ROLLOVER STABILITY MEASUREMENTS FOR 2019 NEW CAR ASSESSMENT PROGRAM (NCAP)

Introduction

This report contains results from the measurements including track width and center-of-gravity (CG) height for 41 light duty vehicles under one loading condition: Driver Only. The relationship between the track width and CG height of a vehicle is a static metric that has been used for vehicle-to-vehicle comparison. The most common form, "T/2h," is computed as one-half the average track width ($T/2$) divided by the vehicle center-of-gravity height (h). In this report, the Static Stability Factor (SSF) is defined as $T/(2h)$ for the Driver Only loading condition. These measurements were performed for the National Highway Traffic Safety Administration's Office of Crash Avoidance Standards under contract DTNH22-14-D-00326 (hereinafter referred to as "the Contract"). The particular make/models represent a subset of the vehicles in the 2019 National Highway Traffic Safety Administration (NHTSA) frontal and side impact New Car Assessment Program.

Discussion

Each of the vehicle models listed in Table I was secured in new or as-new condition. Prior to testing, each test vehicle's fuel tank was filled with gasoline, and its tires inflated to the vehicle manufacturer's recommended pressure. All tests are conducted with the Driver Only load: each test vehicle had an anthropomorphic test dummy placed in the driver seating position of the vehicle. In all tests, the driver was an un-instrumented "Hybrid II" anthropomorphic test dummy (weighing 163.0 lbs) which is representative in size, overall weight, and weight distribution of a 50th percentile human male.

Table II lists the information recorded, measured, and computed for each vehicle. All of the information listed in Table II is provided in Appendix A. The information related to vehicle mass and center-of-gravity locations was obtained using SEA, Ltd.'s (S-E-A) Vehicle Inertia Measurement Facility (VIMF). The NHTSA document titled "Laboratory Test Procedure for Rollover Stability Measurement for New Car Assessment Program (NCAP) – Static Stability Factor (SSF) Measurement," details the procedure for making the measurements (1). Descriptions of the design and operation of the VIMF are provided in the papers listed in the references (2-3).

The track width measurements were made using the procedure detailed in the contract. In summary, this is:

- Measure the track width with the vehicle in its driver only configuration.
- Make two Tire Edge Determination Tools as shown in Figure 1. These are modified 4-inch beams which, when placed on the floor and pushed against the tire, will define a longitudinal line on the inside or outside lower sidewall of the tire approximately 4 inches (106 mm) above the floor. Figure 2 shows the beams as used at S-E-A's VIMF.
- Place the beams on the right sides of both front tires and measure the separation of the beams below the front and rear edges of the tires. Repeat this with the beams on the left sides of the front tires for four measurements - the average of which is the front track width. An identical procedure is used for measuring the rear track width. Thus, a total of eight measurements are taken, the average of which is reported as the vehicle track width.

Figure 3 contains a sample results page from one of the vehicle tests, the 2019 Acura RDX, in the "Driver Only" condition. The results pages contain all of the information in Table II, as well as additional information. The individual wheel weights, the four front track width measurements, the four rear track width measurements, and the left and right side wheelbase measurements are recorded on the test pages. Additionally, details specific to the VIMF measurements of CG Height are included. These are the Applied Weights (calibrated hanging weights used to tilt the VIMF platform in pitch during a VIMF CG Height test), the Platform Angle (resulting VIMF pitch angle), Relative Motion (relative longitudinal motion between the vehicle body and VIMF platform), and the resulting individual CG Height measurements.

The critical calculations listed on the pages are Average Track, Average C.G. Height, and T/2h. As mentioned, the Average Track is calculated from eight individual track width measurements, four for the front track and four for the rear track. Each of the eight measurements is made using a tape measure divided into tenths of an inch. The measurements are recorded to the nearest half division, which is 0.05 inches. The four front measurements are averaged using Microsoft Excel to compute the Front Track listed on the results sheets. Similarly, the four rear measurements are averaged to compute the Rear Track listed. The Average Track is the average of Front Track and Rear Track. Since no rounding takes place in the calculations of Front Track and Rear Track, the value computed for Average Track is the same as if all eight individual measurements were averaged. The individual measurements are listed on the results sheets using two decimal places. This is because the measurements are made to the nearest 0.05 inches. The Front Track, Rear Track, and Average Track calculations are listed using one decimal place. However, decimal places beyond the first are retained in Excel and used in the calculations for SSF. The Front Track, Rear Track, and Average Track width measurements are thought to be accurate to the nearest 0.1 inches. Based on a 60 inch Average Track and 0.1 inches measurement accuracy, the Average Track value listed is good to an accuracy of 0.17%. The resolution in the recorded value is 0.05 inches, which is one-half of the listed accuracy.

The Average C.G. Height listed is based on the average value calculation for the four individual C.G. Height tests (Runs #2-5 listed on the results pages). The VIMF software/database uses more than two decimal places in this calculation, and rounding to two decimal places is done for reporting purposes. The values listed on the sheets for Average C.G. Height are to the nearest

0.01 inches, with a resolution of 0.005 inches. Based on theoretical error analysis, on doing numerous repeat testing of the same vehicles, and on numerous tests done using calibration fixtures; the accuracy of the VIMF is thought to be 0.5% or better. This means that for a 20 inch C.G. Height, the measured value is accurate to 0.1 inches, or better. Based on this fact and the significance of the VIMF measurement values that go into calculating C.G. Height, recording the Average C.G. Height using two decimal places is warranted.

As requested by NHTSA, the T/2h values are listed on the data sheets using four decimal places. The SSF, defined by NHTSA as the two decimal place value of the T/2h for the vehicle with a driver, is reported accordingly in the Summary Results Table, Appendix B.

Results

Results for all the values listed in Table II are summarized for all 41 vehicles tested in the spreadsheet contained in Appendix A.

Appendix B contains a one-page Summary Results Table containing all measured track widths, C.G. Heights, and SSF values using two decimal places.

Appendix C contains individual test results pages for all 41 tests.

Photos of the test vehicles (a side view and a ¾ front view) are provided in Appendix D.

Table I. Test Vehicles

Test Sequence Number	Vehicle Make/Model	Date Tested	VIMF Number
3	Acura RDX AWD	9/14/2018	7027

Table II
Vehicle Information Contained in Results Spreadsheets

MY

Model Year (all test vehicles are model year 2018 or 2019)

Make, Model and Body Style

Three columns with Manufacturer's information about the test vehicle

Drive

FWD – Front Wheel Drive
RWD – Rear Wheel Drive
AWD – All Wheel Drive
4WD or 4X4 – Four Wheel Drive
4X2 – Two Wheel Drive

VIN

17 Digit Vehicle Identification Number

Engine Size/Type

Vehicle engine size and type

Trans. Type

Vehicle transmission type

Doors

Number of doors

Significant Options

Optional equipment that may significantly affect the CG Height.

Shorthand notes: RR = Roof Rack, RB = Running Boards, SR = Sun Roof, MR = Moon Roof, PSR = Panoramic Sunroof.

Front Tire Make/Type – Front Tire Size - Front Press.**Rear Tire Make/Type – Rear Tire Size - Rear Press.**

These six columns contain information on the tires on the test vehicles. The tire size and type are specified, and the tire pressures are the vehicle manufacturers' specified tire pressures that were used during the tests.

Front Track - Rear Track - Average Track (T)

Front, rear and average track widths measured on test vehicles

Table II (continued)
Vehicle Information Contained in Spreadsheets

Wheelbase

Average of measured left side wheelbase and right side wheelbase

GVWR, GAWR Front, GAWR Rear

Gross vehicle and axle weight ratings for the test vehicle

Load

Driver Only - described in the Discussion section on page 2 of the report.

Test Date

Test date for the VIMF test

VIMF Test No.

VIMF test number

Roof Height

Measured height of test vehicle after loading – does not include roof rack

Test Weight

Measured weight of test vehicles

CG Long.

Longitudinal distance from front wheel axis (axis through the centers of the front wheels) to vehicle center of gravity location

CG Lateral

Lateral distance from vehicle centerline to vehicle center of gravity location (negative to driver's side of vehicle)

CG Height (h)

Measured height of vehicle center of gravity

T/2h

(Average Track Width) / (2 x CG Height)

Volkswagen Jetta

YEAR: 2019
MAKE: Volkswagen
MODEL: Jetta
VIN: 3VWC57BUXKM12#####

DATE TESTED: 1/11/2019
VIMF TEST NO.: 7120
Mfg Date: 10/18

BODY STYLE AND TRIM: Sedan
LOAD: Driver
ENGINE SIZE AND TYPE: 1.4L I4 Turbo
TRANSMISSION TYPE: 8AT
DRIVE: FWD
DOORS: 4
FUEL: Full

OPTIONAL EQUIPMENT:

FRONT TIRE TYPE: Hankook Kinergy GT M+S
FRONT TIRE SIZE: 205/55R17 91H

FRONT TIRE PRESSURE: 36
REAR TIRE TYPE: Hankook Kinergy GT M+S
REAR TIRE SIZE: 205/55R17 91H

REAR TIRE PRESSURE: 36

			Track Width Measurements		
FRONT TRACK:	60.8	inches	Front A	60.75	inches
REAR TRACK:	60.2	inches	B	60.80	inches
AVERAGE TRACK:	60.5	inches	C	60.80	inches
WHEELBASE:	105.4	inches	D	60.80	inches
ROOF HEIGHT:	57.3	inches	Rear E	60.20	inches
GVWR	4123	lb	F	60.20	inches
FRONT GAWR	2161	lb	G	60.20	inches
REAR GAWR	2072	lb	H	60.20	inches
LEFT FRONT WEIGHT	1001.9	lb	Wheelbase Measurements		
RIGHT FRONT WEIGHT	898.5	lb	Left Side	105.40	inches
LEFT REAR WEIGHT	690.8	lb	Right Side	105.40	inches
RIGHT REAR WEIGHT	666.3	lb			
TOTAL WEIGHT	3257.5	lb			
C.G. LONGITUDINAL	43.91	inches (From Front Axle)			
C.G. LATERAL	-1.19	inches (Negative Towards Driver's Side)			

VIMF C.G. HEIGHT MEASUREMENT RESULTS

	Applied Weight (lb)	Platform Angle (deg)	Relative Motion (inches)	C.G. Height (inches)
