15 lbs/yr heaters			
Comments:	Most pages of the source are not read-able. Report appears to show maximum hourly air concentration but appears to be conservative model estimates based on predicted emissions but numbers are illegible			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	expected to be accurate
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	US data
	Metric 3:	Applicability	Uninformative	Release data are from emissions from boilers, heaters, and coolers. Based on information provided in source, EPA assumes formaldehyde produced as a combustion byproduct, which is not within the scope of the risk evaluation
	Metric 4:	Temporal Representativeness	Low	data greater than 20 years old
	Metric 5:	Sample Size	Low	characterized by no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	Release data include release media but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	release data study does not address variability or uncertainty.
Overall Quality Determination		Uninformative		

Study Citation:	ENSR, (1991). AB 2588 health risk assessments: Corrected and alternative emissions cases for the Taft area oil fields - Taft, California with attachments and cover letter dated 090591.		
HERO ID:	1481750		
Conditions of Use:	”Processing aids, specific to petroleum production in: oil and gas drilling, extraction, and support activities and all other basic inorganic chemical manufacturing”		
EXTRACTION			
Parameter	Data		
Release quantity:	emission factors and release quantities are provided in the included Air Toxic Emission Data System Review and Update Report Process and Emittent Data sheets. These data are provided by CAS ID, SCC and process unit description. It should be noted that report includes over 300 pages of data that are in a non-searchable graphic format. Given the age of the data, it may not be appropriate to retrieve these data.		
Release or emission factors:	Release or emission factors		
Release frequency:	monthly profiles are included in the Air Toxic Emission Data System Review and Update Report Process and Emittent Data		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Low	The Air Toxic Emission Data System Review and Update Report Process and Emittent Data include a code for the emission estimation methods, but the reference for each code is not provided.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	Data from the US
	Metric 3: Applicability	High	The release data are for area oil field workers, which is an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Low	The data were published in 1991, before the most recent PEL (1992) and more than 20 years old.
	Metric 5: Sample Size	N/A	No statistical data are provided only emission factor values and calculated release data.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Low	Release data include release media but no other metadata.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	The release data study does not address variability or uncertainty.
Overall Quality Determination		Low

HERO ID:	7349020
Conditions of Use:	Chemical substances in plastic products

EXTRACTION	
Parameter	Data

Description of release source:

Emissions from plastic products manufacturing come from a variety of sources and are highly dependent upon the chemical makeup of the raw materials (resins, additives) and types of production processes used. In addition, the diverse nature of these raw materials and manufacturing techniques results in a wide range of potential combinations of emission sources and pollutants. The primary sources of emissions at plastic products manufacturing facilities are the pieces of equipment (e.g., extruder hopper, die head, sander) used to handle raw materials and produce the final product. These are typically the locations where chemical reactions occur, liquid solvents and solvent blends are exposed to the atmosphere, solid resin is heated and melted, and additives are introduced. In addition to emissions generated directly from primary production processes associated with plastic products manufacturing, there may be additional emissions produced by secondary processes at these facilities. Emission sources from these secondary processes include storage tanks, equipment leaks, wastewater treatment, combustion sources, and cleaning and surface coating operations. There are multiple processes occurring at plastic products manufacturing facilities that give rise to a wide variety of pollutants. Emissions from plastic products manufacturing may be generally classified as follows: - Volatile organic compound (VOC) and hazardous air pollutant (HAP) emissions resulting from the volatilization of free monomer or solvent in the primary polymer blend during processing; - VOC and HAP emissions that result from secondary process materials, such as blowing agents, additives, and lubricants (mold release compounds); - VOC, HAP, and particulate matter (PM) emissions that result from byproducts formed by chemical reactions or formed during heating of resins; and - PM emissions generated during raw material handling and finishing operations. The following discussion provides additional information on some of the specific pollutants emitted from plastic products manufacturing facilities and the specific processes giving rise to emissions.

Free Monomer/Solvent Emissions of free monomer (a single molecule of a chemical used in a polymer) may occur when a solid resin is heated during extrusion, molding, or other processes. For example, one recent study found a monomer (styrene) to be the principle component of the emissions produced during the extrusion of acrylonitrile-butadiene-styrene (ABS) resins. Emissions of free monomer would also be expected from resins used in solvent form. Some resins may be handled using a solvent medium to store and transport the resin prior to processing. In this case, emissions would also come from the solvent used to suspend the resin prior to the polymerization step. Thermoset resins are often handled in monomer form prior to solidifying under heat or pressure, or reaction with a hardening agent to generate a solid polymer. For example, when curing of thermosets is accomplished during processing or when processing involves polymerization (such as when thermoset polyurethane elastomers are processed using reaction injection molding), substantial emissions of monomers are likely to be generated.

Secondary Process Materials In addition to the bulk polymer and additives used to form the plastic product, additional materials may be used to assist in lubrication, or, in the case of blowing agents used to manufacture foams, to decrease the density of the final product. Lubrication is used in molding and forming operations to prevent plastic material from sticking to mold surfaces. A mold release agent (lubricating or parting agent) is sprayed on a mold cavity surface in a thin waxy layer to facilitate the release or removal of the molded plastic form from the mold. Mold release agents contain carrier solvents (HAP-based and non-HAP based) that evaporate immediately when the mold release agent adheres to the mold cavity surface.

Blowing Agents Emissions also occur from blowing agents used to manufacture certain foams. In expanded polystyrene (EPS) bead manufacturing, the blowing agent is typically contained in the raw polymer beads as they come from the supplier. This causes the beads to expand when exposed to heat. There are three general classes of emissions from this type of foam production: manufacturing emissions; prompt foam cell losses, which are losses that typically occur during storage and shipping; and banked emissions, which are losses that occur through slow diffusion of blowing agents out of the foam over the life of the product. Another type of polystyrene foam is extruded polystyrene foam sheet (PSF). Pentane is the predominant hydrocarbon blowing agent used to manufacture PSF. After extrusion, sheets of intermediate product are wound into rolls and aged for 3 to 5 days. After aging, the sheets are thermoformed into consumer products and packaged for shipment. Typically 50 percent of the blowing agent is lost during the manufacturing and reclaim operations and the remainder as fugitives during warehousing, transportation, and after the product is sold. In the manufacture of polyurethane foams, large quantities of auxiliary blowing agents are used to reduce foam density. The use of these blowing agents (predominantly methylene chloride or chlorofluorocarbons) does not involve any chemical reactions, but is merely a change of the physical state of the blowing agent. Volatilization of the auxiliary blowing agent from liquid to gas provides the volume needed to increase the number and size of foam cells. One recent study estimates that approximately 60 percent of methylene chloride is lost within the first 10 minutes of the process and the remaining 40 percent is lost slowly by diffusion over the next 24 hours. The initial bulk of emissions are typically released through process vents located at the foaming equipment, while the remaining 40 percent of emissions are released fugitively while the foam is being transported and stored.

Chemical Reactions/Byproducts VOC and HAP emissions may be generated from chemical reactions occurring as a direct part of the process, as in the case of thermoset

Study Citation:	FWIC, (2020). Comments of the Federal Wood Industries Coalition regarding the draft scope of the risk evaluation for formaldehyde (comment submitted by Jackson Morrill).			
HERO ID:	10370211			
Conditions of Use:	Commercial Use, Building/ construction materials (wood and engineered wood products)			
EXTRACTION				
Parameter	Data			
Description of release source:	"It has long been recognized that wood, as it comes from a tree, contains no added formaldehyde, but can emit some small amounts of naturally occurring formaldehyde. Although emissions are accentuated when the wood is subjected to very high temperatures, such as during pressing of the furnish in composite wood panel manufacturing or in artificial laboratory conditions, they can be measured under normal conditions of use. As noted by Salem et al.:Formaldehyde is also detectable even if wood has never been heated as well as under more or less ambient conditions. The presence of formaldehyde in the emissions from wood that does not contain adhesive resin has been explained bythermal degradation of polysaccharides in the wood. The emission levels of formaldehyde depend on factors such as wood species, moisture content, outside temperature, and time of storage." (page 13-14 of 17)			
Release quantity:	See page 14 for a table that shows an analysis for formaldehyde emissions from a variety of species of trees with different characteristics using various test methodologies:

	Metric 3:	Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	data greater than 20 years old
	Metric 5:	Sample Size	Low	no statistics
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Low	no other metadata
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The release data study does not address variability or uncertainty.
Overall Quality Determination		Low		

Study Citation:	Harper, R.J., Andrews, B.A., Harris, J.A., Reinhardt, R.M., Vail, S.L., Bathija, A.P., Ulsamer, A.G. (1984). Formaldehyde release from labeled and unlabeled cross-linked cotton and cotton-polyester fabrics.			
HERO ID:	5950203			
Conditions of Use:	Fabric/Textile			
EXTRACTION				
Parameter	Data			
Description of release source:	Cross-linked cotton and cotton-polyester (50/50) fabrics treated with unisolated dimethyloldihydroxyethyleneurea (DMDHEU) prepared by either two- or three-component synthesis using formaldehyde. The conditions evaluated included laundering fabrics with and without chlorine bleach and drying them under various conditions; exposing fabrics to a carbon arc after tumble-drying; laundering fabrics 5, 10, 15, or 25 times and tumble-drying; and storing samples for 1, 2, 3, or 12 months.			
Release quantity:	Formaldehyde releases (p/m) from unlabeled 3-component all-cotton fabric were 513 (sealed jar test) and 16 (cold Na2SO4). Formaldehyde releases (p/m) from unlabeled 3-component 50/50 cotton-polyester fabric were 464 (sealed jar test) and 13 (cold Na2SO4). Formaldehyde releases (p/m) from unlabeled 2-component all-cotton fabric were 605 (sealed jar test) and 15 (cold Na2SO4). Formaldehyde releases (p/m) from radiolabeled 3-component all-cotton fabric were 237 (sealed jar test) and 14 (cold Na2SO4). Formaldehyde releases (p/m) from radiolabeled 3-component 50/50 cotton-polyester fabric were 173 (sealed jar test) and 11 (cold Na2SO4). Formaldehyde releases (p/m) from radiolabeled 2-component all-cotton fabric were 589 (sealed jar test) and 11 (cold Na2SO4). Formaldehyde release measured for unlabeled 100% cotton fabric for different processing conditions were: after 5, 10, 15, and 25 launderings and tumble-dry – 316 to 177 p/m; tumble-dried and hang in locker for 1, 2, 3, and 12 months – 358 to 138 p/m; and other similar conditions. In general, the laundering and storage tests showed declining values of formaldehyde release with laundering or storage, whether measured by the cold sodium sulfite method or the sealed-jar method. However, there were exceptions in the values for the cold sodium sulfite method after the spin-dry cycle of the wash (before drying), after exposure to a carbon arc, and after laundering five times. The latter instance was unexpected and needs further verification. By contrast, sealed-jar values decreased in almost every instance, when compared with original sample values, during laundering or storing of samples.See Tables 1 - 7 for more info

HERO ID:	6064683			
Conditions of Use:	FA emission from fiber and particle boards			
EXTRACTION				
Parameter	Data			
Description of release source:		There are multiple sources of formaldehyde to indoor air, which can be divided into temporary (e.g. combustion, cooking), intermitting (e.g. indoor chemistry, air cleaners) and permanent sources (e.g. building products and furniture). As wood-based boards, such as particleboards (PBs) and fiberboards (medium density-MDF and high density-HDF), are one of the main permanent formaldehyde sources to indoor air. Formaldehyde-based glues are not the only cause of formaldehyde emissions from wood-based boards. Wood itself has natural formaldehyde emissions that increase depending on the processing procedure.		
EVALUATION				
Domain		Metric	Rating	Comments
Domain 1: Reliability	Metric 1:	Methodology	High	Data is peer reviewed so contains high quality data.
Domain 2: Representativeness	Metric 2:	Geographic Scope	Medium	The data are from an OECD country other than the U.S.
	Metric 3:	Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	High	Data less than 10 years old (2019).
	Metric 5:	Sample Size	Medium	Distribution of samples is characterized by a range with uncertain statistics. It is unclear if analysis is representative.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Release data include most critical metadata, including release media and release frequency, but lacks additional metadata, such as process, unit operation, and/or activity that is the source of the release.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	The release data study does not address variability or uncertainty.

Study Citation:	HPVA, (1985). Formaldehyde emissions chracteristics of 3-ply veneer core hardwood plywood 1984 - 1985 with cover letter dated 072985.			
HERO ID:	5901014			
Conditions of Use:	commercial use			
EXTRACTION				
Parameter	Data			
Description of release source:	Formaldehyde emissions from hardwood plywood and certain other wood panel products. The data is confined to 3-ply veneer core type hardwood plywood, the primary construction used for hardwood plywood wall panels.			
Release quantity:	The hardwood plywood paneling formaldehyde desiccator values (ug/ml), as obtained from the Clayton Environmental consultants report, provides desiccator values for six panels from each of two different hardwood plywood populations. The average desiccator value for higher plywood group is 1.99 +/- 0.78 ug/ml, and the average desiccator value for lower plywood group is 0.43 +/- 0.18 ug/ml. Hardwood plywood paneling formaldehyde emission rates (mg HCHO/m2 h) are: Interboard averages ranged between 0.075 and 0.474. Formaldehyde emission characteristics of 3-ply hardwood plywood (June 1984 to late June 1985) were between 0.1 and 1.37 ug/ml for 72 samples.

EXTRACTION				
Parameter	Data			
Description of release source:	Formaldehyde is emitted from the cadavers that have been prepared with a formalin solution (10% formaldehyde, 12.5% phenol, 12.5% ethylene glycol, 50% ethanol, with remaining balance water). The cadaver is placed on the table in a 4 in recessed area 25.5 inches wide by 74.25 inches long. A pair of hinged-lid doors cover the cadaver when not in use. Emission factor is applicable where the cadavers are prepared in similar embalming fluid.			
Release or emission factors:	Release or emission factors			
Comments:	Six supply diffusers and 10 air return grills provided general ventilation to the laboratory. The diffusers were uniformly spaced on the ceiling along the center line axis of the room. Eight of the air returns were at floor levels as illustrated in figure. Two additional returns were on the ceiling in the southeast and southwest corners of the laboratory. There was no recirculation of air removed from the laboratory via the returns. The air was exhausted out a roof stack			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1: Methodology	High	The release data methodology is expected to be accurate and is known to cover all release sources at the site.	
Domain 2: Representativeness	Metric 2: Geographic Scope	High	U.S. data	
	Metric 3: Applicability	Medium	The data are for an occupational scenario that is similar to an occupational scenario within the scope of the risk evaluation	
	Metric 4: Temporal Representativeness	Low	The data were collected more than 20 years ago.	
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized. Sample size is sufficiently representative.	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	Release data include all associated metadata, including release media; activity that is the source of the release; and release frequency.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	High	The study addressed variability by measuring at different locations, separate days over a 16 week span. Uncertainty was accounted for in accounting for potential interferences and comparing data with previous studies.	
Overall Quality Determination		High

Study Citation:	Margosian, R. (1990). Initial formaldehyde emission levels for particleboard manufactured in the United States. Forest Products Journal 40(6):19-20.		
HERO ID:	5937165		
Conditions of Use:	Wood Product Adhesive		
EXTRACTION			
Parameter	Data		
Description of release source:	When UF adhesives are used to bond wood-based panels, small amounts of free formaldehyde are emitted for a period of time after manufacture. Formaldehyde emissions from wood products decrease with time.		
Release quantity:	The average initial emission level of all NPA Certification Program tests in 1985 and 1986 was 0.17 ppm (table 1). In 1987, 1988, and most of 1989, NPA's tests averaged 0.18 ppm. When the 89 tests from other certifiers are added for 1988, the average initial emission level is still 0.18 ppm (table 2). Average formaldehyde emission levels of particleboard manufactured in the United States have been consistently in the 0.17 to 0.18 ppm range for the 5-year period of 1985 to 1989.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	The release data methodology is known or expected to be accurate but may not cover all release sources at the site.

HERO ID:	8724621		
Conditions of Use:	All COUs		
EXTRACTION			
Parameter	Data		
Release quantity:	13,088 lbs released in 2009; TURA Data Formaldehyde 2009- Releases[No units provided in table]: Boremco Speciality Chemicals-0, Dow-10, Ineos Melamines (claims trade secret), MW Custom Papers- 6234, Raytor Compounds, Inc- 1164, Suddekor LLC- 2285, The Dodge Company- 3395; TURA Data Formaldehyde 2009 Transfers [No units provided]- Boremco Speciality Chemicals-0, Dow-5365, Ineos Melamines (claims trade secret), MW Custom Papers- 239, Raytor Compounds, Inc- 562, Suddekor LLC- 5, The Dodge Company- 2766		
Release or emission factors:	Release or emission factors		
Comments:	TURA table in appendix did not note units, likely lbs/year based on referenced data in the report.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Low	The release data methodology is not specified in report, data is pulled from TURA program for state MA. However report does not go into detail on how companies determine amounts of release.
Domain 2: Representativeness	Metric 2: Geographic Scope	High	The data are from the United States and are representative of the industry being evaluated.
	Metric 3: Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	Medium	Data is from 2009, which is more than 10 years old but less than 20 years old.
	Metric 5: Sample Size	Medium	Amount for each site provided but uncertain if there is any statistical distributions involved in the method of release estimates.
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Release data include most critical metadata, including release media, but lacks additional metadata, such as process, unit operation, and/or activity that is the source of the release.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	The release data study provides only limited discussion of the variability in the determinants of release by providing different sites. However little is provided about the processes at the different sites. The release data study provides little discussion of the uncertainty in the release results beside noting that releases will occur outside of these sites which are not required to report to TURA.

HERO ID:	5946053			
Conditions of Use:	Construction Manufacturing			
EXTRACTION				
Parameter	Data			
Description of release source:	Board is made with an excess of formaldehyde which is either released during manufacture or from the finished product. An additional reason is that UF-resins in particleboard are spread over a very large surface and are in contact with hydroscopicwood. Furthermore, the resin does not form a uniformglue line, but is distributed as a thin uneven film that formscomplex interfaces of varying size and thickness with thewood. Such interfaces are difficult to cure. Finally, bydesign, particleboard is not a uniform material and is notuniformly heated during it manufacture, and the mat isintentionally formed in a high humidity and temperaturegradient... These engineering features are in direct conflict with uniform resin curing. The flux of heat and moisture from the face towards the core causes migration of volatile resin components that will accumulate in the aqueous phase at thecoldest point of the board...the fmished boardcontains traces of incompletely cured resin fragments, residual formaldehyde, methylene glycol, methylolurea, andother low molecular weight or weakly bonded functionthat constitute a latent source of formaldehyde release.

EXTRACTION				
Parameter	Data			
Description of release source:	Emissions From Processing Wood			
Release quantity:	VOC emissions (tons/yr), including formaldehyde, from processing wood (includes only facilities with the potential to emit at least 100 tons/yr): Logging – 326 (2 facilities), Sawmills and planing mills - 17,721 (56 facilities), Softwood veneer and plywood - 16,318 (37 facilities), Hardwood veneer and plywood - 1,691 (5 facilities), Particleboard - 1,448 4 facilities), Reconstituted wood products - 12,381 (34 facilities), Pulp mills - 27,172 (40 facilities), Paper mills - 58,482 (85 facilities). Based on emissions data from steam-heated dryers, formaldehyde emission are: 0.02 lb./Mft3 for western softwood plywood, 0.01 lb./Mft3 for southern softwood plywood, 0.001 lb./Mft3 for hardwood plywood, 0.12 lb/ODT western softwood particleboard, 0.027 lb/ODT southern pine particleboard, 0.31 lb/ODT southern pine oriented strandboard, 0.57 lb/ODT hardwood oriented strandboard. Materials used to glue, coat, and finish wood may also contribute to the emissions from a facility. The most well-known example is formaldehyde from the pressing of panels containing urea- or phenol-formaldehyde resins.			
Release or emission factors:	Release or emission factors			
Comments:	Drying of wood may releases formaldehyde. "For oriented strand dryers, the values range from 0.7 to1.8 lb./ODT, with formaldehyde or acetaldehyde being dominant ” (pg. 3)

Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data are from Japan/New Zealand, OECD member countries.	
	Metric 3: Applicability	High	Data are for building and construction materials, an in-scope occupational scenario.	
	Metric 4: Temporal Representativeness	High	Data are no more than 10 years old.	
	Metric 5: Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).	
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	High	All metadata (regarding emission factors) provided.	
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Medium	Variability addressed by assessing emissions during and after panelboard manufacture, but uncertainty is not addressed.	
Overall Quality Determination		High		

Study Citation:	Moezzi pour, B., Abdolkhani, A., Doost-Hoseini, K., Ramazani, S.A., Tarmian, A. (2018). Practical properties and formaldehyde emission of medium density fiberboards (MDFs) recycled by electrical method. Holz als Roh- und Werkstoff 76(4):1287-1294.
HERO ID:	5957969
Conditions of Use:	Recycling

EXTRACTION

Parameter	Data
Description of release source:	In this study, a new recycling process based on this heating method was designed that involves various steps which are completely different from the well-known recycling process based on hydrothermal treatment. Especially with this new method, the refining step is eliminated. Furthermore, an additional preheating step helps to facilitate the recycling process. This newly defined recycling process was denominated as electrical method in this study. Emission of formaldehyde from boards are measured
Release or emission factors:	Release or emission factors
Waste treatment methods and pollution control:	Waste treatment methods and pollution control

EVALUATION

Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	High	Source is peer reviewed with methodology expected to be accurate, but the source only provides emission from the boards not expected cover all releases from a recycling site.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	Data is for Germany, an OECD country.
	Metric 3: Applicability	High	The data are for an occupational scenario (commercial use of building/construction materials – wood and engineered wood) within the scope of the risk evaluation.
	Metric 4: Temporal Representativeness	High	Data is less than 10 years old (2018)
	Metric 5: Sample Size	Medium	Characterized with values but uncertain statistics
Domain 3: Accessibility/ Clarity	Metric 6: Metadata Completeness	Medium	Includes description of release source, chemical concentration, waste treatment and emission factors.
Domain 4: Variability and Uncertainty	Metric 7: Metadata Completeness	Low	Does not address variability or uncertainty.

Overall Quality Determination**Medium**

Study Citation:	Monsanto Research Corp, (1983). Detailed industrial hygiene survey: formaldehyde production, Georgia-Pacific Corporation, Albany, Oregon.			
HERO ID:	8728033			
Conditions of Use:	Manufacture			
EXTRACTION				
Parameter	Data			
Description of release source:	Leaks from equipment during manufacture			
Release quantity:	Table 12. Mass Loadings released from Sources- Daily release rate, g/dAbsorber pump #1- 9.8E-4Absorber pump #2- 2.26E-3 -5.56E-3*Loading pump- 9.43E-3*Side agitator tank F-8- 15.7E-2*Side agitator tank F-10- 13.9E-2**Breakthrough occurred- values reported are minimum.			
Release frequency:	Plant operates 7 days a week.			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Medium	The release data methodology is known or expected to be accurate but may not cover all release sources at the site.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	The data are from the United States.
	Metric 3:	Applicability	High	The release data are for an occupational scenario (manufacture) within the scope of the risk evaluation.
	Metric 4:	Temporal Representativeness	Low	more than 20 years old
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	High	Release data include all associated metadata, including release media; process, unit operation, or activity that is the source of the release; and release frequency.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	The release data study addresses variability in the determinants of release. The release data study addresses uncertainty in the release results.
Overall Quality Determination			High	

Formaldehyde

Environmental Releases

Study Citation:	Monsanto Research Corp, (1983). Detailed industrial hygiene survey: Formaldehyde production, Reichhold Chemicals, Incorporated, Hampton, South Carolina.			
HERO ID:	8728034			
Conditions of Use:	Manufacture			
EXTRACTION				
Parameter	Data			
Description of release source:	Spray tower #2 pump, spray box pump, interim product pump, blending pump, distillation pump.			
Release or emission factors:	nan			
Release frequency:	5 days/week			
Waste treatment methods and pollution control:	Waste treatment methods and pollution control			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	High	Methodology is known and expected to be accurate and cover all release sources at the site.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for manufacture, an in-scope occupational scenario.
	Metric 4:	Temporal Representativeness	Low	Data were collected prior to the most recent NESHAP.
	Metric 5:	Sample Size	High	Statistical distribution of samples is fully characterized (discrete sampling data provided).
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Release media and release frequency provided but missing release quantity.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	High	Uncertainty is addressed by sampling methods. Variability addressed by sampling multiple release points.
Overall Quality Determination		High		

Formaldehyde

Environmental Releases

HERO ID: 9493520 Table: 1 of 1

Study Citation:	Mooney, J. J. (2004). Emission control, automotive.			
HERO ID:	9493520			
Conditions of Use:	Fuels and related products			
EXTRACTION				
Parameter	Data			
Release or emission factors:	Release or emission factors			
Waste treatment methods and pollution control:	Waste treatment methods and pollution control			
EVALUATION				
Domain	Metric	Rating	Comments	
Domain 1: Reliability	Metric 1:	Methodology	Low	Methodology is not specified.
Domain 2: Representativeness	Metric 2:	Geographic Scope	High	Data are from the U.S.
	Metric 3:	Applicability	High	Data are for fuels and related products, an in-scope occupational scenario, however, note that formaldehyde may be formed as a combustion byproduct in exhaust.
	Metric 4:	Temporal Representativeness	Low	Data are greater than 20 years old.
	Metric 5:	Sample Size	Low	Sample distribution is characterized by no statistics.
Domain 3: Accessibility/ Clarity	Metric 6:	Metadata Completeness	Medium	Release media and emission factors provided but missing release quantity.
Domain 4: Variability and Uncertainty	Metric 7:	Metadata Completeness	Low	Variability and uncertainty are not addressed.
Overall Quality Determination			Low	

Study Citation:	Moubarik, A., Pizzi, A., Allal, A., Charrier, F., Charrier, B. (2009). Cornstarch and tannin in phenol-formaldehyde resins for plywood production. Industrial Crops and Products 30(2):188-193.		
HERO ID:	2867010		
Conditions of Use:	Compressed Wood Product Manufacturing		
EXTRACTION			
Parameter	Data		
Description of release source:	Emissions obtained from panels bonded with cornstarch–quebracho tannin–PF and panels bonded with control phenol–formaldehyde.		
Release quantity:	Emissions from panels bonded with cornstarch–quebracho tannin–PF were found to be 1.92 +/- 0.11 mg/m2/h, and panels bonded with control phenol–formaldehyde were found to be 2.62 +/- 0.19 mg/m2/h. Panels bonded with cornstarch–quebracho tannin–PF resin showed 26% reductions in formaldehyde emission compared to plywood prepared with control PF resins.		
EVALUATION			
Domain	Metric	Rating	Comments
Domain 1: Reliability	Metric 1: Methodology	Medium	The release data methodology is known or expected to be accurate but may not cover all release sources at the site.
Domain 2: Representativeness	Metric 2: Geographic Scope	Medium	OECD country (France)
	Metric 3: Applicability	High	The release data are for an occupational scenario within the scope of the risk evaluation.
