G. **Provide appropriate human consideration as part of decisions that pose a high risk to rights or safety.** Agencies should identify AI functionality that plays a role in decisions that pose a high risk to rights or safety and ensure that the AI functionality is not permitted to intervene directly in such situations without appropriate human consideration and accountability.

H. **Provide public notice and plain-language documentation through the AI use case inventory.** Agencies must ensure, to the extent consistent with applicable law and governmentwide guidance, including those concerning protection of privacy and of sensitive law enforcement, national security, and other protected information, that the AI's entry in the use case inventory serves as adequately detailed and generally accessible documentation of the system's functionality that provides public notice of the AI to its users and the general public. Where practicable, agencies should include this documentation or link to it in contexts where people will interact with or be impacted by the AI. Where agencies' use cases are excluded from the public inventory requirements described in this guidance, they may still be required to report relevant information to OMB and must ensure adequate transparency in their use of AI, as appropriate and consistent with applicable law.

v. Additional Minimum Practices for Rights-Impacting AI.

Starting on August 1, 2024, agencies must follow the above minimum practices for AI that is *either* safety-impacting *or* rights-impacting. In addition, agencies must also follow these minimum practices *before* initiating use of new or existing rights-impacting AI:

A. **Take steps to ensure that the AI will advance equity, dignity, and fairness.** This should include at least:

1. *Proactively identifying and removing factors contributing to algorithmic discrimination or bias.* Agencies must assess whether their rights-impacting AI materially relies on information about a class protected by Federal nondiscrimination laws in a way that could result in algorithmic discrimination or bias against that protected class. Agencies should also assess whether proxies produce undue influence on their rights-impacting AI. In either case, if the AI's reliance on such information results in unlawful discrimination or harmful bias against protected classes, the agency must cease the use of the information before using the AI for decision-making.

2. *Assessing and mitigating disparate impacts.* Agencies must test their AI to determine whether there are significant disparities in the AI's performance across demographic groups, including in the AI's real-world deployment,

and, consistent with applicable law, appropriately address disparities that have the potential to lead to discrimination, cause meaningful harm, or decrease equity, dignity, or fairness. If adequate mitigation of the disparity is not possible, then agencies should not use or integrate the AI tool.

3. *Using representative data.* Agencies should ensure that data used to develop, operate, and assess their AI is adequately representative of the communities who will be affected by the AI, and has been reviewed for improper bias based on the historical and societal context of the data.

B. **Consult and incorporate feedback from affected groups.** To the extent practicable and consistent with applicable law and governmentwide guidance, agencies must consult affected groups, including underserved communities, in the design, development, and use of the AI, and use such feedback to inform agency decision-making regarding the AI. In the event of negative feedback, agencies must consider not deploying the AI or removing the AI from use. Agencies are strongly encouraged to solicit feedback on an ongoing basis from affected groups, such as customers,[32] Federal employee groups, and employees' union representatives, particularly after significant modifications to the AI or the conditions or context in which it is used. To carry out such consultations, agencies should take adequate steps to solicit input from the groups affected by the AI, which could include:[33]

1. Direct user testing, such as observing users interacting with the system;
2. General solicitations of comments from the public, such as a request for information in the *Federal Register* or a "Tell Us About Your Experience" sheet with open ended space for responses;
3. Post-transaction customer feedback collections;[34]
4. Public hearings or meetings, such as a listening session; or
5. Any other transparent process that seeks public input, comments, or feedback from the affected groups in a meaningful, equitable, accessible, and effective manner.

Starting on August 1, 2024 and on an ongoing basis *while* using new or existing covered rights-impacting AI, agencies must ensure these practices are followed for the AI:

[32] Customers can include individuals, businesses, or organizations that interact with an agency.
[33] Agencies are not required to conduct consultations in a format that would require OMB clearance under the Paperwork Reduction Act (44 U.S.C. § 3507), provided the steps the agency takes are adequate to solicit input from the groups affected by the AI.
[34] Information on post-transaction customer feedback surveys can be found in OMB Circular A-11, Section 280 – Managing Customer Experience and Improving Service Delivery, https://www.whitehouse.gov/wp-content/uploads/2018/06/s280.pdf.

C. **Conduct ongoing monitoring and mitigation for AI-enabled discrimination.** As part of their ongoing monitoring requirement cited in Section 5(c)(iv)(D), agencies must also monitor rights-impacting AI to assess and mitigate AI-enabled discrimination against protected classes that might arise from unforeseen circumstances, changes to the system after deployment, or changes to the context of use or associated data. Where sufficient mitigation is not possible, agencies must safely discontinue use of the affected AI functionality.

D. **Notify negatively affected individuals.** Where practicable and consistent with applicable law and governmentwide guidance, agencies must notify individuals when AI meaningfully influences the outcome of decisions specifically concerning them, such as the denial of benefits.[35] Such notice should be timely and written in a manner that is consistent with the Plain Writing Act of 2010,[36] if applicable. Agencies should consider the timing of their notice and when it is appropriate to provide notice in multiple languages and through alternative formats and channels, depending on the context of the AI's use. The notice must also include a clear and accessible means of contacting the agency and, where appropriate, requesting timely remediation for any related issues. Agencies are also strongly encouraged to provide explanations for such decisions and actions.[37]

E. **Maintain human consideration and remedy processes**. Agencies must provide timely human consideration and potential remedy to the use of the AI by a fallback and escalation system in the event that an impacted individual would like to appeal or contest the AI's negative impacts on them. In developing appropriate remedies, agencies should follow OMB guidance on calculating administrative burden and the remedy process should not place unnecessary burden on the impacted individual.[38] When law or governmentwide guidance precludes disclosure of the use of AI or an opportunity for an individual appeal, agencies must create appropriate mechanisms for human oversight of rights-impacting AI.

F. **Maintain options to opt-out where practicable**. Agencies must prominently provide and maintain a mechanism to conveniently opt out from AI functionality

[35] In some instances, such as an active law enforcement investigation, providing immediate notice may be inappropriate or impractical, and disclosure may be more appropriate at a later stage (i.e., prior to a defendant's trial).
[36] Pub. L. No. 111-274 (codified at 5 U.S.C. § 301 note), https://www.congress.gov/111/plaws/publ274/PLAW-111publ274.pdf.
[37] Explanations might include, for example, how and why the AI-driven decision or action was taken. While exact explanations of AI decisions are often not technically feasible, agencies should characterize the general nature of such AI decisions through context such as the data that the decision relied upon, the design of the AI, and the broader decision-making context in which the system operates. Such explanations should be technologically valid, meaningful, useful, and as simply stated as possible, and higher-risk decisions should be accompanied by more comprehensive explanations.
[38] *See* OMB M-22-10 and supporting document "Strategies for Reducing Administrative Burden in Public Benefit and Service Programs."

in favor of a human alternative where practicable and consistent with applicable law and governmentwide guidance. An opt-out mechanism must exist where the affected people have a reasonable expectation of an alternative or where lack of an alternative would meaningfully limit accessibility or create unwarranted harmful impacts.

d. Managing Risks in Federal Procurement of Artificial Intelligence

This section provides agencies with recommendations for responsible Federal procurement of AI. In addition to these recommendations and consistent with section 7224(d) of the Advancing American AI Act and Section 10.1(d)(ii) of the AI Executive Order, OMB will also develop an initial means to ensure that AI contracts align with the guidance in this memorandum.

i. **Aligning to National Values and Law**. Agencies should ensure that procured AI exhibits due respect for our Nation's values, is consistent with the Constitution, and complies with all other applicable laws, regulations, and policies, including those addressing privacy, confidentiality, copyright, human and civil rights, and civil liberties.

ii. **Transparency and Performance Improvement**. Agencies should take steps to ensure transparency and adequate performance for their procured AI, including by:
   A. obtaining adequate documentation of procured AI, such as through the use of model, data, and system cards;
   B. regularly evaluating AI-performance claims made by Federal contractors, including in the particular environment where the agency expects to deploy the capability; and
   C. considering contracting provisions that incentivize the continuous improvement of procured AI.

iii. **Promoting Competition in Procurement of AI.** Agencies should take appropriate steps to ensure that Federal AI procurement practices promote opportunities for competition among contractors and do not improperly entrench incumbents. Such steps may include promoting interoperability and ensuring that vendors do not inappropriately favor their own products at the expense of competitors' offerings.

iv. **Maximizing the Value of Data for AI**. In contracts for AI products and services, agencies should treat relevant data, as well as modifications to that data—such as cleaning and labeling—as a critical asset for their AI maturity. Agencies should take steps to ensure that their contracts retain for the Government sufficient rights to data and any improvements to that data so as to avoid vendor lock-in and facilitate the Government's continued design, development, testing, and operation of AI. Additionally, agencies should consider contracting provisions that protect Federal information used by vendors in the development and operation of AI products and services for the Federal Government so that such data is protected from unauthorized disclosure and use and

cannot be subsequently used to train or improve the functionality of commercial AI offerings offered by the vendor without express permission from the agency.

v. **Responsibly Procuring Generative AI**. Agencies are encouraged to include tailored risk management requirements in contracts for generative AI, and particularly for dual-use foundational models, including:
   A. requiring adequate testing and safeguards, including external AI red teaming, against risks from generative AI such as discriminatory, misleading, inflammatory, unsafe, or deceptive outputs;
   B. requiring that generative AI models have capabilities, as appropriate and technologically feasible, to reliably label or establish provenance for their content as generated or modified by AI; and
   C. Agencies are encouraged to consider the relevant NIST standards, as appropriate, defined pursuant to Sections 4.1(a) and 10.1(d) of the AI Executive Order when imposing such requirements.

6. DEFINITIONS

The below definitions apply for the purposes of this memorandum.

Agency: The term "agency" has the meaning established in 44 U.S.C. § 3502(1).

Algorithmic discrimination: The term "algorithmic discrimination" has the meaning established in Section 10(f) of Executive Order 14091 of February 16, 2023.

Artificial Intelligence (AI): The term "artificial intelligence" has the meaning established in Section 238(g) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019,[39] which states that "the term 'artificial intelligence' includes the following":

1. Any artificial system that performs tasks under varying and unpredictable circumstances without significant human oversight, or that can learn from experience and improve performance when exposed to data sets.
2. An artificial system developed in computer software, physical hardware, or other context that solves tasks requiring human-like perception, cognition, planning, learning, communication, or physical action.
3. An artificial system designed to think or act like a human, including cognitive architectures and neural networks.
4. A set of techniques, including machine learning, that is designed to approximate a cognitive task.

[39] Pub. L. No. 115-232, § 238(g), https://www.govinfo.gov/content/pkg/PLAW-115publ232/pdf/PLAW-115publ232.pdf.

5. An artificial system designed to act rationally, including an intelligent software agent or embodied robot that achieves goals using perception, planning, reasoning, learning, communicating, decision making, and acting.

For the purposes of this memorandum, the following technical context may assist in interpreting this definition:

1. This definition of AI encompasses, but is not limited to, the AI technical subfields of machine learning (including, but not limited to, deep learning as well as supervised, unsupervised, and semi-supervised approaches), reinforcement learning, transfer learning, and generative AI.
2. This definition of AI does not include robotic process automation or other systems whose behavior is defined only by human-defined rules or that learn solely by repeating an observed practice exactly as it was conducted.
3. For this definition, the technical complexity of a system (e.g., the number of parameters in a model, the type of model, or the amount of data used for training purposes) is not a relevant consideration for determining whether it constitutes AI.
4. This definition includes systems that are fully autonomous, partially autonomous, and not autonomous, and it includes systems that operate both with and without human oversight.

Artificial Intelligence Maturity: A Federal Government organization's capacity to successfully and responsibly adopt AI into their operations and decision-making across the organization, manage its risks, and comply with relevant Federal law, regulation, and policy on AI.

Artificial Intelligence Red Teaming: The term has the meaning established for "AI red-teaming" in Section 3(d) of the AI Executive Order.

Automation Bias: The propensity for humans to inordinately favor suggestions from automated decision-making systems and to ignore or fail to seek out contradictory information made without automation.

CFO Act Agency: Refers to the agencies identified in 31 U.S.C. § 901(b).

Dual-Use Foundation Model: Has the meaning established in Section 3(k) of the AI Executive Order.

Equity: Has the meaning established in Section 10(a) of Executive Order 14091.[40]

Federal Information: Has the meaning established in OMB Circular A-130.

Generative AI: Has the meaning established in Section 3(p) of the AI Executive Order.

[40] Executive Order 14091, *Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government,* https://www.govinfo.gov/content/pkg/FR-2023-02-22/pdf/2023-03779.pdf.

Intelligence Community: Has the meaning established in 50 U.S.C. § 3003.

National Security System: Has the meaning established in 44 U.S.C. § 3552(b)(6).

Research and Development: As in OMB Circular No. A-11, *Preparation Submission, and Execution of the Budget* (2023), research and development is defined as creative and systematic work undertaken in order to increase the stock of knowledge—including knowledge of people, culture, and society—and to devise new applications using available knowledge.

Rights-Impacting AI:[41] AI whose output serves as a basis for decision or action that has a legal, material, or similarly significant effect on an individual's or community's:

1. Civil rights, civil liberties, or privacy, including but not limited to freedom of speech, voting, human autonomy, and protections from discrimination, excessive punishment, and unlawful surveillance;
2. Equal opportunities, including equitable access to education, housing, credit, employment, and other programs where civil rights and equal opportunity protections apply; or
3. Access to critical resources or services, including healthcare, financial services, social services, transportation, non-deceptive information about goods and services, and government benefits or privileges.

Risks from the Use of AI: Risks related to efficacy, safety, equity, fairness, transparency, accountability, appropriateness, or lawfulness of a decision or action resulting from the use of AI to inform, influence, decide, or execute that decision or action. This includes such risks regardless of whether:

1. the AI merely informs the decision or action, partially automates it, or fully automates it;
2. there is or is not human oversight for the decision or action;
3. it is or is not easily apparent that a decision or action took place, such as when an AI application performs a background task or silently declines to take an action; or
4. the humans involved in making the decision or action or that are affected by it are or are not aware of how or to what extent the AI influenced or automated the decision or action.

While the particular forms of these risks continue to evolve, at least the following factors can create, contribute to, or exacerbate these risks:

1. AI outputs that are inaccurate or misleading;
2. AI outputs that are unreliable, ineffective, or not robust;
3. AI outputs that are discriminatory or have a discriminatory effect;
4. AI outputs that contribute to actions or decisions resulting in harmful or unsafe outcomes, including AI outputs that lower the barrier for people to take intentional and harmful actions;

[41] Section 5(b) of this memorandum lists AI applications that are presumed to be rights-impacting.

5. AI being used for tasks to which it is poorly suited or being inappropriately repurposed in a context for which it was not intended;
6. AI being used in a context in which affected people have a reasonable expectation that a human is or should be primarily responsible for a decision or action; and
7. the adversarial evasion or manipulation of AI, such as an entity purposefully inducing AI to misclassify an input.

This definition applies to risks specifically arising from using AI and that affect the outcomes of decisions or actions. It does not include all risks associated with AI, such as risks related to the privacy, security, and confidentiality of the data used to train AI or used as inputs to AI models.

Safety-Impacting AI:[42] AI that has the potential to meaningfully impact the safety of:

1. Human life or well-being, including loss of life, serious injury, bodily harm, biological or chemical harms, occupational hazards, harassment or abuse, or mental health, including both individual and community aspects of these harms;
2. Climate or environment, including irreversible or significant environmental damage;
3. Critical infrastructure, including the critical infrastructure sectors defined in Presidential Policy Directive 21[43] and the infrastructure for voting and protecting the integrity of elections; or,
4. Strategic assets or resources, including high-value property, information marked as sensitive or classified by the Federal Government, and intellectual property.

Significant Modification: An update to an AI application or to the conditions or context in which it is used that meaningfully alters the AI's impact on rights or safety, such as through changing its functionality, underlying structure, or performance such that prior evaluations, training, or documentation become misleading to users, overseers, or individuals affected by the system. This includes significantly changing the context, scope, or intended purpose in which the AI is used.

Underserved Communities: Has the meaning established in Section 10(b) of Executive Order 14091.

[42] Section 5(b) of this memorandum lists AI applications that are presumed to be safety-impacting.
[43] Presidential Policy Directive 21 (PPD-21), *Critical Infrastructure Security and Resilience*, https://obamawhitehouse.archives.gov/the-press-office/2013/02/12/presidential-policy-directive-critical-infrastructure-security-and-resil.

Appendix I: Consolidated Table of Actions

Responsible Entity	Action	Section	Deadline
Each Agency	Designate an agency Chief AI Officer and notify OMB	3(a)(i)	60 days
Each CFO Act Agency	Convene Agency AI Governance Boards	3(a)(ii)	60 days
Each Agency	Submit to OMB and release publicly an agency plan to achieve consistency with this memorandum or a written determination that the agency does not use and does not anticipate using covered AI	3(a)(iii)	180 days and every two years thereafter until 2036
Each CFO Act Agency	Develop and release publicly an agency strategy for removing barriers to the use of AI and advancing agency AI maturity	4(a)(i)	365 days
Each Agency*	Publicly release an expanded AI use case inventory (for DoD: submit to OMB metrics on use cases other than National Security Systems)	3(a)(iv), 3(a)(v)	Annually
Each Agency*	Stop using any safety-impacting or rights-impacting AI that is not in compliance with Section 5(c) and has not received an extension or waiver	5(a)(i)	August 1, 2024 (with extensions possible)
Each Agency*	Report to OMB any agency-specific lists of AI purposes that are presumed to be rights-impacting or safety-impacting	5(b)	Annually
Each Agency*	Conduct periodic risk reviews of any safety-impacting and rights-impacting AI in use	5(c)(iv)(D)	At least annually and after significant modifications
Each Agency*	Report to OMB any determinations made under Section 5(b) or waivers granted under Section 5(c)	5(b); 5(c)(iii)	Ongoing, within 30 days of granting waiver

* Excluding agencies in the Intelligence Community.

General Comment

Re: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum; FR Doc. 2023-24269, 23 Nov. 2023.

Dear Ms. Martorana,

Artificial Intelligence (AI) has the potential to dramatically impact nearly all the federal government's operations and engagement with the American people. The opportunities and risks of AI, combined with the power of the state, places an even greater burden on the federal government to ensure its ethical use of AI, especially when AI is used for purposes that impact safety or rights. The federal government, its contractors, and its grantees' use of AI should only be allowed if those AI systems are effective, safe, and nondiscriminatory.

The Center for American Progress (CAP) has called for the Executive Branch to take immediate action on AI and has joined the civil rights community and other allies in advocating for centering the White House Blueprint for an AI Bill of Rights (AI Bill of Rights) in any AI executive order (EO) and Office of Management and Budget (OMB) guidance. The President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (AI EO) represents a strong start on the guidance needed to ensure the development of safe and effective AI.

The accompanying draft OMB guidance "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" is essential guidance for federal agencies and contractors that are already using AI systems. Particularly worthy of praise is the draft guidance's definition of safety-impacting and rights-impacting AI and purposes that are presumed to be safety-impacting and rights-impacting. These thoughtful definitions are an important step forward in outlining the conditions in which the use of AI requires extra attention and caution.

Below CAP provides the following response to the Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum; FR Doc. 2023-24269. Please contact Adam Conner (aconner@americanprogress.org) with any questions.

Sincerely,

The Center for American Progress

Adam Conner

Re: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum; FR Doc. 2023-24269, 23 Nov. 2023.

Dear Ms. Martorana,

Artificial Intelligence (AI) has the potential to dramatically impact nearly all the federal government's operations and engagement with the American people. The opportunities and risks of AI, combined with the power of the state, places an even greater burden on the federal government to ensure its ethical use of AI, especially when AI is used for purposes that impact safety or rights. The federal government, its contractors, and its grantees' use of AI should only be allowed if those AI systems are effective, safe, and nondiscriminatory.[1]

The Center for American Progress (CAP) has called for the Executive Branch to take immediate action on AI[2] and has joined the civil rights community and other allies in advocating for centering the White House Blueprint for an AI Bill of Rights (AI Bill of Rights)[3] in any AI executive order (EO) and Office of Management and Budget (OMB) guidance.[4] The President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence[5] (AI EO) represents a strong start on the guidance needed to ensure the development of safe and effective AI.[6]

The accompanying draft OMB guidance "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"[7] is essential guidance for federal agencies and contractors that are already using AI systems.[8] Particularly worthy of praise is the draft guidance's definition of safety-impacting and rights-impacting AI and purposes that are presumed to be safety-impacting and rights-impacting. These thoughtful definitions are an important step forward in outlining the conditions in which the use of AI requires extra attention and caution.

Below CAP provides the following response to the Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum; FR Doc. 2023-24269. Please contact Adam Conner (aconner@americanprogress.org: 202-669-5671) with any questions.

Sincerely,

The Center for American Progress

Adam Conner
Vice President, Technology Policy
The Center for American Progress

The draft OMB AI guidance puts principles from the 2022 White House Blueprint for an AI BIll of Rights into effect for the federal government's use of AI

The White House AI Bill of Rights "identified five principles that should guide the design, use, and deployment of automated systems to protect the American public in the age of artificial intelligence"[9] along with examples of how to implement those principles in practice. The draft OMB AI guidance integrates aspects of the AI Bill of Rights in its guidance to federal agencies within the limits of executive authority.

The integration of the AI Bill of Rights principles of "Safe and Effective Systems" and "Algorithmic and Discrimination Protections" into federal agency guidance is reflected in the minimum requirements for safety-impacting and rights-impacting AI, including: 1) AI impact assessments that include examining purpose and risks, 2) Testing and independent evaluation, 3) Mitigating emerging risks to rights and safety, 4) Tasks to ensure AI advances equity, dignity, and fairness.[10]

The AI Bill of Rights principle of "Human Alternatives, Consideration, and Fallback" [11] can be seen in the requirements for periodic human review, human training and assessment, and appropriate human consideration.[12] This direct application of the AI Bill of Rights practice for agencies using AI systems is essential to ensuring their trustworthiness and is how the government can lead by example by putting the AI Bill of Rights in practice.

Conversely, the draft OMB AI Guidance lacks needed specifics for agencies to implement the AI Bill of Rights Principles of "Notice and Explanation" and "Data Privacy."[13] Recommendations regarding the addition of those two principles can be found below.

Agencies must be instructed to include "Notice and Explanation" to users who encounter any AI systems

The ongoing minimum requirements for a safety-impacting or rights-impacting AI are outlined in Section 5.c.iv.D through Section 5.c.iv.H of the draft OMB guidance. In particular, Section 5.c.iv.H, "Provide public notice and plain-language documentation through the AI use case inventory," states that

> "Agencies must ensure…that the AI's entry in the use case inventory serves as adequately detailed and generally accessible documentation of the system's functionality that provides public notice of the AI to its users and the general public. Where practicable, agencies should include this documentation or link to it in contexts where people will interact with or be impacted by the AI."[14]

This language suggests that the AI's listing in the use case inventory is sufficient public notice of the use of the AI to the users, which seems an unlikely proposition as it would require users to know about and seek out an agency's AI use case inventories. The recommendation for agencies to "include this documentation or link to it in contexts where people will interact with or be impacted by the AI" is a kind of notice and explanation. But the suggestion to include or link to AI use case inventories as a way to alert users of interaction with a specific AI system and to learn more information about that AI system is a poor user experience. The existing agency AI use case inventories listed on AI.gov[15] tend to list all AI use cases in one large PDF or .csv file,[16] making it difficult to easily digest and forcing a user to search for whatever AI system they are interacting with in a PDF or spreadsheet. A more viable alternative to this approach is detailed below.

The section on practices that must be followed on an "ongoing basis" for safety-impacting or rights-impacting AI in Section 5.c.iv.D through Section 5.c.iv.H of the draft OMB AI guidance should add a separate requirement to provide notice and transparency to a public end user that is interacting with or being affected by a specific AI system. This notice and explanation requirement should, in real-time, provide information about the specific system involved and if linking to an AI use case, should link to a specific individual use case explanation, not a list of all AI use cases. This notice and transparency requirement is in line with one of the principles of the AI Bill of Rights, "Notice and Explanation", which states "You should know that an automated system is being used and understand how and why it contributes to outcomes that impact you."[17] As the AI Bill of Rights notes in its detailed discussion of the "Notice and Explanation" principle under "What should be expected in automated systems" these notices should be "Provide clear, timely, understandable, and accessible notice of use and explanations," "Provide explanations as to how and why a decision was made or an action was taken by an automated system," and "Demonstrate protections for notice and explanation."[18] Accessible notice and explanation is a fundamental expectation people should have when interacting with AI and the US Government should model its development here.

The draft OMB AI guidance does not provide guidance on "Data Privacy," one of the principles in the AI Bill of Rights

The draft OMB AI guidance does not provide guidance on implementing data privacy practices for AI systems used by the government, contractors, or grantees from the "Data Privacy" principle of the AI Bill of Rights. The guidance's primary mention of data in the minimum practices for safety-impacting and rights-impacting Artificial Intelligence is in Section 5.iv.A.3 "The quality and appropriateness of the relevant data" and Section 5.v.A.3 "using representative data."[19] While federal agencies are governed by existing laws, including the Privacy Act of

1974,[20] and understanding the need for new federal privacy legislation and to address government's use of data, there is no reason for OMB to not outline additional requirements around data privacy such as a directive to collect only strictly required information, stipulate data retention guidelines, and ensure basic data privacy protections. For example, OMB should require federal agencies to uphold the Data Privacy principle of the AI Bill of Rights by having agencies and contractors adopt new data minimization standards, such as those proposed in the bipartisan American Data Privacy and Protection Act (ADPPA) introduced in the 117th Congress.[21]

The purposes that are presumed to be Safety-Impacting or Rights-Impacting AI are among the most important contributions in the draft OMB guidance to the broader development of responsible AI

The federal government wields enormous power to potentially impact lives for the better or worse. In outlining the specific areas where AI is presumed to be safety-impacting or rights-impacting, the draft OMB AI guidance is setting out the first U.S. specific roadmap for how to think about actual scenarios where AI is poised to do the most potential harm and requires additional responsibility. This is particularly true when the entity is the federal government, which operates with tremendous power and where the public has more limited recourse than when dealing with the private sector.

As the draft OMB AI guidance only binds the federal government, contractors, and grantees in cases of AI for potential safety-impacting and rights-impacting purposes, any complaints that these minimum requirements are overly burdensome or will impact innovation should be ignored. In fact, these requirements will ensure that when the government uses AI for these purposes, innovation will explicitly not trade off against protecting safety or rights. If the approach of safety-forward innovation is adopted by those whose AI systems are used by the government, contractors, or grantees who fall under the OMB AI guidance, then that is a net innovation benefit for all.

Additional clarification and transparency are required for any determination that an AI does not meet the definition of "safety-impacting AI" or "rights-impacting AI"

Section 5b "Determining Which Artificial Intelligence Is Presumed to Be Safety-Impacting or Rights- Impacting" of the draft OMB guidance[22] states:

> "Where an agency currently uses or plans to use AI for a purpose described below, the CAIO, in coordination with other relevant officials as specified by the agency, may make a determination (or reverse a prior determination) that the AI application or component does not match the definitions of "safety-impacting AI"[23] or "rights-impacting AI"[24] and is therefore not subject to the minimum practices. The agency CAIO may make or reverse this determination only with a documented context-specific and system-specific risk assessment. Any such determination or reversal must be reported to OMB within 30 days."[25]

The determination that AI used for purposes that are presumed to be safety-impacting or rights-impacting, but that does not meet the definition of "safety-impacting AI" or "rights impacting AI," is a confusing one to imagine in execution. Additional clarity is needed to specify what can only be anticipated as the limited circumstances in which AI technology being used for safety-impacting or right-impacting purposes would not meet the definition of "safety-impacting AI" or "rights-impacting AI." Otherwise, the ability to make this determination looms large as a potential loophole that could exempt vast swathes of AI that should otherwise be subject to the minimum practices for safety-impacting and rights-impacting AI. In the draft guidance the CAIO retains sole authority to determine if an AI meets the definition of "safety-impacting AI" or "rights-impacting AI" without any potential recourse for disagreement.[26] OMB should direct agencies to create an additional level of review that allows for a decision by the CAIO to be revisited through a process that raises the definition issue to the Deputy Secretary or equivalent that the CAIO reports to.[27] Finally, these definition determinations by the CAIO must only be reported to OMB, but agencies and OMB should be required to jointly make these determinations public in order to provide transparency and prevent abuse.

Clarity and transparency are required for any waivers from minimum practices for safety-impacting and rights-impacting AI

Additional clarity is needed to outline the circumstances under which agencies can seek waivers from having to meet minimum practices for either safety-impacting or rights-impacting AI.[28] Delineating these minimum requirements will be essential to providing critical assurance to the public and those in charge of oversight that the use of AI that is safety-impacting or rights-impacting or for safety-impacting or rights-impacting purposes will be monitored. Clarity is needed to ensure a very high bar for issuance and uniformity in that approach. Similar to the note above for definitions, the draft guidance gives an agency CAIO sole authority to issue waivers from minimum practices without any potential recourse for disagreement.[29] OMB should direct agencies to create an additional level of review that allows for a waiver decision by the CAIO to be revisited through a process that raises the issue to the Deputy Secretary or equivalent that the CAIO reports to.[30] Agencies must be required to report such waivers to OMB within 30 days, make any waiver determinations public, and publish a master list of such waivers.

OMB should establish a process to add new presumed safety-impacting or rights-impacting AI purposes

As noted above, the OMB AI guidance purposes that are presumed to be safety-impacting or rights-impacting[31] are a critical step in ensuring a balanced assessment around the purpose and risk of agencies using AI. However, the guidance does not outline any process to add new presumed safety-impacting or rights-impacting AI purposes in the future. As AI technology continues to advance, flexibility should be provided to ensure these purposes can keep pace with new developments. OMB should establish a process to add new purposes to the initial list of safety-impacting or rights-impacting AI, possibly under the section "Determining Which Artificial Intelligence Is Presumed to Be Safety-Impacting or Rights- Impacting."[32] OMB should also create a mechanism by which the public can submit new safety-impacting or rights-impacting purposes for consideration. The responsibility for adding new purposes presumed to

be safety-impacting or rights-impacting should be driven by the interagency council to coordinate AI that will consist of the agencies CAIO's once designated in Section 10.1 of the AI EO.[33]

The OMB AI Guidance does not clearly state that not adopting AI that is safety-impacting or rights-impacting should always be a strong option and that failing any part of the minimum requirements should result in an agency not using or to stop using AI

The draft OMB AI guidance allows the adoption of AI by federal agencies, so long as the process requirements in the minimum practices for AI that are automatically presumed to be safety-impacting or rights-impacting are completed. The draft guidance does not and should clearly state that not adopting AI that is safety-impacting or rights-impacting should always be a strong option for an agency. OMB should issue clearer general criteria to make clear when an AI system should not be considered as an option.

OMB should also add to Section 5.iv. "Minimum Practices for Either Safety-Impacting or Rights-Impacting AI"[34] to specifically state that AI that fails to meet individual components of the minimum practices should result in the agency not using or to stop using that AI.

Failing any part of the AI impact assessment should also result in an agency not using or stopping using AI. The AI impact assessment minimum practice requirement for safety-impacting or rights-impacting AI should clearly state and require that failing any of the three parts of the AI impact assessment (purpose and benefit, risk, and quality of appropriateness of the data) should result in the agency not using the AI systems. In the current draft of the AI impact assessment requirements only the second requirement "The potential risks of using AI" section explicitly states "if the benefits do not meaningfully outweigh the risks, agencies should not use the AI."[35] The overall requirements for "Complete AI impact assessment"[36] should explicitly state that failing any three parts of the assessment below should disqualify an AI system from use by the agency. Additionally, the first requirement "The intended purpose for the AI and its expected benefit"[37] should explicitly state that if the AI cannot be shown to meet its expected purpose or benefit, it should not be used. Similarly, the third requirement "The quality and appropriateness of the relevant data"[38] should make explicit that if data cannot be shown to meet the fitness and quality to meet the AI's intended purpose, the AI should not be used.

Section 5.c.iv.C "Independently evaluate the AI"[39] should be strengthened to explicitly state that if the independent reviewing authority does not find that the AI "works appropriately and as intended, and that its expected benefits outweigh its potential risks," the AI system should not be used.

Section 5.c.iv.D "Conduct ongoing monitoring and establish thresholds for periodic human review" states that ongoing monitoring and periodic human reviews are "to determine whether the existing implementation of the minimum practices in this section adequately mitigates any new risk."[40] This should be clarified to explicitly state that if a new, inadequately mitigated risk comes to light during monitoring or periodic human review, then a process must be initiated to mitigate the risk or to stop using the AI.

Labor and Workforce
In Section 5.b.ii, we recommend the addition of "collective bargaining, workplace organizing, union membership, or concerted activity" to part G to ensure the further protection of workers from AI systems and to continue the Biden-Harris administration's historic support for organized labor and the working people of America.

Concerns Around Disability and Civil Rights
The disability community is impacted by AI in numerous safety-impacting and rights-impacting purposes and must be top of mind as a consideration in any AI usage by agencies, the OMB guidance should reflect this. While AI has great promise for increasing accessibility in both the online and real world,[41] accessibility cannot be the only issue in which the disability community is engaged. Members of the disability community have the potential to be harmed across multiple areas of presumed safety-impacting or rights-impacting purposes of AI through , and accessibility is a distinct subset of many AI issues. The draft guidance should specifically include a focus on the disability community by incorporating the following changes to the guidance.

The definitions of "Rights-Impacting AI"[42] and "Safety-Impacting AI"[43] should be modified to specifically reference and include those with disabilities (additions below in **bold and underlined**):

> Rights-Impacting AI: AI whose output serves as a basis for decision or action that has a legal, material, or similarly significant effect on an individual's or community's:
>
> 1. Civil rights, civil liberties, or privacy, including but not limited to freedom of speech, voting, human autonomy, **disability rights,** and protections from discrimination, excessive punishment, and unlawful surveillance;
> 2. Equal opportunities, including equitable access to education, housing, credit, employment, **disability rights, reasonable accommodations**, and other programs where civil rights and equal opportunity protections apply; or
> 3. Access to critical resources or services, including healthcare, financial services, social services, transportation, non-deceptive information about goods and services, and government benefits or privileges.

> Safety-Impacting AI:AI that has the potential to meaningfully impact the safety of:
>
> 1. Human life or well-being, including loss of life, serious injury, bodily harm, biological or chemical harms, occupational hazards, harassment or abuse, **language access, disability,** or mental health, including both individual and community aspects of these harms;
> 2. Climate or environment, including irreversible or significant environmental damage;
> 3. Critical infrastructure, including the critical infrastructure sectors defined in Presidential Policy Directive 2143 and the infrastructure for voting and protecting the integrity of elections; or,

4. Strategic assets or resources, including high-value property, information marked as sensitive or classified by the Federal Government, and intellectual property.

Additionally, Section 5.b.ii "Purposes That Are Presumed to be Rights-Impacting"[44] should add a section addressing the impact on the disability community:

L. Impacting those with disabilities or medical conditions including but not limited to accommodations, accessibility, protections including the Americans with Disabilities Act. Agencies should be instructed to consider the specific impact on the disabled community in all safety-impacting and rights-impacting purposes. The safety-impacting and rights-impacting purposes that are likely to impact the disability community include but are not limited to Section 5.b.ii B (Law enforcement or surveillance-risk), C (immigration, asylum, or detention status), D (Detecting or measuring emotions or attention), E (in education), F (Tenant screening), G (Determining the terms and conditions of employment), H (decisions regarding medical devices), J (government benefits or services), and K (Recommendations or about child welfare, child custody).

Finally, the OMB Guidance should recommend the appointment of a Federal Chief Accessibility Officer to coordinate the implementation of AI for greater accessibility in government.[45]

Generative AI as a new feature in existing approved and procured office productivity software

The leading office software suites, Microsoft 365 and Google Workplace,[46] have already announced they will be bringing generative AI to their millions of enterprise customers, which include almost every federal agency.[47] While most agencies use the government specific versions of office productivity software, they have very few if any functional differences with the commercial versions. Microsoft has already announced its generative AI roadmap for the government.[48]

Section 5.v.d.v "Responsibility Procuring Generative AI"[49] appears to refer to generative AI and contracts to procure it only in the future tense. It ignores the likely widespread rollout of generative AI to the federal government within existing contracts and the addition of generative AI as a feature to office productivity software systems that are already procured by nearly every federal agency. Additional procurement guidance should be provided to clarify generally the addition of AI features to existing procured software. Specifically, given the near-term widespread availability of generative AI as a feature in every federal agency's already procured office productivity software, OMB should require federal guidance before enabling widespread deployment of generative AI in existing office productivity software. OMB should task the Office of the Federal Chief Information Officer and the CIO Council to craft such guidance in coordination with the new interagency council of agency CAIOs.[50]

Procurement

OMB should clarify in the guidance that the new AI EO and accompanying draft OMB AI guidance applies to federal agencies and their contractors. OMB should also provide clarity to ensure that federal grants, especially to state and local governments, are also covered by the Memo. AI is a new technology and vendors may be prone to making promises that are unrealistic or impossible.[51] Procurement guidelines should emphasize that vendors claims should be scrutinized to pre-procurement and after-procurement and information on systems, especially false claims, should be shared across the federal government to provide maximum information for future procurements.

Elevate prior AI EO and OMB AI guidance on reporting agency statutory regulatory authorities for AI

The new draft OMB guidance "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" notes "The principles of this memorandum do not, by contrast, govern agencies' regulatory actions designed to prescribe law or policy regarding non-agency uses of AI."

While understanding regulation is not the focus of this OMB guidance, the proposed document provides an opportunity to elevate and prioritize one strong aspect of the previous Executive Order 13859 of "Maintaining American Leadership in Artificial Intelligence"[52] from February 11, 2019 and OMB guidance M-21-06 "Guidance for Regulation of Artificial Intelligence Applications"[53] from November 17, 2020. EO 13859 required "the heads of implementing agencies that also have regulatory authorities shall review their authorities relevant to applications of AI and shall submit to OMB plans to achieve consistency with the memorandum" which OMB M-21-06 noted "Executive Order 13859 requires that implementing agencies with regulatory authorities review their authorities relevant to AI applications and submit plans to OMB on achieving consistency with this Memorandum. The agency plan must identify any statutory authorities specifically governing agency regulation of AI applications, as well as collections of AI-related information from regulated entities" with a template requiring "Statutory Authorities Directing or Authorizing Agency Regulation of AI Applications. List and describe any statutes that direct or authorize your agency to issue regulations specifically on the development and use of AI applications." The Department of Health and Human Services was the only agency to publicly release their collection of AI authorities.[54] This inventory of agency regulatory authorities for AI is a strong exercise for agencies to undergo to better understand their authorities in relation to AI. This regulatory undertaking would be of immense interest to Congress, civil society, and the public as we work to understand if new AI laws are needed or if existing AI authorities are sufficient.

In order to aid all agencies in achieving the goals outlined in the President's new Executive Order 14110 "Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence,"[55] the new draft OMB AI guidance should resurface the requirement from OMB M-21-06[56] for agencies to inventory their full list of potential AI regulatory authorities, add the requirement to inventory for AI regulatory authorities for the agencies and CAIOs in Section 3.a and 3.b.,[57] require that list to be submitted to OMB and the new White House AI Council

established in EO 14110 within 90 days, and the list of such agency regulatory authorities should also be made public by the agencies and the White House on AI.gov.

Questions from the Requests for Comment

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

As noted above, the disability community is impacted by numerous purposes in the list of purposes that are presumed to be safety-impacting or rights-impacting. Too often when it comes to AI, the disability community's concerns are reduced to accessibility when the impact of AI on the disability community is much broader. The disability community's specific needs should be added as a specific consideration in Section 5(b) with language like this:

> Impacting those with disabilities or medical conditions including but not limited to accommodations, accessibility, protections including the Americans with Disabilities Act. Agencies should be instructed to consider the specific impact on the disabled community in all safety-impacting and rights-impacting purposes. The safety-impacting and rights-impacting purposes that are likely to impact the disability community include but are not limited to Section 5.b.ii B (Law enforcement or surveillance-risk), C (immigration, asylum, or detention status), D (Detecting or measuring emotions or attention), E (in education), F (Tenant screening), G (Determining the terms and conditions of employment), H (decisions regarding medical devices), J (government benefits or services), and K (Recommendations or about child welfare, child custody).

In Section 5.b.ii, we recommend the addition of "collective bargaining, workplace organizing, union membership, or concerted activity" to part G to ensure the further protection of workers from AI systems and to continue the Biden-Harris administration's historic support for organized labor and the working people of America.

Finally, we recommend a category for the administration of democratic processes, including but not limited to election administration, voter registration, public comments submitted to the government, and other aspects of the democratic process overseen by federal agencies.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum practices identified for safety-impacting and rights-impacting AI are a commendable step by the administration to set higher level safeguards for certain usages of AI in the federal government, including with contractors and grantees. However, it is critical that these determinations are made in a way that can be iterative, changed, and added to. Given the nascent yet rapidly advancing nature of the technology, there will undoubtedly be additional

uses and expanded current uses that can and should be deemed safety- or rights-impacting in the future. OMB should set out processes for evaluating new and updating existing cases in a thorough, efficient, and timely manner prior to any new or updated uses of AI in government to ensure this approach is future-proof. Specifically for existing applications of AI for new uses or with enhanced models, OMB should stipulate exact thresholds for when these are reviewed and outline the process by which agencies must do so and when.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The annual use case inventory should be in an easily readable format and also available in a machine-readable format that does not require significant technical expertise to access, understand, or analyze. NIST should work with the interagency council to coordinate AI in government to help prototype standards to be used for this use case inventory. Additionally, it should include the below specific information for each unique use case, even when shared among the same models or system including:

- Name, description, and developer information of AI model/system
- Exact ways the model is utilized and for which use cases
- Model inputs and outputs by data type, anonymized for maximum privacy protection
- Who the intended recipients of the model's decisions are and for what purpose
- Information regarding human in the loop on AI-generated decisions
- Last time model was assessed for rights- and safety-impacting determinations and what those outcomes were

Comment Submitted: December 5, 2023
Docket No. 2023-24269

INTRODUCTION

As President Biden said in the AI executive order he announced on October 30, "Responsible AI use has the potential to help solve urgent challenges while making our world more prosperous, productive, innovative, and secure."[1] The promise of this technology, for both private and public application, cannot be understated. As the OMB revises its guidance, it is essential that the office both embrace and disseminate an understanding that, for public-sector application, AI is a collection not of "what ifs" but of real, transformative applications that can and must be employed today. Already, we are seeing the tip of the iceberg for truly impactful and beneficial relevant public-sector application of this technology:

- **In some cases, AI can supercharge key government services**. In November, DeepMind introduced GraphCast, a weather-forecasting algorithm that can produce higher accuracy predictions in one minute than the National Weather Service's gold standard models produce in hours.[2] Implementation of these AI models would have the added bonus of dramatically lowering the National Weather Service's staggering carbon toll.
- **In other cases, AI can help further government priorities**. Using AlphaFold, DeepMind solved the notoriously complex *protein folding problem*, providing crucial biological understanding that may supercharge rapid, ultra-targeted vaccine and drug development during future pandemics.[3]

The ideas presented in this document do not represent official positions of the Mercatus Center or George Mason University.

- **Critically, AI is also helping officials manage the now unwieldy bloat of government rules.** To distill and manage its policies—a cumbersome body of text longer than 100 copies of Leo Tolstoy's 500,000-word novel *War and Peace*—the Department of Defense developed GAMECHANGER, a program that parses and navigates these policies, a task no longer humanly possible.[4]

Beyond these already mature, relevant public-sector applications, there are countless other potential use cases: Powerful agency chatbots could cost-effectively serve constituents on a 24/7 basis; conduct consular interviews; qualitatively deepen census data; monitor budgetary waste, fraud, and abuse; and provide instant translation for non-English speakers. To harness this potential, and the many mature AI applications, I urge the administration and the OMB to pivot toward a "diffusion-centric AI strategy," focused not on rules-for-rules' sake but on guidance aimed at building trust, fostering engagement, and pushing the broad, rapid diffusion of this technology across federal agencies and society where applicable.[5]

The OMB should also recognize that the significance of getting this right for the federal government goes beyond just seizing these AI opportunities. While 71 percent of government executives believe the benefits of emerging AI applications outweigh the risks,[6] a sense of AI skepticism and fear has taken root in the broader workforce. Today's government workers will be tomorrow's decision-makers, and their view of AI will have deep impacts on future policies and implementation efforts. To counter AI skepticism and fear of the AI unknown, AI diffusion is essential. Only through direct hands-on experience with AI can the government workforce understand its benefits. If public-sector AI diffusion lags, we will miss this hands-on experience: interest in AI's promise will likely fade and long-term efforts will likely fail.

With this important goal of paid AI diffusion in mind, below I highlight certain concerns and opportunities the OMB should consider to improve this guidance and serve a diffusion-centric implementation strategy:

1. Provide education on AI potential, use cases, and mature applications.
2. Consider opportunity costs for minimum practices for safety-impacting or rights-impacting AI.
3. Recognize excessive regulation as a barrier to responsible use.
4. Measure AI diffusion.

1. PROVIDE EDUCATION ON AI POTENTIAL, USE CASES, AND MATURE APPLICATIONS

Broad AI success requires energy, engagement, and understanding of the possible. Today, many in the government workforce may not understand how AI can be used and why this technology may matter in their work; for most, the concept of "AI" is often falsely limited to chatbots like ChatGPT.

For agencies and their staff to successfully identify and imagine use cases, they need to understand the wide range of AI capabilities beyond chatbots. I recommend that the OMB require each agency to hold educational sessions for staff at all levels on mature AI technologies—both their range and ability to

[4] Ken Klippensteain, "Pentagon's Budget Is So Bloated That It Needs an AI Program To Navigate It," *The Intercept*, September 20, 2023.

[6] Fedscoop, "Government Gears Up to Embrace Generative AI," October 17, 2023.

improve work. If implemented well, such sessions should help generate a sense of engagement and excitement, emboldening agencies and their staff to *want* AI rather than to feel compelled to use it.

2. CONSIDER OPPORTUNITY COSTS FOR MINIMUM PRACTICES FOR EITHER SAFETY-IMPACTING OR RIGHTS-IMPACTING AI

Responsibility is essential when implementing AI technologies, but the OMB's guidance must recognize that attaining true AI safety and responsibility is not equivalent to providing a list of rules. Opportunity costs, implementation burdens, and the potential negatives of low-tech alternatives also matter. While it's unclear whether the eight new minimum practices required for AI applications listed in this guidance will be burdensome or not, I urge the OMB to err on the side of a light touch. If process burdens are flexible, agencies will have the freedom to experiment and choose the most responsibility-enhancing IT paths forward.

To illustrate, consider the opportunity cost of forgoing machine-translation services. While human translators may be more familiar and therefore more trusted, by over-relying on this limited human labor the government will necessarily forgo the ability to make translation services accessible in real time to a diverse audience. In this case, delaying or blocking AI application may indeed be the irresponsible option.

Recognition of such opportunity cost means embracing that AI may indeed be the safest, most efficient, low-cost, and responsible option. Recognition of opportunity costs is not tantamount to blind AI boosterism; embracing this principle, likewise, means recognizing that in many cases standard digital options might indeed be the most responsible best path forward. These balanced considerations of AI responsibility and opportunity costs, however, may not be possible if excessive processes create a burden of longstanding IT implementations, bureaucratic hoops, and millions of taxpayer dollars. Faced with high effort and high costs, the ability to weigh AI benefits against traditional capacities may be removed from decision-makers, forcing them to rely on older technologies and capacities that might limit their ability to successfully carry out government functions and reap the rewards of innovation.

3. RECOGNIZE EXCESSIVE REGULATION AS A BARRIER TO RESPONSIBLE USE

I commend the guidance's emphasis on removing needless barriers to responsible AI. Building AI capacity indeed requires recognizing that bussiness as usual, and exsisting capacities, are likely insufficient. What's missing, however, from the OMB's list of barriers is perhaps the biggest barrier of all: bureaucratic process burdens. As I argued in *Noema Magazine*,

> Today's bureaucratic culture is often structured like a waterfall: Policymakers at the top of the falls make one-way decisions that flow down on top of developers and project managers who, operating under rigid strictures, struggle to build successful systems. The result is a culture of IT inflexibility, where developer ingenuity is bound by rules written by often inaccessible decision-makers. Rather than succeed at policy outcomes, systems are instead designed to follow rules.

Former Obama-Era Deputy Chief Technology Officer and Code for America founder Jennifer Phalka has concurred, arguing that the key to successful policy and IT implementation success lies in "peeling back the layers of process that have accumulated on top of policy."[7]

[7] Jennifer Phalka, "Culture Eats Policy," Niskanen Center, June 21, 2023, https://www.niskanencenter.org/culture-eats-policy/.

To achieve AI success, therefore, the OMB must adjust this guidance to recognize regulatory process as a barrier. The OMB must emphasize to agencies that flexible rules and the removal of needless processes will be the key to experimentation, appropriate design, and rapid deployment.

To build on this emphasis, one potential opportunity the OMB should consider is requiring agencies to create "regulatory burden notification channels" between the low-level staff who pen the code and contracts and the high-level officials who have power to adjust the processes. With such channels in place, process barriers can be revealed and systems adjusted, allowing the system to accommodate implantation needs. In support of the administration's emphasis on AI responsibility, providing such flexibility will allow implementors to experiment, build, and iterate on systems to maximize safety and results, rather than build to maximize adherence to rules.

4. MEASURE AI DIFFUSION

Measurement of AI diffusion will be essential for an effective rollout. In the OMB's guidance, as well as in the executive order, agencies are required to annually take stock of their AI systems inventory. What these inventories miss, however, are key metrics relating to the "depth of adoption." Are these systems being used, or are they collecting dust? Are staff failing to adapt to new AI tools? Are certain departments or offices lagging in AI uptake? Is there perhaps an overreliance on AI automation? All of these questions are important to identify capacity gaps, opportunities for change, and, for the public, transparency about the depth of AI automation in government services.

To capture essential metrics and provide the nuanced detail needed to support whole-of-government efforts, the OMB should require agencies to develop depth of adoption metrics, to illustrate not only what systems they have, but when and how deeply they are being used. Naturally, pushing for the development of such metrics may be beyond the expertise of certain agencies. To aid this process, I recommend the OMB, and perhaps expert agencies like the National Institute of Standards and Technology (NIST), develop default depth of adoption metric recommendations individual agencies can use as a template for their own metrics.

SEIZING OPPORTUNITY

The federal government must embrace the unique nature of the moment. AI is here, yet the AI future remains uncertain. While driving in the dark of AI policy, the OMB must embrace the fact that present uncertainty demands future flexibility. We cannot say what future technologies will emerge and problems will arrise in the coming years. Just as the European Union's AI Act failed to predict the rise of ChatGPT, any rule written today will no doubt fail to account for future developments. Prediction remains a challenge, but what we can say is that AI diffusion and harnessing the positive benefits of proven AI technology must be the end goals. Charting this course therefore means building an AI-ready government, with the the talent, process flexibility, and measured data needed to deploy this tech, experiment, and meet unexpected challenges as they emerge.

Working towards this goal and managing unexpected issues require building an AI-ready government, armed with an AI-educated workforce, low process burdens, and measurements needed to understand, confront, and nimbly solve future AI-related challenges.

APA Response to OMB AI Governance RFI 12.05.23

AMERICAN PSYCHOLOGICAL ASSOCIATION SERVICES, INC.

December 5, 2023

The Office of Management and Budget
725 17th Street, NW
Washington, DC 20503

Response to AI Memo Request for Comment

Submitted Electronically

Dear Cindy Martinez:

The American Psychological Association Services, Inc. (APA Services) respectfully submits the following response to the request for comment on the governance, innovation, and risk management for agency use of artificial intelligence (AI). APA Services is the companion organization of the American Psychological Association, which is the nation's largest scientific and professional nonprofit organization representing the discipline and profession of psychology, as well as over 146,000 members and affiliates who are clinicians, researchers, educators, consultants, and students in psychological science.

Helping ensure that technology shapes the future for the better requires understanding the psychology of human-technology interaction. Just as new technological tools are emerging, the psychological science on human interaction with new products and services is also developing. A burgeoning area of psychological science involves the development, use, and impact of artificial intelligence.

Psychologists who study human intelligence are unlocking ways to enhance artificial intelligence and to ensure its ethical and appropriate use. Applied psychologists are studying how important characteristics of AI technologies impact identity and psychological wellbeing. Clinicians are navigating an increasingly complex environment where AI tools can assist in evaluation and diagnosis. Meanwhile, research points out that the deployment of AI is not a one-size-fits-all solution and is perceived differently by different groups of people. For example, even when factors such as age, gender, education, technology skills, and country-level GDP per capita are held constant, those living in societies with greater inequality are more likely to perceive AI as a threat to their role in the workplace.[1]

APA stands in support of the current draft guidance being put forward to heads of agencies related to the governance and use of AI. We believe it is essential for there to be an all-

of-government approach to governing new artificial intelligence tools and their development. This requires adequate coordination and cross-coordination across government and the involvement of psychologists, well-versed in the research necessary to make the rollout and governance of these new technologies successful. We appreciate a focus on the responsible development of new AI tools and encourage more research funding and access to be main components of this effort. Similarly, the risk-mitigation focus of this proposal is essential to safeguard against the most harmful impacts of these new technologies. We believe this memo represents an important step in the right direction and appreciate the Administration's focus on this issue.

Below are additional considerations the Office of Management and Budget and others in federal agencies should consider when seeking to understand, develop, and regulate new AI-based technologies.

AI Standards

Policymakers and employers alike should be aware of the risks and benefits inherent to developing and using AI in the workplace. To maximize the efficiency and effectiveness of AI, and minimize damages to labor markets, workplaces, and employees, APA believes that artificial intelligence should:

- **Be Human-Centric –** People must remain a central part of technologies involving artificial intelligence, including in the development, deployment, and evaluation stages.
- **Elevate Ethics & Diversity –** Diversity must be present in the individuals, backgrounds, perspectives, and thought processes of those responsible for the creation and deployment of new technologies. Companies must endeavor to embed diversity and reduce unconscious and conscious discrimination in both the development of AI tools and their deployment.
- **Be Well-Researched** – Psychological science focused on the development and deployment of artificial intelligence is a relatively new area of study and more research is needed to ensure effective development of these technologies and to understand the impact of these technologies on human behavior.
- **Be Effective & Risk Adverse–** New uses for AI technologies are discovered every day and deployment of these tools is often done without proper consideration of ethics and efficacy. AI must be properly tested, and the use of these technologies must be limited to applications where it is safe and effective in achieving the intended purpose.
- **Prioritize Privacy –** The data collection fueled by the increased deployment of AI tools is leading to increased risks for individual data privacy. Companies must redouble their efforts to protect data and ensure privacy around data collected by AI technologies. This should include copyright and trademark protection.
- **Maintain Copywrite & Intellectual Property Rights –** Current AI tools and programs exist in violation of copyright and intellectual property standards required of other

APA.ORG

750 First Street, NE
Washington, DC 20002-4242
202.336.5800
202.336.6123 TDD

similarly situated technologies, more must be done to ensure compliance with current standards and new standards must be created where necessary.

- **Be Transparently Deployed** – The prevalence of AI tools deployed in the creation of and distribution of content is often unknown by the end user, fueling misunderstandings and misconceptions about the technologies; companies should take steps to increase transparency around the presence of these tools to ensure individuals are aware of the role AI might play in impacting their experience in real world and online environments.
- **Further Digital Literacy** – It is essential that new avenues of education be paired with the deployment of new technologies. Users should be informed about the way new AI technologies work, how they might impact their lives, and how best to interact with these platforms to minimize negative impacts.

As agencies are considering areas within the federal government to centralize AI leadership, APA believes the Office of Science and Technology Policy is well situated to create cross-cutting government policies related to AI. We also believe that there is a role for the National Science Foundation, the National Institutes of Health, specifically the National Institute of Mental Health, and the National Institute on Minority Health and Health Disparities. It is imperative that the government take concrete steps now to form governing bodies and research efforts to better understand the impact of AI.

Data privacy training should be embedded into processes for the development, deployment, and evaluation of AI tools. AI technologies collect and store large amounts of data, including personally identifiable data, and increasingly health-care related data. Federal and state privacy standards must be reexamined to adequately ensure that privacy protections are adequately robust in the fact of increasingly complex technologies. Adequate steps must be taken to ensure that the data collected by these tools is meeting privacy laws and copyright policies.

As with a requirement for data privacy, so should there be requirements for transparency around AI tools. Access for researchers should not be limited to only those that work within the company developing the tools and mechanisms must be built into new technologies that easily allow for researchers to access and analyze anonymized data.

Supporting Medical Innovation

While we need to continue to support and expand the mental and behavioral health care workforce, artificial intelligence and innovative technologies have the potential to positively impact the health care system and the future of service delivery. For example, AI technologies may improve patient care by enhancing diagnostic precision, allowing for more individualized treatment, and improving engagement. AI technologies may assist psychologists and other health professionals in their clinical work by automating administrative tasks and supporting clinical decision making. Additionally, AI could foster the early detection of behavioral health concerns and enable the scaling of interventions to reach a much broader segment of the population than

APA.ORG
APASERVICES.ORG

202.336.6123 TDD

currently can access care. For example, digital therapeutics can be used to deliver evidence-based interventions on a scale that vastly exceeds the capacity of the current clinician workforce. These developments, if realized, represent meaningful improvements in the lives of individuals, significant benefits to overall population health, and possible decreases in health care costs.

Technology aimed at identifying and treating social isolation, mental and physical health issues, and providing new tools from transportation to caregiving show promise in improving health.[2] Some of these tools provide a means for helping predict health risks or recommend personalized treatment plans, and others interface directly with patients in the form of therapeutic chatbots.[3]

Yet, the use of AI technology within mental health care raises several ethical considerations. First, AI can be susceptible to bias; if the datasets used to train AI technologies are incomplete or reflect systemic biases, then the resulting AI technologies also will reflect those biases. Ultimately, this could exacerbate existing disparities and inequities. Secondly, given the sensitivity of mental health data, there needs to be considerable attention to data safeguarding to prevent public harm. Users of apps, chatbots, and other AI-based technology must be comprehensively informed about the privacy implications, including what personal data is being collected, how it is stored, who has access to it, and what happens to their data after they stop using the tool. Thirdly, greater transparency is needed regarding the development and technology underlying AI-based tools (while protecting copyright and intellectual property), as well as rigorous testing of the AI-based tools to foster public trust, to establish efficacy, and to minimize unintended consequences.

Ultimately, finding a balance between continued health care innovation and public safety is imperative. Psychologists should be at the forefront of AI development and employment to ensure that human-technology interactions are effective and ethical.

Medical Ethics and Protecting Patients

APA wholeheartedly agrees that new AI tools should centralize transparency and effectiveness in their development and deployment. Unexpected or unacknowledged collection of data being employed in the training of AI models raises serious privacy and transparency

concerns. The prevalence of AI tools is often unknown by the end user, fueling misunderstandings and misconceptions about the technologies; companies should take steps to increase transparency around the presence of these tools to ensure individuals are aware of the role AI might play in impacting their experience in real world and online environments. The use and exploitation of data will have unknown consequences on the perception and experience of AI tools.[4] AI, like humans, is varied; yet people often see AI as homogeneous. This may result in AI failures being treated as global rather than specific, affecting perception and trust in AI.[5] Trust between humans is earned. Humans, AI, and the context in which AI is employed determine trust in technology, and the limits of this trust must be closely considered.[6]

Transparency requirements should be paired with public education efforts centered around technological literacy. Users should be informed about the way new AI technologies work and use user-provided data, how they might impact their lives, and how best to interact with these platforms to minimize negative impacts.

Deployment of AI tools is often done without proper consideration of ethics and efficacy. AI must be properly tested prior to widespread deployment and the use of these technologies must be limited to applications where it is safe and effective, minimizing unknown, unintended, and inequitable impacts. These new AI technologies can be greatly improved by psychological science.[7] User experience researchers and designers with strong backgrounds in psychological science can play an important role in ensuring new tools are more human, more effective, and more ethical.

The data collection being fueled by the increased deployment of AI tools is leading to increased risks for individual data privacy. Companies must be required to redouble their efforts to protect data and ensure privacy around data collected by AI technologies, especially in the case of sensitive information possessed by health care providers and when copywritten material is present. Companies must also be more transparent related to user data practices and data used for AI training.

Practical Uses for AI in the Workplace

APA acknowledges that new AI technologies can have profound positive impacts on the workplace and worker productivity when developed, tested, and deployed in a responsible way. Already, psychologists are not only working on understanding perceptions of AI in the

202.336.6123 TDD

workplace, but also are involved in developing AI for more effective use in the workplace. For example, psychologists recently used job descriptions, in tandem with natural-language processing algorithms, to estimate the knowledge and skills necessary for existing and even future jobs.[8]

In a recent survey fielded by APA and The Harris Poll, workers were asked about their perceptions of AI in the workplace.[9] 51% of respondents who worry about AI said their work has a negative impact on their mental health, compared with 29% of workers not worried about AI making some or all of their job duties obsolete in the future. The survey shows 46% of workers worried about AI making part or all of their job duties obsolete. We see that worry about AI is more disproportionately felt among workers with less education, high school graduates worry about AI at a rate 10 percentage points higher than those that completed a four-year degree. Similar disparities were noted in workers of color and younger workers.[10] This upheaval will impact the job satisfaction of workers as well as their security. 46% of individuals worried about AI intend to look for a new job in the next year, compared with 25% of those who did not report being worried. These disparities are likely to grow as the prevalence of AI technologies impact more parts of the workforce. It is essential to understand and create resources to serve the workers most vulnerable to worry and displacement by AI.

It is important to note that psychologists are not only working on understanding perceptions of AI in the workplace, but also are involved in developing AI for more effective use in the workplace. For example, psychologists recently used job descriptions, in tandem with natural-language processing algorithms, to estimate the knowledge and skills necessary for existing and even future jobs.[11] This work underscores the importance of including psychological scientists in the development, regulatory, and evaluation of these new technologies.

AI and Working Conditions

Three AI challenges facing policymakers are working conditions, discrimination, and job displacement. There have been recent reports that highlight the poor working conditions of those individuals responsible for training and inputting data into new AI tools.[12] Often for low wages and centralized to workers in the global south, the work necessary to create tools like ChatGPT comes at a high human cost. We know that workers in these conditions are likely to have a lower

level of life satisfaction and higher prevalence of depression and anxiety.[13] These workers are also exposed to high level of graphic images, which is an activity associated with a number of other mental health symptoms.[14] Because of lack of transparency requirements currently being imposed on companies developing new AI technologies, there is not more information about these workers and their condition. The federal government can and should do more to prevent these working conditions and potential exploitation that can lead to mental health harm.

The European Union, in their recently proposed EU AI Act, have taken an important step to recognize the potential for unfairness and discrimination that new AI tools present.[15] Stating that "'diversity, non-discrimination and fairness' means that AI systems shall be developed and used in a way that includes diverse actors and promotes equal access, gender equality and cultural diversity, while avoiding discriminatory impacts and unfair biases that are prohibited by Union or national law," this regulation seeks to minimize the negative impacts we know are possible with AI. Adoption of a similar proposal at the federal level in the U.S. would be an important step forward in avoiding discrimination and furthering fairness. A similar framework has been proposed by psychological scientists that can also be considered.[16]

We are beginning to understand how AI technologies might displace individual workers or entire sections of our economy. Researchers "argue that the conditions for AI to either enhance or threaten workers' sense of identity derived from their work depends on how the technology is functionally deployed (by complementing tasks, replacing tasks, and/or generating new tasks) and how it affects the social fabric of work."[17] Agencies have the ability to set resources aside to prepare for these negative impacts and create an environment that helps to minimize them.

The early evidence shows that decisions about AI and how it is implemented reflect the world view and values of the human beings who design them and set policy for how it is used. Given the massive and increasing influence of AI on people's lives, it is critical to better appreciate how people understand and react to such influence, especially when the AI is perceived to be biased or unfair.

As with other areas of technology, there remains an imperative for diversity, ethics, and inclusion to be a central component of any oversight model. Requiring diversity training, especially in teams developing AI tech can be an important first step to ensuring teams developing these new products are well versed in the components of DEI, which in turn can help to reduce the possibility of a biased product.[18]

There are, additionally, ethical implications for what AI learns, how AI learns, and AI's subsequent decision-making. For example, developing transparency enhancing algorithms for measuring and simulating AI bias and equity would make it possible to analyze the ethical implications of AI in a variety of domains including natural language and computer vision.[19] Alternatively, these AI methods could examine and analyze current and historical social biases and human cognition.[20] Research programs focused on this area would allow for understanding how AI is co-evolving with humanity, as AI is shaping society and impacting individuals' lives in an accelerated manner and at an unprecedented scale.

Given evidence that AI can reproduce discrimination and bias against individuals and groups, it is imperative the government leverage psychological science and examine people's expectations about and reactions to the fairness and potential discrimination of AI versus human agents. An emerging line of research suggests that people expect AI to be less biased than humans in some cases while being less outraged when they learn of bias from an AI versus human actors.[21] Algorithms appear less discriminatory than humans, perhaps incorrectly engendering trust and comfort from human users.

Without the inclusion of psychological science, we risk harming already disadvantaged populations and creating systems that perpetuate harmful stereotypes and bias. AI systems are often trained using large data sets of human attributes or demographics that have the potential to integrate biases related to gender identity, race, and other characteristics. These systems then

spread the biases in their interactions with humans or other technology-informed systems, with implications for equity and fairness. Psychologists' research on the various forms of resulting bias and the detrimental impacts are being used to develop data sets that are less biased and AI systems that can detect and compensate for biases in data. Findings from this research should be incorporated into future deployments of artificial intelligence tools, especially when being funded or used by the federal government.

Thank you again for the opportunity to weigh in on these questions. To the extent that our psychologists can serve as a resource to your office, please feel free to reach out to Corbin Evans (Senior Director Congressional & Federal Relations, Science Advocacy) at CEvans@apa.org.

Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence-AHIP Comments

Dear Director Young,

AHIP appreciates the opportunity to provide feedback on the Office of Management and Budget's (OMB) draft memorandum entitled "*Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence*," ("draft memo"). AHIP is the national association whose members provide health care coverage, services, and solutions to hundreds of millions of Americans every day. We are committed to making health care better and coverage more affordable and accessible for everyone including through leveraging emerging technologies.

Safe and ethical AI use could be transformative across all facets of American life and improve how the United States government serves its citizens. AI has the potential to offer Americans great improvements in government services, improve our national safety and security, and advance solutions to pressing societal challenges. However, integrating AI into government business practices must be done responsibly and safely. We agree that as the use of AI grows, there is a need to protect Americans' rights and safety and guard against risks. However, we must seek policies that balances risk and reward to ensure that while we are safeguarding Americans, we are not stifling transformative innovation.

Strengthening AI Governance

We support OMB's proposed policy to require agencies to designate a Chief AI Officer as well as OMB's vision to enhance agencies' expertise in AI. In addition to internal coordination, we encourage OMB to support agencies in coordinating across the federal government as well as with the private sector. We also appreciate the proposed policy's focus on alignment and compliance with relevant laws and policy. Additionally, OMB should focus on promoting appropriate transparency rather than regulating how or when AI can be used. A focus on transparency gives stakeholders the information they need to make informed decisions about using AI without impeding technological innovation or agencies' ability to leverage AI to

improve processes and workflows. However, the government should work with private sector stakeholders to develop a common definition of transparency that balance the needs of the public to understand how and when AI is used while promoting competition and protecting trade secrets.

We also ask that OMB clarify the scope of this memo to apply to government agency use of AI only. We recommend that OMB include a statement confirming that this memo addresses agency requirements for the AI governance, innovation, and risk management, but does not impose such requirements on non-governmental actors that are regulated by or receive funds from the agencies governed by this memo. As entities regulated by, or receiving funds from, numerous agencies that would be governed by this memorandum, we recommend that any requirements or standards for AI governance, innovation, and risk management for our adoption within a specific program's context be put forward through notice and comment rulemaking.

Specific to the proposal for agencies to post AI inventories, we note that annual posting of all AI uses cases may be challenging, may not be sustainable, and may not meet intended goals of transparency. Ultimately, this will likely create undue burden for the agencies. Further discussions, studies, and standards development are needed regarding model notice and transparency requirements, including if multiple models compromise a larger AI system and how that is to be reported in public-facing inventories. For example, rather than requiring an annual disclosure of all uses, OMB could require agencies to update their inventories when there is a material change in their use of AI. OMB should also clarify that these inventories focus on high risk uses, contain the minimum necessary information, and only apply to systems that are truly artificial intelligence and not simply the results of an algorithm or programming rule.

Advancing Responsible AI Innovation

AI has many advantages that include, among others, operational efficiencies, cost reduction, technical innovation (e.g., allowing users to perform tasks that could not be done before) and error reduction, but to achieve such ends the applications must be managed as they augment, not replace, human work. Thus, we support the vision of increasing agencies' expertise in AI. We agree that federal agencies should have embedded AI experts; however, agencies could also consider ways to enhance their expertise by convening advisory panels and technical expert panels to support agency staff with private sector and other outside experts.

Managing Risks from the Use of AI

We appreciate OMB's attention to managing potential risks from AI that could impact a person's safety or rights. However, we urge OMB to ensure that agency guidance is not applied in an overly broad way that could prevent Americans from benefiting from AI. Oversight of federal AI

use should rely on a risk-based framework that targets necessary safeguards within the context of specific use cases.

Leverage Existing Work to Mitigate Harm

We appreciate the federal government's work to date to promote safe and ethical AI use. AI usage today occurs against an important backdrop of existing laws and regulations at both the federal and state levels to protect consumers such as those touching on privacy, security, discrimination, and data interoperability. We have been supportive of the federal standards work through the National Institute of Science and Technology (NIST) including its AI Risk Management Framework. We again encourage agencies to defer to existing laws and consumer protections, including when considering recommendations on AI documentation. Specific to federal contractors, we also encourage OMB to ensure alignment with existing Federal Acquisition Regulations (FAR), and to enable appropriate comment processes for updates where needed.

Of note, there are also numerous ongoing voluntary activities among industry participants that go beyond law and regulation, such as the development and use of principles, best practices, and standards specific to AI use. The private sector has also started to create governance, ethical, and practice standards for organizations developing and deploying AI. For example, AHIP worked with the Consumer Technology Association (CTA) and the American National Standards Institute (ANSI), on the recent development of the consensus-driven standard, ANSI/CTA-2090, The Use of Artificial Intelligence in Health Care: Trustworthiness.[1] In September 2023, CTA released voluntary standards outlining ways to identify and manage AI bias in health care.[2] Moreover, the Coalition for Health AI (CHAI), the Health AI Partnership, and Association of Food and Drug Officials (AFDO) and the Regulatory Affairs Professionals Society (RAPS) are developing guidelines for the use of AI in the health and health care sector while the National Academy of Medicine has outlined a code of conduct for the use of AI in health, health care, and biomedical science. These standards and guidelines outline types of biases and suggest strategies to mitigate bias throughout the development process.

OMB should leverage existing federal and industry standards when considering acceptable AI use by the federal government to avoid duplication of work. As these efforts, and additional ones, continue to evolve and mature, industry and federal government agencies need to work together to consolidate and coalesce towards a set of common national standards that can be adopted consistently across organizations. Consumers should have confidence that the same or similar standards apply regardless of whether AI is used by public or private sector actors.

[1] https://shop.cta.tech/products/the-use-of-artificial-intelligence-in-healthcare-trustworthiness-cta-2090
[2] Artificial Intelligence in Health Care: Practices for Identifying and Managing Bias (CTA-2116)

Purposes that are presumed to be safety- and rights-impacting

OMB should have agencies use a risk-based approach, aligned with the NIST AI Risk Management Framework (RMF), to AI governance and minimum practices for AI uses cases. Additionally, further discussions on standards and best practices, including private industry input, are needed to advance minimum practices for these higher risk uses cases.

Minimum practices for safety-impacting and rights-impacting AI

Specific to the information or for "minimum practices," we request inclusion of language "the requirement would increase risk to safety or rights overall, could risk exposure of sensitive or other protected information, or would create an unacceptable impediment to critical agency operations" to ensure further protection of American' consumers sensitive data.

We appreciate OMB's inclusion of minimum requirements to evaluate AI. However, standards for algorithmic evaluations and audits are not yet defined and will vary by use case. Inadequate standards may risk evaluations that fail to identify issues as intended. Further discussions and standards development are needed, including private-public collaboration.

Definitions

OMB's guidance must support alignment of definitions used to established AI definitions and terminology to ensure non-AI technologies are appropriately carved out of potential requirements and oversight. We support the NIST AI RMF definition of "AI System" as an engineered or machine-based system that can, for a given set of objectives, generate outputs such as predictions, recommendations, or decisions influencing real or virtual environments.

Mitigating the Risks of AI Bias

We appreciate OMB's attention to the potential of AI-enabled discrimination and outlining the need for appropriate monitoring and human oversight. We agree that bias could negatively impact certain populations necessitating monitoring and mitigation. To do this, healthcare organizations must be able to use the elements and techniques best suited for the model in accordance with sound governance frameworks and existing laws and consumer protections. For example, using demographic data could identify a lack of representativeness in data sources, or differential impact of applying the models. Then an organization can take, and document, mitigating steps such as augmenting data sources or scaling to minimize the unintended bias. Depending on the nuances of a model, mandatory data elements or precluded data elements may reduce the precision of the model for a given population and reduce the benefit. Race, for instance, was an important variable to include in health plan efforts tracking and trending COVID-19 rates to assist people with vaccination access.

It is possible, and sometimes necessary to "tune" machine learning (ML) models to so they work exceptionally well for specific groups of people who need intervention or support, or perhaps it is not realized that a targeted intervention is needed until the ML uncovers the need. These groups could be defined by having certain diseases, living in certain geographies, or of a certain socioeconomic status. ML, and the AI behind it, provides us the opportunity to optimize models to perform best among their intended populations.

While OMB may aim to mitigate risks such as algorithmic bias, overly prescriptive rules could unintentionally limit the ability of agencies to use AI to combat systemic inequality by targeting health interventions at specific underserved communities – including at-risk and historically marginalized groups. OMB should also ensure that policies meant to prevent harms from AI bias do not hamper the ability of agencies to use AI to promote equity. While we agree safeguards should exist to protect underserved communities, we recommend pending regulations focus on outcomes, not specific processes for technologies, and encourage ongoing alignment with expert-developed standards.

The use of AI holds great promise to improve processes across all facets of government and private industry. We are thankful for the opportunity to provide this feedback to OMB and we appreciate OMB's leadership in the significant work of ensuring federal government use of AI balances the value of innovation with the need to mitigate harms. We can work together to address the challenges and ensure Americans are protected while promoting innovation. Engaging a diverse set of stakeholders is essential to success, and AHIP and our health insurance provider members are eager to work with you and other stakeholders on these important efforts. If you have any questions, please feel free to contact me at dlloyd@ahip.org

Sincerely,

Danielle A. Lloyd

Subject: Response to Request for Comment on AI Governance for Federal Agencies

I am writing on behalf of Harris County Public Health in response to your Request for Comment on AI Governance for Federal Agencies. We appreciate the opportunity to provide feedback on the proposed memorandum, and we believe that effective AI governance is crucial, particularly in the context of public health.

Question 1: The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

Response: The roles and responsibilities outlined for Chief AI Officers should be adaptable to the diverse nature of federal agencies, including those within public health. It is essential that the Chief AI Officer's role be flexible to address existing and emerging challenges and emergencies in public health. Additionally, supporting roles in data integrity, privacy, and security are paramount to ensuring ethical and equitable data-driven decision-making.

Flexibility is key to the Chief AI Officer's ability to form policies, guidelines, and considerations for the use of Generative AI tools. This includes assessing feasibility, use cases, and encouraging staff usage within specified guidelines that acknowledge the tools' usefulness, concerns, and limitations.

In terms of flexibility, the Chief AI Officer must manage diverse data for AI-driven analytics in epidemiology, disease surveillance, and emergency response. This ensures a comprehensive approach to data governance and analytics in the field of public health.

Question 2: What types of coordination mechanisms would be effective for agencies to model in their establishment of an AI Governance Body?

Response: Establishing an AI governance body is crucial for government agencies. This body can facilitate critical collaboration and coordination, advancing multi-agency information sharing mechanisms and supporting unified data governance with advanced analytics. The advantages include agility in responding to new AI tools, developing subject-specific SMEs, and providing a

unified organizational approach. However, challenges include scaling up, maintenance costs, and potential conflicting guidance from existing bodies.

Question 3: How can OMB best advance responsible AI innovation?

Response: OMB can best advance responsible AI innovation for public health by advocating for AI-driven applications that enhance disease surveillance, accessibility to social and health services, community outreach, and education. This advocacy should prioritize data privacy, security, and ethical responsible use.

Question 6: Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline for all agencies and uses of AI? How can they be improved?

Response: Minimum practices for AI utilization in public health should include data standardization and a common dictionary to ensure quality, privacy, and ethical application. These practices and standardization frameworks should be continually reviewed as AI technology evolves. Additionally, specific language regarding access to the provenance and security of data should consider integrity and privacy concerns such as HIPAA.

Thank you for considering our comments on this important matter. We look forward to continued collaboration in shaping responsible AI governance for federal agencies.

Sincerely,

Harris County Public Health

Washington, DC 20503

Re: Draft policy, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* (AI) OMB-2023-0020-0001

Dear Director Young:

On behalf of the physician and medical student members of the American Medical Association (AMA), I appreciate the opportunity to offer our comments to the Office of Management and Budget (OMB) on new draft policy on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI). Ensuring the responsible, equitable, ethical, and transparent design, development, and deployment of high-performing augmented intelligence (AI)-enabled tools within the health care space is a key priority for AMA members.[1] We applaud the Administration's commitment to action by releasing this proposed guidance following the Executive Order that realizes the promise of AI while managing its risks, and furthermore recognizes that the interests of Americans who increasingly use, interact with, or purchase AI and AI-enabled products in their daily lives must be protected. Such protections are especially important in critical fields like health care where mistakes by or misuse of AI could harm patients, impact costs to consumers or employers, or jeopardize safety or patient rights. We agree that the three pillars that are identified in this draft policy are critical considerations to effectuate future success from a safety or rights-impacting standpoint, both in the health care sector and beyond.

Overall, the AMA supports the actions set forth to advance the goals of strengthening AI governance, advancing responsible AI innovation, and managing risks from the use of AI. We agree with the acknowledgment that new agency requirements and guidance are both timely and necessary at this juncture. The AMA emphasizes the need for rigorous scrutiny of health care AI, as highlighted in the draft policy. We agree with the Administration that AI impacting an individual's or community's access to health care must adhere to essential standards and practices. Discussed in further detail below, the AMA has developed a set of AI Principles and health care-specific practices that should be met as AI is developed and deployed. The AMA also extends its expertise, educational resources, and unique perspectives to assist any future Chief AI Officer overseeing health care matters, as well as to assist in the development of specific AI policies and the creation of new requirements focused on the potential risks of

[1] The AMA refers to AI as "augmented intelligence"—a crucial concept in health care that emphasizes the enhancement of human decision-making through AI technologies, rather than replacing human expertise, ensuring a synergistic partnership where AI tools assist health care professionals in delivering more accurate, efficient, and personalized patient care.

relying on AI to inform or carry out agency decisions and actions, particularly when such reliance impacts safety or the rights of patients.

AMA Policy on Augmented Intelligence

AI is not a new issue to our AMA; we have been developing substantive policy and working with other stakeholders since 2018, when the AMA's House of Delegates—the AMA's policy-making body composed of every state and national specialty society—adopted our first policy on health care AI.[2] This policy provides that the AMA will leverage its ongoing engagement in digital health and other priority areas for improving patient outcomes and physicians' professional satisfaction by helping set priorities for health care AI. First and foremost, our policy supports the use of AI systems to advance the quadruple aim of health care. Specifically, AI systems should: 1) enhance the patient experience of care and outcomes; 2) improve population health; 3) reduce overall costs for the health care system; and 4) support the professional satisfaction of physicians and the health care team. Our policy supports the development of thoughtfully designed, high-quality, clinically validated health care AI that:

- Is designed and evaluated in keeping with best practices in user-centered design, particularly for physicians and other members of the health care team;
- Is transparent;
- Conforms to leading standards for reproducibility;
- Identifies and takes steps to address bias, avoids introducing or exacerbating health care disparities while actively addressing the same, including when testing or deploying new AI tools on marginalized populations; and
- Safeguards patients' and other individuals' privacy interests and preserves the security and integrity of personal information.

Initial AMA policy contemplated the use of AI in direct patient care. However, with the introduction of technologies, such as generative AI and large language models , as well as expanding use in nonclinical settings, such as payors' claims and coverage determinations, AMA policy continues to evolve. At our House of Delegates meeting in June 2023, new AMA policy[3] was adopted that recognizes that there are potential unforeseen consequences that will arise as the number of AI-enabled health care tools and systems continue to grow. The AMA has therefore recently developed new principles for AI development, deployment, and use to help foster a consistent governance structure for advancements in health care technology. Building upon current policy on AI, the principles underscore the AMA's commitment to supporting the implementation of national governance policies that prioritize the development and deployment of AI in a manner that is ethical, equitable, responsible, and transparent.

Key concepts outlined by the AMA principles include:

- **Oversight:** The AMA encourages a whole of government approach to implement governance policies to mitigate risks associated with health care AI, but also acknowledges that non-government entities have a role in appropriate oversight and governance of health care AI.
- **Transparency:** The AMA emphasizes that transparency is essential for the use of AI in health care to establish trust among patients and physicians. Key characteristics and information

[2] "Augmented Intelligence in Health Care" H-480.939.
[3] "Assessing the Potentially Dangerous Intersection Between AI and Misinformation" H-480.935; ""Use of Augmented Intelligence for Prior Authorization" D-480.956.

regarding the design, development, and deployment processes should be mandated by law where possible, including potential sources of inequity in problem formulation, inputs, and implementation.

- **Disclosure and Documentation:** The AMA calls for appropriate disclosure and documentation when AI directly impacts patient care, access to care, medical decision making, communications, or the medical record.
- **Generative AI:** To manage risk, the AMA calls on health care organizations to develop and adopt appropriate polices that anticipate and minimize negative impacts associated with generative AI. Governance policies should be in place prior to its adoption and use.
- **Privacy and Security:** Built upon the AMA's Privacy Principles, the AMA prioritizes robust measures to protect patient privacy and data security. AI developers have a responsibility to design their systems from the ground up with privacy in mind. Developers and health care organizations must implement safeguards to instill confidence in patients that personal information is handled responsibly. Strengthening AI systems against cybersecurity threats is crucial to their reliability, resiliency, and safety.
- **Bias Mitigation:** To promote equitable health care outcomes, the AMA advocates for the proactive identification and mitigation of bias in AI algorithms to promote a health care system that is fair, inclusive, and free from discrimination.
- **Liability:** The AMA will continue to advocate to ensure that physician liability for the use of AI-enabled technologies is limited and adheres to current legal approaches to medical liability.

In addition, these principles address when payors use AI and algorithm-based decision-making to determine coverage limits, make claim determinations, and engage in benefit design. We find many parallels between the proposals in the administration's draft policy and what we have developed in the principles and would welcome the opportunity to discuss how our principles may be used to influence and spark an ongoing dialogue on the impact of AI on the practice of medicine and health care delivery.

We look forward to continuing working with you to advance the integration of health care AI. Please do not hesitate to contact Shannon Curtis, Assistant Director of Federal Affairs, at Shannon.Curtis@ama-assn.org with any questions or to discuss further.

Sincerely,

James L. Madara, MD

Attachment

American Medical Association Principles for Augmented Intelligence Development, Deployment, and Use

Approved by AMA Board of Trustees on November 14, 2023

As the number of Augmented Intelligence (AI)-enabled health care tools and systems continue to grow, these technologies must be designed, developed, and deployed in a manner that is ethical, equitable, responsible, and transparent. With a lagging effort towards adoption of national governance policies or oversight of AI, it is critical that the physician community engage in development of policies to help inform physician and patient education, and guide engagement with these new technologies. It is also important that the physician community help guide development of these tools in a way that best meets both physician and patient needs, and help define their own organization's risk tolerance, particularly where AI impacts direct patient care. The AMA is committed to ensuring that AI can meet its full potential to advance clinical care and improve clinician well-being. This may only be accomplished by ensuring that physicians engage only with AI that satisfies rigorous standards to meet the goals of the quadruple aim,[1] advance health equity, prioritize patient safety, and limit risks to both physicians and patients.

These new principles build on earlier AMA policy development activities, including the 2018 foundational AMA AI policy, Augmented Intelligence in Medicine,[2] followed by 2019 policy for payment and coverage of AI.[3] However, as AI has rapidly developed beyond AI-enabled medical devices, new policy and guidance for adoption of both device and non-device uses of AI-enabled technologies is necessary to assist in deployment of these new advances to physicians and patients. These principles will serve as the foundation for AMA's evolving advocacy on AI.

The AMA is dedicated to providing continued guidance to physicians on how to best engage with new AI-enabled technologies with the understanding that policy development related to AI will likely continue to develop given the rapid pace of change in this space.

Oversight of Health Care Augmented Intelligence

There is currently no national policy or governance structure in place to guide the development and adoption of non-device AI. While the Food and Drug Administration (FDA) regulates AI-enabled medical devices, many types of AI-enabled technologies fall outside the scope of FDA oversight, including AI that may have clinical applications, such as some clinical decision support functions. While the Federal Trade Commission and the Health and Human Services Office for Civil Rights have oversight over some aspects of AI, their authorities are limited and not adequate to ensure appropriate development and deployment of AI generally, and specifically in the health care space. The AMA encourages a whole of government approach to implement governance policies that ensure overall and disparate risks to consumers and patients arising from AI are mitigated to the greatest extent possible.

In addition to government, health care institutions, practices, and professional societies share some responsibility for appropriate oversight and governance of AI-enabled systems and technologies. Beyond government oversight or regulation, purchasers and users of these technologies should have appropriate and sufficient policies in place to

[1] AI systems should enhance the patient experience of care and outcomes, improve population health, reduce overall costs for the health care system while increasing value, and support the professional satisfaction of physicians and the health care team.
[2] American Medical Association. (2018). "AI in Healthcare: A Report from the American Medical Association Board of Trustees." AMA, https://www.ama-assn.org/system/files/2019-08/ai-2018-board-report.pdf (Accessed September 14, 2023).
[3] American Medical Association. 2019). "AI in Healthcare: A Report from the American Medical Association Board of Trustees - 2019." https://www.ama-assn.org/system/files/2019-08/ai-2019-board-report.pdf (Accessed September 14, 2023).

ensure they are acting in accordance with the current standard of care. Similarly, clinical experts are best positioned to determine whether AI applications are high quality, appropriate, and whether the AI tools are valid from a clinical perspective. Clinical experts can best validate the clinical knowledge, clinical pathways, and standards of care used in the design of AI-enabled tools and can monitor the technology for clinical validity as it evolves over time.

- Health care AI must be designed, developed, and deployed in a manner which is ethical, equitable, responsible, and transparent.
- Use of AI in health care delivery requires clear national governance policies to regulate its adoption and utilization, ensuring patient safety, and mitigating inequities**.** Development of national governance policies should include interdepartmental and interagency collaboration.
- Compliance with national governance policies is necessary to develop AI in an ethical and responsible manner to ensure patient safety, quality, and continued access to care. Voluntary agreements or voluntary compliance is not sufficient.
- Health care AI requires a risk-based approach where the level of scrutiny, validation, and oversight should be proportionate to the potential overall or disparate harm and consequences the AI system might introduce. [See also Augmented Intelligence in Health Care H-480.939 at (1)]
- Clinical decisions influenced by AI must be made with specified human intervention points during the decision-making process. As the potential for patient harm increases, the point in time when a physician should utilize their clinical judgment to interpret or act on an AI recommendation should occur earlier in the care plan.
- Health care practices and institutions should not utilize AI systems or technologies that introduce overall or disparate risk that is beyond their capabilities to mitigate. Implementation and utilization of AI should avoid exacerbating clinician burden and should be designed and deployed in harmony with the clinical workflow.
- Medical specialty societies, clinical experts, and informaticists are best positioned and should identify the most appropriate uses of AI-enabled technologies relevant to their clinical expertise and set the standard of care for AI usage in their specific domain. [See Augmented Intelligence in Health Care H-480.940 at (2)]

When to Disclose: Transparency in Use of Augmented Intelligence-Enabled Systems and Technologies

As implementation of AI-enabled tools and systems continues to increase, it is essential that use of AI in health care be transparent to both physicians and patients. Transparency requirements should be tailored in a way that best suits the needs of the end users. Disclosure should contribute to physician and patient knowledge and not create unnecessary administrative burden. When AI is utilized in health care decision-making, that use should be disclosed and documented in order to limit risks to, and mitigate inequities for, both physicians and patients, and to allow each to understand how decisions impacting patient care or access to care are made. While transparency does not necessarily ensure AI-enabled tools are accurate, secure, or fair, it is difficult to establish trust if certain characteristics are hidden.

- When AI is used in a manner which directly impacts patient care, access to care, or medical decision making, that use of AI should be disclosed and documented to both physicians and/or patients in a culturally and linguistically appropriate manner. The opportunity for a patient or their caregiver to request additional review from a licensed clinician should be made available upon request.
- When AI is used in a manner which directly impacts patient care, access to care, medical decision making, or the medical record, that use of AI should be documented in the medical record.
- AI tools or systems cannot augment, create, or otherwise generate records, communications, or other content on behalf of a physician without that physician’s consent and final review.
- When health care content is generated by generative AI, including by large language models, it should be clearly disclosed within the content that was generated by an AI-enabled technology.
- When AI or other algorithmic-based systems or programs are utilized in ways that impact patient access to care, such as by payors to make claims determinations or set coverage limitations, use of those systems or programs must be disclosed to impacted parties.

© 2023 American Medical Association. All rights reserved.

- The use of AI-enabled technologies by hospitals, health systems, physician practices, or other entities, where patients engage directly with AI should be clearly disclosed to patients at the beginning of the encounter or interaction with the AI-enabled technology.

What to Disclose: Required Disclosures by Health Care Augmented Intelligence-Enabled Systems and Technologies

Along with significant opportunity to improve patient care, all new technologies in health care will likely present certain risks and have limitations that physicians must carefully navigate during the early stages of clinical implementation of these new systems and tools. AI-enabled tools are no different and are perhaps more challenging than other advances as they present novel and complex questions and risks. To best mitigate these risks, it is critical that physicians understand AI-driven technologies and have access to certain information about the AI tool or system being considered, including how it was trained and validated, so that they can assess the quality, performance, equity, and utility of the tool to the best of their ability. This information may also establish a set of baseline metrics for comparing AI tools. Transparency and explainability regarding the design, development, and deployment processes should be mandated by law where possible, including potential sources of inequity in problem formulation, inputs, and implementation. Additionally, sufficient detail should be disclosed to allow physicians to determine whether a given AI-enabled tool would reasonably apply to the individual patient they are treating. Physicians should understand that, where they utilize AI-enabled tools and systems without transparency provided by the AI developer, their risks of liability for reliance on that AI will likely increase. The need for full transparency is greatest where AI-enabled systems have greater impacts on direct patient care, such as by AI-enabled medical devices, clinical decision support, and interaction with AI-driven chatbots. Transparency needs may be somewhat lower where AI is utilized for primarily administrative, practice-management functions.

- When AI-enabled systems and technologies are utilized in health care, the following information should be disclosed by the AI developer to allow the purchaser and/or user (physician) to appropriately evaluate the system or technology prior to purchase or utilization:
    - Regulatory approval status
    - Applicable consensus standards and clinical guidelines utilized in design, development, deployment, and continued use of the technology
    - Clear description of problem formulation and intended use accompanied by clear and detailed instructions for use
    - Intended population and intended practice setting
    - Clear description of any limitations or risks for use, including possible disparate impact
    - Description of how impacted populations were engaged during the AI lifecycle
    - Detailed information regarding data used to train the model:
        - Data provenance
        - Data size and completeness
        - Data timeframes
        - Data diversity
        - Data labeling accuracy
    - Validation Data/Information and evidence of:
        - Clinical expert validation in intended population and practice setting and intended clinical outcomes
        - Constraint to evidence-based outcomes and mitigation of “hallucination” or other output error
        - Algorithmic validation
        - External validation processes for ongoing evaluation of the model performance, e.g., accounting for AI model drift and degradation
        - Comprehensiveness of data and steps taken to mitigate biased outcomes
        - Other relevant performance characteristics, including but not limited to performance characteristics at peer institutions/similar practice settings
        - Post-market surveillance activities aimed at ensuring continued safety, performance, and equity

© 2023 American Medical Association. All rights reserved.

    - Data Use Policy
        - Privacy
        - Security
        - Special considerations for protected populations or groups put at increased risk
    - Information regarding maintenance of the algorithm, including any use of active patient data for ongoing training
    - Disclosures regarding the composition of design and development team, including diversity and conflicts of interest, and points of physician involvement and review
- Physicians should carefully consider whether or not to engage with AI-enabled health care technologies if this information is not disclosed by the developer. As the risk of AI being incorrect increases risks to patients (such as with clinical applications of AI that impact medical decision making), disclosure of this information becomes increasingly important. [See also Augmented Intelligence in Health Care H-480.939]

Generative Augmented Intelligence

Generative AI is a type of AI that can recognize, summarize, translate, predict, and generate text and other content based on knowledge gained from large datasets. Generative AI tools are finding an increasing number of uses in health care, including assistance with administrative functions, such as generating office notes, responding to documentation requests, and generating patient messages. Additionally, there has been increasing discussion about clinical applications of generative AI, including use as clinical decision support to provide differential diagnoses, early detection, and intervention, and to assist in treatment planning. While generative AI tools show tremendous promise to make a significant contribution to health care, there are a number of potential risks and limitations to consider when using these tools in a clinical setting or direct patient care. To manage risk, health care organizations should develop and adopt appropriate polices that anticipate and minimize negative impacts. Physicians who are considering utilizing a generative AI-based tool in their practice should ensure that all practice staff are educated on the risks and limitations, including patient privacy concerns, and additionally, should have appropriate governance policies in place for its use prior to adoption.

- Generative AI should: (a) only be used where appropriate policies are in place within the practice or other health care organization to govern its use and help mitigate associated risks; and (b) follow applicable state and federal laws and regulations (e.g., HIPAA-compliant Business Associate Agreement).
- Appropriate governance policies should be developed by health care organizations and account for and mitigate risks of:
    - Incorrect or falsified responses; lack of ability to readily verify the accuracy of responses or the sources used to generate the response
    - Training data set limitations that could result in responses that are out of date or otherwise incomplete or inaccurate for all patients or specific populations
    - Lack of regulatory or clinical oversight to ensure performance of the tool
    - Bias, discrimination, promotion of stereotypes, and disparate impacts on access or outcomes
    - Data privacy
    - Cybersecurity
    - Physician liability associated with the use of generative AI tools
- Health care organizations should work with their AI and other health information technology (health IT) system developers to implement rigorous data validation and verification protocols to ensure that only accurate, comprehensive, and bias managed datasets inform generative AI models, thereby safeguarding equitable patient care and medical outcomes. [See Augmented Intelligence in Health Care H-480.940 at (3)(d)]
- Use of generative AI should incorporate physician and staff education about the appropriate use, risks, and benefits of engaging with generative AI. Additionally, physicians should engage with generative AI tools only when adequate information regarding the product is provided to physicians and other users by the developers of those tools.

© 2023 American Medical Association. All rights reserved.

- Clinicians should be aware of the risks of patients engaging with generative AI products that produce inaccurate or harmful medical information (e.g., patients asking chatbots about symptoms) and should be prepared to counsel patients on the limitations of AI-driven medical advice.
- Governance policies should prohibit the use of confidential, regulated, or proprietary information as prompts for generative AI to generate content.
- Data and prompts contributed by users should primarily be used by developers to improve the user experience and AI tool quality and not simply increase the AI tool's market value or revenue generating potential.

Physician Liability for Use of Augmented Intelligence-Enabled Technologies

The question of physician liability for use of AI-enabled technologies presents novel and complex legal questions and potentially poses risks to the successful clinical integration of AI-enabled technologies. As legal theories of liability and accountability for AI continue to evolve, the AMA will continue to advocate to ensure that physician liability for the use of AI-enabled technologies is limited and adheres to current legal approaches to medical malpractice.

- Current AMA policy states that liability and incentives should be aligned so that the individual(s) or entity(ies) best positioned to know the AI system risks and best positioned to avert or mitigate harm do so through design, development, validation, and implementation. [See Augmented Intelligence in Health Care H-480.939]

    - Where a mandated use of AI systems prevents mitigation of risk and harm, the individual or entity issuing the mandate must be assigned all applicable liability.
    - Developers of autonomous AI systems with clinical applications (screening, diagnosis, treatment) are in the best position to manage issues of liability arising directly from system failure or misdiagnosis and must accept this liability with measures such as maintaining appropriate medical liability insurance and in their agreements with users.
    - Health care AI systems that are subject to non-disclosure agreements concerning flaws, malfunctions, or patient harm (referred to as gag clauses) must not be covered or paid and the party initiating or enforcing the gag clause assumes liability for any harm.
- When physicians do not know or have reason to know that there are concerns about the quality and safety of an AI-enabled technology, they should not be held liable for the performance of the technology in question.

Data Privacy and Augmented Intelligence

Data privacy is highly relevant to AI development, implementation, and use. The AMA is deeply invested in ensuring individual patient rights and protections from discrimination remain intact, that these assurances are guaranteed, and that the responsibility falls with the data holders. AI development, training, and use requires assembling large collections of health data. AI machine learning is data hungry; it requires massive amounts of data to function properly. Increasingly, more electronic health records are interoperable across the health care system and, therefore, are accessible by AI trained or deployed in medical settings. AI developers may create legal arrangements, e.g., business associate agreements, that bring them under the Health Insurance Portability and Accountability Act (HIPAA) Privacy and Security Rules. Yet even HIPAA cannot protect patients from the "black box" nature of AI which makes the use of data opaque. AI system outputs may also include inferences that reveal personal data or previously confidential details about individuals. This can result in a lack of accountability and trust and exacerbate data privacy concerns. Often, AI developers and implementers are themselves unaware of exactly how their products use information to make recommendations.

It is unlikely that physicians or patients will have any clear insight into a generative AI tool's conformance to state or federal data privacy laws. Large language models (LLM) are trained on data scraped from the web and other digital

© 2023 American Medical Association. All rights reserved.

sources (including HIPAA-covered environments),[4] yet few, if any, controls are available to help users protect the data they voluntarily enter in a chatbot query. For instance, there are often no mechanisms in place for users to request data deletion or ensure that their inputs are not stored or used for future model training. While tools designed for medical use should align with HIPAA, many "HIPAA-compliant" generative tools rely on antiquated notions of deidentification, i.e., stripping data of personal information. With today's advances in computing power, data can easily be reidentified. Rather than aiming to make LLMs compliant with HIPAA, all health care AI-powered generative tools should be designed from the ground up with data privacy in mind.

The AMA's Privacy Principles were designed to provide individuals with rights and protections and shift the responsibility for privacy to third-party data holders. While the Principles are broadly applicable to all AI developers, e.g., entities should only collect the minimum amount of information needed for a particular purpose, the unique nature of LLMs and generative AI warrant special emphasis on entity responsibility and user education.

Entity Responsibility:

- Entities should make information available about the intended use of generative AI in health care and identify the purpose of its use. Individuals should know how their data will be used or reused, and the potential risks and benefits.
- Individuals should have the right to opt-out, update, or forget use of their data in generative AI tools. These rights should encompass AI training data and disclosure to other users of the tool.
- Generative AI tools should not reverse engineer, reconstruct, or reidentify an individual's originally identifiable data or use identifiable data for nonpermitted uses, e.g., when data are permitted to conduct quality and safety evaluations. Preventive measures should include both legal frameworks and data model protections, e.g., secure enclaves, federated learning, and differential privacy.

User Education:

- Users should be provided with training specifically on generative AI. Education should address:
    - legal, ethical, and equity considerations,
    - risks such as data breaches and re-identification,
    - potential pitfalls of inputting sensitive and personal data, and
    - the importance of transparency with patients regarding the use of generative AI and their data.

[See Augmented Intelligence in Health Care H-480.940 at (4),(5)]

Augmented Intelligence Cybersecurity

Data privacy relies on strong data security measures. There is growing concern that cyber criminals will use AI to attack health care organizations. AI poses new threats to health IT operations. AI-operated ransomware and AI-operated malware can be targeted to infiltrate health IT systems and automatically exploit vulnerabilities. Attackers using ChatGPT can craft convincing or authentic emails and use phishing techniques that entice people to click on links—giving them access to the entire electronic health record system.

AI is particularly sensitive to the quality of data. Data poisoning is the introduction of "bad" data into an AI training set, affecting the model's output. AI requires large sets of data to build logic and patterns used in clinical decision-making. Protecting this source data is critical. Threat actors could also introduce input data that compromises the

[4] Feathers, T., et al. "Facebook is receiving sensitive medical information from hospital websites. The Markup. June 16, 2022." https://themarkup.org/pixel-hunt/2022/06/16/facebook-is-receiving-sensitive-medical-information-from-hospital-websites.

© 2023 American Medical Association. All rights reserved.

overall function of the AI tool. Failure to secure and validate these inputs, and corresponding data, can contaminate AI models—resulting in patient harm.

Because stringent privacy protections and higher data quality standards might slow model development, there could be a tendency to forgo essential data privacy and security precautions. However, strengthening AI systems against cybersecurity threats is crucial to their reliability, resiliency, and safety.

AI cybersecurity considerations:

- AI systems must have strong protections against input manipulation and malicious attacks.
- Entities developing or deploying health care AI should regularly monitor for anomalies or performance deviations, comparing AI outputs against known and normal behavior.
- Independent of an entity's legal responsibility to notify a health care provider or organization of a data breach, that entity should also act diligently in identifying and notifying the individuals themselves of breaches that impact their personal information.
- Users should be provided education on AI cybersecurity fundamentals, including specific cybersecurity risks that AI systems can face, evolving tactics of AI cyber attackers, and the user's role in mitigating threats and reporting suspicious AI behavior or outputs.

Payor Use of Augmented Intelligence and Automated Decision-Making Systems

Payors and health plans are increasingly using AI and algorithm-based decision-making in an automated fashion to determine coverage limits, make claim determinations, and engage in benefit design. Payors should leverage automated decision-making systems that improve or enhance efficiencies in coverage and payment automation, facilitate administrative simplification, and reduce workflow burdens. While the use of these systems can create efficiencies such as speeding up prior authorization and cutting down on paperwork, there is concern these systems are not be designed or supervised effectively—creating access barriers for patients and limiting essential benefits.

Increasingly, evidence shows that payors are using automated decision-making systems to deny care more rapidly, often with little or no human review. This manifests in the form of increased denials, stricter coverage limitations, and constrained benefit offerings. For example, a payor allowed an automated system to cut off insurance payments for Medicare Advantage patients struggling to recover from severe diseases, forcing them to forgo care or pay out of pocket. In some instances, payors instantly reject claims on medical grounds without opening or reviewing the patient's medical record. There is also a lack of transparency in the development of automated decision-making systems. Rather than payors making determinations based on individualized patient care needs, reports show that decisions are based on algorithms developed using average or "similar patients" pulled from a database. Models that rely on generalized, historical data can also perpetuate biases leading to discriminatory practices or less inclusive coverage.[5,6,7,8]

We must ensure that automated decision-making systems do not reduce needed care, nor systematically withhold care from specific groups. Steps should be taken to ensure that these systems are not overriding clinical judgement. Patients and physicians should be informed and empowered to question a payor's automated decision-making.

There should be stronger regulatory oversight, transparency, and audits when payors use these systems for coverage, claim determinations, and benefit design. [See Use of Augmented Intelligence for Prior Authorization D-480.956; Prior Authorization and Utilization Management Reform H-320.939]

- Use of automated decision-making systems that determine coverage limits, make claim determinations, and engage in benefit design should be publicly reported, based on easily accessible evidence-based clinical guidelines (as opposed to proprietary payor criteria), and disclosed to both patients and their physician in a way that is easy to understand.
- Payors should only use automated decision-making systems to improve or enhance efficiencies in coverage and payment automation, facilitate administrative simplification, and reduce workflow burdens. Automated decision-making systems should never create or exacerbate overall or disparate access barriers to needed benefits by increasing denials, coverage limitations, or limiting benefit offerings. Use of automated decision-making systems should not replace the individualized assessment of a patient's specific medical and social circumstances and payors' use of such systems should allow for flexibility to override automated decisions. Payors should always make determinations based on particular patient care needs and not base decisions on algorithms developed on "similar" or "like" patients.
- Payors using automated decision-making systems should disclose information about any algorithm training and reference data, including where data were sourced and attributes about individuals contained within the training data set (e.g., age, race, gender). Payors should provide clear evidence that their systems do not discriminate, increase inequities, and that protections are in place to mitigate bias.
- Payors using automated decision-making systems should identify and cite peer-reviewed studies assessing the system's accuracy measured against the outcomes of patients and the validity of the system's predictions.
- Any automated decision-making system recommendation that indicates limitations or denials of care, at both the initial review and appeal levels, should be automatically referred for review to a physician (a) possessing a current and valid non-restricted license to practice medicine in the state in which the proposed services would be provided if authorized and (b) be of the same specialty as the physician who typically manages the medical condition or disease or provides the health care service involved in the request prior to issuance of any final determination. Prior to issuing an adverse determination, the treating physician must have the opportunity to discuss the medical necessity of the care directly with the physician who will be responsible for determining if the care is authorized.
- Individuals impacted by a payor's automated decision-making system, including patients and their physicians, must have access to all relevant information (including the coverage criteria, results that led to the coverage determination, and clinical guidelines used).
- Payors using automated decision-making systems should be required to engage in regular system audits to ensure use of the system is not increasing overall or disparate claims denials or coverage limitations, or otherwise decreasing access to care. Payors using automated decision-making systems should make statistics regarding systems' approval, denial, and appeal rates available on their website (or another publicly available website) in a readily accessible format with patient population demographics to report and contextualize equity implications of automated decisions. Insurance regulators should consider requiring reporting of payor use of automated decision-making systems so that they can be monitored for negative and disparate impacts on access to care. Payor use of automated decision-making systems must conform to all relevant state and federal laws.

Risk Management for Agency Use of Artificial	)	
Intelligence Draft Memorandum	)	Docket No.: OMB-2023-0020

COMMENTS OF THE CITY OF NEW YORK

The City of New York ("City"), through its Office of Technology and Innovation ("OTI"), submits this response to the Office of Management and Budget's ("OMB") Request for Comment on the draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*.[1] While the draft memorandum directly impacts the operations of federal agencies only, the City has a vested interest in the federal government's development and deployment of effective, useful, and practical guidelines and requirements for federal agencies, given that federal policymaking and practices often serve as a model for state and local governments.

In October 2023, the City published its own AI Action Plan ("Action Plan"),[2] a pioneering commitment by the City to meaningfully and responsibly use and govern AI within City agencies. Included in the Action Plan are a series of initiatives related to the development and deployment of guidelines and policy for City agencies that are very much aligned with the President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence[3] and OMB's subsequent draft memorandum. The City appreciates the efforts of both federal documents and views them as critical and influential references as it proceeds in developing its own responsible AI framework.

Generally, the City believes that a framework for responsible governance of AI must strike a balance between a complex set of needs, including: ensuring the framework's constitutive parts are sufficiently comprehensive to address relevant risks and opportunities; outlining requirements such that they are both generalizable across diverse agencies and policy domains, and sufficiently specific to produce meaningful outputs; and realistically accounting for the administrative burden new requirements will pose for agencies. These dynamics may be in opposition with one another; specifically, as additional or more detailed requirements are deployed to ensure a comprehensive approach to risk or opportunity, administrative burden increases. The goal in developing such a framework should be a set of requirements that are as comprehensive as possible, generalizable across agencies while preserving unique

[2] OTI, *The New York City Artificial Intelligence Action Plan,* (2023), available at https://www.nyc.gov/assets/oti/downloads/pdf/reports/artificial-intelligence-action-plan.pdf

[3] Executive Order 14110 of October 30, 2023, https://www.federalregister.gov/documents/2023/11/01/2023-24283/safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence

considerations for each, and minimally burdensome to avoid negative impacts on agencies' ability to deliver their core services.

Further, while the City believes that AI governance is context-specific, in that approaches to governance must acknowledge the unique circumstances for a particular government (or agency) and its constituents, it also believes that state and local governments will benefit from the emerging standardization of policy, practices, and other approaches at the federal level. For example, the AI Risk Management Framework[4] published by the National Institute for Standards and Technology ("NIST") and the White House Blueprint for an AI Bill of Rights[5] represent federal approaches that state and local governments may use as either a template or point of reference for their own governance, thereby encouraging shared or similar practices across governments. Similarly, the City routinely leverages the concept of "reuse" from the FedRAMP program[6], to the extent practical, for technology solutions with an existing security accreditation by the federal government or similar authorization body.

The City's comments submitted in this response reflect the value that the City places on federal policymaking and practices in informing and guiding local governments' own policymaking. While overall supportive of the requirements and recommendations within the draft memorandum, the City wishes to highlight, through the lens of the dynamic balance of factors cited above, certain areas in which the draft memorandum's commitments for federal agencies may impact the City indirectly to the extent they serve as a model for the City's own practices. These specific sections of the draft memorandum represent, generally, areas in which the City is in agreement with OMB's approach but would suggest additional considerations to support a better balance for agency efforts. While the primary effect of OMB's draft guidance is a direct call to action for federal agencies, it is the City's hope that through these comments OMB considers the secondary effect that its guidance will have serving as a model or template for state and local governments.

The sections that follow enumerate the City's comments for selected sections of the draft memorandum.

I. Section 3(a)(iv)

The City is supportive of efforts to document use of AI for the purposes of improved public transparency and accountability; the City currently publishes a "directory" of algorithmic tools, many of which are considered applications of AI, under the auspices of New York City's Local Law 35 of 2022.[7] It is the City's experience that agencies are able to more effectively and substantially report on uses of algorithms or AI when provided with guidance to navigate complex and imperfect definitions; in particular, the term "artificial intelligence," even when defined in law, is quite broad and open to interpretation. While Section 3(a)(iv) directs agencies to comply with Section 7225 of the Advancing American AI Act,[8] which

[6] FedRAMP, *Program Basics*,

[7] New York City Office of Technology and Innovation, *CY 2022 Summary of Agency Compliance Reporting of Algorithmic Tools*, https://www.nyc.gov/assets/oti/downloads/pdf/reports/2022-algorithmic-%20tools-reporting.pdf

[8] Advancing American Artificial Intelligence Act, 40 USC 11301, Sec. 7225, https://uscode.house.gov/view.xhtml?req=advancing+american+ai+act&f=treesort&fq=true&num=1&hl=true&edition=prelim&granuleId=USC-prelim-title40-section11301

itself cites the definition of AI from Section 238(g) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019,[9] the City recommends that OMB develop additional guidance for agencies that enables them to meaningfully interpret the definition of AI and therefore appropriately comply with reporting requirements.

II. Section 3(c)

The City enthusiastically agrees with the inclusion of a wide, multidisciplinary array of agency personnel in matters related to AI governance, and equally agrees that AI risk management should be considered as part of broader risk management frameworks. However, the City finds that the draft memorandum includes few specific activities that the mandated AI governance boards are expected to carry out. In the absence of additional clarity, it is more difficult for local governments to meaningfully evaluate this approach to governance for their own purposes. Greater clarity about these boards and their responsibilities would enhance the City's ability to continue to develop its own governance apparatus.

III. Section 4(a)

The City broadly supports efforts to advance the use of AI by agencies and appreciates the breadth of planning considerations required by this section. The City however has several concerns regarding the requirement to produce annual AI strategies. First, while the apparent spirit of these strategies is to spur innovation and enable broader AI utilization within agencies, the very agencies that have reduced AI maturity (and therefore greater opportunity for increased adoption of AI) may be more challenged to produce these strategies, given the administrative resources required, including a multidisciplinary workforce with the depth and breadth of requisite AI-related subject matter. Second, all agencies that are required to produce AI strategies will also be required to produce compliance plans consistent with the requirements of Section 3(a)(iii). Agencies across the full range of the AI-maturity spectrum may find the production of both documents to be resource- and time-intensive. Additionally, some requirements for the strategies and compliance plans could be considered to overlap. For example, , Section 4(b) instructs agencies to remove barriers to responsible use of AI; to the extent that those requirements exist within the memorandum, a compliance plan pursuant to Section 3(a)(iii) should include the agency's description of plans to comply with Section 4(b). To address these concerns, the City recommends, first, that the requirements of the compliance plans and AI strategies be sufficiently differentiated. Second, the City recommends that the requirements for AI strategies be phased, such that for the inaugural report only elements (i), (ii), (iii), and (vi) be required to serve as a baseline, with the additional elements to be included beginning in the second year of reporting.

IV. Section 4(a)(iv)

The City broadly supports this initiative. However, the City recommends that the development of enterprise capacity for AI innovation, especially as it relates to the cybersecurity compliance necessary to build, test, and maintain AI, be established through updating the existing federally required security accreditation and authorization process, i.e. NIST security controls and FedRAMP authorization process. This would allow for a standardized approach to ensure cybersecurity compliance of AI-enabled systems.

V. Section 4(b)

The City is supportive of efforts to enable the use of AI within government. However, the City finds that the implication of the section's heading, "Removing Barriers to the Responsible Use of Artificial

[9] John S. McCain National Defense Authorization Act for Fiscal Year 2019, https://www.govinfo.gov/content/pkg/BILLS-115hr5515enr/pdf/BILLS-115hr5515enr.pdf

Intelligence," is not fully aligned with the enumerated recommendations that follow. The City feels that the recommendations point to valuable considerations and governance tools that can be leveraged to work in harmony with, and not in conflict with, responsible use of AI. The City recommends reframing this section heading to reflect the importance of those recommendations and the role they play in making responsible AI a reality. Further, the City also recommends the addition of "Privacy" as a sixth consideration for special attention in relation to embracing innovation. The City considers privacy as a core element to balance with innovation, not as a trade off or barrier to technological advancement. Agencies should be encouraged to review and update, as necessary, privacy protocols to account for new or novel applications related to AI. Where identifying information is concerned, privacy policies and regulation must meet the needs of responsible use of AI.

VI. Section 4(b)(iii)

As described above in paragraph IV, the City concurs that agencies should update their relevant processes for security authorization to support AI-enabled systems. However, standardized controls should be developed or updated with considerations for AI as part of the relevant and required security authorization process. This would allow for immediate benefits to be realized across the broadest set of stakeholders and avoid a segmented agency-by-agency approach.

The City incorporates the spirit of the federal government's initiative on "reuse" and "reciprocity" as it relates to security accreditation and authorization, especially for cloud-based technology solutions. While the FedRAMP program is only available to the federal sector, the City has aligned the spirit of its processes to its cloud authorization process. As an example, the City concurs with OMB's statement on "strongly incentivizing reuse of one FedRAMP authorization by multiple agencies" as described in the most recent draft memorandum, *Modernizing the Federal Risk and Authorization Management Program (FedRAMP)*[10]. The unification and alignment of this security authorization process, by incorporating AI security control considerations, would allow for greater utilization and speed to deployment for new AI capabilities embedded in technology solutions.

The City is also interested in better understanding the role OMB or other federal agencies (e.g., NIST) would have in the development of training data sets made available to government agencies for the quality assurance of AI models, should they be developed for government-wide use.

VII. Section 4(b)(iv)

The City concurs in prioritizing workforce development in AI and would recommend including the skillsets needed to promote the development of AI systems and to protect and defend them through both AI and cybersecurity.

VIII. Section 4(b)(v)

The City understands the role that generative AI is currently playing in both the national discourse and in very concrete strategic planning efforts within government bodies. Indeed, the City will be prioritizing the publication of preliminary guidance for its agencies related to generative AI as one of its first actions to implement from its AI Action Plan. However, singling out generative AI within the "Removing Barriers" section of the draft memorandum may lead to the accidental minimization of efforts to identify highly

[10] Executive Office of the President, Office of Management and Budget, *Modernizing the Federal Risk Authorization Management Program (FedRAMP), https://www.cio.gov/assets/files/resources/FedRAMP-updated-draft-guidance-2023.pdf*

beneficial use cases of other types of AI technologies. Instead the City recommends that this section be framed around proactive identification of beneficial use cases for all types of AI, including generative AI.

IX. Section 5(b)

This section indicates that agencies must annually report to OMB the list of any purposes for which AI is safety-impacting or rights-impacting. The City is interested in better understanding the role that those agency-specific lists will continue to play in defining the landscape of safety- and rights-impacting AI, and if the intent is to make it available to be shared with other government agencies. The City appreciates the draft memorandum's list of presumed use cases as a helpful guide for steering its own considerations for understanding AI impacts, but feels that additional uses surfaced by agencies would similarly be helpful if incorporated into ongoing, visible guidance.

X. Section 5(b)(ii)(C)

The City recommends that translation of official communications be considered on its own as a presumed rights-impacting purpose. Translation is a critical component of a wide array of government services—not just those associated with immigration—and while not all occurrences of translation services may be materially impactful, many are.

XI. Section 5(c)

As stated previously, federal work in the space of AI governance and risk management has been an essential point of reference for the City's work. The City encourages OMB to leverage the opportunity of this draft memorandum to help harmonize the efforts of the NIST AI Risk Management Framework and Blueprint for an AI Bill of Rights, either within the draft memorandum itself or in subsequent guidance issued to agencies. The City is also interested in OMB's approach to harmonizing the newly released DHS CISA and UK NCSC guidelines for secure AI system development[11] within the body of this draft memorandum or subsequent guidance. As local governments, including the City, embark on their own efforts to establish risk management practices, guidance on the appropriate utilization of each of the frameworks—and the relationship between them—is critical to reducing ambiguity and enabling policymakers to create coherent and effective practices.

XII. Section 5(c)(iv)-(v)

The City is immensely supportive of OMB's efforts to produce in Sections 5(c)(iv) and 5(c)(v) a set of concrete requirements to operationalize a risk management process. The City also largely agrees with most of the individual requirements contained within these sections, but does have concerns that, as currently drafted, the execution of the totality of these requirements represents a substantial administrative cost for agencies and could benefit from alignment with existing processes and management frameworks. And while the draft memorandum applies only to federal agencies, as mentioned previously, the City expects the federal model as constructed in this draft memorandum to strongly influence legislative and executive approaches to policymaking. As such, the City urges OMB to assess the drafted requirements in these sections both collectively and individually against the expected administrative impact for agencies.

Additionally, specific to Sections 5(c)(iv)(B)-(C), the City recommends additional guidance on the distinction between testing versus evaluation activities. Because definitions of testing and evaluation may

[11] Cybersecurity & Infrastructure Security Agency, *DHS CISA and UK NCSC Release Joint Guidelines for Secure AI System Development,* https://www.cisa.gov/news-events/news/dhs-cisa-and-uk-ncsc-release-joint-guidelines-secure-ai-system-development

differ from agency to agency or across policy frameworks, and given that ownership over AI testing and evaluation activities must differ as required by this draft memorandum, a clearer distinction between those activities would benefit efforts to complete testing and evaluation requirements in practice.

Finally, specific to Section 5(c)(iv)(H), and as previously stated, the City strongly supports efforts to enable transparency around the use of AI by agencies. In the City's experience, such transparency is improved when agencies report information about their AI use through a structured and standardized template. The City recommends OMB establish such a template for federal agencies.

In summary, the City wishes to convey its appreciation and support for OMB's draft memorandum and to reiterate the importance of such federal guidance within the local policymaking context. To that extent the City encourages OMB in finalizing its memorandum to consider the implications of its requirements in their final form on the efforts and trajectories of state and local governments. It is the City's sincere hope that a final OMB memorandum will continue to thoughtfully balance comprehensiveness, detail, and awareness of administrative burden, such that its utility can be expanded beyond the direct application to federal agencies.

PUBLIC SUBMISSION

As of: March 22, 2024
Tracking No. lps-s26m-vlub
Comments Due: December 05, 2023

Docket: OMB-2023-0020
Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Comment On: OMB-2023-0020-0001
Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

CIPL response to OMB Request for Comments on Agency Use of Artificial Intelligence Draft Memorandum - FINAL

cipl_ten_recommendations_global_ai_regulation_oct2023

Response by the Centre for Information Policy Leadership to OMB's Request for Comments on its Proposed Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

Docket number OMB–2023–0020
Submitted December 5, 2023

The Centre for Information Policy Leadership (CIPL)[1] welcomes the opportunity to respond to the request for comments by the Office of Management and Budget (OMB) on its draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence."[2]

CIPL supports the adoption of risk management practices for uses of AI that impact the rights and safety of the public. As noted in our paper "Ten Recommendations for Global AI Regulation,"[3] any regulatory approach to AI should seek to protect fundamental human rights and minimize risks to individuals and society, while enabling development and use of AI for the benefit of both.[4] A holistic risk-based approach would facilitate practical protective measures that are proportional to the risks and benefits of a particular AI system.[5] Our paper is enclosed with this submission.

Indeed, OMB's proposed memorandum recognizes the need to apply a **risk-based approach** by requiring agencies to complete an AI impact assessment.[6] CIPL has been on the forefront of promoting a risk-based approach for more than 20 years. CIPL's Accountability Framework[7] (see Figure 1) includes the core elements for any organizational privacy, data, or technology governance program. An accountability-based program seeks to ensure that organizations (as well as government agencies) implement demonstrable processes and measures that help them comply with applicable legal requirements, adopt best practices, and improve societal trust in legitimate and beneficial uses of data.

Figure 1

Source: CIPL

An accountability framework expressly requires entities to perform **contextual risk assessments**, which enable them to (1) identify the impact on individuals and society of data and technology uses; (2) weigh the identified and potentially competing risks and benefits; and (3) devise appropriate mitigations and controls that reduce or minimize the risks while also preserving the benefits.

OMB's proposed memorandum appropriately requires agencies to identify "context-specific risks that are associated with their determined use cases and address them as appropriate."[8] It also requires agencies to conduct adequate testing to ensure that the AI, as well as components that rely on it, will work in its intended real-world context.[9] CIPL supports the OMB's context-specific approach.

Moreover, consistent with CIPL's approach, OMB's proposed memorandum encourages agencies to foster innovation, requiring agencies to improve their ability to use AI in ways that benefit the public and increase mission effectiveness.[10]

Indeed, the OMB's proposed memorandum appears to address all seven elements of CIPL's Accountability Framework:

1. Leadership & Oversight: Each agency must designate a Chief AI Officer, who bears primary responsibility on behalf of the head of the agency for implementing OMB's memorandum and coordinating implementation with other agencies.[11] Moreover, agencies must ensure that AI issues receive adequate attention from each agency's senior leadership.[12] Agencies identified in the Chief Financial Officer (CFO) Act must establish AI Governance Boards.[13]

2. Risk Assessment: As mentioned above, agencies must complete an AI impact assessment before using AI presumed to impact the rights and safety of the public.[14]
3. Policies & Procedures: Each agency must submit to OMB and post publicly on the agency's website either a plan to achieve consistency with the memorandum, or a written determination that the agency does not use and does not anticipate using covered AI.[15]
4. Transparency: Agencies must annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency's website.[16] Agencies must ensure that the AI's entry in the use case inventory serves as adequately detailed and generally accessible documentation of the system's functionality that provides public notice of the AI to its users and the general public. [17]
5. Training & Awareness: Agencies must ensure there is sufficient training and oversight for operators of the AI to interpret and act on the AI's output.[18]
6. Monitoring & Verification: Agencies must conduct ongoing monitoring and establish thresholds for periodic human review.[19]
7. Response & Enforcement: Upon identifying new or significantly altered risks to rights or safety, agencies must take steps to mitigate those risks, including, as appropriate, through updating the AI to reduce its risks or implementing non-technical mitigations, such as greater human oversight.[20]

CIPL has produced a considerable portfolio of thought leadership specifically related to AI governance. We incorporate the following documents by reference and invite the OMB to review them individually:

- In October 2023, CIPL published "Ten Recommendations for Global AI Regulation," which seeks to guide AI policymaking and regulation to ensure the development and deployment of accountable, responsible, and trustworthy AI.[21] (We have attached this paper as part of our submission).
- In June 2023, CIPL submitted a response to the U.S. National Telecommunications and Information Administration's Request for Comments on Artificial Intelligence Accountability.[22]
- In March 2023, CIPL submitted a response to the California Privacy Protection Agency's Invitation for Preliminary Comments on Proposed Rulemaking for cybersecurity audits, risk assessments, and automated decision-making.[23]

Moreover, CIPL will be releasing a **new report on accountable AI governance** in the near future; we look forward to sharing that report with OMB upon publication.

CIPL also has a rich history of convening stakeholders for thoughtful and meaningful discussions on AI. For example:

- In November 2023, CIPL hosted a roundtable discussion in Brussels exploring the latest developments on the EU AI Act, how some long-established data protection principles may be in tension with AI, and concrete examples of current best practices to address risks and challenges.[34]
- In October 2023, in the margins of the UK's AI Safety Summit, CIPL co-hosted a London event with AI Fringe that delved into best practices from organizations building and implementing programs and procedures for responsible AI development, deployment, and compliance.[35]
- Also in October 2023, CIPL hosted a side event at the 45th Global Privacy Assembly in Bermuda that explored a range of important questions associated with the responsible development and deployment of AI and considered concrete examples of current best practices and attempts to address the risks and challenges.[36]
- In September 2023, CIPL hosted its annual Executive Retreat in Washington, DC, which focused on the future of AI, responsible innovation, the challenges posed by emerging technologies, the implications of AI's rapid rise for data regulation, policy, enforcement, and more.[37]
- In June 2023, CIPL hosted a roundtable that shed light on the technology that underpins generative AI and explored the challenges encountered while developing generative AI tools.[38]
- In May 2023, CIPL hosted a webinar on the evolving role of the Chief Privacy Officer amidst the rapid acceleration in and adoption of generative AI and other AI tools.[39]
- In May 2022, CIPL hosted a roundtable discussion with MEP Dragoș Tudorache on the European Commission's proposed AI Act.[40]
- In April 2022, CIPL hosted a roundtable discussion with MEP Axel Voss on the European Commission's proposed AI Act.[41]

Annex I – CIPL Accountability Framework 14

Annex II – Mapping Best Practices in AI Governance to the CIPL Accountability Framework 15

INTRODUCTION

Artificial Intelligence (AI)[i] is generating wide and growing societal benefits, including powering medical research, addressing climate change, transforming industries, and modernizing governments. At the same time, the rapid rollout and adoption of new applications, such as generative AI chatbots and image generators, have intensified longstanding concerns and raised new questions related to privacy and data protection, transparency and explainability, human rights, intellectual property, security, bias, workforce impacts, generation and dissemination of misinformation and disinformation; and other societal effects. In response, organizations are developing operational controls and governance frameworks to ensure responsible development and deployment of AI; industry experts are working to develop standards; policymakers are writing new laws; and regulators are testing the limits of existing authorities and proposing new ones.[ii] However, there is no consensus among countries on the best approach to regulating AI: should the focus be hard regulation, co-regulatory models, certifications and assurances, industry standards, or some combination?[iii]

CIPL has been a thought leader on organizational accountability and a risk-based approach to data policy and practices for over 20 years, and was an early contributor toward scoping challenges and defining solutions for AI governance and industry practices. Key CIPL contributions in this space include *Artificial Intelligence and Data Protection in Tension* (October 2018), *Hard Issues and Practical Solutions* (February 2020) and *Artificial Intelligence and Data Protection: How the GDPR Regulates AI* (March 2020).[iv] CIPL has also prepared detailed responses to public consultations on AI policy in Brazil, the European Union, the United Kingdom, and the United States.[v]

Drawing on this experience and our extensive engagement with private sector leaders developing and deploying AI technologies, policymakers, and regulators, CIPL offers in this paper ten recommendations to guide AI policymaking and regulation to enable accountable, responsible, and trustworthy AI. These ten recommendations encapsulate CIPL's view on a layered or three-tiered approach to AI regulation:

a) principle- and outcome -based rules,
b) demonstrable organizational accountability, and
c) robust and smart regulatory oversight.

Such an approach provides future-proof rules grounded in core principles that can guide ethical development and deployment of AI even as technology and use cases evolve. We describe this approach below.

Recommendations for Regulating AI

CIPL recommends a risk-based and tiered approach to regulating AI that builds on existing laws and standards and on accountable practices of organizations. This approach should be backed by innovative regulatory oversight and co-regulatory instruments.

Any legislative or regulatory approach to AI should follow these overarching recommendations:

A. Principle-and Outcome-Based Rules
   1. Create a flexible and adaptable framework that defines the outcomes to be achieved, rather than prescribing details of how to achieve them
   2. Adopt a risk-based approach that considers risks and benefits holistically
   3. Build on existing hard and soft law foundations
   4. Empower individuals through transparency, explainability, and mechanisms for redress

B. Demonstrable Organizational Accountability
   5. Make demonstrable organizational accountability a central element of AI regulations
   6. Advance adoption of accountable AI governance practices
   7. Apportion liability carefully, with a focus on the party most closely associated with generating harm

C. Smart Regulatory Oversight
   8. Create mechanisms for coordination and cooperation across regulatory bodies
   9. Institute cooperation-based regulatory oversight and enable ongoing regulatory innovation
   10. Strive for global interoperability

I. PRINCIPLE- AND OUTCOME-BASED RULES

1. Create a flexible and adaptable framework that defines the outcomes to be achieved, rather than prescribing details of how to achieve them

To be effective, AI regulations must be able to remain relevant as technology and use-cases continue to advance. Any rules should be *technology neutral*: a framework that is overly prescriptive and specific to individual technologies or current business models and practices risks becoming quickly outdated and inhibiting beneficial innovations. Indeed, an approach based on lists of specific technologies will require frequent amendments to keep up with technological change. If rules include lists of presumptively high-risk technologies and applications, they should enable those presumptions to be rebuttable and to evolve over time.

Rules should also be *principle- and outcome-based*. They should enable organizations to ensure the required outcomes (e.g., fairness, non-bias, transparency, accuracy, security, human oversight)

through risk-based, verifiable internal policies, procedures and controls that are appropriate in their specific contexts, without prescribing how to achieve these outcomes. Such an approach provides developers the flexibility to innovate, including the ability to innovate in the actual controls, technical tools and safeguards, while maintaining consistency with core principles and outcomes.[vi]

Similarly, a regulatory framework should not be overly prescriptive as to methodologies of AI impact- and risk assessments, but describe criteria that should be considered when assessing risks and benefits of an AI application and leave it to the competent regulators to provide further tailored, realistic and practical guidance in collaboration with those developing and deploying AI technologies.

At the same time, the rules should provide as much certainty as possible regarding their scope of application. For example, a regulatory framework for AI must define AI so that stakeholders can clearly understand what systems are covered by the rules. Absent such clarity and outcome-based focus, regulatory ambiguity and regulatory over-prescription will risk inhibiting investment and innovation—especially for small- and medium-sized enterprises (SMEs) and start-ups that are powerful engines of AI innovation and investment.

2. Adopt a risk-based approach that considers risks and benefits holistically

Any regulatory approach to AI should seek to protect fundamental human rights and minimize risks to individuals and society, while enabling development and use of AI for the benefit of both. Indeed, risks to individuals and society can also materialize from *not* using effective AI technologies, such as those that have the capacity to predict and prevent disease, or to reduce online harm, cybersecurity threats and fraud. A holistic risk-based approach promotes this goal by facilitating practical protective measures that are proportional to the risks and benefits of a particular AI system. Its focus is on potential impacts of AI technology in the context of specific use cases.

A risk-based regulatory framework for AI would provide non-exhaustive criteria to assist organizations to determine the likelihood and severity of any harm resulting and the measures required to mitigate it. Assessing and understanding the potential impact of their AI applications allows organizations to tailor their mitigations to the actual risks and avoid the implementation of unnecessary measures. For example, k-nearest neighbors algorithm (KNN) is a machine learning algorithm used in a variety of applications[vii]: in retail to recommend products, in healthcare to predict the risk of heart attacks and prostate cancer, in finance to detect fraudulent activity, in agriculture to predict crop yield and in transportation to predict and optimize traffic. These different uses of the same KNN algorithm have different levels of risk – the likelihood and severity of harm in recommending songs or clothing differ from the same in emergency medicine.

A risk-based framework should also assess the potential benefits of an AI system for individuals, organizations and society. These can then be weighed against the identified risks of deploying (or not deploying) AI. For example, the risks from autonomous vehicles (AVs) depend on the different surroundings in which they are deployed. There is arguably a lower risk of harm to people in deploying autonomous vehicles in mining and farming as opposed to urban or residential areas. At the same time, autonomous vehicles in the former settings offer different benefits, such as easing labor supply, supporting sustainable farming and improving productivity[viii]. The same example is helpful for highlighting the importance of weighing carefully the metrics by which to measure risk: one could assess risk of AVs versus the status quo (a world where most cars are driven by people) and/or a designated, optimal standard for AVs.

In short, the outcomes of holistic risk assessments for the use of a specific AI technology may vary significantly across use cases. From a policymaking perspective, this means that it may be hard to definitively identify high or low risk uses in advance, as the context of deployment is key. A risk-based approach is preferable to a categorical approach of defining AI systems that are automatically deemed to be high-risk. For example, considering all AI systems that are making inferences based on biometric data as high risk could encompass relatively low-risk ancillary uses, such as where AI is used to apply filters or improve video quality in video calls.

A more suitable approach would be:

A) to describe factors, criteria and potential harms that risk assessments should consider;
B) to provide, at most, an illustrative list of potentially higher vs. lower risk uses that can be rebutted in each particular case;
C) to provide ongoing guidance on how to assess risks and benefits based on learnings over time.

3. Build on existing hard and soft law foundations

A flexible and adaptable AI regime should build on existing legal frameworks, including regulations and legislation ("hard laws") and "soft law" (e.g., the OECD AI Principles). Many sectors where AI finds application are already highly regulated (e.g., healthcare, finance) and existing laws and regulations already provide requirements, compliance structures, and remedies that apply to the use of AI. However, relevant existing laws and regulations may also have to be interpreted in a new way and adapted to the realities of AI. Where there are regulatory gaps concerning AI-related risks, they should be closed with targeted regulatory and co-regulatory intervention, prioritizing sectors where existing regulations do not apply.

Relying on existing hard law frameworks to the extent possible reduces the risk of creating overlapping or conflicting rules that could lead to legal uncertainty and inconsistent protections. Existing anti-discrimination, consumer protection, intellectual property, and importantly, data protection and privacy rules are relevant to address many of the most important risks associated with AI. For example, in March 2020, CIPL produced a comprehensive analysis describing how the EU General Data Protection Regulation already regulates AI in relation to use of personal data.[ix] Where there are gaps in legislative frameworks—as in the United States, which currently lacks a comprehensive federal privacy law—filling them is an important foundation for sound AI regulation.[x] Where existing frameworks are relevant, regulatory agencies can foster compliance by issuing guidance on how those rules apply to AI. By consulting with a range of stakeholders, regulators can identify circumstances where such guidance will be most useful.

Further, it is important to recognise that existing rules may require some adaptation and evolved regulatory interpretation to align them with developments in AI technology. For example, certain principles found in many data protection law, such as lawful basis for processing, purpose specification and use limitation, may be in tension with the needs of AI systems and the way they operate.

As to the concept of lawful basis, there may not be sufficient lawful bases in current data protection laws to enable AI developers to use sensitive categories of personal data, such as health, gender, and ethnicity to ensure the AI model is trained and operates in a way that does not result in biased or discriminatory outcomes. Also, if personal data are processed based on a specific legal basis for specified purposes, and used only for those purposes or for "compatible" purposes, often with

narrow interpretations as to what constitutes "compatible", this may contradict the nature of how AI algorithms operate and learn. Given AI's potential for discovering new and unforeseen uses of data, these principles may unnecessarily thwart beneficial applications of AI unless they are given a broader interpretation for the AI context. An example for such a broader interpretation would be to apply a broader definition of "compatible" that includes any purposes that do not negate or conflict with the initial purpose and do not increase the risk of harm to individuals. Another solution would be to consider algorithmic training as a purpose on its own, separate from the purpose of deploying the algorithm to a particular use-case. This would allow broader collection and use of data in the training phase in order to ensure proper training and functioning of the algorithm. Finally, similar tensions arise with respect to the principles of data minimization and retention limitation, which may limit algorithms' opportunities to "learn" through recognition of correlations. In short, if certain traditional data protection principles are interpreted too rigidly, they may block development and deployment of beneficial AI applications—or have unintended consequences such as introducing unwanted bias, by limiting access to diverse training data.[xi] Regulators need to be able to evolve the interpretation of existing data protection principles through regulatory guidance developed in consultation with AI developers and deployers.

Finally, existing rules must be augmented with soft law frameworks, industry standards and co-regulatory tools developed in partnership with stakeholders, such as codes of conduct, certifications, and assurance models. International standards can help establish baseline requirements for development and deployment of AI that reflect shared understandings and values arrived at through multistakeholder development processes. The G7 Digital and Tech Ministers reaffirmed the key role of standards at their Hiroshima Summit in April 2023[xii] and agreed in September to develop a Code of Conduct for organizations developing advanced AI systems[xiii], while the multi-stakeholder Certification Working Group is leading promising work on AI Certification .[xiv] Leveraging soft law frameworks such as the OECD AI Principles can foster international alignment on AI regulations: for example, the Parliament's version of the EU AI Act derives its definition of "Artificial Intelligence" from those principles.

4. Empower individuals through transparency, explainability, and mechanisms for redress

CIPL has advocated for individual empowerment as a core principle of sound privacy regulation, and the same holds true for AI. For AI to be trustworthy and beneficial to all, regulations, co-regulatory frameworks, and industry practices must empower individuals through:

- **Transparency.** Developers and deployers of AI should provide context-appropriate and meaningful transparency about the inputs and operations of AI systems, while preserving privacy and data protection, security, safety, and trade secrets. Such contextualized transparency should extend to business users of AI systems, auditors, regulators, and the general public.

    - **High-risk AI systems** should document how the system is intended to be used, known inappropriate uses and risks, and recommendations for deployers on how to manage those risks.
    - **Generative AI** requires steps to ensure that users understand models' data practices and limitations. Ideally, developers and deployers should provide transparency through multiple mechanisms, including policies, terms of service, in-product notifications, and centralized resource hubs.

- **Explainability.** Explainability is an aspect of transparency and a means of boosting accountability and trust. It requires that developers and deployers meaningfully explain how AI systems affect decisions and outcomes that impact individuals, while bearing in mind trade-offs, such as between explainability and security/safety, and explainability and accuracy. The more complex and accurate the algorithm is, the harder it may be to explain how it actually works. There may also be technical constraints on explainability in some circumstances. For example, it may not always be possible to explain how large language models (LLMs) generate specific results based on individual inputs or model parameters. Organizations will have to document the relevant trade-offs to demonstrate how and why they prioritised accuracy over explainability. A case in point may be AI algorithms used in healthcare and medicine, where AI may enable certain health benefits not achievable by non-AI tools, yet may not be explainable. Under those circumstances, accuracy may take precedence over explainabilty. In short, depending on the context, risks, and potential benefits of a specific use case, requiring full explainability as a condition for use may not be appropriate in all instances.

- **User Feedback and Redress.** Where individuals do not understand an AI-made decision, or believe they have been harmed by AI, there should be clear options for user feedback, inquiries, complaints, further transparency, the right to contest the decision, a requirement for human review and, ultimately, redress, as well as action by enforcement authorities, where appropriate and necessary. Developers and business users should consider how to enable further transparency, human review in case of a contested use of AI, as well as opportunities for complaint capture and redress as part of the design of end-to-end solutions that leverage AI.

II. DEMONSTRABLE ORGANIZATIONAL ACCOUNTABILITY

5. Make demonstrable organizational accountability a central element of AI regulations

To ensure accountability within the broader ecosystem, regulations should facilitate organizations' demonstrable use of accountability frameworks and governance programs that provide the tools and processes for organizations to implement all relevant legal requirements and other standards. As in other areas of traditional corporate compliance and business ethics—and more recently in data, security, and digital spheres—accountability must be built into and implemented across all stages of the AI lifecycle and the AI "technology stack", including AI datacenter infrastructure, models, and applications.[xv]

There are a variety of accountability frameworks that provide useful models for devising organizational accountability and AI governance programs, including the U.S. NIST AI Risk Management Framework, Singapore's Model AI Governance Framework, and CIPL's own Accountability Framework described in Annexes 1-3 of this report.[xvi]

Organizations also need to be able to *demonstrate* accountability internally – to their C-suite and corporate Boards, as well as externally - to shareholders, investors, regulators and the general public. Certifications, audits, codes of conduct, and assessments are helpful tools for demonstrating accountability. Indeed, these accountability mechanisms are essential in digital policy and regulation, including for developers and deployers of artificial intelligence, for the following reasons:

- They demonstrate to all actors across the organization a commitment and the ability to ensuring that products and services meet specific criteria.
- They enable organizations to translate principle- and outcome-based legal requirements into demonstrable and risk-based controls, ensuring more effective regulation and better compliance in practice.
- They play an important role in providing legal certainty and strengthening trust, including in business-to-business contexts.

Any AI regulation should explicitly include demonstrable accountability as a core element, as well as enable development and use of co-regulatory frameworks, such as certification schemes and codes of conduct, that facilitate and demonstrate such accountability.

6. Advance adoption of accountable AI governance practices

While a core set of accountability practices should be required for organizations developing and deploying AI, policymakers and regulators should also proactively encourage and incentivize adoption of broader accountability practices, frameworks, tools and technologies. They should work with stakeholders to co-develop tools and frameworks for building and demonstrating AI accountability. The goal should be to create an environment wherein organizations see adoption of well-developed accountability frameworks as differentiators for creating value and deepening trust in their data practices, beyond fulfilling baseline legal and regulatory obligations.

Policymakers and regulators should also understand drivers and challenges with respect to accountable technology practices and technology solutions, such a Privacy Enhancing Technologies (PETs), and take steps to incentivise their further development and wider adoption.[xvii]

Consideration should be given to a broad range of potential incentives for accountability[xviii], including:

- Formally recognising demonstrated or certified accountability as a mitigating factor in enforcement actions and in assessing sanctions and/or levels of fines;
- Using demonstrated accountability as a form of "licence to operate", by giving accountable organizations greater freedom to develop and deploy AI models responsibly;
- Allowing broader use of data in AI projects for socially beneficial research that has been validated by relevant risk assessments, mitigations, oversight, and controls in accountability programs;
- Enabling parties acquiring AI systems to fulfil due diligence requirements by procuring systems that have been certified to recognized standards for responsible AI.
- Using demonstrated AI accountability as an eligibility criterion for public procurement projects, to incentivize contractors to obtain responsible AI certification.

7. Apportion liability carefully, with a focus on the party most closely associated with generating harm

Adoption of organizational accountability mechanisms by all actors in the AI ecosystem will lead to better compliance and outcomes on the ground, and likely result in less need to resort to questions around liability. Yet, where liability does raise concerns, active debates are underway regarding the appropriate apportionment across parties in the AI ecosystem.

In principle, liability should be assigned chiefly to the party most closely associated with generating the harm in question, but assigning liability may be complex in practice. The analysis will be shaped by existing legal standards and precedent, as well as the extent to which parties disclose relevant information through transparency and reporting requirements.

Depending on the circumstances, liability might be assigned to the developer, the deployer, end users, or some combination. Developers might be the appropriate focus of liability for systems that have been insufficiently tested for potential harms, or provided to users with misleading indications on capabilities. On the other hand, users share responsibility for how they use AI systems, as they determine whether to use a system for a higher risk use or in ways that are expressly contraindicated by guidance provided by developers.

As in other areas of commerce, contracts—including specific, emerging AI contracting practices—will play an important role in apportioning the responsibilities and liabilities of parties in the AI development and deployment life cycle. For example, if a developer contractually prohibits a high-risk use case of their product, the risk of misuse should shift to the user who has wilfully breached the terms of that contract. In scenarios where third parties provide AI models or AI-enabled solutions, accountability between model developers and deployers should be specified in contracts.

III. SMART REGULATORY OVERSIGHT

8. Create mechanisms for coordination and cooperation across regulatory bodies

AI is used across sectors governed by different regulations and regulators. For example, data protection authorities (DPAs) will have general competence over the processing of personal data using AI. Other regulators have more sector-specific remits over AI applications—as in in healthcare, housing, financial services, telecommunications, pharmaceuticals and in cross-cutting disciplines, such as intellectual property. In most circumstances, there should not be a need for a new, overarching AI regulator, as that would likely result in regulatory overstep, overlap, inconsistency, and lack of legal certainty. Rather, it is more appropriate to

a) enhance the competencies and capabilities of existing regulators to be ready for AI oversight and supervision; and
b) enable high-level AI policy coordination and collaboration across existing authorities.

While each regulator should maintain competence over its own remit (e.g., for purposes of legal certainty, DPAs should retain general competence over AI applications involving the processing of personal data and/or impacting individuals' privacy), a standing central governmental coordination body should be created to set high-level AI policies and goals applicable across all sectors and industries, and facilitate alignment, regulatory coordination, and joint action between different regulatory bodies, where necessary and appropriate. The coordination body can provide regulators a space in which to discuss trade-offs between different policy objectives including efficiency, productivity, fairness, privacy, security and resilience. It can also provide clarity on where parties should turn for guidance in specific circumstances of AI development and deployment.

This approach would be beneficial to both organizations and regulators by fostering consistency in regulatory approaches as well as holistic and inter-disciplinary policy and guidance that is easier to implement and monitor by specialized regulators and industry over time. Such an approach may also be helpful for harmonizing new laws and regulations with existing ones.

An example of cross-regulatory coordination is the UK Digital Regulation Cooperation Forum (DRCF). It includes a permanent CEO and staff, joint activities, joint guidance, and other regulatory action, as well as formal collaboration projects and staff secondments. AI has been a focus of the DRCF's work, as evidenced by its multi-year workstream on algorithmic transparency. [xix] Other countries, such as Australia, France, Ireland, and the Netherlands, have also established cooperation mechanisms for regulators.[xx]

9. Institute cooperation-based regulatory oversight and enable ongoing regulatory innovation

As technology continues to evolve, regulators, regulatory techniques, and tools need to evolve as well.

a) Regulators need to enhance their capabilities, capacities and how they operate in a world where there are competing and multiple interests at stake. For example, the task of data protection authorities should not be limited to protecting fundamental rights of individuals, but also to enable responsible and accountable use of data and development of AI technology for the benefit of society and economy in a way that protects fundamental rights. This requires a shift in regulatory mindset, regulatory priorities and regulatory action. This shift is essential if current regulators are to remain relevant and effective in a new digital world.

b) Regulators should take a risk-based approach in order to be strategic and effective. This requires understanding the risks and benefits of AI systems and focusing on those areas that present the highest risks to individuals and society, while preserving the benefits of AI technology and its advancement. It also requires regulators to prioritize all of their work – regulatory strategy, guidance, supervision and enforcement and to focus on areas that create the highest risks for individuals and society.

c) Traditional oversight mechanisms based exclusively or primarily on *ex post* enforcement may no longer be sufficient in a digital- and AI enabled society. Reliance on fixing market failures by enforcement alone will not result in desired outcomes. Given the pace of advancement of AI technology and the need to understand its risks and benefits, there is a pressing need for a more co-operative approach based on ongoing constructive engagement between regulators and regulated entities, sharing of experiences and information on technological developments, and working together to develop realistic compliance targets and interpretations of applicable rules. This requires both regulators and regulated entities to be transparent and ready to engage in constructive information sharing in real time as technologies and business practices change.[xxi] Investing in *ex ante* measures such as incentivizing proactive and demonstrable accountability is likely to achieve better outcomes than expensive *ex post* enforcement. Of course, enforcement should still remain a regulatory option and an important lever for repeated, serious and negligent breaches that cause real harm to individuals and society.

d) Innovative regulatory tools, such as sandboxes and policy prototyping, can be effective for regulatory oversight of new technology such as AI. They provide regulators with deeper understanding and first-hand experience of AI applications and developments, aimed at the general market. They also provide for safe harbor for industry to test the risks and benefits

of responsible innovation with a direct link to the competent regulator. Governments must provide appropriate funding and resources for regulators to develop and engage in regulatory sandboxes and be able to scale these activities for larger group of participants, including on a sectoral basis.

Regulatory Sandboxes: Regulatory sandboxes are important mechanisms for regulatory exploration and experimentation as they provide a test bed for applying laws to innovative products and services in real-life settings under the supervision of a regulator.[xxii] They can be used to help address and resolve some of the more challenging aspects of deploying AI against the backdrop of prevailing legal requirements, particularly those that appear inconsistent or in tension with new technologies. Examples include:

- The UK information Commissioner Office has run an established sandbox program since 2020, with a particular focus on emerging technologies and biometrics;[xxiii]
- The Singapore Infocomm Media Development Authority (IMDA)'s Data Regulatory Sandbox enables businesses to obtain regulatory guidance for innovative, data-intensive technologies. IMDA also operates a specific sandbox to foster development and adoption of Privacy-enhancing Technologies (PETs).[xxiv]
- The Norwegian Data Protection Authority (Datatilsynet) launched a special regulatory sandbox for AI applications;[xxv]
- The Colombian government has developed a regulatory sandbox to promote Privacy by Design and Default in AI projects;[xxvi]
- France's CNIL operates a sandbox that has completed projects in digital health and educational technology. In 2023, it announced a new initiative focused on AI[xxvii];
- The EU's draft AI Act would enable, and may ultimately require, member states to establish regulatory sandboxes for AI. Spain was the first member state to pilot an AI sandbox.[xxviii]

Regulatory sandboxes should be designed in a manner that encourages innovation, information sharing, and other modes of cooperation. Any AI regulatory framework should provide an explicit statutory basis for regulators to set up sandboxes, including cross-regulatory sandboxes with appropriate and relevant regulators including data protection, competition, media, consumer, health/pharma, telecom, and financial regulators. Regulations should be mindful of how legal authorities or enforcement priorities may affect company participation. At the same time, to ensure public trust in the results, sandboxes should include assurances that individuals will continue to be protected from harms even as policy experimentation takes place.

Policy prototyping: These are pilot projects that mobilize public and private actors to jointly explore, assess, and develop different legislative models of governance prior to their actual enactment. The process typically involves selecting a group of participants, such as early-stage technology companies, to develop and apply policy prototypes in partnership with government, industry, and academic experts. Meta's OpenLoop program has been a leading practitioner of policy prototyping, including for the EU's proposed AI Act.[xxix] Singapore's IMDA has a policy prototyping program within its Data Regulatory Sandbox that has focused on notice, consent, and disclosure; AI transparency and explainability; and transparency and consent in the metaverse, including contexts for application of legitimate interest as a basis for processing.[xxx]

10. Strive for global interoperability

Given the global nature of AI technology – from the data it uses for training, to research and development, computing infrastructure, and applications that cross borders – it is clear that no government can satisfactorily address AI policy and regulation in isolation. Cooperation at the international level is essential to ensure that individuals and societies globally can rely on the benefits of trustworthy and accountable AI and that new risks are assessed and mitigated on an ongoing basis. This work would benefit from a dedicated international forum that enables governmental and other stakeholders to cooperate on AI policy.

Furthermore, international cooperation must foster interoperability of AI policies and regulations. As CIPL has noted in the context of data protection, global interoperability enables responsible provision of services across borders, broadens access, reduces compliance costs, increases legal certainty, and ensures consistent protection of the rights and interests of individuals.[xxxi] Different jurisdictions will have their own priorities, legal traditions, and body of existing regulation, but may be able to coalesce around core principles and approaches in considering AI policy and regulation – similar to those CIPL has advanced in this paper. They can also take steps to codify interoperability through recognition and certification mechanisms, including through participation in the Global Cross-Border Privacy Rules (CBPR) system in the context of data protection and trusted cross-border data flows[xxxii]. There have been encouraging efforts toward AI interoperability through the aforementioned G7 initiative, the OECD AI Principles,[xxxiii] trade and economic agreements like the Digital Economic Partnership Agreement (DEPA)[xxxiv], and the Global Partnership on AI.[xxxv]

ANNEX I – CIPL ACCOUNTABILITY FRAMEWORK

ANNEX II – MAPPING BEST PRACTICES IN AI GOVERNANCE TO THE CIPL ACCOUNTABILITY FRAMEWORK

The following table outlines examples of accountable AI activities undertaken by select organizations of different sectors, geographies, and sizes, based on the CIPL Accountability Framework and mapped against each accountability element. The practices are not intended to be mandatory industry standards, but serve as specific examples that are calibrated based on risks, industry context, business model, size, and maturity level of organizations.

ACCOUNTABILITY ELEMENT	RELATED PRACTICES
Leadership and Oversight	• Public commitment and tone from the top to respect ethics, values, specific principles in AI development, deployment and use • Institutionalized AI processes and decision-making with escalation criteria • AI/ Ethics/ Oversight Boards, Committees (internal or external) - to review risky AI use cases and to continuously improve AI practices • Appointing a board member for AI oversight • Appointing a responsible AI lead, AI officer or AI champion • Setting up an internal interdisciplinary AI board or AI committee • Ensuring inclusion and diversity in AI model development and AI product teams
Risk Assessment	• Algorithmic impact assessment or fairness assessment tools to monitor and continuously test algorithms to avoid human bias, unfair discrimination and concept drift throughout the entirety of AI lifecycles • Ethics impact assessment / human rights impact assessment / Data protection impact assessment • Developing standardized risk assessment methodologies, which take into account the benefits and the likelihood and severity of risk factors on individuals and/or society, level of human oversight involved in individually automated decisions with legal effects as well as their explainability according to context and auditability • Trade-offs documentation (e.g., accuracy—data minimization, security—transparency, impact on few—benefit to society) for high-risk processing as part of the risk assessment • Data quality assessment via KPIs • Data evaluation against the purpose—quality, provenance, personal or not, synthetic, in-house or external sources • Framework for data preparation and model assessment – including feature engineering, cross-validation, back-testing, validated KPIs by business • Working in close collaboration between business and data experts (data analysts, data engineers, IT and software engineers) to regularly assess the needs and accuracy results to ensure that the model can be properly used
Policies and Procedures	• Adopting specific AI policies and procedures on how to design, use or sell AI • Policies on the application of privacy and security by design in AI life cycle • Rule setting the level of verification of data input and output • Pilot testing of AI models before release • Use of protected data (e.g., encrypted, pseudonymised, tokenised or synthetic data) in some models • Use of high quality but smaller data sets • Use of federated AI learning models, considering trade-off with data security and user responsibilities • Special considerations for organizations creating and selling AI models, software, applications • Due diligence/self-assessment checklists or tools for business partners using AI • Definition of escalation steps with regard to reporting, governance, and risk analysis

	• Ideation phase between all stakeholders (data scientists, business, final user, control functions) where needs, outcomes, validations rules, maintenance, need for explainability, budget, are discussed
Transparency	• Different needs for transparency to individuals, regulators, business partners and internally at the different stages of AI lifecycle based on context • Adequate disclosures communicated in simple, easy to understand manner • Take into account that AI must be inclusive and accessible by those with special needs/disabilities • Set up a transparency trail for explainability of decisions and broad workings of algorithm to make the AI system auditable • Explain that it is an AI/ML decision, if possibility for confusion (Turing test) • Provide counterfactual information • Understand customers' expectations and deploy based on their readiness to embrace AI • Implement tiered transparency • From black box to glass box—looking at the data as well as algorithm/model • Aspiration of explainability helps understand the black box and builds trust • Define criteria of deployment of AI technologies within the organization based on usage scenarios and communicate them to the user • Produce model cards (short documents accompanying AI models to describe context in which model should be used, what is the evaluation procedure) • Data hub for transparency on data governance, data accessibility, data lineage, data modification, data quality, definition, etc. • Tailor transparency to the identified risk: e.g. watermarking for generative AI output
Training and Awareness	• Data scientist training, including how to limit and address bias • Cross functional training – privacy professionals and engineers • Ethics and fairness training to technology teams • Uses cases where problematic AI deployment has been halted • Role of "translators" in organizations, explaining impact and workings of AI
Monitoring and Verification	• Capability for human in the loop in design, in oversight, in redress • Capability for human understanding of the business and processes using AI • Capability for human audit of input and output • Capability for human review of individual decisions with legal effects • Monitoring the eco-system from data flow in, data process and data flow out • Reliance on different audit techniques • Reliance on counterfactual testing techniques • Pre-definition of AI audit controls • Internal audit team specialised on AI and other emerging technologies • Processes must allow human control or intervention in the AI system where both technically possible and reasonably necessary • Model monitoring (back-testing and feedback loop) and maintenance process
Response and Enforcement	• Processes and procedures to receive and address feedback and complaints • Redress mechanisms to remedy an AI decision • Redress to a human, not to a bot • Feedback channel

[i] For this report, CIPL uses the term "artificial intelligence" in a manner consistent with the definition of "AI systems" developed by the U.S. National Institute of Standards and Technology (NIST) in its Risk Management Framework 1.0, adapted from a comparable definition developed by the Organisation for Economic Co-operation and Development (OECD): "*An AI system [is referred to as] as an engineered or machine-based system that can, for a given set of objectives, generate outputs such as predictions, recommendations, or decisions influencing real or virtual environments. AI systems are designed to operate with varying levels of autonomy*." See https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf.

[v] CIPL, "Response to NTIA Request for Comment on AI Accountability Policy," June 2023, https://www.informationpolicycentre.com/uploads/5/7/1/0/57104281/cipl_response_to_ntia_ai_accountability_policy_june2023.pdf; "CIPL's Top Ten Recommendations for Regulating AI in Brazil," October 2022, https://www.informationpolicycentre.com/uploads/5/7/1/0/57104281/[en]_cipls_top_ten_recommendations_for_regulating_ai_in_brazil__4_october_2022_.pdf; "Response to UK DCMS Proposed Approach to Regulating AI," September 2022, https://www.informationpolicycentre.com/uploads/5/7/1/0/57104281/cipl_response_to_uk_dcms_proposed_approach_to_regulating_ai_23_09_22.pdf; "CIPL Response to the EU Commission's Consultation on the Draft AI Act," July 2021, https://www.informationpolicycentre.com/uploads/5/7/1/0/57104281/cipl_response_to_the_consultation_on_the_draft_ai_act__29_july_2021_.pdf.

[vi] There are no universally accepted definitions for AI developers, deployers, and users; indeed, a 2023 taxonomy jointly developed by the EU and U.S. described the definitions of deployment, developer, and user as "pending" (See "EU-U.S. Terminology and Taxonomy for Artificial Intelligence: First Edition", https://www.nist.gov/system/files/documents/noindex/2023/05/31/WG1%20AI%20Taxonomy%20and%20Terminology%20Subgroup%20List%20of%20Terms.pdf). In this paper, we use the term "developers" to refer to parties that design and build AI systems, "deployers" as parties that make such systems available for use, and "users" as the end-users that operate those systems on an ongoing basis. A single entity could play each of these roles at different points or simultaneously.

FINAL AI Rule Comment 2023 12 05

1. **The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?**
    - The diversity in agency size and mission necessitates that roles for Chief AI Officers be adaptable. Given the dominance of small businesses in the U.S. economy, it's vital that AI governance does not hinder their growth. Policies should be supportive and not overly complex, especially for smaller agencies with limited AI resources.
2. **What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body?**
    - Prior to establishing new AI governance bodies, we recommend conducting a study focused on streamlining existing agencies and structures. This step should ideally lead to effective consolidation, reducing bureaucratic redundancy. When considering the creation of a new AI governance entity, the emphasis should be on clearly defining its mission with a narrow focus. This approach helps to ensure that any new body is purpose-driven and avoids unnecessary expansion of bureaucratic scope, aligning with the overall goal of efficient and targeted AI governance.
3. **How can OMB best advance responsible AI innovation?**
    - To advance responsible AI innovation, the OMB should foster an environment that prioritizes incentivization over a burdensome regulatory framework. To advance responsible AI innovation, the OMB should consider the potential impact of burdensome regulations, which may inadvertently favor larger companies equipped to navigate them. This could hinder the involvement of smaller, innovative AI/ML businesses. Instead, implementing incentive structures that support ethical AI solutions from both small and large enterprises can foster a more diverse and vibrant innovation landscape. Such an approach not only upholds ethical standards but also encourages participation from a wider range of businesses, driving true innovation in AI.
4. **With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?**
    - Agencies should leverage generative AI as a tool to enhance efficiency in operations, focusing on automating routine tasks. However, expert oversight is crucial to ensure these technologies align with operational goals. The true value and impact of generative AI on agency missions should be thoroughly assessed.
5. **Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?**
    - While revising Section 5(b), it's recommended to maintain a narrowly defined list of critical use cases, in line with the broader recommendation for the prioritization of incentives over a complex regulatory framework. For example, expanding the use case of AI in unmanned systems and autonomous weapons is crucial due to their significant safety implications. Similarly, including AI in mental health assessments within rights-impacting AI use cases reflects its growing importance and potential impact. However, these additions should be carefully considered,

ensuring that the list remains focused on truly critical areas. Establishing a clear definition of 'criticality' is key, avoiding a broad or uniform approach that could impede innovation and flexibility across different AI applications. This approach aligns with promoting a regulatory environment that encourages ethical AI development while supporting technological advancement.

6. **Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?**
    - While minimum practices provide a baseline, they should not be overly restrictive. Promoting ethical AI through a framework that incentivizes best practices, rather than just setting minimum standards, could foster a more innovative and ethical AI landscape.
7. **What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?**
    - Recognizing the challenges faced by small businesses in federal contracting, it's essential to approach AI requirements in contracts with a focus on fostering innovation. By streamlining and consolidating frameworks, and emphasizing incentive structures, the government can create an environment where ethical AI practices are naturally incentivized. This strategy not only alleviates the burden of stringent compliance for small businesses but also promotes a merit-based ecosystem. Encouraging businesses to independently pursue responsible AI innovation can lead to a more vibrant and competitive marketplace, where ethical practices become a benchmark for excellence and success. To further aid these businesses, clear, detailed guidance from the government on obtaining Authorizations to Operate (ATOs) or Facility Clearance Levels (FCLs) is crucial. Step-by-step instructions, coupled with references to pertinent regulations, can demystify complex processes and empower small businesses to navigate the federal contracting landscape more effectively. This clarity and accessibility in guidance can be instrumental in enabling innovative small businesses to contribute significantly to responsible AI development in the government sector.
8. **What kind of information should be made public about agencies' use of AI in their annual use case inventory?**
    - In the spirit of fostering innovation through incentive structures, the annual AI use case inventory should be streamlined to provide essential information without overburdening agencies. This inventory could focus on highlighting exemplary uses of AI, showcasing how agencies leverage AI responsibly and effectively. By doing so, it not only serves the purpose of transparency and public accountability but also acts as an incentive for agencies to develop and utilize AI in ways that are both innovative and ethically sound. This approach aligns with a broader vision of encouraging ethical AI practices through positive reinforcement rather than stringent regulatory mandates. For small businesses like ours today, it is also crucial that this inventory includes more qualitative data, enabling us to benchmark our offerings against those of larger government contractors. Access to such detailed comparisons would provide valuable insights into the competitive

landscape, helping small businesses to identify areas for improvement, innovation, and strategic alignment with government needs. This level of transparency and detail in the AI use case inventory would be immensely beneficial in positioning smaller businesses effectively within the government contracting ecosystem.

AI EO Draft Implementation Memo - APHSA Comment

December 5, 2023

Clare Martorana, U.S. Federal Chief Information Officer
Office of the Federal Chief Information Officer
Office of Management Budget
725 17th Street NW
Washington, DC 20503

Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI) Draft Memorandum

As the bipartisan, national membership association representing state, county, and city human services agencies, the American Public Human Services Association (APHSA) welcomes the opportunity to submit comment on the Office of Management and Budget's Proposed Memorandum: *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (memo)*, accompanying Executive Order 14110, *Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (EO)*. APHSA's members administer economic assistance and child and family well-being services and benefits – such as the Supplemental Nutrition Assistance Program (SNAP), Temporary Assistance for Needy Families (TANF), child welfare, child care and others – at the state, county, and city levels. Our members are experts in overseeing and aligning these programs, which bolster community well-being through access to food, health care, employment, child care, and other key building blocks.

In addition, APHSA's members are leading experts in data analysis, health and human services IT systems, workforce development and training, and legal dimensions of the sector. By convening affinity groups such as IT Solutions Management for Human Services (ISM)[1] and the Public Human Services Attorneys (PHSA),[2] APHSA stays informed on common interests and concerns of IT and legal professionals in the human services sector. In addition to these affinity groups, APHSA convenes a Process Innovation Community of Practice, which focuses on person-centered process improvements in human services to enhance service delivery and improve customer experience, and its associated AI Workgroup. The input reflected in this comment letter is deeply informed by the insight and input of these member groups.

Overview: Inputs & Engagements Informing Response

Over the past year, APHSA engaged its membership and partner networks across the country in dialogue about Artificial Intelligence (AI), building on our established history of leading technology conversations among human services practitioners and creating productive space for person-centered innovation. Because our membership stands to be directly impacted by forthcoming federal regulations and guidance that this EO and memo direct, we consulted cross-sections of human services practitioners through the above-mentioned groups, through attendees at its conferences and events, and through special project teams to understand state, county, and city human services practitioners' reactions to

[1] For more information on ISM, see https://aphsa.org/ISM/.
[2] For more information on PHSA, see https://aphsa.org/PHSA/.

the Executive Order and Implementation Memo, their needs from forthcoming guidance, and their early ideas for how AI might enhance public programs.

From these conversations, APHSA has learned that – overall – our membership is eager to safely and securely use AI technology to optimize their service delivery and customer experience, and the available network of government partners is equally eager to support. To do this effectively, members and partners are readying themselves through early education and exploration of newly unlocked possibilities but have expressed a need for federal guidance to ensure further development, testing, and implementation of AI-enabled technologies that align with regulations and best practices.

With this, APHSA – on behalf of its membership – encourages OMB to heed the following considerations upon implementation of the Executive Order, including in the process of issuing guidance, exploring regulatory changes, developing use case inventories, and other EO required actions.

Key Considerations for Federal Agencies Implementing EO

1. **Federal level coordination is key to state, county, and city government success.** State, county, and city agencies stand to benefit greatly from a coordinated approach across federal agencies that lead human services programs such as CMS, ACF, and FNS. The coordination directives outlined in the EO and Memo represent significant steps towards this goal. See more discussion of key considerations and potential challenges to successful implementation of coordination directives in response to prompts 1 and 2 below.

2. **Federal supports can boost agency adoption of human-centered practices.** To enable the human services sector to effectively harness the potential of AI to advance Equity, Diversity, Inclusion, and Belonging as well as an ethos of customer centricity, federal supports should focus on enhancing agency skillsets in user research and human-centered design while promoting transparent procurement for technology solutions. See more discussion on this consideration in response to prompts 3, 7, and 8 below.

3. **Customer and end-user input is key to tech-enabled, community-driven process innovation**. We recognize and appreciate the EO and Memo's emphasis on equity and customer involvement. However, we believe these elements should be even more central to AI implementation, especially in domains like human services, health, labor, and other community-serving supports. In our desired future state, such inclusive and community-driven process innovations are not just beneficial, but necessary. More insights on this are provided in our response to prompt 4.

1300 17TH STREET NORTH, SUITE 340, ARLINGTON, VA 22209 | **TEL** (202) 682-0100 | **FAX** (202) 204-0071 | WWW.APHSA.ORG

Memo Prompt Responses

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. **Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?**

The roles, responsibilities, seniority, position, and reporting structures outlined for CAIOs outlined in the Memo are comprehensive and do offer significant flexibility in their structure. However, members and partners have highlighted potential challenges with the rapid implementation of these directives. A common anticipated challenge is in filling the CAIO position quickly, especially for agencies without a clear precursor in their Chief Technology or Data Officer, or similar roles. Insufficient capacity to recruit a well-equipped CAIO could result in inequitable levels of support and stewardship of human-centered, technology-enabled innovation at the federal level. Without strong leadership and AI sponsorship, agencies will struggle to meet the reasonable minimum standards for AI innovation outlined in the EO, which in turn may prevent human services programs from advancing their AI innovation goals.

In addition to support with recruiting and onboarding CAIO roles onto their teams, FNS, ACF, the Centers for Medicaid and Medicare Services (CMS), and other Federal agencies will benefit greatly from their CAIO's participation in intentionally coordinated bodies, as discussed in response to prompt 2 below.

2. What **types of coordination mechanisms**, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the **benefits or drawbacks** to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

State, county, and city agencies stand to benefit greatly from a well-coordinated approach to EO implementation, as is reflected in mandates in the EO and Implementation memo, including the directed approaches to meetings. Ensuring that there are dedicated positions at the agencies to drive coordination is also critical, which we appreciate seeing in the EO. However, these federal agencies currently vary vastly in their levels of readiness and face a spectrum of resource constraints. The Office of Management and Budget (OMB) can play a critical role in bolstering essential coordination by consulting with federal agencies to assess the feasibility of proposed timelines and ensure their ensuing guidance and support are comprehensive and tailored to the needs of state, county, and city governments.

As is clearly recognized in the EO and memo, effective coordination mechanisms are essential for the success of an AI Governance Body in both public and private sectors. Establishing a governance body of CAIOs requires a framework that fosters collaboration, federal alignment, and efficient operation. This is crucial to mitigate the known downstream impacts of federal silos on critical public supports like food, cash, and healthcare access. Of particular import, agency leadership personnel with technological oversight must coordinate with their counterparts who oversee program business operations and policy to ensure cohesion not only across agencies but also across functions within agencies.

To enhance coordination, OMB should consider its ability to support CAIOs through setting up peer networks of expertise and support for the individuals in these roles. Examples of such supportive actions could include facilitating regular meetings, creating digital networks, and supplying administrative assistance. This support should be both initial and ongoing, focusing on harmonizing the diverse

1300 17TH STREET NORTH, SUITE 340, ARLINGTON, VA 22209 | **TEL** (202) 682-0100 | **FAX** (202) 204-0071 | WWW.APHSA.ORG

capabilities of different agencies. Such alignment not only ensures compliance with governance standards but also promotes active contribution to human-centered AI innovation.

Coordination Features, Mechanisms, & Strategies:

- Coordination and alignment require intentional relationship establishment and maintenance to foster trust among members of the group.
- Coordinated bodies work together on joint activity and initiatives.
- The coordinated group has shared responsibility and accountability.
- A core feature of true coordination is regular attendance at scheduled recurring meetings that have intentional agendas and follow-up actions.

These strategies can be helpful for ensuring CAIOs and their groups are not only operational but also efficient and synergistic in their efforts.

In response to the second part of this question, we acknowledge that there are benefits and drawbacks to either of the approaches outlined: setting up a new AI governance body or expanding the scope of existing groups. While using existing bodies offers the advantage of involving individuals already invested in related areas, this approach will limit diverse representation in the new body, which is crucial for risk mitigation and bias avoidance. Even if agencies start by leveraging existing bodies, we encourage robust consideration of the additional needed perspectives and characteristics of people that make up AI governance bodies with expanded scopes and purviews.

3. How can **OMB best advance responsible AI innovation?**

To advance responsible AI innovation, we encourage OMB to focus its support on two key areas:

Coordinated AI Governance: OMB can help federal agencies in adopting a unified approach to AI governance. This should include facilitating coordinated rulemaking and providing clear guidance, particularly with regard to use of AI across agency supports that require Advance Planning Documents (APDs) for allocating costs across funding streams.[3] By ensuring that agencies work together harmoniously, OMB can help establish consistent, effective AI policies and practices across the federal landscape.

AI Competitive Procurement: OMB should encourage competition among contractors in AI-related procurements to prevent the entrenchment of incumbents and foster a diverse market of AI solutions. Requiring publication of vendor documentation requirements can further enhance transparency and accountability in this process and can be done without disclosure of proprietary knowledge, as is discussed further in response to prompt 8 below.

These strategies will contribute to a more competitive and responsible AI ecosystem, aligning various affected parties under common governance frameworks and procurement practices.

[3] For example, see overview of FNS Advance Planning Document: https://www.fns.usda.gov/sso

1300 17TH STREET NORTH, SUITE 340, ARLINGTON, VA 22209 | **TEL** (202) 682-0100 | **FAX** (202) 204-0071 | WWW.APHSA.ORG

4. With adequate safeguards in place, how should agencies take advantage of **generative AI to improve agency missions or business operations?**

For agencies to effectively use AI to enhance their operations and as a tool to aid in everyday tasks, approaches to implementation should focus on equity and customer involvement and prioritize best practices for seeking input from end-users. This approach builds toward modernization in a way that ensures that the technology works in service of inclusive, equitable outcomes aligned with the agency's mission. APHSA encourages agencies to anchor to our desired future state for human services when embedding AI into operations, which is importantly led by people with lived expertise and driven by a fierce commitment to equity, diversity, inclusion, and belonging.[4]

APHSA is currently leading a research project on this subject specifically focused on how AI is currently used, and how it might be used in the future, to support administrative actions agency staff complete when processing customers' SNAP cases. Through this project, a team is analyzing statutory and regulatory issues affecting current and potential future use cases for artificial intelligence in SNAP case processing, with an overarching theme of assessing potential for bias and other negative impacts to the customer. Our research in this context has led to our understanding that the incorporation of generative AI into agency business operations offers a transformative opportunity for government entities, particularly in public-serving sectors like human services, to advance their missions.

This research and related member feedback has also clarified that to harness this technology effectively and responsibly, agencies must prioritize equity and customer involvement at the core of their AI implementation strategies.

Streamlining administrative processes for customer-centered service delivery: Generative AI has the potential to revolutionize how human services agencies run by simplifying processes and workflows that

[4] For further discussion of APHSA's Desired Future State for Human Services, see:
- APHSA's 2023 Action Plan - https://files.constantcontact.com/391325ca001/81b1eb42-5f8f-4975-8b3f-8668343ee016.pdf
- APHSA's Strategic Playbook: https://files.constantcontact.com/391325ca001/a307409a-6ff4-4e11-ad9c-e3f419e0ab48.pdf

1300 17TH STREET NORTH, SUITE 340, ARLINGTON, VA 22209 | **TEL** (202) 682-0100 | **FAX** (202) 204-0071 | WWW.APHSA.ORG

undergird accurate and timely benefit and service delivery, and that thereby free up valuable human resources for more complex and nuanced tasks and for authentic, dignified customer interactions. State, county, and city agencies that administer benefits and services look forward to being able to use AI work aids for staff – such as AI tools can undertake rote and tedious tasks like data re-entry, scheduling, and notetaking. By automating routine functions agencies can operate more efficiently and effectively, leading more accurate benefit determinations at government agencies, more efficient and responsible use of federal funds, and ultimately and most importantly to improved service delivery for customers.

User-led technology development and service design: When developing generative AI use cases, those leading the development must build into their development process the critical step of obtaining input from end-users and impacted parties. Their feedback should guide the development and deployment of AI tools to ensure that technology truly meet the needs of those it is designed to serve.

Accessibility in communications and information sharing: Generative AI can play a significant role in enhancing user-centered communications. Its capability to assist with lingual and visual translations can reduce the impact of language barriers and make information and services more accessible to a diverse population. Furthermore, this technology can contribute to significant improvements in accessibility, ensuring equitable access to government services and information. Examples of how AI can advance accessible in the human services sector include, but are not limited to:

- Integration of advanced screen readers and audio aids into government websites and digital services;
- Conversion of text into braille for government documents, forms, and notices, ensuring that visually impaired citizens have equal access to essential information;
- Real-time transcription and translation for hearing-impaired individuals and people with limited English proficiency;
- Leveraging tools for language simplification to translate policy, legal, and bureaucratic verbiage into plain language, making government communications more accessible to individuals with various levels of literacy or those who are not native speakers of the primary language used in these communications;
- Virtual sign language interpretation to supply real-time translation of spoken or written language into sign language; and,
- Creating customizable communication formats to allow people who receive government communications about their public benefits to choose how they receive information (e.g., larger text, high-contrast colors, audio descriptions), thereby catering to various accessibility needs.

5. Are there **use cases for presumed safety-impacting and rights-impacting AI** (Section 5 (b)) that should be **included, removed, or revised**? If so, why?

It is incredibly valuable and necessary to carefully define safety-impacting and rights-impacting use cases of AI while emphasizing that in many cases, these concepts are interconnected. APHSA takes particular interest in the rights-impacting use cases detailed, which are most relevant to the health and human services sectors, and we applaud the comprehensiveness of activities and decisions detailed. It is particularly meaningful to our membership to see an acknowledgment that public benefits innovation and protection falls under “rights-impacting” AI.

1300 17TH STREET NORTH, SUITE 340, ARLINGTON, VA 22209 | **TEL** (202) 682-0100 | **FAX** (202) 204-0071 | WWW.APHSA.ORG

Our members have underscored the need for caution regarding AI use cases that might lead to adverse impacts on customers. Examples include AI applications for predicting behavior that could restrict service access, for determining program eligibility, for detecting fraud, and for automating other scenarios where there's potential for causing harm or perpetuating existing biases and inequalities. As we progress towards modernizing technology, it's crucial that Federal agencies approach these sensitive use cases not as initial forays into AI, but rather as areas for future consideration once a more mature phase of AI implementation is reached. This approach enables swift innovation in lower-risk scenarios and necessitates rigorous testing and de-biasing efforts to mitigate risks for broader uses so that we can collectively ensure equitable design and delivery of human services.

6. **Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies** and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum practices set for safety-impacting and rights-impacting AI are critical, so we encourage OMB and implementing agencies to carefully consider and plan for implementation, particularly in instances when these requirements will be passed down to states through federal regulations and guidance. To enhance these practices, it would be beneficial for agencies to have access to tools and tailored support to meet these standards, as is further discussed in response to prompt 7 below. Implementing these practices will also require investment of time and funding to be successful.

As the memo mentions, OMB should also encourage agencies to develop their own context-specific practices; in this aspect, support through funding, technical assistance, or other avenues would be valuable to human services leaders. Providing templates for assessments and reports, along with examples of AI project implementation checklists, best practices, and training will support state- and local-level success, ensuring that customers benefit from the intentions behind these minimum practices.

7. What **types of materials or resources** would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

IT & Data Supports. Human services agencies commonly struggle with IT infrastructure and data readiness, which are pivotal for AI maturity. Treating relevant data, including its modification such as cleaning and formatting/standardizing, as a critical asset is essential, and agencies require materials and resources to do so. In addition, agencies at the state and local levels require guidance and resource materials on what constitutes AI for human services programs (as opposed to non-AI automation). Human services agencies would also find resources and materials on how to execute or modify data sharing agreements (DSAs) with consideration for AI-enabled data systems extremely valuable, especially considering the new capacities AI stands to unlock for aligned operability across human services systems.

Vendor Quality Supports. APHSA's membership appreciates that this guidance paves a lane toward better transparency and relationship between vendors and government. To this end, agencies would benefit from access to resources like template requirements agencies can adapt and include in their vendor contracts, independent evaluator tools, vendor quality assessments, and support for confident procurement of AI and other advanced technologies.

1300 17TH STREET NORTH, SUITE 340, ARLINGTON, VA 22209 | **TEL** (202) 682-0100 | **FAX** (202) 204-0071 | WWW.APHSA.ORG

User Experience (UX) & Design Resources. As we have mentioned throughout, it is crucial for programs to develop and deploy mechanisms for customer feedback loops and satisfaction measurement in program design as human service system transforms into an AI-enabled, modernized state. Education and technical assistance on UX and design are vital for agencies to develop in-house expertise or manage external services effectively, ensuring they demand best practices in requests for proposals and procurements. In addition to Subject Matter Expert vendors, agencies at the state and local levels will need education and technical assistance to eventually be able to bring such functions in house, or at minimum, to develop in-house expertise for effectively managing external. When developing user research plans, our experience has been that agencies require assistance and guidance for building comprehensive processes for conducting ethical, fairly compensated user research.

8. What kind of **information should be made public about agencies' use of AI** in their annual use case inventory?

For the annual use case inventory on agencies' use of AI, the information made public should enable action toward transparent procurement and tech solutions which include implementation details, documentation or links to tools, vendors or partners involved, and costs. It will also be beneficial to include details that state-level agencies might need for their own research into AI tools for adoption. This comprehensive information will aid in making informed decisions and fostering responsible AI use within agencies. APHSA's membership appreciates that this guidance paves a lane toward better transparency and relationship between vendors and government.

Conclusion

As proposed, the memorandum would establish new requirements in areas of AI governance, innovation, and risk management, and would direct agencies to adopt specific minimum risk management practices for uses of AI that impact the rights and safety of the public. With this, we should acknowledge that a wide spectrum of responses has already begun emerging from AI skeptics to early adopters and AI champions – some are primarily fearful of risks, biases, and privacy implications that come with AI use, while others are primarily eager to innovate their programs with modern technology, and many are somewhere in the middle. This memo and ensuing federal actions stand to even out this spectrum and create a secure middle from which agencies can confidently run, modernize, and improve programs. Above all, AI implementation, especially for human serving agencies and those administering benefits and services to historically underserved populations, should be connected into a desired future state where community and people with lived experience are central to program design and service delivery.

Thank you for considering our feedback and for your dedication to enabling safe, secure innovation of government programs that support economic security and community well-being.

Sincerely,

Matthew Lyons

Re: Docket No. OMB- 2023-24269
Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Director Young,

The National Fair Housing Alliance (NFHA) and the undersigned civil rights advocacy organizations appreciate the opportunity to submit comments in response to the Office of Management and Budget (OMB) Request for Comments (RFC) on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (A1) Draft Memorandum on November 3, 2023. We commend federal regulators for seeking input on this important topic and hope our comments below will help inform the regulators' views.

Founded in 1988, the National Fair Housing Alliance (NFHA) is the country's only national civil rights organization dedicated solely to eliminating all forms of housing and lending discrimination and ensuring equal opportunities for all people. As the trade association for over 170 fair housing and justice-centered organizations and individuals throughout the U.S. and its territories, NFHA works to dismantle longstanding barriers to equity and build diverse, inclusive, well-resourced communities.

We applaud the OMB's efforts to establish novel agency requirements in AI governance, innovation, and risk management through the draft AI memorandum. The direction provided by the OMB to direct agencies to adopt specific minimum risk management for uses of AI that impact the rights and safety of the public is imperative for pushing forward a cohesive and responsible AI framework across the federal government. We welcome the opportunity to ensure the administration continues to push forward policies for mitigating the risks and maximizing the benefits of AI. A focus on equity and civil rights within the OMB's guidance is necessary to push for effective and safe AI systems that protect all minorities and underserved groups against algorithmic discrimination.

Questions posed in the RFI

Question 1. How can OMB best advance responsible AI innovation?

EVALUATION AND ACCOUNTABILITY MECHANISMS

The memorandum proposes strengthening artificial intelligence through improving accountability or AI issues. Though the memorandum states agencies must designate a Chief AI officer as is consistent with Section 10.1(b) of the AI Executive Order and that CAIOs bear primary responsibility on behalf of the agency for implementation of the proposed memorandum and coordinating implementation with other agencies, there is a lack of guidance on guidance on how agencies will be held accountable for AI misuses and failure in the case of adverse impact.

We propose the OMB implement definitive and well-structured mechanisms to ensure accountability in cases of adverse impact by agencies due to AI misuse or failure. This should be structured as a three-tiered approach:

1. Clearly Defined Responsibility: The OMB should provide explicit guidelines stipulating which parties are responsible in cases of AI misuse or failure by federal agencies. This clarity is crucial for establishing accountability and should detail the roles and responsibilities of relevant stakeholders to ensure a clear understanding of who is accountable for various aspects of AI system deployment and operation.
2. Relief Plans for Impacted Consumers: Pre-established measures for providing relief to consumers adversely affected by AI failure or misuse are needed to ensure those impacted by AI misuse or failure are not left without recourse and that standardized procedures are in place to address grievances. Measure to outline specific steps for redress, including compensation, corrective services, or other forms of support are needed.
3. Protocol for Outcome Remediation: Alongside relief measures, there should be a defined protocol for remedying the actual outcomes caused by the AI system's failure or misuse. This includes steps to rectify any errors in the system, prevent future occurrences, and restore any harm done. It is imperative that these protocols are not only reactive but also proactive, guiding agencies in reviewing and improving AI systems continuously to prevent similar incidents.

ACCESSIBILITY AND INCLUSIVITY

AI used in safety and rights-impacting decisions must be comprehensively accessible and understandable to all, including those who may speak different languages, have a disability, or belong to other marginalized groups. AI systems affecting the above groups must include all to ensure no adverse impact or disparities. Ensuring accessibility could involve translating information into multiple languages, providing alternative formats for those with visual or hearing impairments, and using clear, simple language to make the content understandable.[1] Addressing this aspect more explicitly in the guidance will reinforce its importance and effectiveness. It is imperative because many who commonly face discrimination based on protected class are more at risk of being victims of adverse impact through AI systems.[2] The OMB should also require agencies to advocate for inclusivity in AI systems by ensuring those developing AI systems consider diverse perspectives and experiences in the development of the process.

REGULAR REVIEW AND UPDATE OF POLICIES

AI technology and applications are rapidly evolving. New developments, techniques, and applications are constantly emerging; thus, policies and guidelines created at one point in time may quickly become outdated or insufficient to address new challenges or opportunities that arise. It is essential for the OMB to regularly review and update its policies and guidelines to keep pace with these changes, particularly as new use cases for AI develop that may be safety or rights impacting. A systematic, ongoing process of evaluation and modification is required to ensure that policies remain current and effective. Lastly, the public should have space to flag developing new use cases and comment on the agency inclusion of emerging risks from new use cases.

PUBLIC ENGAGEMENT AND TRANSPARENCY

The proposed agency practice of providing public notice and plain language documentation through the AI use inventory is beneficial in promoting transparency. However, a more structured approach from the OMB could be beneficial. A structured approach would ensure consistency across agencies and make it easier for the public to engage with and understand the information provided. Specific guidance on public engagement, whether it includes public forums, surveys, or open comment periods, is needed to gather various perspectives from individuals directly affected by these systems. It is important that these engagement methods are designed to capture a wide range of perspectives, including public advocacy or research groups.

[2] Orwat, C. (2020). Risks of Discrimination through the Use of Algorithms. *Berlín: Federal Anti-Discrimination Agency*.

Question 5: Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why

ADMINISTRATION OF DEMOCRATIC PROCESSES

Beyond the integrity of voting infrastructure, AI in political campaigns, voter targeting, and spreading political messages should be addressed, considering the impact on democratic processes. Political campaigns increasingly use AI for various purposes, such as analyzing voter data to tailor messages, predict voter behavior, and optimize campaign strategies. While this can make campaigns more efficient, there is a risk that AI-driven microtargeting can lead to manipulation or exploitation of voter preferences and biases. This raises ethical concerns about the influence of AI on the democratic decision-making process. AI can analyze vast amounts of data to identify and target specific voter groups with personalized political messages. Targeting may be based on demographic information, online behavior, or perceived political inclinations. While targeted messaging is not new, AI significantly enhances its precision and scale. Concerns arise about privacy invasion, the potential for deepening political polarization, and the risk of spreading misinformation tailored to individual vulnerabilities.

The alarming use of AI to spread political messages on social media can significantly impact public opinion and must be flagged. AI algorithms determine what content users see, often prioritizing content that engages users the most, which can sometimes be sensational or polarizing. Personalized content has implications for the quality of political discourse and the potential to create echo chambers, where people are only exposed to similar viewpoints. The 2016 presidential election particularly publicized the impact of sensational or polarizing content, raising concerns about AI's role in prioritizing such content and potentially influencing election outcomes.[3]

AI IN MILITARY CONTEXTS

While specific uses of AI in national security systems might be exempt from specific regulatory requirements, such as inventory under the Advancing AI Act, it is vital to distinguish general AI applications in military contexts from those specifically designated as national security systems. AI in the military spans a broad range of applications, many of which may not fall under the umbrella of national security systems but still have significant safety implications.[4] Thus, AI technologies in military contexts should be explicitly recognized as safety-impacting use cases, meaning their development, deployment, and operational use must be subject to rigorous safety

[3] Cho, J., Ahmed, S., Hilbert, M., Liu, B., & Luu, J. (2020). Do search algorithms endanger democracy? An experimental investigation of algorithm effects on political polarization. *Journal of Broadcasting & Electronic Media*, *64*(2), 150-172.

[4] Geiß, R., & Lahmann, H. (2021). The use of AI in military contexts: opportunities and regulatory challenges. *The Military Law and the Law of War Review*, *59*(2), 165-195.

assessments and oversight. Military AI applications can have profound consequences for the personnel and systems directly involved, civilians, and the global geopolitical landscape.

One of AI's most debated and critical aspects in military contexts is its use in autonomous weapon systems (AWS). AWS are capable of selecting and engaging targets without human intervention. AWS include the risk of malfunctioning, the challenges in ensuring reliable target identification and discrimination, and the unpredictability of AI behavior in complex combat environments.[5] Ethically, the delegation of life-and-death decisions to machines raises profound questions about human dignity and the laws of war.

E-COMMERCE PLATFORMS

AI plays a significant role in e-commerce platforms, from personalized product recommendations to dynamic pricing strategies. While these AI applications can improve user experience and operational efficiency, they also pose risks like manipulating consumer behavior, unfair pricing practices, or unintentional discrimination.[6] Consumer protection guidelines in e-commerce should address transparency in AI-driven recommendations, fairness in pricing, and safeguards against discriminatory practices.

Additionally, AI's ability to analyze consumer data and create personalized marketing strategies can lead to more effective and targeted advertising. However, this also raises issues around privacy, consent, and the potential for invasive or manipulative advertising practices. Guidelines in this area could focus on ensuring that consumers have control over their data, understand how it is used for marketing purposes, and are protected from misleading or manipulative advertising tactics.

Question 8: What kind of information should be made public about agencies' use of AI in their annual use case inventory?

As the landscape of Artificial Intelligence (AI) evolves into federal agency spaces, its intersection with civil rights, particularly in the domains of housing and related financial services, warrants careful consideration. AI systems and automated systems, heralded for their potential to revolutionize operational efficiency within federal agencies, also carry implications that stretch into the realm of civil rights and societal equity. We aim to provide an in-depth overview of the essential components of information that should be made public about agencies' use of AI in their annual use case inventory, highlighting

[5] Schwarz, E. (2021). Autonomous weapons systems, artificial intelligence, and the problem of meaningful human control. *Philosophical Journal of Conflict and Violence*.
[6] Soni, V. D. (2020). Emerging roles of artificial intelligence in ecommerce. *International Journal of trend in scientific research and development*, *4*(5), 223-225.

the purpose, metrics, and strategic considerations that underpin these advanced technological tools with the focus on ensuring these systems operate within the boundaries of fairness, transparency, and accountability.

GENERAL INFORMATION

Artificial Intelligence (AI) systems are often promoted as solutions intended to enhance operational efficiency. Federal Government agencies adopting AI systems or automated systems may also have justifications that include refining decision-making processes, improving workflow efficiency, and elevating the precision and effectiveness of services rendered to the public. Metrics reflecting transparency and explainability of any AI application in governmental use should be reported for the public to conduct civil rights audit of the systems. Agencies should be mandated to ensure substantial transparency in the operation of this tool. In instances where direct quantification of these attributes is impracticable, agencies should be obliged to provide exhaustive documentation and pertinent data sets sufficient for independent algorithmic auditors and trusted civil rights communities to conduct disparate impact and disparate treatment analyses on the systems. This requirement is imperative to facilitate independent evaluation of the tool's transparency by civil rights communities and research entities.

Use of an AI or automated system by agencies may span a wide array of domains, including data administration, information technology security, privacy, civil rights, and liberties and these domains often interoperate to create downstream effects on society. Hence, agencies should include information on downstream applications and processes impacted by their systems so that civil rights communities and researchers can assess if the system's functionality enhanced by seamless integration with pre-existing systems may cause societal harms that infringe on civil rights laws and liberties.

The development and implementation of AI solutions or automated systems represent significant strides toward augmenting government efficacy and public service delivery. Nevertheless, these advancements can be accompanied by inherent challenges, notably in data privacy, security, and the potential for biases and discrimination. To mitigate these concerns, the systems should be subject to continuous monitoring and periodic updates, an essential protocol to align the tool with the dynamic landscape of policy and technological advancements. Information about updates, system versions, and monitoring cadence should be shared with the public. In addition, information about the scope of the tool, whether local, state, or national, should be reported alongside demographics that civil rights communities and researchers can further use to test its impact at the community level.

PROBLEM AND DATA INFORMATION

Project goals, stakeholders' expectations, stakeholders' requirements, and stakeholders' objectives, collectively referred to as the business problem, are usually set before an AI system or automated system is designed and developed. Hence, information that could guide civil rights communities and researchers to make an informed decision about risks that the business problem may pose to consumers and society at large should be reported. Detailed information that provides answers to questions about whose interests the business problem serves and how these interests are measured at a high level with clear measurable markers to determine risks that solving the problem may pose to consumers and society should be provided.

Like information on the problem being solved by the AI system or automated system, high-level information about the type and source of data driving the system should be reported. Any business problem that has an algorithmic solution needs to be formulated as a data problem. Information that civil rights communities and researchers can use to assess data representation of the problem being solved by the AI system or automated system and information about any techniques used to mitigate risks associated with data paucity, data insufficiency, or data quality issues should be shared with the public. Information that provides answers to data questions like the following should be provided:

1. How representative are features or variables across protected class data like race, sex, and age where applicable?
2. Is an intended use case for the system appropriately defined and will the system be constrained to that use case?
3. What metrics are used to measure system performance and fairness (including potential disparate impact) of the algorithmic solution?
4. If there is a cut off score and pass rate at the decision stage of the system, what is it and how does it affect system fairness (including disparate impact)?

MODEL AND DEPLOYMENT INFORMATION

AI systems and automated systems often employ advanced algorithms tailored to manage and interpret vast, multifaceted datasets effectively. Chosen for their reliability and proficiency in similar tasks, these algorithms can enhance governmental applications to adapt to diverse data and operational needs. Information that civil rights communities and researchers can use to evaluate the design, theory, and logic used to develop the system should be provided. Demographic information and education background of the model development and model deployment teams, data collection and data transformation systems used in the development stage, methods used to decide features or variables relevant to the system objective, and techniques or metrics used to validate system performance should be reported.

In addition, the deployment of the AI system involves a strategic rollout usually planned in phases, ensuring a smooth transition and minimal disruption to existing operations. For civil rights communities and researchers to assess if the AI deployment environment is robust and secure, with stringent data protection measures in place, several key pieces of information and metrics that should be provided by the agency include:

1. Security Audit Results: Details from comprehensive security audits, including penetration testing and vulnerability assessments, should be disclosed. These results help in evaluating the robustness of the system against potential breaches or attacks that may impact consumers of color.
2. Data Encryption Standards: Information on the encryption protocols used for data at rest and in transit and metrics related to the strength of these encryption methods (like encryption key lengths) can offer insights into the security of the data and should be shared with the public.
3. Compliance with Standards: Agencies should be obliged to provide details regarding compliance with recognized security standards and frameworks, such as ISO/IEC 27001 or National Institute of Standards and Technology (NIST) guidelines. Compliance levels, certifications obtained, and any non-conformities identified in compliance audits provide a measure of the system's security posture.
4. Incident Response Metrics: Agencies should be obliged to provide data on past security incidents, including the frequency, nature, and response times to security breaches. These metrics reflect the system’s resilience and the effectiveness of its incident response protocols.
5. User Access Controls: Agencies should be obliged to provide information on access control mechanisms and policies, including user authentication and authorization procedures. Metrics related to access control breaches or unauthorized access attempts are critical for assessing system security.
6. Data Privacy Compliance: Agencies should be obliged to provide evidence of adherence to applicable data privacy laws and regulations. Metrics like the number of data privacy violations or complaints can be indicative of the system's effectiveness in protecting user privacy.

Providing these metrics and information helps stakeholders assess the robustness and security of the AI deployment environment, ensuring that it meets the necessary standards for data protection and cybersecurity.

MONITORING INFORMATION

Monitoring and human fallback mechanisms are critical to the success of an AI system or automated system. Continuous monitoring is needed to ensure the system operates

as intended and to quickly identify and resolve any issues. Regular reports that provide insights into the system's performance and highlight areas for improvement should be shared with the public. The report should include key performance indices (KPIs) and success indicators that can be used to evaluate the AI system's effectiveness. In addition to these metrics, information on feedback and complaint mechanisms in place, allowing users and stakeholders to report concerns and provide suggestions for enhancements, should be provided. This feedback loop is vital for ongoing refinement and ensuring the AI system meets the evolving needs of government operations.

Monitoring reports for AI systems should include a range of metrics and insights to effectively gauge system performance and identify areas for improvement. Key metrics should cover:

1. Accuracy and Reliability: Data on the system's accuracy in various operational scenarios, highlighting instances of incorrect predictions or decisions.
2. Efficiency: Metrics such as processing time and resource utilization, indicating the system’s operational efficiency.
3. User Satisfaction: Feedback from users regarding their experience with the system, which can be gathered through surveys or direct feedback mechanisms.
4. Error Rates and Types: Detailed analysis of errors encountered by the system, categorized by type and frequency.

Regarding feedback and complaint mechanisms, the reports should provide clear information on how users and stakeholders can report concerns or suggest enhancements. This includes:

1. Contact Channels: Details on various channels available for feedback submission, such as online forms, email addresses, or phone numbers.
2. Response Procedures: Explanation of how feedback is processed and acted upon, including typical response times and escalation paths.
3. Feedback Utilization: Examples of how past feedback has led to system improvements, demonstrating the effectiveness of the feedback mechanism.
4. Transparency Reports: Regular updates or reports summarizing the feedback received, actions taken, and improvements implemented.

Providing this information to the public ensures transparency and encourages active participation from users and stakeholders in the continuous improvement of AI systems.

CONCLUSION

The National Fair Housing Alliance and undersigned civil rights advocacy organizations appreciate the opportunity to contribute to the Office of Management and Budget's

Request for Comments on the Draft Memorandum regarding AI's governance, innovation, and risk management in agency use. Our submission highlights the need for robust and dynamic AI governance frameworks that prioritize public engagement, accountability, accessibility, inclusivity, and regular policy reviews to adapt to the rapidly evolving landscape of AI technology. We appreciate the opportunity to provide our views on the OMB's Draft Memorandum on AI. We trust that our insights will inform and enhance the regulators' perspective, leading to more equitable, safe, and responsible AI applications across federal agencies. Please direct any questions about these comments to Michael Akinwumi, Chief Responsible AI Officer, at makinwumi@nationalfairhousing.org.

Sincerely,

The National Fair Housing Alliance

V. CONCLUSION 13

I. INTRODUCTION

CTIA[1] welcomes the opportunity to comment on the Office of Management and Budget's ("OMB") Proposed Memorandum for the Heads of Executive Departments and Agencies regarding *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* ("Draft Memo").[2] Consistent with the President's directive in the October 30, 2023 Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence ("AI EO"),[3] the Draft Memo proposes "new agency requirements and guidance for [artificial intelligence ("AI")] governance, innovation, and risk management."[4] In particular, the Draft Memo proposes "minimum practices" for federal agencies when using "rights-impacting [AI]" and "safety-impacting AI,"[5] as well as "a series of recommendations for managing AI risks in the context of Federal procurement."[6]

The Draft Memo sets forth three pillars to guide federal agency use of AI—(1) "[s]trengthening AI governance," (2) "[a]dvancing responsible AI innovation," and (3) "[m]anaging risks from the use of AI"[7]—and explicitly states its intent to advance AI innovation within the federal government, making clear that "[a]gencies must increase their capacity to successfully and responsibly adopt AI, including

---

[1] CTIA – The Wireless Association® ("CTIA") (www.ctia.org) represents the U.S. wireless communications industry and the companies throughout the mobile ecosystem that enable Americans to lead a 21st century connected life. The association's members include wireless carriers, device manufacturers, suppliers as well as apps and content companies. CTIA vigorously advocates at all levels of government for policies that foster continued wireless innovation and investment. The association also coordinates the industry's voluntary best practices, hosts educational events that promote the wireless industry and co-produces the industry's leading wireless tradeshow. CTIA was founded in 1984 and is based in Washington, D.C.

[2] Proposed Memorandum from Shalanda D. Young, OMB, on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence to the Heads of Executive Departments and Agencies (Oct. 30, 2023), https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf ("Draft Memo").

[3] Exec. Order No. 14110, 88 Fed. Reg. 75191, 75218-23 (Nov. 1, 2023), https://www.federalregister.gov/documents/2023/11/01/2023-24283/safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence ("AI EO").

[4] Draft Memo at 1.

[5] *Id.* at 2.

[6] *Id.*

[7] *Input*, AI.gov, https://ai.gov/input/ (last visited Nov. 28, 2023).

generative AI, into their operations."[8] CTIA broadly agrees with these goals; the federal government must be able to leverage the massive benefits that AI promises, which is critical for AI innovation and leadership on the global scale. However, the Draft Memo goes too far in burdening adoption of AI technology in areas that are not high risk. Specifically, the Draft Memo attempts to take a risk-based and risk-management approach, providing guidance so that agencies can both "realize significant benefits from AI" and "manage a range of risks,"[9] but its broad definitions and overly prescriptive baseline requirements cut against OMB's goals of successful adoption of responsible AI.

To better achieve its stated goals, CTIA urges OMB to adjust the Draft Memo to adopt a true risk-management approach. OMB should ensure that its Final Memo: (1) harmonizes with other federal approaches, in particular with respect to the definition of AI; (2) is narrower in scope, focusing only on high-risk AI use cases; (3) is more flexible, outlining desired outcomes but not dictating how agencies achieve such outcomes, consistent with the National Institute of Standards and Technology's ("NIST") AI Risk Management Framework ("AI RMF"); and (4) remains focused on federal agencies.

II. ADVANCING AI INNOVATION IS KEY TO ENSURING U.S. LEADERSHIP IN GLOBAL AI COMPETTION AND STANDARDS.

A. CTIA Applauds OMB's Focus on Advancing AI Innovation, Which Is Consistent with Broader Administration AI Policies.

Consistent with broader Administration goals to facilitate U.S. innovation and leadership on AI, one of the three main pillars of the Draft Memo tasks federal agencies with "[a]dvancing responsible AI innovation."[10] As the National Security Commission on Artificial Intelligence ("NSCAI") Report explained, "AI is part of a broader global technology competition. Competition will speed up

[8] Draft Memo at 2.

[9] *Id.*

[10] *Input*, AI.gov, https://ai.gov/input/ (last visited Nov. 28, 2023).

innovation. We should race together with partners when AI competition is directed at the moonshots that benefit humanity . . . ."[11]

CTIA agrees that global U.S. leadership on AI is critical. Given the transformative potential of AI—and the fact that it can be used both responsibly to improve society and also harmfully by bad actors—it is imperative that the United States lead globally, not only on innovative research and development of AI technologies and applications, but also in developing global consensus standards for AI technologies. As NIST recognizes, global consensus standards will "speed the pace of reliable, robust, and trustworthy AI technology development."[12] From a national security perspective, as the Department of Defense has acknowledged, U.S. adversaries are also investing heavily in AI, making it imperative that the United States not fall behind in the development and implementation of AI technologies.[13] As discussed below, a key aspect of promoting U.S. leadership is to refrain from erecting barriers that make it unduly burdensome for the federal government to leverage emerging AI technologies.

B. The Federal Government Should Be Able to Utilize the Benefits of AI—Especially to Promote and Protect Rights and Safety—Without Undue and Unnecessary Barriers.

The Draft Memo recognizes that "[i]f implemented responsibly, AI can improve operations and deliver efficiencies across the Federal Government."[14] CTIA agrees with this premise. AI promises massive benefits, which should be encouraged and not stifled by approaches that erect barriers to adoption without being tailored to actual AI risks. For example, AI is already being used to: (1)

[12] U.S. Leadership in AI: A Plan for Federal Engagement in Developing Technical Standards and Related Tools, NIST, at 22 (Aug. 9, 2019), https://www.nist.gov/system/files/documents/2019/08/10/ai_standards_fedengagement_plan_9aug2019.pdf (emphasis removed).

[13] Press Release, Department of Defense, DOD Announces Establishment of Generative AI Task Force (Aug. 10, 2023), https://www.defense.gov/News/Releases/Release/Article/3489803/dod-announces-establishment-of-generative-ai-task-force/.

[14] Draft Memo at 8.

strengthen national security and cybersecurity,[15] (2) analyze and detect fraud,[16] (3) optimize networks to promote energy efficiency and sustainability,[17] (4) improve accessibility,[18] and (5) enhance customer service and customer experiences.[19] Any approach that OMB takes to help federal agencies manage potential AI risks should fully consider and recognize these important benefits and provide a roadmap for federal agencies to leverage the full benefits of AI in a responsible way.

III. OMB SHOULD ENSURE THAT ITS FINAL MEMO IS HARMONIZED WITH OTHER FEDERAL APPROACHES AND IS MORE CLOSELY ALIGNED WITH LONGSTANDING RISK-MANAGEMENT PRINCIPLES.

A. OMB Should Align Its Definition of AI with Other Federal Approaches.

As policymakers across the federal government and internationally consider AI risk management approaches, it is critical that the United States promote harmonization among these efforts. Fragmentation poses serious issues for governments, organizations, and individuals. As CTIA explained in its comments to the White House's Office of Science and Technology Policy regarding a National AI Strategy, policy fragmentation can lead to overlapping and conflicting regulatory approaches that result

in an overall drag on innovation, and impede U.S. AI competition and leadership globally when such goals should be a focus of federal AI policy.[20] Fragmentation also has direct negative impacts on individual consumers when there is confusion caused by uneven expectations and regulations.[21]

Recognizing that the federal government's use of AI will have considerations that are unique to the government and to individual agencies, OMB should still strive to promote a harmonized approach to AI risk management principles. At a minimum, OMB should use a common definition for AI across agencies, and in alignment with the latest executive and congressional guidance. As currently drafted, the Draft Memo uses a definition of AI from the 2019 National Defense Authorization Act ("NDAA")[22] and adds additional context from OMB itself to assist in interpreting the definition.[23] But the AI EO—which is the impetus for the Draft Memo—defines AI based on the National Artificial Intelligence Initiative Act of 2020.[24] Rather than rely on the 2019 NDAA's definition or its own variation, OMB

[21] *Id.*

[22] *See* Draft Memo at 22-23 ("The term 'artificial intelligence' has the meaning established in Section 238(g) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019, which states that 'the term 'artificial intelligence' includes the following': 1. Any artificial system that performs tasks under varying and unpredictable circumstances without significant human oversight, or that can learn from experience and improve performance when exposed to data sets. 2. An artificial system developed in computer software, physical hardware, or other context that solves tasks requiring human-like perception, cognition, planning, learning, communication, or physical action. 3. An artificial system designed to think or act like a human, including cognitive architectures and neural networks. 4. A set of techniques, including machine learning, that is designed to approximate a cognitive task. 5. An artificial system designed to act rationally, including an intelligent software agent or embodied robot that achieves goals using perception, planning, reasoning, learning, communicating, decision making, and acting.").

[23] *See id.* at 23 ("For the purposes of this memorandum, the following technical context may assist in interpreting this definition: 1. This definition of AI encompasses, but is not limited to, the AI technical subfields of machine learning (including, but not limited to, deep learning as well as supervised, unsupervised, and semi-supervised approaches), reinforcement learning, transfer learning, and generative AI. 2. This definition of AI does not include robotic process automation or other systems whose behavior is defined only by human-defined rules or that learn solely by repeating an observed practice exactly as it was conducted. 3. For this definition, the technical complexity of a system (e.g., the number of parameters in a model, the type of model, or the amount of data used for training purposes) is not a relevant consideration for determining whether it constitutes AI. 4. This definition includes systems that are fully autonomous, partially autonomous, and not autonomous, and it includes systems that operate both with and without human oversight.").

[24] *See* AI EO at 75193 ("The term 'artificial intelligence' or 'AI' has the meaning set forth in 15 U.S.C. 9401(3): a machine-based system that can, for a given set of human-defined objectives, make predictions, recommendations, or decisions influencing real or virtual environments. Artificial intelligence systems use machine- and human-based inputs to perceive

should instead adopt the definition in the AI EO that will be operative across multiple agencies' activities. This straightforward step will help promote a harmonized approach to AI across the federal government by ensuring there is a consistently defined scope of governed activities.

B. The Final Memo Should Only Apply to High-Risk AI Use Cases and Not Inadvertently Sweep in Lower-Risk Applications.

There is a significant consensus that a risk-based approach to AI is the most effective way to promote the technology's benefits and manage its potential risks. For example, the AI EO encourages agencies to "address[] AI systems' most pressing security risks," promoting activities that "will provide a vital foundation for an approach that addresses AI's risks without unduly reducing its benefits."[25] As NIST explains in its landmark AI RMF: "When applying the AI RMF, risks which the organization determines to be highest for the AI systems within a given context of use call for the most urgent prioritization and most thorough risk management process."[26] This risk-based approach is sound. Focusing on high-risk applications of AI—rather than trying to address AI as a monolithic technology or treating all applications of AI the same—will allow organizations to leverage the benefits from AI without undue barriers, while effectively addressing identified risks.

The Draft Memo appears to attempt to establish a risk-based foundation by only imposing baseline requirements on applications that pose "risks to the rights and safety of the public."[27] However, this approach is undermined by the Draft Memo's definitions and presumptions, which could be read to sweep in lower-risk AI applications.

---

real and virtual environments; abstract such perceptions into models through analysis in an automated manner; and use model inference to formulate options for information or action.").

[25] *Id.* at 75191.

[26] Artificial Intelligence Risk Management Framework (AI RMF 1.0), NIST, at 8 (Jan. 2023), https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf.

[27] Draft Memo at 10.

The Draft Memo's definitions of "rights-impacting"[28] and "safety-impacting" [29] AI have the potential to sweep in AI applications that are not high-risk because they are overly broad and vague. Both definitions rely on relatively general and undefined goals that are subject to ongoing debate and policy discussions. For example, while individual privacy is an important consideration, the contours of what implicates "privacy" sufficient to trigger heightened "minimum standards" is neither settled nor defined. And the definitions of these terms rely on vague standards—such as "critical resources or services," "well-being," and "strategic assets or resources"[30]—which do not provide meaningful guidance to agencies for determining which AI applications are high-risk and could sweep in more applications than intended. Additionally, the definition for "safety-impacting AI" is triggered by "potential" impact—not *actual* or even reasonably likely impact—which is overly broad and ambiguous, and therefore difficult to administer.[31]

The Draft Memo also establishes a list of AI applications that are automatically presumed to be rights-impacting or safety-impacting. These lists are categorical in nature and do not sufficiently distinguish between high- and low-risk applications for any given purpose.[32] This approach sweeps too

[28] *Id.* at 24 (defining "Rights-Impacting AI" as "AI whose output serves as a basis for decision or action that has a legal, material, or similarly significant effect on an individual's or community's: 1. Civil rights, civil liberties, or privacy, including but not limited to freedom of speech, voting, human autonomy, and protections from discrimination, excessive punishment, and unlawful surveillance; 2. Equal opportunities, including equitable access to education, housing, credit, employment, and other programs where civil rights and equal opportunity protections apply; or 3. Access to critical resources or services, including healthcare, financial services, social services, transportation, non-deceptive information about goods and services, and government benefits or privileges.").

[29] *Id.* at 25 (defining "Safety-Impacting AI" as "AI that has the potential to meaningfully impact the safety of: 1. Human life or well-being, including loss of life, serious injury, bodily harm, biological or chemical harms, occupational hazards, harassment or abuse, or mental health, including both individual and community aspects of these harms; 2. Climate or environment, including irreversible or significant environmental damage; 3. Critical infrastructure, including the critical infrastructure sectors defined in Presidential Policy Directive 2143 and the infrastructure for voting and protecting the integrity of elections; or, 4. Strategic assets or resources, including high-value property, information marked as sensitive or classified by the Federal Government, and intellectual property.").

[30] *Id.* at 24-25.

[31] *Id.* at 25.

[32] *See id.* at 11-13.

broadly, as it may require agencies to treat more benign applications—including security applications—the same as high-risk applications.

Overall, the Draft Memo's overly broad approach risks creating hurdles to federal agency use of beneficial AI, which undercuts the Draft Memo's goals of enhancing innovation and reducing barriers.[33] Imposing strict and reflexive requirements on AI use generally will ultimately stifle—not enhance—agencies' "ability to use AI in ways that benefit the public and increase mission effectiveness."[34] OMB should more carefully distinguish between low- and high-risk AI applications and focus baseline requirements on a more narrowly circumscribed list of high-risk activities.

C. The Final Memo Should Be Flexible and Not Attempt to Establish a One-Size-Fits-All Approach for Addressing Complex and Dynamic AI Risks.

Flexibility is a well-established principle that has been at the heart of risk management approaches for emerging technologies for decades. As NIST recognized early in the development process for the AI RMF, an effective approach must "[b]e risk-based, outcome-focused, cost-effective, voluntary, and non-prescriptive. It should provide a catalog of outcomes and approaches to be used voluntarily, rather than a set of one-size-fits-all requirements."[35] Building in sufficient flexibility allows any AI approach to account for the complex and diverse range of AI applications, allowing organizations to tailor any risk management processes or controls to specific risks in each application's unique context. Flexibility also makes AI risk management more future-proof and adaptable to ever-changing technological developments and emerging threats. Conversely, establishing a "one-size-fits-all" checklist for any organization to use for any AI application has the opposite impact. Such a rigid approach promotes a "compliance mindset," which encourages a check-the-box approach to addressing

[33] *Id.* at 1-2.

[34] *Id.* at 8.

[35] AI Risk Management Framework Concept Paper, NIST, at 4 (Dec. 13, 2021), https://www.nist.gov/document/airmfconceptpaper.

risks. Inflexibility locks organizations into processes and controls that may quickly become ineffective and outdated. Rigid requirements can also provide valuable information to sophisticated bad actors about the controls and protections that organizations will be using, which threat actors will almost certainly work to exploit.

Unfortunately, the Draft Memo fails to adopt sufficient flexibility and instead proposes a "minimum requirements" approach that effectively requires a rigid, "one-size-fits-all" if AI falls into a certain category. Indeed, the Draft Memo contemplates more of a "checklist" style of minimum requirements for applications deemed to be rights-impacting or safety-impacting, which is not tailored to individual AI applications.

AI Impact Assessments. As part of the requirement to complete an AI impact assessment, the Draft Memo prescribes in specific detail the metrics that an agency should use, as well as the content of the impact assessment.[36] Dictating the details of risks assessments threatens to transform these tools from meaningful risk management analyses into rote, check-the-box exercises. OMB can better achieve its goal of promoting the uniform use of meaningful impact assessments by providing more general guidance to federal agencies, but not being overly prescriptive in what each assessment must look like. Given the diversity of federal agencies—including in size, mission, and AI use/adoption—each impact assessment will need to be tailored to each unique context.

Stakeholder Engagement. The Draft Memo instructs that for rights-impacting AI, agencies "*must* consult affected groups, including underserved communities, in the design, development, and use of the AI, and use such feedback to inform agency decision-making regarding the AI."[37] While the Draft Memo rightly caveats this requirement to be applied "[t]o the extent practicable,"[38] it is still overly

[36] Draft Memo at 15-16.

[37] *Id.* at 19-20 (emphasis added).

[38] *Id.* at 19.

burdensome and unnecessary to adequately assess risks in many situations. Indeed, direct community or outside stakeholder engagement is infeasible in many circumstances, especially where organizations are deploying low-risk AI systems.

Opt-out. The Draft Memo would establish rigid opt-out rules for certain rights-impacting AI applications.[39] Overly broad opt-out requirements can have unintended consequences. Many AI applications are low-risk and/or necessary to provide customized services. An overly broad opt-out may result in individuals opting out of uniquely tailored experiences or processes necessary to provide desired services—without individuals understanding the scope of their opt-out. Further, an overly broad opt-out could lead to organizations maintaining dual systems for the same functions—one AI system and one non-AI system. This would be duplicative and costly, and could result in federal agencies forgoing AI systems altogether, thereby impeding innovation using AI that would directly benefit individuals.

Rather than use the approach in the current Draft Memo, OMB should adjust its requirements for high-risk AI applications to align with—and map to—NIST's AI RMF. The AI RMF was developed at the direction of Congress, includes robust stakeholder involvement, and thoughtfully outlines a voluntary, flexible, and risk-based approach to deploying AI in a responsible manner. It provides guidance for incorporating trustworthiness considerations into the development and use of AI systems, and can be applied flexibly to a variety of use cases and in alignment with existing industry standards. This kind of risk-based approach that maintains flexibility will promote innovation while appropriately

[39] *Id.* at 20-21 ("Maintain options to opt-out where practicable. Agencies must prominently provide and maintain a mechanism to conveniently opt out from AI functionality in favor of a human alternative where practicable and consistent with applicable law and governmentwide guidance. An opt-out mechanism must exist where the affected people have a reasonable expectation of an alternative or where lack of an alternative would meaningfully limit accessibility or create unwarranted harmful impacts.").

addressing risks. And it will help to realize the White House's "commitment to seizing the opportunities and managing the risks posed by AI."[40]

The Draft Memo currently advises that "[t]o fill potential risk management gaps, agencies are encouraged to promote and to incorporate, as appropriate, additional best practices for AI risk management, such as from the National Institute of Standards and Technology (NIST) AI Risk Management Framework . . . ."[41] While encouraging agencies to utilize the AI RMF is a good starting point, OMB should go further and encourage federal agency use of the AI RMF by mapping its guidance to the AI RMF, which foregoes a "one-size-fits-all" approach to managing AI risk. While several of the requirements in the Draft Memo are drawn from the AI RMF, it is critical that OMB implement them in a flexible manner.[42] In particular, OMB should emphasize that risk management is not a uniform "checklist" approach, and that different approaches will be appropriate to address unique risks.

IV. THE SOLE FOCUS OF OMB'S FINAL MEMO SHOULD BE FEDERAL AGENCIES.

A. In Drafting Procurement Guidance, OMB Should Focus Only on AI Systems, Tools, and Services Provided to the Federal Government.

The Draft Memo indicates that OMB plans to "develop an initial means to ensure that AI contracts align with the guidance in this memorandum."[43] CTIA's members include many of the

---

[40] *Biden-Harris Administration Announces New NIST Public Working Group on AI*, NIST (June 22, 2023), https://www.nist.gov/news-events/news/2023/06/biden-harris-administration-announces-new-nist-public-working-group-ai.

[41] Draft Memo at 13-14.

[42] *See NIST AI RMF Playbook, Govern 5.1*, NIST, https://airc.nist.gov/AI_RMF_Knowledge_Base/Playbook/Govern (last visited Nov. 30, 2023) ("Organizational policies and practices are in place to collect, consider, prioritize, and integrate feedback from those external to the team that developed or deployed the AI system regarding the potential individual and societal impacts related to AI risks. . . . Beyond internal and laboratory-based system testing, organizational policies and practices may consider AI system fitness-for-purpose related to the intended context of use. Participatory stakeholder engagement is one type of qualitative activity to help AI actors answer questions such as whether to pursue a project or how to design with impact in mind. This type of feedback, with domain expert input, can also assist AI actors to identify emergent scenarios and risks in certain AI applications. The consideration of when and how to convene a group and the kinds of individuals, groups, or community organizations to include is an iterative process connected to the system's purpose and its level of risk. Other factors relate to how to collaboratively and respectfully capture stakeholder feedback and insight that is useful, without being a solely perfunctory exercise.").

[43] Draft Memo at 21.

world's largest telecommunications carriers that provide voice, data, and cloud-based services, as well as information and communications technology ("ICT") products, to the federal government under contracts and subcontracts. Accordingly, CTIA urges OMB to ensure that its guidance reaches federal contractors only insofar as they are providing AI systems, tools, or services to the federal government. Already, the Draft Memo signals that OMB plans to remain focused on federal agency use of AI. In particular, the Draft Memo discusses "AI contracts."[44] As it moves forward with developing this guidance, OMB should take care to remain focused only on AI systems, tools, and services being directly sold or provided to the federal government. It should not attempt to set requirements for a contractor's more general operations or its commercial tools and services that are not directly related to their government contract.

B. OMB Should Not Create Duplicative or Overlapping Guidance for Critical Infrastructure.

The AI EO contemplates several federal government workstreams that address AI use within Critical Infrastructure. For example, "[w]ithin 180 days of the date of [the AI EO], the Secretary of Homeland Security, in coordination with the Secretary of Commerce and with [Sector Risk Management Agencies ("SRMAs")] and other regulators as determined by the Secretary of Homeland Security, shall incorporate as appropriate the AI Risk Management Framework, NIST AI 100-1, as well as other appropriate security guidance, into relevant safety and security guidelines for use by critical infrastructure owners and operators."[45] While OMB has a role to play in this guidance for Critical

[44] *Id.*

[45] AI EO at 75199-75200. *See also, e.g.*, *id.* at 75199 ("Within 90 days of the date of this order, and at least annually thereafter, the head of each agency with relevant regulatory authority over critical infrastructure and the heads of relevant SRMAs, in coordination with the Director of the Cybersecurity and Infrastructure Security Agency within the Department of Homeland Security for consideration of cross-sector risks, shall evaluate and provide to the Secretary of Homeland Security an assessment of potential risks related to the use of AI in critical infrastructure sectors involved, including ways in which deploying AI may make critical infrastructure systems more vulnerable to critical failures, physical attacks, and cyber attacks, and shall consider ways to mitigate these vulnerabilities. Independent regulatory agencies are encouraged, as they deem appropriate, to contribute to sector-specific risk assessments.").

Infrastructure,[46] that process should be conducted separately from this guidance for federal agencies, and in consultation with other agencies. OMB should refrain from providing guidance regarding Critical Infrastructure under this Draft Memo, as creating overlapping or duplicative guidance will lead to confusion and unnecessarily fragmented directives.

V. CONCLUSION

CTIA appreciates the opportunity to provide input on the Draft Memo and generally supports the goal of promoting AI innovation while managing risks. OMB should align its definition of AI with the AI EO, carefully distinguish between low- and high-risk AI use cases, and promote flexibility by further aligning with the NIST AI RMF. The Final Memo should also only focus on federal agencies' use of AI.

Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Document: OMB-2023-0020-0114
Comment on OMB-2023-0020-0001

Submitter Information

Organization: Citizens and Technology Lab, Cornell University

General Comment

The Citizens and Technology Lab (CAT Lab) of Cornell University is pleased to provide input in response to the request for comment (RFC) on OMB's draft memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. These comments respond to questions 2, 3, 5, and 8 of the RFC, and provide additional feedback. With our attached supporting materials we:

- Encourage the OMB to acknowledge and support the role of community/participatory science in the oversight of AI tools.
- Urge the OMB to develop guidelines for soliciting and supporting participation in AI innovation and governance from underrepresented groups who have been historically excluded from AI research and development - and who face disproportionate risks from AI systems.
- Advise the OMB to account for the labor, rights, and mental health consequences for volunteer and professional communities whose work is used to train AI systems and manage AI safety.

About the Citizens and Technology Lab

The Citizens and Technology Lab (CAT Lab) at Cornell University works alongside the public to discover effective community ideas for change in ways that advance scientific knowledge. CAT Lab has worked with communities of tens of millions of people on reddit, Wikipedia, and Twitter to study socio-technical safety and reliability questions, including online safety and discrimination.

CAT Lab is led by Dr. J. Nathan Matias, Assistant Professor at Cornell in the departments of Communication and Information Science. In 2010, he developed one of the first socio-technical testing systems for a generative language model in his capacity at one of the earliest neural network predictive text software companies (SwiftKey).

CAT Lab has particular expertise with AI systems that are built on adaptive algorithms: systems that train on their outputs such as systems for ranking and sorting, resource allocation, logistics management, and generative AI. As Dr. Matias has outlined in a recent article in Nature, the creators of these systems cannot currently make reliable assurances about the performance and safety of systems that adapt to their human

environments. He outlines the needed scientific work of testing, forecasting, and preventing harms from this kind of collective AI and human behavior, including the essential role of community/citizen science. When AI systems adapt to widely different contexts, attempts at AI transparency, accountability, and regulation will grossly fail the most vulnerable in society without significant support for community/participatory science on AI and its social impacts.

Coordination mechanisms and OMB's role advancing responsible AI innovation (questions 2, 3, 8)

OMB should direct agency heads to establish a task force to build community/participatory science-based review of AI tools.
OMB should include indicators in any system it develops to inventory AI use cases (pursuant to section 7225 of the Advancing American AI Act) to seek clarity from Federal agencies on the diversity of analysis in safety-impacting and rights-impacting AI.

To engage the public in responsible AI innovation, federal agencies should consider the roles of access to data, ethics, and volunteer labor that make up the governance systems of digital decision-making.
CAT Lab recommends that the OMB reflect on how federal agencies can approach AI governance with the role of semi-professional moderators in mind, and designate a person to lead in advancing our understanding of the role of volunteer moderators in advancing responsible AI innovation.
OMB should direct agency leads to support the work of developing best standards and practices for mitigating the mental health and secondary trauma of trust and safety teams and moderators working with AI systems.

Use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised (question 5)

Harms from human-algorithm interaction in AI systems should be considered to develop and change both in their harms and benefits over time. OMB should consider expanding the list of safety and rights impacting AI to specify arenas where the initial effect may not yet be easily observed, but where research has shown initial effects, specifically:
-The chilling effect on freedom of speech that emerges from the use of AI to establish automated law enforcement to deter behavior. This includes systems of legal action in which a computer is responsible for unsupervised decision-making, which distributes or outsources surveillance and enforcement to parties that are not governments.
- The potential for such automated law enforcement tools to be deployed in requirements to watermark generative AI content. Early research has shown that receiving takedown notices from copyright enforcement bots drives down individuals' rate of posting, on average, regardless of whether the takedown notice was legitimate or not.

Citizen and Technology Lab's Submission to OMB Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Office of Management and Budget
Regulations.gov Docket Number OMB–2023–0020

The Citizens and Technology Lab (CAT Lab) of Cornell University is pleased to provide input in response to the request for comment (RFC) on OMB's draft memorandum on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence.* These comments respond to questions 2, 3, 5, and 8 of the RFC, and provide additional feedback. In this document we:

- Encourage the OMB to acknowledge and support the role of community/participatory science in the oversight of AI tools.
- Urge the OMB to develop guidelines for soliciting and supporting participation in AI innovation and governance from underrepresented groups who have been historically excluded from AI research and development - and who face disproportionate risks from AI systems.
- Advise the OMB to account for the labor, rights, and mental health consequences for volunteer and professional communities whose work is used to train AI systems and manage AI safety.

About the Citizens and Technology Lab

The Citizens and Technology Lab (CAT Lab) at Cornell University works alongside the public to discover effective community ideas for change in ways that advance scientific knowledge. CAT Lab has worked with communities of tens of millions of people on reddit, Wikipedia, and Twitter to study socio-technical safety and reliability questions, including online safety and discrimination.

CAT Lab is led by Dr. J. Nathan Matias, Assistant Professor at Cornell in the departments of Communication and Information Science. In 2010, he developed one of the first socio-technical testing systems for a generative language model in his capacity at one of the earliest neural network predictive text software companies (SwiftKey).

CAT Lab's position with respect to testing, forecasting, and preventing harms from collective AI and human behavior

CAT Lab has particular expertise with AI systems that are built on adaptive algorithms-systems that train on their outputs such as systems for ranking and sorting, resource allocation, logistics management, and generative AI. As Dr. Matias has outlined in a recent article in *Nature*,[1] the creators of these systems cannot currently make reliable assurances about the performance and safety of systems that adapt to their human environments. He outlines the needed scientific work of testing, forecasting, and preventing harms from this kind of collective AI and human behavior, including the essential role of community/citizen science. When AI systems adapt to widely different contexts, attempts at AI transparency, accountability, and regulation will grossly fail the most vulnerable in society without significant support for community/participatory science on AI and its social impacts**.**

Coordination mechanisms and OMB's role advancing responsible AI innovation *(questions 2, 3, 8)*

OMB should direct agency heads to establish a task force to build community/participatory science-based review of AI tools.

Citizen/community science offers an important mechanism to overcome severe safety and inclusion risks of science and industry. When Dr. Safiya Noble wrote "Algorithms of Oppression," documenting the gross misrepresentation of Black girls with images of pornography on Google, she was drawing attention to a system problem in AI systems that went largely undetected by AI creators in academia and industry for over a decade. As one of the only Black women in information science, she was partly able to observe this problem because it affected her and her communities. Over a decade later, US Information Science as a field has not increased the rate of Black women PhDs. Given the severe under-representation of minorities in computing, work on AI safety and reliability cannot wait for academia to change in order for communities to be safe.[2] Citizen/community science can fill these knowledge gaps and transform the diversity of the scientific and industry workforce by broadening who participants in research and by creating pathways for opportunity.

The EPA's program in Participatory Science for Environmental Protection is one such model, as documented in the 2022 report "Using Participatory Science at EPA: Vision and Principles (PDF)." In establishing this task force, OMB should seek agency input on funding needs for universities, civil society, state/regional/local governments, and Tribal communities to pursue scientific inquiry along

[2] Matias, J.N., Lewis, N.A. & Hope, E.C. US universities are not succeeding in diversifying faculty. *Nat Hum Behav* **6**, 1606–1608 (2022). https://doi.org/10.1038/s41562-022-01495-4

community designs. It is critical to begin now to build the scientific and engineering practice to understand collective patterns of human-algorithm behavior.

OMB should include indicators in any system it develops to inventory AI use cases (pursuant to section 7225 of the Advancing American AI Act) to seek clarity from Federal agencies on the diversity of analysis in safety-impacting and rights-impacting AI.

As Dr. Matias noted in a response to *RFC NTIA Docket No. 230407-0093*,[3] the contextual dependence of AI systems perpetuates harms over long periods of time, in particular where harms occur for people underrepresented in computing. Advancing responsible AI innovation will require a coordination mechanism that reflects this context.

To engage the public in responsible AI innovation, federal agencies should consider the roles of access to data, ethics, and volunteer labor that make up the governance systems of digital decision-making.

CAT Lab notes that federal policies need to work in tandem with algorithm transparency to enable communities to produce high quality research in the public interest, and that researchers need protection from private-sector retaliation for research and documentation of harms. We have documented some of the opportunities to enable independent research in a recent Tech Policy Press article, Enabling Independent Research Without Unleashing Ethics Disasters.[4]

CAT Lab recommends that the OMB reflect on how federal agencies can approach AI governance with the role of semi-professional moderators in mind, and designate a person to lead in advancing our understanding of the role of volunteer moderators in advancing responsible AI innovation.

Though trust and safety professionals are part of the bulwark of protection against AI harms, much of the day-to-day activity of protecting online spaces and mitigating algorithmic harm is done by volunteer moderators of online communities, whose conversations have become so-called "ground truth" for the training of AI systems. Community moderators who safeguard platforms, including Wikipedia and reddit, have already experienced overwhelming amounts of information from generative AI bots escalating the amount of spam they deal with to maintain online community spaces.[5] Scholars have begun to document the disruptions from AI-generated content in these

[3] Matias, J.N. (2023). *AI Policy Will Fail Society Without Community Science.* NTIA Docket No. 230407-0093*, also available at* https://citizensandtech.org/2023/06/ntia-submission-06-2023/

[4] Lukito, Josephine, Matias, J., Gilbert, S (2023 May 10). *Enabling Independent Research Without Unleashing Ethics Disasters.* Tech Policy Press. https://www.techpolicy.press/enabling-independent-research-without-unleashing-ethics-disasters/.

[5] Clarke, Laurie (2023 April 11). *Reddit Moderators Brace for a ChatGPT Spam Apocalypse.* Vice. https://www.vice.com/en/article/jg5qy8/reddit-moderators-brace-for-a-chatgpt-spam-apocalypse.

communities; the downstream effects on generative AI systems from this potential information pollution are still poorly understood.[6]

Similarly, the software systems that help enable volunteer moderation are often built and maintained by volunteer open-source engineers. We encourage the OMB to include the governance of volunteer and open-source sociotechnical systems as part of its safety-impacting and rights-impacting AI framework. OMB should also incentivize basic research and the development of open-source software and standards focused on the mitigation of algorithmic harm.

OMB should direct agency leads to support the work of developing best standards and practices for mitigating the mental health and secondary trauma of trust and safety teams and moderators working with AI systems.

When policymakers discuss the safety and rights implications of AI, they often consider end-users of AI, but AI development also involves managing the safety and rights of the workers who train AI systems and monitor their safety. This work, as documented by Siddharth Suri and Mary Gray in "Ghost Work", Alexa Koenig and Andrea Lampros in “Graphic: Trauma and Meaning in Our Online Lives”, and by Sarah T. Roberts in "Beyond the Screen," can expose workers to severe secondary trauma and mental health risks that psychologists have still not discovered how to reliably mitigate. There is much more research to be supported in this developing field of AI mitigation, such as emerging research around AI’s ability to render style-transfer filters to mitigate impact.[7] At Cornell, we have a team currently working on compiling a systematic review of these secondary trauma issues, how to measure the psychological harms from training AI systems to be safe, and how to introduce workplace protections that safeguard the health of the people behind the screen of AI.

Use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised *(question 5)*

Harms from human-algorithm interaction in AI systems should be considered to develop and change both in their harms and benefits over time. OMB should consider expanding the list of safety and rights impacting AI to specify arenas where the initial effect may not yet be easily observed, but where research has shown initial effects, specifically:

1. The chilling effect on freedom of speech that emerges from the use of AI to establish automated law enforcement to deter behavior. This includes systems of legal action in which

[6]Lloyd, T., Reagle, J., Naaman, M. (2023). *“There Has To Be a Lot That We're Missing": Moderating AI-Generated Content on Reddit*. aRxiv. https://doi.org/10.48550/arXiv.2311.12702.
[7] Sarridis, I, Spangenberg, J., Papadopoulou, O., & Papadopoulos, S. (2023). *Mitigating Viewer Impact from Disturbing Imagery using AI Filters: A User-Study.* arXiv. https://doi.org/10.48550/arXiv.2307.10334

a computer is responsible for unsupervised decision-making, which distributes or outsources surveillance and enforcement to parties that are not governments.

2. The potential for such automated law enforcement tools to be deployed in requirements to watermark generative AI content. Early research has shown that receiving takedown notices from copyright enforcement bots drives down individuals' rate of posting, on average, regardless of whether the takedown notice was legitimate or not.[8]

* * * * *

Thank you for the opportunity to provide comments. The Citizens and Technology Lab looks forward to serving as a potential resource for policy discussions on this issue.

Comment on OMB-2023-0020-0001

Submitter Information

Organization: Muse Technologies, Inc.

General Comment

Muse Technologies Inc., a woman-owned small business, is an IT consulting firm located in Lanham, Maryland. We were founded in 2013 by Dr. Linda Cureton, the former NASA CIO, and offer a range of services, including program/project management, organizational development, IT strategy and governance, facility management, property management, and strategic communication.

The "AI in Government Memo" is a critical step towards harnessing the potential of Artificial Intelligence (AI) while safeguarding the public against its risks. It proposes comprehensive guidelines for advancing governance innovation and managing risks associated with AI deployment in federal agencies, emphasizing the necessity of balancing the technological boon of AI with the imperative to protect the safety and rights of citizens. The memo mandates the designation of Chief AI Officers in agencies, reflecting a commitment to high-level accountability in AI governance.

The requirements for AI governance include enhanced accountability and oversight, improved risk management, operational efficiency and innovation, and a balance between innovation and regulation. However, the effectiveness of these requirements depends on their implementation, particularly if agencies lack the necessary expertise, resources, or infrastructure to support advanced AI systems and governance structures.

Balancing innovation with regulation requires flexibility in the governance framework, as different AI applications may pose varying levels of risk and require different management strategies. Effective regulation should minimize risks and encourage responsible innovation, promoting ethically designed, transparent, and accountable AI applications while also effectively and efficiently addressing government objectives.

Collaboration with stakeholders, including AI experts, ethicists, and the public, is essential for formulating guidelines that are both innovative and ethically grounded. Continuous evaluation and revision of regulations and guidelines can ensure that governance keeps pace with technological advances while maintaining necessary safeguards.

Suggestions for improving accountability and effectiveness in AI governance include continuous education and training for agency heads and Chief AI Officers, instituting ethics and organizational leadership in executive capacity building, involving a broader range of stakeholders in AI governance decisions, developing clear performance metrics and reporting, and establishing feedback loops and continuous improvement mechanisms.

The evolving nature of AI technology necessitates ongoing education, adaptation, and improvement of risk management strategies. Public and private organizations should stay informed about emerging, ethical, and regulatory standards and continuously assess and enhance their approaches to AI implementation. By prioritizing ongoing education and staying abreast of evolving standards, organizations can foster an environment that embraces innovation and upholds ethical considerations and regulatory compliance.

Continuous assessment and enhancement of risk management strategies are imperative in navigating the dynamic landscape of AI. As technology evolves, so do potential risks related to data security, privacy, bias, and legal compliance. Proactive measures, such as robust governance structures, regular performance reviews, and stakeholder engagement, are critical to mitigating these risks.

The synergy between education, adaptation, and risk management is pivotal for responsibly harnessing AI's full potential. Public and private entities that commit to a culture of continuous improvement will optimize their AI implementations and contribute to the responsible advancement of AI technology on a broader scale. As we navigate the future of AI, the commitment to ethical practices and regulatory compliance will be the compass guiding organizations toward sustainable and impactful AI integration.

Muse would like to acknowledge the invaluable involvement of:

• Dustin S. Sachs, Senior Manager, Information Security Risk Management, World Kinect Corporation
• Joyce Hunter, CEO, Vulcan Enterprises, LLC

Respectfully Submitted,
Dr. Linda Y. Cureton

RFC OMB AI (3)

OMB AI RFC Addendum (1)

Executive Summary

The rapid advancement of Artificial Intelligence (AI) technologies has presented unparalleled opportunities and challenges for government agencies. The "AI in Government Memo," drafted for public review by the Executive Office of the President, Office of Management and Budget, embodies a critical step towards harnessing the potential of AI while safeguarding the public against its risks. Under the directive of Shalanda D. Young, this memo proposes comprehensive guidelines for advancing governance innovation and managing risks associated with AI deployment in federal agencies. It emphasizes the necessity of balancing the technological boon of AI with the imperative to protect the safety and rights of citizens, aligning with the mandates of the Artificial Intelligence in Government Act of 2020, the Advancing American AI Act, and President Biden's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence.

The significance of this memorandum cannot be overstated in an era where AI is increasingly integral to the operations and efficiency of the Federal Government. It establishes new requirements and guidance for AI governance, calling for robust risk management practices, especially for AI applications impacting public rights and safety. The memo mandates the designation of Chief AI Officers in agencies, reflecting a commitment to high-level accountability in AI governance. By evaluating the directives, strategies, and risk management practices outlined in the memo, this response aims to provide substantive feedback, critically examining the potential impacts of these policies on AI innovation and deployment within the

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

government. The goal is to assess the feasibility and effectiveness of these guidelines and propose enhancements that could lead to more responsible and efficient AI governance in federal agencies.

Analysis of AI Governance and Innovation Requirements

Enhanced Accountability and Oversight: As proposed in the memo, the requirements for AI governance, including appointing Chief AI Officers in agencies, will likely lead to increased accountability and oversight. By assigning specific responsibilities for AI governance to high-level officials, agencies are more likely to prioritize AI's ethical and responsible use, aligning with national values and laws.

Improved Risk Management: The emphasis on risk management, particularly for AI uses that impact public rights and safety, could lead to more robust and comprehensive approaches to identifying, assessing, and mitigating potential harms associated with AI systems. This proactive stance on risk management can prevent adverse outcomes and maintain public trust in government-operated AI systems.

Operational Efficiency and Innovation: The requirements can also drive innovation within government agencies. By mandating AI governance and risk management, agencies are encouraged to explore new AI technologies and applications, which could lead to operational efficiencies and enhanced service delivery to the public.

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Challenges in Implementation: However, the effectiveness of these requirements depends on their implementation. Agencies may face challenges integrating these guidelines into their operations, particularly if they lack the necessary expertise, resources, or infrastructure to support advanced AI systems and governance structures.

Keeping the Balance Between Innovation and Regulation

Potential for Stifling Innovation: While regulation is necessary to ensure responsible AI use, there is a risk that overly stringent or prescriptive requirements could stifle innovation. Agencies might become overly cautious in adopting new AI technologies, fearing non-compliance or the complexities of navigating the governance framework.

Need for Flexibility: Balancing innovation with regulation requires a degree of flexibility in the governance framework. Regulations should be designed to adapt to the rapidly evolving nature of AI technologies. A one-size-fits-all approach may not be practical, as different AI applications may pose varying levels of risk and require different management strategies.

Encouraging Responsible Innovation: Effective regulation should minimize risks and encourage responsible innovation. This involves promoting AI applications that are ethically designed, transparent, and accountable while also effectively and efficiently addressing government objectives.

Collaboration with Stakeholders: Striking the right balance between innovation and regulation will require collaboration with various stakeholders, including AI experts, ethicists, and the

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

public. Input from these groups can help in formulating guidelines that are both innovative and ethically grounded.

Continuous Evaluation and Revision: Given the dynamic nature of AI, regulations, and guidelines should be subject to continuous evaluation and revision. This adaptive approach can ensure that governance keeps pace with technological advances while maintaining necessary safeguards.

Evaluation of AI Governance Strengthening Measures

Responsibilities of Agency Heads:

- **Positive Aspects:** Assigning AI governance responsibilities to agency heads is strategic. It ensures that AI initiatives align with the overall goals and objectives of the agency, fostering a top-down approach to ethical AI use.
- **Concerns:** However, agency heads often juggle multiple priorities and may not always have the specialized knowledge required for effective AI governance. This could lead to a superficial or compliance-focused approach rather than a deeply ingrained ethical AI culture.

Requirement to Appoint a Chief AI Officer:

- **Advantages:** The creation of a Chief AI Officer role is commendable for providing a dedicated focus on AI governance. This role can bridge the gap between technical AI

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

applications and strategic organizational goals, ensuring AI is used responsibly and effectively.

- **Limitations:** The effectiveness of this role depends on the authority and resources allocated to it. If the Chief AI Officer lacks sufficient influence or support, their ability to implement meaningful changes could be significantly hampered. Making this an adjunct role to the Chief Technology Officer or the Chief Data Officer will dilute the authority and dedication of the role to "duties as otherwise assigned."

Suggestions for Improving Accountability and Effectiveness in AI Governance

Continuous Education and Training:

- Implement training programs for agency heads and Chief AI Officers to keep them abreast of AI advancements and ethical considerations. This can enhance their ability to make informed decisions.
- Institute ethics and organizational leadership in baseline and continuing executive capacity building in agency heads and Chief AI Officers. Ethical leadership emphasizes principles like trust, integrity, and accountability, fostering trust and respect within the organization. It drives the organization's vision, inspires employees, and fosters innovation. Ethical leadership contributes to long-term success of AI Governance, builds trust with customers, partners, and the community, and positively impacts decision-making processes

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Stakeholder Engagement:

- Involve a broader range of stakeholders in AI governance decisions, including AI experts, ethicists, and public representatives. This can provide diverse perspectives and enhance the legitimacy of AI governance frameworks.

Performance Metrics and Reporting:

- Develop clear metrics for evaluating the effectiveness of AI governance and make these evaluations public. Regular reporting on AI projects, like we do for IT (Information Technology) projects with the Federal Information Technology Acquisition Reform Act (FITARA), can increase transparency and accountability.
- Implementing a FITARA-like process for AI can help organizations manage and optimize their AI initiatives effectively while ensuring alignment with broader business objectives.

Feedback Loops and Continuous Improvement:

- Establish mechanisms for regular feedback from both internal and external stakeholders. Use this feedback for continuous improvement of AI governance practices. Participating in developing industry-wide standards can contribute to a collective effort to address these concerns effectively.

Collaboration and Knowledge Sharing:

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

- Encourage collaboration and knowledge sharing between different agencies. This can help develop best practices and learn from each other's experiences in AI governance. This could be accomplished by establishing a Chief AI Officers Council, like the Chief Data and Chief Information Officers Councils.

Management of Risks Associated with AI Use

Detailed Examination of Policies and Procedures for Managing AI-Related Risks

- **Current State:** The memo outlines that agencies must implement policies and procedures to manage risks associated with AI, particularly those affecting public rights and safety. This includes integrating risk management into the AI lifecycle, from development to deployment and monitoring.
- **Analysis:** A practical risk management framework should encompass comprehensive risk assessment methodologies, including showing potential biases, errors, and unintended consequences of AI systems. Regular audits and impact assessments are crucial in this regard.

Review of Risk Management Practices for Rights and Safety Impacting AI

Assessment: The minimum risk management practices detailed in the memo focus on ensuring AI systems do not infringe on individual rights or pose safety risks. These practices include transparency, accountability, and regular evaluation of AI systems.

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Concerns: While these practices are essential, they might not be sufficient to address the dynamic and often unpredictable nature of AI risks. The complexity and evolving capabilities of AI systems might outpace the current minimum standards.

Suggestions for Enhancing Risk Management Frameworks

Dynamic Risk Assessment Models: Implementing adaptive risk assessment models that can evolve with AI advancements is critical. These models should be capable of identifying new risks as AI technologies develop.

Stakeholder Involvement: Involving a diverse set of stakeholders, including AI ethics experts, civil society, and the public, in risk assessments can provide broader insights into potential impacts.

Regular Updates and Training: Agencies should regularly update their risk management practices and provide ongoing training to staff to keep pace with technological advancements and emerging threats. Implement continuous monitoring of AI systems to detect and address issues promptly. Regularly evaluate AI models' performance and update them to improve accuracy, fairness, and safety.

Approach to AI Procurement and Compliance with National Values

Analysis of Recommendations for Responsible Federal Procurement of AI

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

- **Overview:** The memo emphasizes that AI procurement must align with national values and laws, focusing on transparency, accountability, and performance of AI systems.
- **Observations:** The procurement guidelines aim to ensure that AI systems used by federal agencies are effective, efficient, ethically aligned, and legally compliant. However, evaluating and verifying these aspects can be challenging due to the complexity and opaqueness of some AI technologies.

Discussion on Alignment of Procured AI with National Values, Laws, and Policies

- **Alignment Challenges:** Ensuring that AI systems obtained by government agencies adhere to national values and legal frameworks requires a clear understanding of these values and legal stipulations. It also demands a robust evaluation mechanism to assess compliance.
- **Ethical and Legal Considerations:** AI systems should respect privacy, confidentiality, human rights, and civil liberties. There is a need for clear guidelines on how these considerations are evaluated in the procurement process.

Recommendations for Improving Transparency, Performance, and Competition in AI Procurement

Enhanced Transparency Measures: Agencies should require detailed documentation from vendors, including explainability of AI decision-making and learning processes, to enhance transparency.

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Performance Monitoring: Implementing regular performance reviews and audits of AI systems post-deployment can ensure they continue to meet required standards and adapt to changing needs.

Promoting Fair Competition: Encouraging competition in AI procurement can be achieved by setting standards that promote interoperability and prevent vendor lock-in. This approach encourages innovation and offers agencies a wider choice of solutions.

Robustness and Resilience:

- Build AI systems that are robust and resilient to adversarial attacks or unintended inputs.
    - Test AI models under a variety of conditions to ensure their reliability in real-world scenarios (similar to DR (Disaster Recovery). COOP (Continuity of Operations), and cybersecurity tabletop exercises)
- Human in the Loop and Human Oversight:
    - Integrate human oversight (like the "data wranglers" in the CDO (Chief Data Officer) office) in AI processes, especially in critical decision-making scenarios.
    - When necessary, ensure that the AI systems are designed for human intervention and that human judgment is part of the decision-making process.

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Conclusion

The evolving nature of AI technology requires ongoing education, adaptation, and improvement of risk management strategies. Public and private organizations should stay informed about emerging, ethical, and regulatory standards and continuously assess and enhance their approaches to AI implementation. By prioritizing ongoing education and staying abreast of evolving standards, organizations can foster an environment that embraces innovation and upholds ethical considerations and regulatory compliance.

Continuous assessment and enhancement of risk management strategies are imperative in navigating the dynamic landscape of AI. As technology evolves, so do potential risks related to data security, privacy, bias, and legal compliance. Proactive measures, such as robust governance structures, regular performance reviews, and stakeholder engagement, are critical to mitigating these risks.

The synergy between education, adaptation, and risk management is pivotal for responsibly harnessing AI's full potential. Public and private entities that commit to a culture of continuous improvement will optimize their AI implementations and contribute to the responsible advancement of AI technology on a broader scale. As we navigate the future of AI, the commitment to ethical practices and regulatory compliance will be the compass guiding organizations toward sustainable and impactful AI integration.

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Continuous monitoring of AI systems is crucial to ensure their reliability, performance, and ethical behavior. Here are some ideas on how to implement continuous monitoring for AI systems:

Theme	Recommendation
Performance Metrics	• Monitor key performance indicators (KPIs) such as accuracy, precision, recall, and F1 score. • Track model inference time and resource utilization to identify potential bottlenecks. • Adopt the Federal Information Technology Acquisition Reform Act
Data Drift Detection	• Implement mechanisms to detect changes in input data distribution (data drift) that may affect model performance. • Compare current data statistics with the training data to identify potential shifts.
Model Drift Detection	• Monitor the model's performance over time and detect deviations from the expected behavior. • Implement versioning for models and continuously compare the performance of different versions.
Alerts and Notifications	• Set up automated alerts for significant deviations from expected performance. • Implement a notification system to alert stakeholders in case of critical issues.
Ethical and Bias Monitoring	• Implement tools to detect and mitigate biases in the training data and model predictions. • Regularly audit and assess the ethical implications of the AI system.
Security Monitoring	• Monitor for potential security threats, such as adversarial attacks on the model. • Implement anomaly detection techniques to identify unusual patterns in input data or model behavior.
User Feedback Analysis	• Collect and analyze user feedback to identify potential issues or areas for improvement. • Implement sentiment analysis and natural language processing on user feedback.
Continuous Training and Retraining	• Set up a pipeline for continuous model training and retraining to adapt to evolving data patterns. • Automatically trigger retraining when performance metrics fall below predefined thresholds. • Emphasize ethics in senior leadership baseline and continuous training

4601 Presidents Drive, Suite 240, Lanham, MD 20706 ▪ Tel: 240-7645390▪ Fax: 240-764-5387 ▪ Email : info@muse-technologies.com ▪ Website: www.muse-technologies.com

Theme	Recommendation
Explainability Monitoring	• Monitor the interpretability of the model's decisions, especially in critical applications. • Implement techniques to explain model predictions and ensure transparency.
Regulatory Compliance Monitoring	• Stay informed about regulatory requirements and monitor the AI system for compliance. • Implement checks to ensure that the system adheres to privacy and security regulations.
Model Governance	• Establish a model governance framework with clear roles and responsibilities for monitoring and addressing issues. • Define and enforce model deployment and retirement protocols.
Documentation and Logging	• Maintain detailed logs of model performance, data characteristics, and system events. • Use centralized logging for easy analysis and troubleshooting.
Simulation and Testing Environments	• Create simulated environments to test the AI system under various conditions. • Conduct regular testing to ensure the system behaves as expected in different scenarios.
Collaboration and Communication	• For holistic monitoring, foster collaboration between data scientists, engineers, and domain experts. • Establish clear communication channels for reporting and addressing issues promptly.

Implementing a combination of these strategies will help create a robust continuous monitoring system for your AI applications, enabling timely detection and resolution of issues.

Re: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (Docket ID: OMB-2023-0020)

Dear Ms. Martorana:

On behalf of the American Federation of State, County and Municipal Employees (AFSCME), I am pleased to submit these comments on proposed Office of Management and Budget (OMB) proposed memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. The proposed guidance would create much needed governance structures for the use of rapidly evolving artificial intelligence (AI) technology. AFSCME supports the policy with revisions to strengthen worker input and protections and to advance job quality.

AFSCME members provide the vital services that make America happen. With 1.4 million members in communities across the nation, serving in hundreds of different occupations — from nurses to corrections officers, child care providers to sanitation workers — AFSCME advocates for fairness in the workplace, excellence in public services and freedom and opportunity for all working families. AFSCME represents state, local and federal government workers, including many who administer federally funded, state and locally administered programs.

Workers and unions must play a decision-making role in the design, implementation and continuous monitoring of AI in the workplace.

The guidance correctly points to the need to engage all stakeholders, including system users, workers and clients, in the design, implementation and continuous monitoring of AI in the workplace. AFSCME urges OMB to apply the memo's requirements and guidance to states' and local governments' administration of federally funded programs, including by adding conditions to federal funding, oversight requirements and penalties for noncompliance. Automated decision-making processes

already have federal guidance (e.g., U.S. Department of Labor programs) and could be a model for implementing similar AI guidance. Allowing states to haphazardly implement their own AI policies removes the weight of the current OMB process. Moreover, allowing each agency to release its own AI guidance places a burden on stakeholders to engage with each agency individually.

Before a decision is made to procure or implement AI and throughout the phases of product design, deployment and continuous monitoring, Chief Artificial Intelligence Officers (CAIOs) must be required to consult with workers and their representatives, such as their unions. This collaboration will serve to maintain consistency with collective bargaining agreements and ensure success of the AI tool. Workers should be formally integrated into AI governance bodies with union-designated seats. Requiring engagement with workers and their representatives would align OMB's guidance with the Biden administration's policy of promoting worker empowerment.[1]

When new technology is used in the delivery of public services without workers taking a meaningful role in design and implementation, there is an increased risk of detrimental outcomes. One example is the use of an algorithmic system implemented in Indiana to automate welfare eligibility processes. A casework-based system was replaced with a task-based system. As workers were no longer seeing cases through from the beginning to the end, this resulted in increased and more complicated paperwork, frequent errors, loss of benefits and negative impact to worker well-being.[2]

Other examples include the implementation of Pondera Solutions' fraud detection tools. Pondera Solutions offers tools that numerically score public benefits applicants and recipients based on their supposed likelihood of committing fraud, utilizing data from data brokers, social media scrapers, credit reporting agencies, location servicers and government records databases. A high-risk score may lead to a loss of benefits or subject applicants and recipients to unwarranted investigation. Benefit recipients rarely know when they have been red flagged.[3] According to a 2022 report, Pondera flagged 1.1 million California unemployment insurance claims as "suspicious," leading the state to stop payment on all of them. Upon further investigation, more than 600,000 (54%) of the "suspicious" claims were found to be legitimate.[4]

New Jersey's modernization of its unemployment insurance system demonstrates how worker-centered technology has resulted in overall improved benefits delivery and access. As with all states, New Jersey faced a surge in new claims during the pandemic. To improve its system, the state took a human-centered design approach that made worker testing and feedback an essential part of the design process. The state recognized that the most important stakeholders to

engage are frontline workers serving claimants and making decisions about eligibility every day. Feedback from frontline staff was instrumental to identifying what was unclear to claimants and how process or language changes could cause further confusion. For the past two years, New Jersey has performed among the top states in benefits access and wage replacement. Its approach to incremental improvements has succeeded in improving access and efficiency.[5]

Federal agencies must be required to bargain over the use of AI in the workplace.

AFSCME strongly supports the principle that the responsible development and use of AI require a commitment to supporting American workers, in which workers have a seat at the table, including through collective bargaining, to ensure that they benefit from AI technology. Therefore, federal agencies must be required to bargain over the adoption and impacts of AI technology in the workplace.

Agencies should engage with unions as early as possible when the use of AI is being considered. Before AI technology is procured or implemented, agencies must provide timely, pre-decisional notification of AI use to the union. The notification should include all relevant background, including how the agency intends to use AI, a detailed description of the data used, whether data will be collected on workers, who can access the data, who owns the data, how data will be used and how data will be secured.

In the event of changes or updates in an AI tool or if new or altered risks to rights or safety are identified, the union must be notified immediately and have the right to demand to bargain.

AI should advance job quality and employee wellbeing.

AFSCME strongly supports the principle that AI development should be built on the views of workers and labor unions, educators and employers to support responsible uses of AI that improve workers' lives, positively augment human work and help all people safely enjoy the gains and opportunities from technological innovation. AI must not be deployed in ways that worsen job quality.

Federal agencies must ensure that AI systems are not used in such a way that reduces worker autonomy or replaces human decision-making. Automatic decision-making often negatively affects worker well-being and can result in irreparable harm to the people they serve. One example of a system that caused significant damage is the Michigan Integrated Data Automated System, or MiDAS, which was programmed to determine unemployment insurance eligibility, track case files and even intercept income tax refunds. Relying on that system's erroneous determinations, Michigan wrongly accused 40,000 people of unemployment insurance fraud between 2013 and 2015. As a result, millions of dollars in wages and tax refunds were unjustly seized.[6] AI must not perform functions that are inherently governmental. Automatic

[5] Heldrich Center for Workforce Development, *New Jersey's Worker-centered Approach to Improving the Administration of Unemployment Insurance* (September 2023), https://www.digitalbenefitshub.org/resources/new-jersey-s-worker-centered-approach-to-improving-the-administration-of-unemployment-insurance.

[6] Time Magazine, *States' Automated Systems Are Trapping Citizens in Bureaucratic Nightmares With Their Lives on the Line*, (May 2020), https://time.com/5840609/algorithm-unemployment/.

decision-making systems can make inaccurate eligibility determinations, a function only merit-based staff are legally allowed to perform in public benefits programs such as unemployment insurance, the Supplemental Nutrition Assistance Program (SNAP) and Medicaid.

Protecting job quality and worker well-being also requires that AI not be used in a way that would subject employees to excessive monitoring and a loss of privacy.

Whenever possible, AI deployment should be used to create opportunities for career advancement and to upskill employees into higher-level classifications, particularly cases in which AI enables employees to spend more work time on complex tasks.

New AI jobs in the federal workforce should be union-represented positions, accreted into existing bargaining units and covered by existing collective bargaining agreements when practicable.

Federal AI procurement policy must include worker protections.

Federal AI procurement policy should model effective regulation of responsible AI use and ensure adherence to the principles set forth in the AI Executive Order, including strong worker protections. Procurement policies must include high standards for working conditions and labor rights. Vendors should demonstrate union neutrality and a track record of abiding by labor and employment laws, including health and safety regulations.

Procurement policy should also require vendors to collaborate with workers and their unions in the development and monitoring of AI tools in the workplace. This should include utilizing and responding to worker and union feedback at each phase of design and testing.

Additionally, the memo should clarify that all federal grants to state and local governments are covered under the proposed policy. All AI technology procured using federal dollars must be safe, secure and responsible.

Federal AI procurement policy must include data oversight protections and safeguard transparency and accountability.

AI contracts must incorporate robust data oversight protections to prevent misuse and commercialization of data outputs by AI vendors. The cases of Pondera Solutions and MiDas noted above are just a few examples of participants and beneficiaries of public benefit programs who suffered harmful impacts due to improper use of data collected on them. Federal agencies should maintain ownership and control of data produced by AI systems procured.

Procurement policies must also safeguard transparency and accountability, including joint data access and control. Direct access and oversight are essential to ensuring that an AI system is safe, secure, responsible and effective over time.

Furthermore, federal agencies should retain flexibility to adapt and replace AI systems without prohibitive costs. Contracts should allow for model improvements and other changes without incurring large fees.

Use case list for safety-impacting and rights-impacting AI should be expanded.

The policy should clarify that the use case list for safety-impacting AI includes activities in all behavioral health and long-term care settings. The use case list for safety-impacting and rights-impacting AI should also be expanded to include AI used in the enforcement of worker protections and occupational health and safety regulations, such as workplace hazards assessments.

Robust accountability measures for granting waivers from minimum practices should be in place.

To safeguard accountability and transparency, waivers from minimum practices granted should be publicly reported. There should also be a process in place for impacted communities and members of the public to request AI use cases to be designated as rights- or safety-impacting or to request reevaluation after a waiver is granted. Exclusions and waivers should also be periodically reviewed as new information on harmful impacts becomes available.

Conclusion

OMB's proposed policy is an important step toward responsible AI use by federal agencies. AFSCME urges OMB to finalize the proposed policy with revisions to ensure that the federal government invests in human and worker-centered AI and thereby enhances public services and worker well-being.

Sincerely,

/s/ Dalia R. Thornton

General Comment

We write to you, on behalf of the Center for AI and Digital Policy (CAIDP), in response to the request for public comments on the draft memorandum titled Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI) The Notice seeks comments on the Proposed Memorandum for the Heads of Executive Departments and Agencies (hereinafter the "OMB AI Guidance").

CAIDP wrote to OMB on April 24, 2023 and October 19, 2021, regarding the need for OMB to establish regulations for the use of AI by federal agencies. We applaud the Biden-Harris Administration's Executive Order on AI (hereinafter the "AI Executive Order") and support the OMB AI Guidance as a critical step in the implementation of the AI Executive Order.

We welcome OMB's publication of the draft memorandum addressing the pressing concerns of the use of AI by federal agencies. We commend the detailed and pertinent recommendations to address responsible use of AI by federal agencies based on the principles of democratic values, human rights, and the rule of law. We believe the provisions on minimum practices for "rights-impacting" and "safety-impacting" are foundational requirements for the government's use of AI and will serve to increase public trust of AI systems.

In our detailed comments attached we provide consolidated/combined responses to questions 3, 5, 6, and 8 with reference to specific provisions of the draft memorandum. Our key recommendations in brief are:

1. Establish redline prohibitions across all agencies for systems without scientific validity and which fundamentally undermine human rights, rule of law and democratic process
2. Amend OMB AI Guidance section 5(c)(iii), "Waivers from Minimum Practices" to include strict objective criteria and a disclosure process for waiver
3. Require minimum practices for rights and safety in AI Systems to be applied "during the procurement phase" for procurement regulation with the minimum practices

As in our earlier statements to the OMB, CAIDP reiterates that the public and the Congress must be able

to hold federal agencies the for procurement of AI systems and 1) alignment of policies and goals with the tools, 2) effective use of taxpayer funds, 3) alignment between administrative law and AI system design, 4)mission effectiveness, and 5) quality and safety of public services, and 6) dependency on major vendors. We have set out recommendations and amendments to the proposes OMB AI Guidance to achieve these goals. We also underscore the need to ensure that agencies rules are established in regulation, published in the Federal Register with opportunity to public comment, and subject to judicial review as the Administrative Procedure Act requires.

We support the OMB's effort to undertake rulemaking for the deployment and use of AI systems in federal agencies. For transparency, public trust, and promotion of safe and trustworthy AI, we urge the OMB to incorporate our recommendations. Thank you for your consideration of our views.

Washington, DC 20503

Re: AI Memo Request for Comment: Comments of the Center for AI and Digital Policy (CAIDP) to the Office of Management and Budget (OMB) regarding the Draft Memorandum published in Federal Register 88 FR 75625

Dear Director Young,

We write to you, on behalf of the Center for AI and Digital Policy (CAIDP), in response to the request for public comments on the draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*[1] The Notice seeks comments on the *Proposed Memorandum for the Heads of Executive Departments and Agencies* (hereinafter the "OMB AI Guidance").[2]

CAIDP wrote to OMB on April 24, 2023[3] and October 19, 2021,[4] regarding the need for OMB to establish regulations for the use of AI by federal agencies. We applaud the Biden-Harris Administration's Executive Order on AI[5] (hereinafter the "AI Executive Order") and support the OMB AI Guidance as a critical step in the implementation of the AI Executive Order.

We welcome OMB's publication of the draft memorandum addressing the pressing concerns of the use of AI by federal agencies. We commend the detailed and pertinent recommendations to address responsible use of AI by federal agencies based on the principles of democratic values, human rights, and the rule of law. We believe the provisions on minimum

practices for "rights-impacting" and "safety-impacting" are foundational requirements for the government's use of AI and will serve to increase public trust of AI systems.

In our comments below we provide consolidated/combined responses to questions 3, 5, 6, and 8 with reference to specific provisions of the draft memorandum.

About CAIDP

The Center for AI and Digital Policy (CAIDP) is an independent research and education organization, based in Washington, DC.[6] We advise national governments and international organizations regarding artificial intelligence policy. Our landmark report *AI and Democratic Values*[7] assesses AI policies and practices around the world and emphasizes the importance of transparency in national AI strategies.[8]

Recommendations and Comments

***1) Establish* redline prohibitions across *all* agencies for systems without scientific validity and which fundamentally undermine human rights, rule of law and democratic process**

The OMB AI guidance requires minimum practices for safety-impacting and rights-impacting AI systems. OMB leaves it up to each agency to make the decision whether an AI system compliant with the guidance, or to bring into conformity. However certain AI systems do not have any scientific validity, and are in conflict with human rights, civil rights and rule of law. We urge OMB establish prohibitions ("redlines") for certain AI systems that should not be used in in federal agencies:

- *Require scientific validity:* If an AI system is not scientifically valid, it should be prohibited. This requirement should be added to existing requirements for accuracy, representativeness, robustness and cybersecurity.
- *Ban predictive policing systems:* AI systems claiming to predict a crime before it occurs violate the principle of presumption of innocence and human dignity.
- *Ban emotion recognition systems*: AI systems claiming to identify or infer psychological states, emotions or intentions of natural persons on the basis of their biometric data can lead to discrimination and exclusion of certain groups.
- *Ban biometric categorization systems:* AI systems using biometric to categorize individuals into race, ethnicity, gender, political or sexual orientation, religion groups can constitute discrimination. They deny the right to freely choose one's identity.
- *Ban individualized predictive risk systems in law enforcement and immigration context.* These systems violate the principle of presumption of innocence and human dignity.

[6] CAIDP, https://www.caidp.org.
[7] CAIDP, *AI and Democratic Values* (2023), https://www.caidp.org/reports/aidv-2022/.
[8] *Id*. at 1132-33.

The use cases that involve risk and performance assessments on individuals are predictive. These predictions seek physiological, behavioral, and emotional correlation, which tend to over rely on correlation overlooking causation. The variables vary greatly by individual; and effected by a dynamic environment. They do not have any scientific basis. Moreover, they are intrusive, undermine human dignity and are inconsistent with due process guarantees.

In addition to the propose redlines, the OMB AI guidance should generally require all AI systems satisfy the conditions of auditability, traceability, and contestability in system design; pre-deployment human rights impact assessment at the scoping stage; independent testing and monitoring throughout the lifecycle of the AI system; and a public incident reporting mechanism. Furthermore, redress and remedy process should be available without caveats for rights-impacting systems and limiting language such as "to the extent practicable" should be removed from the minimum practices.

2. Amend OMB AI Guidance section 5(c)(iii), "Waivers from Minimum Practices" [9] to include strict objective criteria and a disclosure process for waiver

The draft OMB AI Guidance grants extraordinary discretion to Chief AI Officer to waive minimum practices requirements for a specific covered AI application. The "waiver" provision could quickly become the loophole that undermines the intention of the Guidance, such as "routine uses" undermined the Privacy Act of 1974.[10]

Minimum requirements waivers must have (1) strict, objective criteria; (2) time limits; (3) public disclosure on the rights-impacting AI risks the agency has considered in its waiver determination and the reasons for granting such waiver. The OMB should also establish a regulatory process that would allow the public to contest waiver determinations, and provide the opportunity for administrative appeal and judicial review of waiver determinations.

a. Strict, objective criteria

OMB must create strict, objective criteria for the waiver process. Section 5(c)(iii) states the following waiver criteria:

> [A]n agency CAIO may waive one or more of the requirements in this section for a specific covered AI application or component after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall *or would create an*

[9] Proposed Memorandum for the Heads of Executive Departments and Agencies, Office of Management and Budget, Executive Office of the President, Section 5(c)(iii), "Waivers from Minimum Practices," 14 (Nov. 2023).
[10] John Shattuck, "Computer Matching is a Serious Threat to Individual Rights," Communications of the ACM, vol. 7, no. 26, pp. 538-41 (June 1984).

> *unacceptable impediment to critical agency operations*[11]…CAIOs may also grant waivers applicable to groups of closely related AI applications or components, provided that: (1) those systems have undergone a risk assessment that *adequately considers the risks* from each individual system; and (2) the systems are substantially identical in their risk profiles.[12] (emphasis added)

The OMB AI Guidance must create criteria for what is an "unacceptable impediment" and what would constitute "critical agency operations." Agency CAIOs must use this strict and objective criteria in their waiver determination. Further, to echo NIST AI Risk Management Framework, such narrow AI systems guardrails "will help to enhance trustworthiness, and in turn, cultivate public trust."[13]

b. Time limits

Waivers from AI governance requirements must not be indefinite. The White House Blueprint for AI asserts that AI systems need to be regularly assessed to mitigate discrimination bias and to continue public safety.[14]

The OECD AI Guidelines, which the U.S. has endorsed,[15] recommends continuous AI system assessment as well. Principle 1.4, Robustness, security, and safety, prescribes:

> AI systems should be robust, secure, and safe throughout their entire lifecycle so that, in conditions of normal use, foreseeable use or misuse, or other adverse conditions, they function appropriately and do not pose unreasonable safety risk. To this end, AI actors should ensure traceability, including in relation to datasets, processes and decisions made during the AI system lifecycle, to enable analysis of the AI system's outcomes and responses to inquiry, appropriate to the context and consistent with the state of art.

---

[11] Proposed Memorandum for the Heads of Executive Departments and Agencies, Office of Management and Budget, Executive Office of the President, Section 5(c)(iii), "Waivers from Minimum Practices," 14 (Nov. 2023).
[12] Proposed Memorandum for the Heads of Executive Departments and Agencies, Office of Management and Budget, Executive Office of the President, Section 5(c)(iii), "Waivers from Minimum Practices," 14, note 25 (Nov. 2023).
[13] NIST, *Artificial Intelligence Risk Management Framework (AI RMF 1.0)*, 1, (Jan. 2023), https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf.
[14] The White House, *Blueprint for an AI Bill of Rights*, 50, (Oct. 2022) https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf.
[15] *U.S. Joins with OECD in Adopting Global AI Principles*, NTIA (May 22, 2019), https://www.ntia.doc.gov/blog/2019/us-joins-oecd-adopting-global-ai-principles .

Thus, waivers from compliance with the minimum requirements set out in the guidance must have specific time limits, such as "one year," "two years," or "three years," and should not be indefinite.

c. Publicly available documentation

We recommend that the OMB AI Guidance include the rights-impacting risks identified by the agency and the *justification* for the waiver. The Guidance currently requires the AI Use Case Inventory to include any related extensions and waivers granted.[16] The Guidance must also make 'basis' or 'grounds' for waivers public. The White House Blueprint for AI recommends "Notice and Explanation… Such notice should be kept up-to-date and people impacted by the system should be notified of significant use case or key functionality changes."[17]

OECD Principle 1.3, Transparency and explainability, asserts: "AI Actors should commit to transparency and responsible disclosure regarding AI systems. To this end, they should provide meaningful information, appropriate to the context, and consistent with the state of art… to make stakeholders aware of their interactions with AI systems."[18] Here, the stakeholders are the American people.

According to the AI Executive Order, the OMB AI Guidance must be consistent with the White House Blueprint and consider governance frameworks like the OECD AI Principles, which the U.S. has endorsed. The public must have access to which federal agencies have waived minimum requirements for AI applications, their reasons, and the AI risks that are considered in the determination of a waiver.

d. Administrative appeal and judicial review

We also urge the OMB to ensure that the criteria for waiver determination is set in an agency-based regulation, subject to the Administrative Procedures Act (APA), that would provide for administrative appeal and judicial review. As the APA makes clear: "A person suffering legal wrong because of agency action, or adversely affected or aggrieved by agency action within the meaning of a relevant statute, is entitled to judicial review thereof.' 5 U.S.C. §702. A person subject to an adverse decision by an AI system, operated by a federal agency,

---

[16] OMB AI Guidance, Section 3(a), at 4.
[17] The White House, *Blueprint for an AI Bill of Rights*, 6, (Oct. 2022), https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf.
[18] OECD AI Principles, *Principle 1.3 Transparency and explainability* (2019), https://oecd.ai/en/dashboards/ai-principles/P7.

that is rights-impacting yet granted a waiver should almost certainly have the opportunity to challenge waiver decision and to do so in court, if necessary.

3. Require minimum practices for rights and safety in AI Systems to be applied "during the procurement phase" for procurement regulation with the minimum practices

OMB AI Guidance Section 5(d), "Managing Risks in Federal Procurement of Artificial Intelligence," should have the same requirements as the minimum practices requirements for rights and safety in AI systems, Section 5(c).[19] Where there is reference to procurement, the AI Guidance uses "procured" AI systems, instead of "for the procurement" of AI systems. This may result in cases where a federal agency awards a contract to a vendor before the system is evaluated against the minimum practices and requirements. If the system is found to be incompatible with the requirements, it might be too late for the agency to reverse the decision and cancel the contract – wasting taxpayer money and putting the public's safety, security civil liberties, human rights and equal opportunities at risk.

The OMB AI Guidance should ensure that the deployment of AI systems through federal procurement practices are not concentrated in small groups of individuals unaccountable to the citizens of the United States. Procured AI systems should conform to the minimum practices set out in the OMB AI Guidance as well as federal procurement standards. Transparency and accountability are key. The OMB AI Guidance should mandate that vendors disclose information about their systems, including reporting how their AI systems work, how their dataset was designed, collected, and annotated, what potential risks their systems pose, and what their strategy is to ensure their models can be evaluated against federal government standards.

The AI Guidance directs many of the "minimum practices" to the 'design, development, and use' of (pp.19) AI systems.[20] Federal procurement of AI systems ought to abide by the OMB AI Guidance's "minimum practices" in order to fully comply with Section 10.1(d)(ii) of the AI Executive Order, which this Guidance asserts itself to be aligned with.[21] Section 10.1(d)(ii) refers to Section 10.1(b).

Section 10.1(b) of the Executive Order states that "the Director of OMB… shall issue guidance to agencies to strengthen the effective and appropriate use of AI, advance AI innovation,

[19] OMB AI Guidance, Sec. 5(c), "Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence," at 13.
[20] OMB AI Guidance, Sec. 5(c), "Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence," at 19.
[21] OMB AI Guidance, Section 5(c), "Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence," at 21; *see also* The White House, *Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence*, (Oct. 30, 2023), https://www.whitehouse.gov/briefing-room/presidential-actions/2023/10/30/executive-order-on-the-safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence/.

and manage risks from AI in the Federal Government."[22] Further, Section 2(g) of the Executive Order urges: "It is important to manage the risks from the *Federal Government's own use of AI* and increase its *internal capacity* to regulate, govern, and support responsible use of AI to deliver better results for Americans."[23]

The *policies and principles* section of the White House Executive Order on AI states:

> Artificial Intelligence policies must be consistent with my Administration's dedication to advancing equity and civil rights … My Administration will build on the important steps that have already been taken—such as issuing the Blueprint for an AI Bill of Rights, the AI Risk Management Framework, and Executive Order 14091 of February 16, 2023 (Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government)— in seeking to ensure that AI complies with all Federal laws and to promote robust technical evaluations, careful oversight, engagement with affected communities, and rigorous regulation." *(emphasis added)*[24]

For the OMB AI Guidance to be consistent with and build upon the AI Executive Order, we recommend that the same requirements of Section 5(c), Minimum Practices[25] be expanded to section 5(d), Managing Risks for Federal Procurement. For procurement of AI, Minimum Practices should require:

a. **Follow practices derived from OSTP's Blueprint for an AI Bill of Rights and the NIST AI Risk Management Framework**

Section 5(d) reflects Section 5(c) in its reliance on NIST. However, Section 5(d) should also be aligned with the Blueprint for an AI Bill of Rights, just as in Section 5(c)[26] and in accordance with the policies and principles section of the AI Executive Order. As the OMB AI Guidance aims to comply with Section 4.1(i) of the AI Executive Order, "Developing Guidelines, Standards, and Best Practices for AI Safety and Security," federal procurement

[23] The White House, *Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence*, Sec. 2(g) (Oct. 30, 2023), https://www.whitehouse.gov/briefing-room/presidential-actions/2023/10/30/executive-order-on-the-safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence.

[24] AI Executive Order, at 75191-92.

[25] OMB AI Guidance, Section 5(c)-(d), "Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence," at 13, 21.

[26] OMB AI Guidance, Section 5(c), "Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence," at 13.

regulations must also follow the Blueprint for an AI Bill of Rights.[27] These considerations should not only be during the design stage but also at the scoping stage to ascertain that the decision to use AI systems by public agencies are aligned with the policy goals of the federal government and in the interest of taxpayers.

b. **Verify and Validate AI system meets the intended purpose supported by specific metrics or qualitative analysis before a procurement decision is finalized**

Section 5(d)(ii) of the Guidance, "Transparency and Performance Improvement," guides federal agencies to obtain "adequate documentation of procured AI, such as through the use of model, data, and system cards."

The OMB must expand this subsection. Use the language of Section 5(c)(iv)(C), where federal agencies "must review relevant AI documentation to ensure that the system works appropriately and as intended… this documentation must include the completed impact assessment and results from testing AI performance in a real-world context… Agencies must incorporate this independent evaluation into an applicable release or oversight process."[28] The verification and validation that AI system meets intended purpose and required performance must be conducted before procurement decision is finalized

c. **Identify potential risks of using AI, as well as what, if any, additional mitigation measures**

In Section 5(d), federal agencies are "encouraged to include tailored risk management requirements in contracts for generative AI."[29] Section 5(d) must encourage agencies to "mitigate emerging risks to rights and safety."[30] Also, as in Section 5(c)(v)(A), "If adequate mitigation of the disparity is not possible, then agencies should not use or integrate the AI tool." The risk identification and mitigation requirements must be assessed during the procurement of all rights-impacting AI systems, not only generative AI systems.

d. **Document the stakeholders that will be most impacted by the use of the system and assess the possible failure modes of the AI and of the broader system, both in isolation and as a result of human users**

Expand Section 5(d)(ii) of the Guidance, "Transparency and Performance Improvement," to document potential risks to stakeholders. As in Sec. 5(c)(iv)(A)(2), "Agencies should

document the stakeholders that will be most impacted by the use of the system and assess the possible failure modes of the AI and of the broader system, both in isolation and as a result of human users"[31] during the procurement of AI systems. Agencies should also meet their administrative law requirements of notice, where applicable.

e. **Assess quality & appropriateness of data**

Section 5(d)(iv), "Maximizing the Value of Data for AI," urges that only the government, not private companies, should own "relevant data" and to protect data from "unauthorized disclosure."[32] Section 5(d)(iv) should also document "the provenance and quality of the data for its intended purpose;"[33] and "how errors from data entry, machine processing, or other sources are adequately measured and limited."[34] It should be the responsibility of the procuring agency to ensure that vendors make use of high-quality, representative data sets.

f. **Test the AI for performance in a real-world context**

Section 5(d)(v)(A) requires "adequate testing and safeguards" only in the context of generative AI. This provision should be clarified to include testing in "real-world context"[35] for all procured AI systems.

g. **Independently evaluate the AI for documentation of impact assessment, performance in real-world context**[36]

Independent evaluation fosters accuracy and public trust. The Blueprint for an AI Bill of Rights encourages independent testing.[37] Additionally, documentation is necessary for transparency and accountability, which unites with public trust. Since Section 5(d) is for the federal government's use of AI, federal procurement regulations must encourage such transparency. The Guidance aims to follow the White House Blueprint for AI and the AI Executive Order[38] and hence these changes should be made to align with those documents.

h. **Ongoing monitoring and thresholds for periodic human review**

Section 5(c)(iv)(D) states that agencies will regularly "monitor degradation to the AI's functionality and to detect changes in the AI's impact on rights or safety. Part of this monitoring process must include periodic human reviews to determine whether the existing implementation of the minimum practices in this section adequately mitigates any new risk."[39] Federal procurement process and contract clauses should reflect the requirement for ongoing risk monitoring, human input and risk mitigation measures.

The AI Executive Order recognizes the weight of "human consideration and remedies for adverse decisions made using AI" in federal government use of AI.[40] The White House Blueprint for AI urges human consideration.[41]

The OMB AI Guidance must expand Section 5(d)(v)(A), "requiring adequate testing and safeguards," to include the "minimum practice" of ongoing monitoring and establish thresholds for periodic human review.[42]

i. **Ensure adequate human training and assessment**

The OMB AI Guidance must ensure that Section 5(d) requires the adequate human training and assessment that Section 5(c) requires.[43] Human training must be periodic and "should be specific to the AI use case, product, or service being operated."[44] President Biden's AI Executive Order advises:

> The Federal Government will work to ensure that all members of its workforce receive adequate training to understand the benefits, risks, and limitations of AI for their job functions, and to modernize Federal Government information technology

infrastructure, remove bureaucratic obstacles, and ensure that safe and rights-respecting AI is adopted, deployed, and used.[45]

j. Grant human consideration and remedies for adverse decisions made using AI

Section 5(c)(iv)(E) states, "Agencies must provide timely human consideration and potential remedy to the use of the AI by a fallback and escalation system in the event that an impacted individual would like to appeal or contest."[46] The OMB must amend Section 5(d)(ii), "Transparency and Performance Improvement," to grant human consideration and remedies. This amendment will promote public trust, as the AI Executive Order centers.[47] Further, this change will align with AI Executive Order[48] and the Blueprint for AI,[49] which recommend such human involvement in adverse decision-making.

As the Blueprint states:

> The American public deserves protection via human review against these outlying or unexpected scenarios. In the case of time-critical systems, the public should not have to wait—immediate human consideration and fallback should be available. In many time-critical systems, such a remedy is already immediately available, such as a building manager who can open a door in the case an automated card access system fails.[50]

[49]The White House, *Blueprint for an AI Bill of Rights* 7 (Oct. 2022), https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf.

[50] The White House, *Blueprint for an AI Bill of Rights* 47 (Oct. 2022), https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf

Federal procurement process and contract clauses should require vendors to provide plans for a possible fallback, switch over or termination of an AI system.

Additional steps for rights-impacting procured AI should be:

k. Conduct public consultation

The Blueprint for AI recommends public consultation:

> The public should be consulted in the design, implementation, deployment, acquisition, and maintenance phases of automated system development, with emphasis on early-stage consultation before a system is introduced or a large change implemented. This consultation should directly engage diverse impacted communities to consider concerns and risks that may be unique to those communities, or disproportionately prevalent or severe for them.[51]

In addition, the NIST AI Framework adds that public consultation "with domain experts and other end users" provide valuable feedback.[52]

l. Consult with affected groups and incorporate their feedback

Agencies must consult with "relevant AI actors, including affected communities, and field data about context relevant risks and trustworthiness characteristics," as the NIST AI Framework encourages.[53] Section 5(c)(v)(B) of the OMB AI Guidance requires consultation and incorporation of feedback with affected groups in rights-impacting AI. The OMB ought to amend Section 5(d) to center such requirements in procured AI as well. Such requirements will ensure human determination in AI risk management, which can encourage public trustworthiness in procured AI.

m. Notify the public of AI use

The OMB should expand Section 5(d)(ii), "Transparency and Performance Improvement," to include public notification of AI use. The Blueprint for AI endorses such public notice:

> Designers, developers, and deployers of automated systems should provide generally accessible plain language documentation including clear descriptions of the overall system functioning and the role automation plays, notice that such systems are in use, the individual or organization responsible for the system, and explanations of outcomes that

[51] The White House, *Blueprint for an AI Bill of Rights* 18 (Oct. 2022), https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf

[52] NIST, *Artificial Intelligence Risk Management Framework (AI RMF 1.0)* 31(Jan. 2023), https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf.

[53] NIST, *Artificial Intelligence Risk Management Framework (AI RMF 1.0)* 31 (Jan. 2023), https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf.

are clear, timely, and accessible. Such notice should be kept up-to-date and people impacted by the system should be notified of significant use case or key functionality changes."[54]

Further, the NIST AI Framework recognizes that public notification is a part of the principle of transparency: "Transparency should consider human-AI interaction: for example, *how a human operator or user is notified* when a potential or actual adverse outcome caused by an AI system is detected."[55]

n. <u>Notify individuals potentially harmed by a use of AI and offering avenues for remedy</u>

Amend Section 5(d)(ii), "Transparency and Performance Improvement," to notify affected individuals. Section 5(c)(v)(D) of the Guidance requires that "agencies must notify individuals when AI meaningfully influences the outcome of decisions specifically concerning them, such as the denial of benefits. Such notice should be timely."[56] Section 5(d)(ii) ought to have this language. Notification of affected individuals promotes transparency and trustworthy AI.[57]

President Biden has endorsed that affected individuals should know "why an outcome impacting you was determined by an automated system, including when the automated system is not the sole input determining the outcome."[58] The Blueprint for an AI Bill of Rights also states: "The American public should be protected via built-in privacy protections, data minimization, use and collection limitations, and transparency, in addition to being entitled to clear mechanisms to control access to and use of their data—including their metadata—in a proactive, informed, and ongoing way."[59]

o. <u>Document terminated AI systems in detail in the AI Use Case Inventory</u>

If an AI system is terminated, as the Universal Guidelines for AI[60] requires if human control is no longer possible, we recommend that the outcome is documented in the AI Use Case Inventory for evidence of assessment, accountability in the future, and a lesson learned.

As in our earlier statements to the OMB, CAIDP reiterates that the public and the Congress must be able to hold federal agencies the for procurement of AI systems and 1) alignment of policies and goals with the tools, 2) effective use of taxpayer funds, 3) alignment between administrative law and AI system design, 4)mission effectiveness, and 5) quality and safety of public services, and 6) dependency on major vendors. We have set out recommendations and amendments to the proposes OMB AI Guidance to achieve these goals. We also underscore the need to ensure that agencies rules are established in regulation, published in the Federal Register with opportunity to public comment, and subject to judicial review as the Administrative Procedure Act requires.

We support the OMB's effort to undertake rulemaking for the deployment and use of AI systems in federal agencies. For transparency, public trust, and promotion of safe and trustworthy AI, we urge the OMB to incorporate our recommendations. Thank you for your consideration of our views.

We welcome the opportunity to speak with you further about these recommendations.

Sincerely yours,

Marc Rotenberg

Lawyers' Committee comments on proposed OMB guidance on agency use of AI

LAWYERS' COMMITTEE FOR CIVIL RIGHTS UNDER LAW

December 5, 2023

Office of Management and Budget
725 17th Street, NW
Washington, DC 20503

Attn: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Re: Comments on OMB–2023–0020

The Lawyers' Committee for Civil Rights Under Law ("Lawyers' Committee") appreciates the opportunity to comment on the draft memorandum[1] issued by the Office of Management and Budget (the "OMB") on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence, released on November 1, 2023. In these comments, the Lawyers' Committee responds to the questions posed in the request for comment,[2] proposes additional areas where the draft memorandum can be improved, and discusses the disproportionate impact that AI-related harms have on Black communities and other communities of color.

[1] Office of Management and Budget, Executive Office of the President, Proposed Memorandum, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (proposed Nov. 1, 2023) [hereinafter Proposed Memorandum].
[2] Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, 88 Fed. Reg. 75625, 75625-75626 (Nov. 3, 2023) [hereinafter RFC].

TABLE OF CONTENTS

I. Introduction 3

II. The Memorandum is a Necessary First Step to Prevent and Mitigate AI-Related Harms, Which Disproporationately Impact Black Communities and Other Communities of Color. 4

III. The Memorandum Establishes Needed Measures for Testing, Monitoring, and Mitigating the Harms Resulting from the Use of AI. 8

IV. Federal Government Use of Black-Box Algorithms to Make Unexplainable Decisions May Violate the Due Process Clause and Administrative Procedures Act, and May Raise Equal Protection Concerns. 9

V. The Memorandum Should Clarify that Chief Artificial Intelligence Officers Must Have Sufficient Expertise in Civil Rights. 11

VI. To Advance Responsible Innovation, The Memorandum Should Clarify that Agencies' AI Strategies Must Center Equity, Not Expand Law Enforcement Applications of AI, and Provide Additional Safeguards to Protect Data Privacy. 13

A. Agencies Should Center Equity in their AI Strategies. 13

B. Law Enforcement Use of AI Results in Discrimination on the Basis of Race and Threatens Civil Rights. Agencies' AI Strategies Should Limit the Use of AI for Law Enforcement Functions. 14

C. Agencies' AI Strategies Should Protect Data Privacy and Establish Appropriate Limits on the Use of Data for Training, Testing, and Operating AI. 15

VII. The Memorandum Should Require Agencies to Report Detailed Information About the Implementation of Minimum Risk Management Practices in their Annual AI Use Case Inventories. 17

VIII. The Memorandum Should Require Detailed Public Disclosure of Agencies' Waiver Processes. 17

IX. AI that Affects Equal Opportunity in Insurance, Utilities, or Places of Public Accommodation Should be Included in the Definition of Rights-Impacting AI. 19

X. The Memorandum Should Clarify that Automated Decision-Making Systems are Included in the Definition of Artificial Intelligence. 20

XI. Conclusion 21

I. Introduction

The Lawyers' Committee supports the draft memorandum as a needed measure to ensure that the federal government responsibly deploys AI and protects civil rights. By requiring agencies to implement minimum risk management practices for rights-impacting and safety-impacting AI, the draft memorandum will help agencies identify and address discriminatory harms resulting from the use of AI that disproportionately affect Black communities and other communities of color. Although we urge the OMB to take additional steps to center equity and civil rights, expand the definition of rights-impacting AI, and increase public reporting, we applaud the OMB's effort thus far.

The Lawyers' Committee for Civil Rights Under Law is a nonpartisan, nonprofit organization, formed in 1963 at the request of President John F. Kennedy to mobilize the nation's leading lawyers as agents for change in the Civil Rights Movement. Today, the Lawyers' Committee uses legal advocacy to achieve racial justice, fighting inside and outside the courts to ensure that Black people and other people of color have the voice, opportunity, and power to make the promises of our democracy real. The Lawyers' Committee's Digital Justice Initiative works at the intersection of racial justice, technology, and privacy to address predatory commercial data practices, discriminatory algorithms, and invasions of privacy that disproportionately affect Black people and other people of color, including people with intersectional identities, like immigrants, women of color, and LGBTQI+ people of color.

The Biden-Harris Administration has already taken a series of actions to mitigate the risks of AI, including by outlining key principles for advancing civil rights and equity in the Blueprint for an AI Bill of Rights,[3] Executive Order 14091 ("Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government"),[4] and Executive Order 14110 ("Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence").[5]

We applaud the draft memorandum as a needed next step for agencies to implement these policies and ensure that all AI systems are equitable, safe, and fair. As the OMB states, "every day, the federal government makes decisions and takes actions that have profound impacts on the lives of Americans. Federal agencies have a distinct responsibility to identify and manage AI risks because of the role they play in our society."[6] To meet this obligation, the draft memorandum establishes baseline practices for agencies to manage the risks of AI, including pre- and post-deployment testing, transparency requirements, human review, and specific safeguards against algorithmic bias and discrimination. These measures create a pathway for agencies to detect and mitigate potential harms before systems are deployed and to address discriminatory outcomes when they occur. Without such safeguards, the increased usage of AI by federal agencies is likely

[3] White House Off. of Sci. & Tech. Pol'y, White House, *Blueprint for an AI Bill of Rights* (2022), https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf [hereinafter *Blueprint*].
[4] Exec. Order No. 14091, 88 Fed. Reg. 10825 (Feb. 16, 2023).
[5] Exec. Order No. 14110, 88 Fed. Reg. 75191 (Oct. 30, 2023).
[6] Press Release, White House, *OMB Releases Implementation Guidance Following President Biden's Executive Order on Artificial Intelligence* (Nov. 1, 2023), https://www.whitehouse.gov/omb/briefing-room/2023/11/01/omb-releases-implementation-guidance-following-president-bidens-executive-order-on-artificial-intelligence/.

to accelerate and worsen existing racial disparities and discrimination. The draft memorandum is key to addressing AI-related civil rights harms and ensuring that the government responsibly and safely uses AI.

In our more detailed comments below, we address questions 1, 3, 5, and 8. The request for comment also invites commenters "to provide feedback on any topic believed to have implications for the content or implementation of the proposed memorandum."[7] Accordingly, we recommend additional areas where the OMB can improve the draft memorandum, including by requiring explanations for certain AI-driven decisions and increasing transparency about the implementation of minimum risk management practices. We urge the OMB to:

- Move forward with the draft memorandum's critical measures to prevent and mitigate AI-related harms that disproportionately impact Black communities and other communities of color.
- Explain agencies' obligation to respect constitutional and statutory rights to due process and equal protection when using AI and adopt requirements that execute this obligation.
- Clarify that Chief Artificial Intelligence Officers must have sufficient civil rights expertise to appropriately carry out their responsibilities to implement the minimum practices for safety-impacting and rights-impacting AI.
- Require that agencies' AI strategies center equity, limit law enforcement applications of AI, and impose additional safeguards to protect data privacy.
- Require agencies to report detailed information about the implementation of minimum risk management practices in their annual AI use case inventories.
- Require detailed public disclosure of agencies' waiver processes to increase transparency about the systems exempted from the minimum risk management practices.
- Add AI that affects equal opportunity in insurance, utilities, and places of public accommodation to the definition of rights-impacting AI.
- Clarify the full scope of automated decision-making systems that are included in the definition of AI.

II. The Memorandum is a Necessary First Step to Prevent and Mitigate AI-Related Harms, Which Disproporationately Impact Black Communities and Other Communities of Color.

Black communities and other communities of color face significant civil rights harms resulting from the use of AI. Agencies must not use AI that causes, contributes, or exacerbates discrimination. Already there is rampant discrimination from algorithms used in sectors spanning

New Data Shows It Perpetuates Them*, The Markup (Dec. 2, 2021), https://themarkup.org/prediction-bias/2021/12/02/crime-prediction-software-promised-to-be-free-of-biases-new-data-shows-it-perpetuates-them; Todd Feathers, *Gunshot-Detecting Tech is Summoning Armed Police to Black Neighborhoods*, Vice: Motherboard (July 19, 2021), https://www.vice.com/en/article/88nd3z/gunshot-detecting-tech-is-summoning-armed-police-to-black-neighborhoods.

Researchers have documented how algorithmic systems produce discriminatory outcomes that impair equal opportunity and erode civil rights protections. In the context of housing, for instance, algorithmic systems limit the ability for Black people and other people of color to access mortgage loans and public housing. A review of over two million mortgage applications found that Black applicants were 80 percent more likely to be rejected by mortgage approval algorithms when compared with similar white applicants.[17] And, in 2023, reporters discovered that the algorithmic scoring system used by the Los Angeles Homeless Services Authority discriminated against Black and Latino people, giving white applicants higher priority in the agency's housing system.[18]

Rather than leveling the playing field, algorithmic systems disproportionately disadvantage communities of color, perpetuating systemic bias and discrimination in the online economy. These disparities can occur because algorithmic systems, such as those used to evaluate prospective mortgage applicants, are trained using vast troves of data that reflect existing societal biases or inequities.[19] This data is built on generations of redlining and segregation that restricted opportunities for Black Americans to access wealth, education, employment, and healthy environments, baking these inequities into present-day technologies.[20] These datasets are compiled using predatory commercial surveillance practices that undermine privacy rights and fuel data-driven discrimination.

Despite these harms, many AI technologies lack appropriate safeguards—such as data minimization requirements, pre- and post-deployment impact assessments, and protections against algorithmic discrimination—to ensure that systems are safe, effective, and free of bias. Due to the "black box" nature of many algorithmic systems, impacted communities frequently lack transparency about when and how AI is used, denying individuals recourse to contest errors or rights violations when they occur.

Government uses of AI systems pose especially significant risks to civil rights. When deployed by governments at scale, AI systems can dramatically expand existing racial disparities in access to services and other equal opportunities. Moreover, unlike the private sector, individuals do not have the same opportunity to opt-out of AI systems deployed by the government. Already, researchers have documented how government-deployed AI poses significant and unique risks to civil rights, privacy, and transparency and accountability.[21] For instance, an automated insurance

fraud detection system implemented by the state of Michigan's Unemployment Insurance Agency falsely accused over 40,000 residents of fraud before the state ceased its use.[22] As a result, thousands of economically vulnerable residents were unable to access needed benefits, forcing some to file for bankruptcy due to false fraud charges.[23]

Agencies have an affirmative obligation to ensure that any AI technology developed, procured, used, or funded does not cause or contribute to discrimination. Federal agencies, including law enforcement, cannot employ technology that is discriminatory. Prior to using such technologies, federal agencies must ensure AI systems comply with existing laws and are not likely to result in the violation of constitutional rights of any individual or group of individuals. Additionally, federal agencies must meet their obligations under Title VI when funding programs or activities that develop or use AI systems. Title VI of the Civil Rights Act of 1964 states, "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving [f]ederal financial assistance."[24] This prohibition on discrimination applies to both intentional discrimination and practices that result in unfair disparate impacts.[25] Every federal agency is obligated to ensure that recipients of their funding comply with Title VI, including any uses of AI technologies.

In addition to the direct effects of governmental use of AI, the federal government's actions can have knock-on effects on the broader market and industry behavior. The purchasing power of governmental actors and governmental investment in research and development helps to shape the global technological landscape. As the Select Committee on Artificial Intelligence of the National Science and Technology Council noted, "[t]he federal government plays a critical role in ensuring that technologies like AI are developed responsibly, and to serve the American people."[26] When the federal government executes standards for responsible AI, its purchasing power can influence adoption of rights-respecting norms and expectations in the private sector as well.

The disproportionate impact of algorithmic bias and discrimination on Black communities and other communities of color as well as the government's obligation to ensure that AI does not cause or contribute to discrimination highlights the need for the risk management practices outlined in the draft memorandum. These practices have the potential to ensure that AI systems used by the government are safe, effective, and nondiscriminatory, thereby increasing public trust and accountability in the government's use of these technologies.

III. The Memorandum Establishes Needed Measures for Testing, Monitoring, and Mitigating the Harms Resulting from the Use of AI.

Section 5 of the draft memorandum establishes minimum practices for mitigating the risks of AI, including heightened safeguards for rights-impacting systems. As the OMB points out, for agencies to "realize significant benefits from AI, they must also manage a range of risks from the use of AI."[27] The draft memorandum provides agencies with clear guidance, including pre- and post-deployment testing, transparency and explainability measures, human review and consideration requirements, and proactive obligations for agencies to assess and mitigate algorithmic bias and discrimination, including disparate impacts. Here we address how these risk mitigation practices are necessary for detecting and addressing AI-related harms.

First, the draft memorandum rightly addresses many discriminatory harms by broadly defining AI systems that are presumed to be rights-impacting.[28] The draft memorandum includes key areas such as law enforcement, education, employment, credit scoring, tenant screening, and government benefits within the AI applications presumed to be rights-impacting. While additional AI systems should be included in the definition of rights-impacting AI, this preliminary list is a good step forward.

Second, the draft memorandum requires agencies to institute critical pre- and post-deployment assessment, evaluation, and monitoring measures.[29] Such requirements are important for verifying that a given AI system is appropriately tailored for its intended use, detecting unforeseen harms and potential bias, and mitigating any unsafe outcomes. These robust oversight mechanisms will ensure that AI systems are reviewed for algorithmic bias and discrimination throughout the lifecycle of deployment.

Third, the draft memorandum institutes several important transparency and explainability measures.[30] These include public notice and plain language documentation and notifications for negatively affected individuals. Although algorithmic systems are used throughout the economy, most people have no knowledge about when or how they are impacted by these systems. Without this awareness, individuals cannot make informed decisions about how they interact with AI and are unable to seek redress when harm occurs. While we believe that the OMB needs to take additional steps to increase public transparency about the implementation of the risk management practices and waiver process, these initial measures will help ensure that individuals can access the information they need to know about when and how AI affects their rights and opportunities.

Fourth, the draft memorandum establishes requirements for human review, consideration, and opt-out.[31] Human oversight and opt-out provides individuals with recourse for appealing or contesting inaccurate or biased results when they occur. Additionally, human review helps to ensure that AI systems are appropriately monitored for new risks.

---

[27] Proposed Memorandum at 2.
[28] *Id.* at 12-13.
[29] *Id.* at 15-17.
[30] *Id.* at 18, 20.
[31] *Id.* at 18, 20.

Finally, the draft guidance directs agencies to proactively identify and address algorithmic bias and discrimination and to test AI systems for significant disparities across demographic groups.[32] Evaluating and monitoring AI systems for such harms should be a baseline requirement for ensuring that such technologies do not produce discriminatory outcomes or compound existing racial disparities.

Together, these measures provide agencies with a pathway to increase the safety, efficacy, fairness, and transparency of their use of AI systems. While we call on the OMB to take additional steps below, we urge the OMB to move forward with the draft memorandum and require that all agencies implement these minimum risk management practices.

IV. Federal Government Use of Black-Box Algorithms to Make Unexplainable Decisions May Violate the Due Process Clause and Administrative Procedures Act, and May Raise Equal Protection Concerns.

OMB should consider the federal government's obligations to respect constitutional rights to due process and equal protection, and provide appropriate guidance for agencies using AI.

If a federal agency uses an algorithm to make or inform decisions, and it cannot explain *how* and *why* the algorithm made its recommendations, that is inconsistent with the right to due process. Due process requires that government agencies have reasoned bases for their decisions and that decisions are not made in an arbitrary fashion.[33] If an agency uses a black-box AI system without understanding how it works and without the ability to explain, every step of the way, *why* it makes the recommendations that it makes, that is an arbitrary decision-making process. For example, suppose an agency is deciding to which applicants to award scholarships. A vendor tells the agency, "Our device can determine which candidates will perform best; just have them go through our face scanner." If the agency uses this device without ascertaining that it actually works as intended and understanding *how* it decides which candidates are best, it is making decisions impermissibly arbitrarily.[34] The technology could just be scanning skin pigment, not aptitude or relevant criteria, and giving race-based results. While this example is hypothetical, it is not far-fetched; universities and bar administrators have used face-scanning technologies to proctor exams, giving rise to similar concerns of racial bias.[35] Use of a decision-making procedure of this kind, without being able to explain it, may raise constitutional concerns. An individual who is adversely

affected by a decision informed by such a system may have a valid claim that their due process rights have been violated.

In addition to constitutional due process, agency uses of AI must also comply with the Administrative Procedures Act. Section 706(2)(A) of the APA provides that federal courts must scrutinize and invalidate agency actions if such actions are "arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law."[36] The agency in question must articulate "a rational connection between the facts found and the choice made" for its action to pass muster under arbitrary and capricious review.[37] Federal courts will only uphold an agency decision based on the reasoning in the agency's decisions; an agency's "*post hoc* rationalizations . . . cannot serve as a sufficient predicate for agency action."[38] Using an AI tool to assist in decision-making or recommendations, without being able to explain how it reached its results, would be an arbitrary and capricious act.

These concerns are particularly acute in settings involving criminal justice and government benefits.[39] Absent "minimal guidelines to govern law enforcement," there is a risk of "a standardless sweep that allows policemen, prosecutors, and juries to pursue their personal predilections" which can result in "arbitrary and discriminatory enforcement."[40] Agencies cannot make arbitrary determinations related to bail, sentencing, parole, grants, subsidies, scholarships, and other government benefits.[41] The Constitution and APA demand a fair and explainable procedure. Agencies should not be allowed to use algorithms without the ability to explain how they work and reach their conclusions.

In addition, federal agencies' use of AI must respect Americans' rights to equal protection under the law. This means that the government cannot make decisions on the basis of protected characteristics such as race, sex, religion, national origin, disability, and other immutable traits.[42] Therefore, if an agency is using an AI system, learns that the system produces unjustified discriminatory outcomes, *and continues to use it*, that may be an equal protection violation.[43] The agency would be intentionally using a system that it knows is discriminatory.

A recent decision by the U.S. District Court for the District of Idaho is instructive.[44] Adults with developmental disabilities sued the Idaho Department of Health and Welfare, which had used certain undisclosed calculations to determine individuals' eligibility for Medicaid payments. Idaho sought a court order allowing the department to prohibit Medicaid recipients from accessing the manual that described how the assessment tool deployed to make these calculations functions. However, the court ruled that doing so would violate participants' procedural due process rights, explaining that without the manual, "the participants will not have the full context of the evidence used to reduce their budgets. Without access to the User's Manual, the [software tool] remains a black box for participants, where they see only certain inputs and outputs, but not the internal workings (e.g., the algorithm applied in the [calculation] software)."[45] The constitutional issues raised by AI can be even greater—where not just a user manual but the fundamental decision-making logic may be unexplained and unknown even to the agency.

Synthesizing the government's due process and equal protection obligations, the OMB should recognize and require that AI systems be both explainable and non-discriminatory to be permissible for agency use. Agencies have to understand and be able to explain how an AI system made a decision or recommendation. That is the due process requirement. Then, if the agency discovers that the AI system is engaging in discrimination, it has to stop using that system or otherwise remedy the discrimination. If it fails to do so, the continued use of an AI system may violate equal protection rights.

To address these concerns, we recommend that the OMB amend the requirement that instructs agencies to notify negatively affected individuals[46] by striking the last sentence of Sec. 5(c)(v)(D) and replacing it with the following: "Agencies must provide explanations for such decisions and actions. These explanations must: 1) explain why the AI system produced the result it produced for this specific individual; 2) be truthful, accurate, and scientifically valid; 3) identify at least the three most significant factors used to inform the decision; and, 4) include a summary of an individual's rights to appeal a decision impacted by AI."

V. The Memorandum Should Clarify that Chief Artificial Intelligence Officers Must Have Sufficient Expertise in Civil Rights.

The OMB asks, in question 1, whether the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers (CAIOs) are sufficiently flexible and achievable for the breadth of covered agencies.[47] Given the risks to civil rights inherent in many uses of AI,

[46] Proposed Memorandum at 20.

[47] RFC at 75625.

it is important that the individuals designated as CAIOs have experience that helps them identify, assess, and address those risks.

Federal agencies should not move fast and break things. Past experience with various types of chief officers at federal agencies (such as technologists and economists) informs us that absent an explicit requirement, it is unlikely that civil rights will be prioritized as highly as innovation and deployment of AI. This would run completely contrary to the goals of advancing safe, effective, and responsible AI outlined in Executive Order 14110 and the draft memorandum. If, several years from now, the civil rights and civil liberties offices at federal agencies are clashing with the CAIOs, this guidance will have failed.

In the absence of a CAIO having civil rights expertise, there is a large chance that serious risks of bias and discrimination may go unnoticed until, at least, the deployment of the AI tool and the emergence of widespread information demonstrating discrimination. Waiting until AI tools begin to harm Black communities and other communities of color is not a reasonable option. Without a background in civil rights and familiarity with practices for addressing discrimination and disparate impact, CAIOs may not be properly equipped to identify potential bias within datasets, consider how an AI tool's output may contribute to or cause discrimination, and evaluate whether available safeguards are sufficient to deploy the AI tool without violating civil rights.

A civil rights background would act as a counterweight to institutional pressure to rapidly adopt new AI technologies without adequate safeguards. As set forth in the guidelines, the CAIO will be appointed by the head of an agency and will likely come from within the agency.[48] The OMB should clarify that CAIO's must have expertise in civil rights by amending the description of CAIOs' roles on page 5 to include the following additions noted in italics: "At CFO Act agencies, the CAIO's primary role must be coordination, innovation, and risk management for their agency's use of AI, *including risks related to civil rights and equity*. Agencies may choose to designate an existing official, such as a Chief Technology Officer, Chief Data Officer, *the senior most civil rights official,* or similar official with relevant or complementary authorities and responsibilities, provided they have significant expertise in AI*, civil rights,* and meet the other requirements in this section."

The CAIO will likely be surrounded by those within the agency who wish to deploy a given AI tool. This environment will push CAIOs to prioritize factors such as government innovation, rapid adoption of new technologies, and economic factors over rigorous application of civil and constitutional rights. Given the competing priorities of the position, there is a serious risk that a CAIO could become an *impediment* to protecting rights, rather than a champion of them. Without a background in civil rights, the CAIO will inevitably be a less effective safeguard against bias, discrimination, and abuse due to these spoken and unspoken pressures. Experience in the field of civil rights will not render the CAIO immune to such effects, but it will increase the likelihood that the individual in that role takes seriously the potential for harm and provides a balanced perspective on a given systems' benefits *and* risks.

[48] Proposed Memorandum at 5.

When taxpayers look at their return on investment in AI, any harms that AI causes are tangible costs that must be internalized. If a CAIO does not have the proper expertise to recognize, prevent, and mitigate these costs, they will miss an entire side of the balance sheet.

VI. To Advance Responsible Innovation, The Memorandum Should Clarify that Agencies' AI Strategies Must Center Equity, Not Expand Law Enforcement Applications of AI, and Provide Additional Safeguards to Protect Data Privacy.

Section 3 of the draft memorandum directs agencies to "build internal enterprise capacity to support responsible AI innovation and take actions to improve their procurement of AI."[49] To do so, the OMB directs each agency to develop an AI strategy and to remove barriers to responsible use of AI. In question 3, the OMB asks how agencies can achieve these goals to advance responsible AI innovation.[50] In its current form, the draft memorandum sends agencies a mixed message about their obligations to ensure that AI systems are safe and effective. While the memorandum sets out clear guidelines for agencies to adopt minimum risk management practices, the required AI strategies place significant pressure on agencies to rapidly adopt new technologies. This may have the unintended consequence of encouraging agencies to deploy AI systems before appropriate safeguards are implemented. In this section, we address question 3 and urge the OMB to take the below steps to ensure that agency AI strategies center equity, limit law enforcement uses of AI, and include data privacy protections.

A. Agencies Should Center Equity in their AI Strategies.

Fundamentally, each agency's AI strategy should, as a threshold matter, ensure that the adoption of any new technology will not result in discrimination or compound existing disparities. At a minimum, the OMB should adopt the following three recommendations to clarify that agency AI strategies must center equity, be developed through stakeholder consultation, and be reviewed by the Department of Justice for compliance with existing civil rights laws.

First, the OMB should clarify that improving the "use [of] AI in ways that benefit the public and increase mission effectiveness"[51] means that agencies have an obligation to center equity as a primary lens of analysis in their AI strategy. To do so, the OMB should require that agencies assess how their AI strategies may cause or contribute to barriers that underserved communities face in accessing or benefitting from the agency's policies, programs, and activities. The OMB should require that each AI strategy include a written description of this assessment with detailed information about how the agency's current and planned uses of AI will mitigate such barriers and how the agency plans to ensure that any expanded use of AI does not widen existing racial and economic disparities.

Second, agencies should be required to consult with stakeholders during the development of their AI strategies. Agencies' AI strategies will have a sweeping impact on the adoption and deployment of AI across the federal government, including many public-facing applications.

[49] *Id.* at 8.
[50] RFC at 75625.
[51] Proposed Memorandum at 8.

Because of this, agencies should be required to consult with a diverse group of stakeholders, including civil rights organizations and directly impacted individuals, about the development and implementation of their AI strategies. We recommend that the OMB do so by amending the description of agency AI strategies on page 8 to include the following: "Agencies must develop their AI strategy in consultation with affected groups, including underserved communities, and use such feedback to inform the agency's uses, governance, investment, and risk management of AI."

Third, agencies should be required to consult with their most senior civil rights official during the development of their AI strategy and to submit their final strategy to the Department of Justice. As directed by the draft memorandum, agency AI strategies serve the purpose of increasing the adoption, development, and deployment of responsible AI across an agency.[52] This directive has significant implications for an agency's existing civil rights obligations, as the implementation of these AI strategies is likely to prompt many agencies to adopt AI systems for a variety of purposes including customer engagement, oversight and enforcement, and direct service delivery. Because of this, the OMB should require each agency to consult with the agency's most senior civil rights official throughout the development of the agency's AI strategy. In addition, the OMB should require the Department of Justice's Civil Rights Division to review each AI strategy for compliance with existing civil rights laws and to ensure that an agency's current and planned uses of AI do not cause or contribute to discrimination.

B. Law Enforcement Use of AI Results in Discrimination on the Basis of Race and Threatens Civil Rights. Agencies' AI Strategies Should Limit the Use of AI for Law Enforcement Functions.

Long-term racial disparities in the criminal justice system fuel the systemic over-policing of Black communities, often enabled and accelerated by the use of surveillance technologies such as AI.[53] Because AI used in law enforcement settings carries special risks to rights and freedoms, the OMB should clarify that agencies' AI strategies should not expand the use of AI for law enforcement functions absent demonstration that the technology is not discriminatory prior to use. Many AI technologies used in law enforcement settings have been shown to result in, or have the potential to result in, intentional discrimination and/or discriminatory disparate impacts. When layered on top of the existing racial disparities within the criminal justice system, AI technologies have the effect of making a discriminatory system more efficient, increasing the quantity or quality of harm. Using a technology to make a discriminatory system operate more efficiently—even if the technology is a purely neutral tool—is a harmful use. Any technology that worsens rather than alleviates discrimination cannot be considered responsible innovation; sometimes friction and inefficiency can be rights-protecting.

Facial recognition technology (FRT), for instance, is widely used by law enforcement agencies despite well-established racial biases in the technology. All known cases of wrongful arrest due to facial recognition have been of Black people—including a Black woman in Detroit

[52] *Id.* at 8.
[53] Simone Browne, *Dark Matters: On the Surveillance of Blackness* 50 (2015); Andrea Dennis, *Mass Surveillance and Black Legal History*, ACS Expert F. (Feb. 18, 2020), https://www.acslaw.org/expertforum/mass-surveillance-and-black-legal-history/.

who was wrongfully arrested when she was eight months pregnant even though the suspect was not pregnant, and a Black man in Georgia who had never been to Louisiana arrested for a crime in Louisiana.[54] In addition to the racial biases in the technology itself, FRT is often deployed in a racially discriminatory manner. One recent report found that the New Orleans Police Department disproportionately used FRT to identify Black individuals, deploying the technology on Black people over 90 percent of the time.[55]

Software developed and sold to law enforcement and courts for so-called "predictive policing," risk assessments, and criminal sentencing has been shown time and again to be racially biased against Black people.[56] For example, one tool disproportionately predicted crime in neighborhoods that had higher populations of Black, Latino, and low-income residents, often predicting little to no crime in wealthier, whiter neighborhoods.[57]

Currently, the draft memorandum's directive for agencies to develop AI strategies risks encouraging agencies to increase the adoption of AI technologies for law enforcement functions, which is likely to cause or contribute to an increase in discriminatory outcomes. The OMB guidance should recognize the heightened threat of discrimination that AI poses within law enforcement settings and clarify that agency AI strategies should not expand such uses without prior demonstration that the technology is not discriminatory.

C. Agencies' AI Strategies Should Protect Data Privacy and Establish Appropriate Limits on the Use of Data for Training, Testing, and Operating AI.

The current draft memorandum states that agencies should remove barriers to responsible AI innovation, including by maximizing appropriate access to data used for training, testing, or using AI.[58] This approach to sharing data presents the wrong message to agencies; greater safeguards should be applied to prevent inappropriate dissemination of personal information. Despite requiring such access to be "appropriate," the functional effect of the current wording is likely to increase indiscriminate access and use of data within agencies by presenting greater dissemination and use as a laudatory goal. The guidelines should be modified to reflect an approach

[58] Proposed Memorandum at 9.

more in line with the cybersecurity concept the principle of "least privilege"[59]: individuals within an agency should only have the access to data that is required for the performance of their duties. Intra-agency sharing of high-quality datasets for use in AI models is efficient, but this increase in efficiency cannot come at the cost of proper controls to prevent unnecessary or inappropriate dissemination and misuse. Moreover, the OMB should clarify that agencies must obtain prior affirmative express consent from individuals to use personal data for the training, testing, or operation of an AI system.

Clarifying that agencies must adopt these safeguards for protecting data privacy is necessary for protecting individuals and preventing data misuse or breaches, as well as to ensure that information is used to train AI responsibly. Data protection is also necessary to enable individuals to securely share sensitive personal data—such as race or location—to design safe and fair AI systems and test for bias without fear that their data will be misused. In the healthcare setting, for instance, individuals feel comfortable sharing incredibly sensitive information with their doctor because they trust that this information will be protected from abuse by HIPAA's privacy regulations. Without similar data protections here, many individuals will not be willing to disclose personal information that is needed to responsibly develop safe and effective AI systems.

Encouraging agencies to use personal data without additional protections could have significant chilling effects on the public's willingness to share information with the government more broadly. In particular, people might not share their personal information to access services such as public benefits out of fear that such information may be shared with law enforcement agencies. ICE, for instance, has exploited data collected from people's basic needs for survival—access to water, heat, and electricity—in order to conduct immigration enforcement.[60] Such practices already deter many Black communities and other communities of color from participating in the Census due to distrust in government and concerns about confidentiality, privacy, and negative repercussions.[61] Similar trends will continue if federal agencies use personal information for AI without establishing sufficient data privacy protections.

People should have meaningful control over how agencies use their personal information to train, test, and operate AI, without fearing that such information will be used against them by law enforcement. The OMB should clarify that this principle must guide agencies' approach to responsible AI innovation and require that agency AI strategies include plans for protecting personal data used for AI.

VII. The Memorandum Should Require Agencies to Report Detailed Information About the Implementation of Minimum Risk Management Practices in their Annual AI Use Case Inventories.

The OMB asks, in question 8, what information should be made public in agencies' annual AI use case inventories.[62] Here we address this question, urging the OMB to require that agencies publicly report detailed information about the implementation of the minimum risk mitigation practices and provide written justifications for systems exempted from the annual use case inventories.

The OMB should consider requiring agencies to report detailed documentation about key minimum practices in their annual AI use case inventories. This should include, at a minimum, summaries of pre-deployment impact assessments and independent evaluations, post-deployment monitoring measures, risks mitigation practices, and practices for addressing algorithmic discrimination and assessing disparate impact. These summaries should include a detailed review and description of all measures undertaken by an agency, sufficient for a person having ordinary skill in the art to understand the functioning, risks, uses, benefits, limitations, risk management practices, and other pertinent attributes of each AI use case.

In addition, the draft memorandum contains a significant loophole that may result in the omission of many safety-impacting and rights-impacting systems from annual use case inventories. In footnote 8, the OMB states, "Agencies must only publicly report use cases to the extent practicable and consistent with applicable law and governmentwide guidance, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information."[63] Because this exception is overly broad, interpretation between agencies is likely to vary significantly. The OMB should clarify and narrowly tailor the scope of this exception by requiring that agencies submit written justifications for systems exempted from the annual use case inventories. The aim of this guidance should be to ensure that the maximum possible number of safety-impacting and rights-impacting systems are included in the annual use case inventories.

VIII. The Memorandum Should Require Detailed Public Disclosure of Agencies' Waiver Processes.

The draft memorandum states that "an agency CAIO may waive one or more of the requirements in this section for a specific covered AI application or component," reporting an overview of the scope, justification, and evidence for such a waiver to OMB within 30 days.[64] In this section, we address the need for the OMB to institute strict requirements for this waiver process, including clarifying waiver criteria, requiring public disclosure, implementing routine external review, and establishing duration limits.

---

[62] RFC at 75626.
[63] Proposed Memorandum at 4 n.8.
[64] *Id.* at 14.

The OMB should clearly and narrowly define the criteria for granting a waiver to ensure that any waiver does not compromise public safety or civil rights. Presently, the draft memorandum states that a waiver may be granted if the CAIO determines that "fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations."[65] Many agencies are likely to use these vague criteria to deploy AI systems that pose significant risks to civil rights by arguing that such technologies serve critical operations. To avoid this potential loophole, the OMB should clarify that in order for an agency to grant a waiver related to "critical agency operations," the CAIO must determine that the benefits to the public and individuals impacted by the use of a particular AI system must, by clear and convincing evidence, outweigh the costs to such individuals' rights and safety, including intangible harms such as chilling free expression or producing stigmatizing indignities.[66] To ensure that such determinations are appropriately made, the OMB should require that all waivers must be reviewed and approved by the Department of Justice's Civil Rights Division.

The OMB should require public disclosure of the bar applied to obtain waivers from minimum practices for safety-impacting and rights-impacting AI. It is crucial that this process be stringent, transparent, and aligned with the highest standards of safety and civil rights protection. Any granted waivers should be accompanied by a detailed public justification that outlines why the waiver was necessary, the specific risk management practices that serve as the basis for a waiver, and what measures the agency is adopting to mitigate any potential risks.

The policy should also include provisions for regular external review and reassessment of the waiver process. This will ensure that each agency's use of AI remains aligned with the evolving standards of safety and civil rights protection, and that waivers are routinely updated when new risks arise. Continuous monitoring and evaluation of exempted AI systems is vital to promptly identify and address any adverse impacts these technologies might have.

We also recommend imposing a duration limit for such waivers. Rather than granting an indefinite waiver, which remains effective until potentially revoked by a CAIO, the OMB should limit the duration of each waiver to a period of one year. This finite duration necessitates that each waiver must be renewed upon expiration. This renewal process would require agencies to re-evaluate their AI systems against current standards and address any emerging concerns or technological advancements. Doing so ensures that the AI systems in use are consistently aligned with the latest safety and civil rights considerations, fostering a culture of continuous improvement and vigilance and ensuring that agencies routinely evaluate AI systems for new risks or impacts on civil rights. This approach not only reinforces the principles of transparency and responsibility in the deployment of AI technologies but also aligns with the public's expectation for modern and safe technology use within government operations.

[65] *Id.*

IX. AI that Affects Equal Opportunity in Insurance, Utilities, or Places of Public Accommodation Should be Included in the Definition of Rights-Impacting AI.

The OMB asks, in question 5, whether there are use cases for presumed safety-impacting and rights-impacting AI that should be included, removed, or revised, and, if so, why.[67] The definition of rights-impacting AI currently includes "[e]qual opportunities, including equitable access to education, housing, credit, employment, and other programs where civil rights and equal opportunity protections apply."[68] We address this question, calling on the OMB to add three additional areas of equal opportunity to this definition: insurance, utilities, and places of public accommodation.

AI systems already used in the insurance sector have been shown to produce discriminatory outcomes that disproportionately harm Black people and other people of color. Recent analyses of car insurance premiums in various states have shown that Black and Brown neighborhoods are systematically charged higher premiums than white neighborhoods of similar risk, regardless of neighborhood affluence.[69] Similar disparities could occur in the delivery of government-operated insurance programs. For example, if AI systems were introduced into the National Flood Insurance Program without adequate controls, the system could come to associate information correlated with people of color with higher flood risk because, according to the Congressional Budget Office, "communities in which most householders are Black (except for those in which the median household income is high) face the largest increases in flood risk from 2020 to 2050."[70] The biased output of such an AI tool could render flood insurance more expensive for Black Americans, which could have follow-on effects on housing segregation and continuing racial disparities in wealth.

Essential utilities—such as electricity, heat, water, municipal trash or sewage services, and internet and telecommunications services—are another critical area of equal opportunity that should be included in the definition. Many state utility regulators presently use AI systems to manage infrastructure and engage with customers.[71] The Federal Communications Commission and National Telecommunications and Information Administration oversee myriad large programs aimed at boosting equal access to broadband internet. To the extent that they employ AI in the future, as contemplated by the executive order, or that telecommunications providers use AI to manage network infrastructure and deployment, the agencies need to be careful that the AI does not exacerbate digital redlining in broadband access.[72] As such uses expand, the OMB should

---

require that agencies have appropriate safeguards to ensure that AI systems do not result in discriminatory barriers to accessing utilities.

Access to public accommodations is also an important area to avoid AI biases. Public accommodations protections are some of the most important civil rights protections in the United States, and the draft memorandum should reflect this by including public accommodations in the definition of rights-impacting AI. In general, a place of public accommodation is a business offering goods or services to the general public.[73] Public buildings, parks, and transportation facilities are public accommodations as well.[74] In this and in utilities and insurance, the responsibilities of federal agencies are twofold: they must ensure that their own use of AI does not reflect bias or perpetuate historical discrimination and they must enforce protections against discrimination by private entities using AI tools. A first step would be to include access to insurance, utilities, and places of public accommodation in the definition of rights-impacting AI so that more stringent requirements apply to agencies' use of AI in those areas.

X. The Memorandum Should Clarify that Automated Decision-Making Systems are Included in the Definition of Artificial Intelligence.

The draft memorandum adopts the definition of artificial intelligence used in the John S. McCain National Defense Authorization Act of Fiscal Year 2019 and includes additional technical context to aid agencies in their interpretation of this definition.[75] Here we address this definition and recommend that the OMB include additional technical guidance to clarify that automated decision-making systems are covered by the definition of AI.

Automated decision-making systems are some of the most common types of AI used by government entities. Within Washington, D.C. alone, government agencies use nearly 30 different automated decision-making systems for a range of purposes, including student risk assessment, predictive policing, and screening applicants for public housing.[76]

Although automated decision-making systems are widely used, the definition of AI in the draft memorandum does not explicitly state that such systems are covered by this policy guidance. The OMB should clarify that automated decision-making systems are indeed included by adding the following to the technical context guidance accompanying the definition of AI: "This definition includes automated decision-making systems that create or facilitate the creation of a product or information; promote, recommend, rank, or otherwise affect the display or delivery of material information; make a decision; or facilitate human decision making."

XI. Conclusion

The Lawyers' Committee applauds the draft memorandum and urges the OMB to implement these measures to protect Black communities and other communities of color from AI-related harms. The draft memorandum imposes important safeguards on the use of AI, including pre- and post-deployment assessments, transparency and explainability requirements, and affirmative obligations to detect and mitigate algorithmic bias and discrimination. The draft memorandum is a needed first step to ensure that AI does not cause or contribute to discrimination and to increase public trust and accountability in the government's use of AI.

While we commend the draft memorandum, we urge the OMB to take following steps: explain agencies' obligation to respect constitutional and statutory rights to due process and equal protection when using AI; clarify that CAIOs must have civil rights expertise; require agency AI strategies to center equity, limit law enforcement uses of AI, and protect data privacy; require agencies to report detailed information about minimum risk management practices in annual use case inventories; require detailed disclosure of agencies' waiver process; add AI that affects insurance, utilities, and places of public accommodation to the definition of rights-impacting AI; and, clarify that automated decision-making systems are included in the definition AI.

Thank you for your attention to and consideration of these comments. Please do not hesitate to contact David Brody at dbrody@lawyerscommitee.org or Quinn Anex-Ries at qanex-ries@lawyerscommittee.org if you have any questions.

Sincerely,

RE: Comments on Draft OMB Memorandum, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (November 1, 2023), OMB-2023-0020-0001

Dear Ms. Martorana:

The Enterprise Cloud Coalition (ECC) appreciates the opportunity to submit comments to the Office of Management and Budget (OMB) on the Draft OMB Memorandum, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI).

The ECC is comprised of mid-sized, enterprise-focused, cloud-based U.S. companies. Our companies' business models aim to solve inefficiencies in a variety of industries through technological innovation and prioritizing ethical standards and safeguards to promote trust. ECC members also provide enterprise software services to the federal government, including through the Federal Risk and Authorization Management Program (FedRAMP). While artificial intelligence is opening new opportunities to positively transform how people and organizations operate, we recognize that trust is essential to successfully developing and using AI. Enterprise cloud companies are well-positioned to build that needed trust through thoughtful policies and balanced frameworks.

Our successful business models have depended on offering innovative technology balanced by important privacy and cybersecurity considerations. Like other emerging technologies, U.S. leadership in AI lends itself to a risk-based regulatory approach and should be careful not to apply regulations too broadly to specific technologies or sectors. Such an approach is reflected in the National Institute of Standards and Technology's (NIST) AI Risk Management Framework (RMF), which was developed at Congress' direction through an open, multi-stakeholder process. Further, industry must be a key partner to identify and address ethical concerns while ensuring that customers can harness the economic benefits of AI innovations.

General Comments on Draft OMB AI Guidance

The ECC recognizes the challenge of offering guidance on agencies' use of AI and appreciates the complexity of developing AI guidance for large and small agencies with different risk profiles. Agencies will benefit from guidance on governance, responsible AI innovation, and how to manage risks from the use of AI, as will technology providers that will be part of these efforts.

While we appreciate the challenges of this AI Guidance, the draft directs agencies to institute processes and governance practices in a manner that may significantly delay the use of responsible AI solutions to solve agency problems. With that in mind, we offer four high-level observations and more specific comments below. First, the draft AI Guidance devotes most of its attention to establishing a new risk framework for broadly defined "safety-impacting" and "rights-impacting" AI uses without recognizing existing controls and risk management programs that already govern AI-specific risks. The NIST AI RMF, which benefits from significant stakeholder input, is almost an afterthought as it is noted as "additional best practices for AI risk management…" (13). We urge OMB to reconsider the NIST AI RMF's current role in the draft AI Guidance and to require agencies to adopt it.

Second, the governance section rightly elevates the AI portfolio in agency organizations by requiring the designation of a Chief AI Officer (CAIO), but this position is given much responsibility with limited recognition of the human capital and budget constraints these directives impose. The draft AI Guidance does list among the CAIO responsibilities "advising the agency CFO and Chief Human Capital Office on resourcing requirements and workforce skillsets…" (6), but "advising" does not provide sufficient authority to accomplish the long list of actions required of the CAIO.

Third, the innovation section of the draft AI guidance provides welcome direction to agencies to avoid bans on AI access and remove barriers to innovation. The draft AI Guidance encourages the removal of "unnecessary and unhelpful barriers" to innovation while retaining guardrails to ensure responsible use and recommends special attention to: (1) ensuring access to IT Infrastructure for AI projects; (2) adequate infrastructure and capacity to curate agency data; (3) updating cybersecurity authorization processes to address AI applications; and (4) focusing on workforce challenges.

Finally, addressing workforce challenges is a key element to encouraging innovation and responsible use of AI. Agencies' success in implementing this draft AI Guidance will hinge directly on addressing workforce issues and in particular the success of the AI and Technology Talent Task Force established under Section 10.2 of the October 30 AI Executive Order. Hiring, paying, and retaining technology talent and specifically AI talent is a difficult and time-intensive task. Without a relentless focus on actions to access talent in and outside the government, establishing the processes envisioned by this draft AI Guidance will be at best challenging and at worst will fail.

Additional Comments

In addition to the general comments outlined above, we have also provided specific comments below, which are organized by sections of the draft AI guidance.

Governance

- Ensure clear guidance to agencies on CAIO reporting structure, budgetary authority, and workforce resources. The use of existing governance structures will be important to avoid duplication. OMB should issue budget guidance to support the AI governance objectives.

- Agencies are required to issue a plan to comply with the objectives of the draft AI Guidance or a written determination that the agency does not use or anticipate using covered AI. This either/or mandate could discourage agency adoption of responsible AI, especially given the wide-ranging agency AI maturity levels.

Advancing Responsible AI Innovation

- The draft AI Guidance requires an AI strategy for "identifying and removing barriers to responsible AI use and achieving enterprise-wide advances in AI maturity" from each large agency within a year of the final guidance. This strategy would be important as a starting point to achieve success in other aspects of the draft guidance and not a year after the guidance is issued. The required strategy elements include the agency's AI workforce capacity and projected AI workforce needs. The workforce assessment is critical to all other aspects of the draft guidance and should be given priority.

Managing Risks from the Use of AI

- This section mandates agencies implement "minimum practices" for safety-Impacting and rights-Impacting AI uses or stop using such capabilities by August 1, 2024. This timeline seems arbitrary and unrealistic given other deadlines. This draft AI Guidance is to be finalized 150 days from the AI EO (October 30, 2023), which would be March 28, 2024. Recommendations on documentation expected of vendors to demonstrate compliance with minimum practices are to be issued 180 days after the draft AI Guidance is finalized, which is September 24, 2024 – a month after agencies are supposed to turn off AI or meet minimum practices. Deadlines should be aligned and/or clarified to promote compliance.

- The draft AI guidance creates significant uncertainty on what is or is not considered safety-impacting or rights-impacting AI uses. The draft guidance lists "a subset of specific purposes for which AI is automatically presumed to be safety-impacting or rights-impacting…" and adds that this is not an exhaustive list. Further, the draft AI Guidance seems to encourage expansion of these lists and potentially agency-specific lists. CAIOs are empowered to make determinations to add or revoke prior

determinations for these lists. There is no mention of a redress process for vendors impacted by such determinations. Agencies are encouraged to "identify additional context-specific risks" associated with their use cases and consider risks considerations such as an undefined "potential harms to worker wellbeing." Overall, this guidance creates uncertainty among vendors and agencies and fragmented application of AI compliance requirements across the federal government.

- Agencies should be encouraged to use the NIST AI RMF as a starting point for their AI risk management practices instead of citing to this key framework as a "best practice" among many.

- There are limited exclusions from minimum practices requirements for AI used for three general purposes. Small businesses and startups will find it difficult to deploy their AI tools in this process-heavy environment. Consider excluding AI uses for additional pilot applications and when there is no public-facing element, such as enterprise technology for threat protection and device signals for cybersecurity purposes.

- There are no required timelines for federal agencies to complete AI impact assessments, testing, or independent evaluations. This could significantly slow adoption of AI deployments in the federal government.

- Rights-Impacting AI Uses.
    - The draft AI guidance does not appear to distinguish between fully automated and human-in-the-loop tools – the latter of which is typically considered lower risk. This is important as tools that "meaningfully influence" outcomes (which is itself a vague threshold) could be considered "rights-impacting." We encourage OMB to remove "meaningfully influence from the definition of "rights-impacting" and apply regulations to AI tools that "control" outcomes.
    - Agencies would be required to obtain public feedback before using "rights-impacting" systems and then if there is "negative feedback" agencies are directed to consider not deploying the AI or removing the AI from use. The "negative feedback" term is vague and could capture minor (albeit negative) feedback that could be mitigated and should not halt deployment. Further, this vague term creates uncertainty and could discourage companies from considering providing AI solutions to the federal government.
    - The definition of rights-impacting systems broadly captures AI in employment, rather than being more specific about consequential employment decisions.

- Managing Risks in Federal Procurement of AI.
    - Additional clarification would be welcome in defining what "initial means" OMB will develop to ensure AI contracts align with the draft AI guidance.

- Ensuring transparency and adequate performance for procured AI and promoting competition are admirable objectives. We also appreciate promoting interoperability and avoiding bundling as important call outs.
- Clear and timely guidance on documentation expected of vendors will be critical to promote these objectives.
- There should be additional clarification on the intent related to the section on "maximizing the value of data for AI," and whether there is the potential for changes from existing federal procurement rules on data rights.

Definitions

- Rights-Impacting AI. This definition does not appear to have regulatory or statutory grounding. Instead, the definition is derived from a list of examples, which may be added or subtracted depending on the agency. By taking this approach agencies could develop specific lists, which would, in turn, fragment an already complicated federal procurement ecosystem.

- Risks from the Use of AI. It would be helpful to understand the origin of this list.

- Safety-Impacting AI. This definition does not appear to have regulatory or statutory grounding. Instead, the definition is derived from a list of examples, which may be added or subtracted depending on the agency. Again, by taking this approach, agencies could develop specific lists, which would, in turn, fragment an already complicated federal procurement ecosystem.

Thank you for the opportunity to participate in this critical policy discussion. The federal government's use of AI will be both an opportunity and a challenge as we all work toward responsible deployment of AI solutions to drive agencies' success in accomplishing their missions.

Sincerely,

Andrew Howell, Executive Director

Enterprise Cloud Coalition

RE: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum, OMB–2023–0020

To Whom It May Concern,

On behalf of the NAACP Legal Defense and Educational Fund, Inc. (LDF), we submit the following comments in response to the Office of Management and Budget (OMB)'s Draft Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI).[1] AI systems used by public and private actors increasingly permeate every area of our lives, including employment, housing, government services and supports, and our interactions with law enforcement and the criminal legal system. Yet these systems reproduce or exacerbate racial bias, inequities, and discrimination. AI systems—some of which may themselves exhibit algorithmic bias, misrepresent their effectiveness, and/or rely on large amounts of sensitive, personal data—can also be deployed in ways that disproportionately harm communities of color, particularly by law enforcement, endangering their liberty and physical safety and risking a range of collateral consequences.

We applaud the OMB for proposing guidance that would acknowledge these civil rights harms and would require federal agencies to take steps to identify and address algorithmic bias. The Draft Memorandum's requirement that agencies follow minimum risk-management practices before using new or existing covered safety-impacting or rights-impacting AI, including law enforcement technologies, holds promise. The risk management practices—completing an AI impact assessment; providing public notice and plain-language documentation through the AI use

[1] 88 Fed. Reg. 75635 (Nov. 3, 2023), https://www.govinfo.gov/content/pkg/FR-2023-11-03/pdf/2023-24269.pdf; Shalanda Young, Executive Office of the President, Office of Management and Budget, Proposed Memorandum for the Heads of Executive Departments and Agencies RE: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (Nov. 3, 2023), https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf (OMB Memo).

case inventory; assessing and mitigating disparate impact; and incorporating feedback from affected groups, including underserved communities, in the design, development, and use of the AI—create an encouraging framework for protections from algorithmic bias. If finalized, the Memorandum would take an important step in translating the White House's October 2022 Blueprint for an AI Bill of Rights[2] into binding policy requirements—including for law enforcement and criminal legal system uses of AI.

In order to fully realize the potential of this memorandum, we urge OMB to strengthen and clarify several provisions. Our key recommendations include: 1. clarifying how federal agencies can assess bias and enhance equity in federal systems; 2. building in-house agency capacity for implementation; 3. ensuring the Memorandum's requirements apply to both technology funded by federal grants and technology procured from third parties; 4. mandating that Chief AI Officers (CAIOs) have civil rights expertise; 5. expanding disclosure in AI use case inventories; 6. providing additional constraints on when and how waivers can be used to exempt AI systems from minimum risk-management requirements; and 7. guaranteeing that civil rights principles guide agencies' AI strategies.

Founded in 1940 by Thurgood Marshall, LDF is the nation's oldest civil rights law organization.[3] LDF was launched at a time when America's aspirations for equality and due process of law were stifled by widespread state-sponsored racial inequality. For more than 80 years, LDF has relied on the Constitution and federal and state civil rights laws to pursue equality and justice for Black people and other people of color. LDF's mission has always been transformative: to achieve racial justice, equality, and an inclusive society.

Since its inception, LDF has worked to increase fairness and equal opportunity for Black people. Some of Thurgood Marshall's early victories in the Supreme Court came in *Shelley v. Kramer*, 334 U.S. 1 (1948), and *McGhee v. Sipes*, 334 U.S. 1 (1948), which held that the state enforcement of racially restrictive covenants violated the Equal Protection Clause. In the decades since those victories, LDF's litigation, policy advocacy, organizing, and public education programs have sought to ensure the fundamental rights of all people to quality education, economic opportunity, the right to vote and fully participate in democracy, and the right to a fair and just judicial system. LDF has continued to challenge public and private policies and practices that deny

[3] LDF has been fully separate from the National Association for the Advancement of Colored People (NAACP) since 1957.

Black people housing, employment, health care, and other opportunities,[4] and has fought to address unconstitutional and racially discriminatory law enforcement conduct.[5]

I. AI Systems Perpetuate Bias and Discrimination Based on Race and Other Protected Categories Across Various Sectors.

AI systems frequently replicate and amplify existing discrimination and bias, denying people of color and other protected classes equal access to housing, credit, employment, and other opportunities,[6] subjecting them to increased law enforcement contact,[7] and potentially endangering their liberty. AI systems can also be deployed in ways that disparately impact certain groups—for example, by requiring recipients of public benefits to share their biometric data in order to verify their identity,[8] or disproportionately deploying surveillance technologies in particular communities. As discussed below, researchers and litigators have found algorithmic bias across several major sectors, including lending, housing, employment, health care, education, and law enforcement.

A. *Lending and Access to Credit*

Algorithmic bias can deprive people of fair access to credit, leading them to pay more for a mortgage, credit card, or other loans or denying them credit entirely. In 2020, for example, the Student Borrower Protection Center (SBPC) tested a lending algorithm developed by a company called Upstart that incorporated educational data—including where the borrower attended college and the average SAT and ACT scores for different colleges and universities.[9] Upstart's algorithm

divided schools into tiers based on standardized test scores.[10] The higher the incoming class's average standardized test scores, the higher the school's tier, and the more favorable the terms offered to students who attended that school.[11] Because students of color perform worse on these standardized tests due to embedded biases, schools with higher percentages of students of color were assigned to lower tranches.[12] As a result, ninety-five percent of Historically Black Colleges and Universities (HBCU) were in the bottom rankings; just two were in the top tier.[13] In practice, this translated into substantially different loan terms for borrowers of color: SBPC found that a hypothetical graduate of the well-known HBCU Howard University who applied for a loan through Upstart's lending platform, was charged nearly $3,499 more over the life of a five-year loan when compared to a similarly situated graduate of New York University, a predominantly white institution.[14] Upstart agreed to a fair lending monitorship in response to a demand letter sent by LDF and SBPC outlining how its algorithm likely violated the Equal Credit Opportunity Act and the Fair Housing Act.[15]

B. *Housing*

Algorithmic bias can also deny people access to housing. For example, housing providers frequently rely on tenant screening reports that include an algorithmically-generated score or a recommendation to accept or reject an applicant,[16] and tenant screening companies encourage housing providers to rely on this eligibility determination.[17] These scores usually include financial data from credit reporting agencies as well as information from data intermediaries and court

Think of AI as your assistant. It can get the essential process of tenant screening done, letting you be completely hands-off."). One recent study by Wonyoung So, a researcher at the Massachusetts Institute of Technology, found that housing providers penalized tenants by rejecting their applications or charging them higher security deposits "when they saw high-risk scores on the reports, rather than utilizing detailed information to make more precise judgements" even when that information was available. Wonyoung So, *Which Information Matters? Measuring Landlord Assessment of Tenant Screening Reports*, HOUSING POL'Y DEBATE (Aug. 30, 2022), https://www.tandfonline.com/doi/full/10.1080/10511482.2022.2113815.

databases on arrests, convictions, and evictions[18] which can disproportionately exclude people of color and other protected classes from housing opportunities.

Similarly, the Markup recently investigated the scoring system the Los Angeles Homeless Services Authority uses to match people in need with subsidized housing.[19] The U.S. Department of Housing and Urban Development requires the use of such a prioritization system to become eligible for certain federal housing funds under its rules.[20] The Markup's investigation found that Black and Hispanic people were significantly less likely than white people to score high enough to be placed in the "high priority" group for housing placement, even though they were overrepresented in Los Angeles' homeless population as a whole.[21]

C. Employment

Employers—including the federal government—increasingly rely on AI and other automated tools throughout the hiring process, from steering job advertisements toward certain candidates through sites like LinkedIn, to identifying strong applicants based on analyses of their resumes, and assessing candidate competencies.[22] Unfortunately, algorithmic decision-making systems used to identify strong candidates are likely to reflect existing patterns of occupational segregation. For example, algorithms that are developed using a data set where people of color are underrepresented among doctors, lawyers, and other professions, or where women are more often nurses and men are more often doctors, may take these observed patterns as a given, resulting in unfair disadvantages for people of color, women, and other protected classes.[23] As a result, researchers have found that algorithms used to decide who is shown advertisements regarding employment opportunities discriminate based on race and gender, often reflecting stereotypes about who works certain kinds of jobs.[24] Similar issues can arise when employers use ADSs to

screen resumes.[25] Finally, several companies market products to employers that they claim can reliably extrapolate personality traits and predict social outcomes, such as job performance.[26] Some of these tools rely on assessments of observable physical factors like facial or voice recognition,[27] despite the fact that these technologies are less accurate at assessing people with darker skin[28] and the voices of Black people.[29] As such, they may produce inaccurate results for people of color.

D. *Healthcare*

Health care providers increasingly rely on algorithms to help diagnose and treat patients, yet these algorithms can lead to Black patients to receive worse care.[30] For example, although Black Americans are four times more likely to have kidney failure, the standard algorithm used around the country to determine transplant list placement explicitly uses race as a factor and puts Black patients lower on the list than white patients, even when all other factors remain identical.[31] Many doctors now believe that the data that led the algorithm's developers to include the race coefficient is actually a reflection of both systemic health disparities and discrimination by providers, and that the continued use of the algorithm leads to negative health outcomes for Black patients.[32]

[32] *Id.*

Technologies used in the education sector risk entrenching the school-to-prison pipeline for Black and Brown youth. There is no independent evidence that student activity monitoring software, for example, improves student safety.[33] On the contrary, studies show that more surveillance in schools *decreases* students' perceptions of safety, equity, and support.[34] Research shows that schools with more students of color are already more likely to adopt stricter and more encompassing surveillance, security, and law enforcement methods.[35] By purchasing student activity monitoring software, administrators are investing in oppressive technologies rather than more empirically supported services to create positive school climates.[36]

F. *Law Enforcement*

Law enforcement agencies use algorithmic technologies for a wide variety of functions, from social media monitoring, crime forecasting, license plate readers, to algorithms used to decide where to deploy officers and to identify purported suspects.[37] These technologies often rely on data reflecting racially discriminatory policing practices and their use creates a feedback loop that perpetuates discriminatory patterns.[38] The use of these technologies by law enforcement officers increases officers' powers to surveil and perpetuate state violence against people of color without creating safer communities.[39] These new technologies are often deployed with little to no transparency regarding when they are used, what data sources they rely on, how they make

decisions, whether they have been independently validated or tested for bias, or notice or explanation to people on whom they are used about why or how they may be adversely affected.

II. The Draft Memorandum Builds Upon the Blueprint for an AI Bill of Rights to Require Federal Agencies to Take Steps to Identify and Address Algorithmic Bias

We commend the administration for advancing efforts to identify and address algorithmic bias. As several federal agencies have recognized, existing civil rights and consumer protection laws—such as Title VII of the Civil Rights Act of 1964, the Fair Housing Act, the FTC Act, and the Equal Credit Opportunity Act—apply to algorithmic discrimination and, in many cases, bar the deployment of algorithms that have a disparate impact on protected classes.[40] The federal government has an obligation not only to vigorously enforce these protections, but to ensure that its own uses of AI comply with these laws and the U.S. Constitution. While the administration's Blueprint for an AI Bill of Rights articulated a set of principles to protect the public from algorithmic bias and other threats to civil rights which occur with the increased use of automated systems, its guidance was not binding. The Draft Memorandum begins the process of embedding these principles within the policies and practices of federal agencies.

In October 2022, the White House Office of Science and Technology Policy took the positive step of issuing a Blueprint for an AI Bill of Rights, which recognized that people should "not face discrimination by algorithms and systems should be used and designed in an equitable way."[41] The Blueprint acknowledges that discrimination by algorithms may, in certain circumstances, violate existing laws,[42] and recommends that "designers, developers, and deployers of automated systems . . . take proactive and continuous measures to protect individuals and communities from algorithmic discrimination and to use and design systems in an equitable way," including conducting equity assessments as part of the system design, using representative and accurate data and protecting against proxies for demographic features, and performing pre-deployment and ongoing disparity testing and mitigation.[43] The Blueprint also describes additional measures that should be taken to ensure that affected individuals receive adequate notice and explanation regarding the use of algorithms, as well as the availability of human alternatives, consideration, and fallback.[44] Unfortunately, the Blueprint is non-binding and does not mandate that companies take these steps.[45] Moreover, the Blueprint includes exemptions that suggest that current and future uses of AI by law enforcement need not be subjected to the same principles or should be weighed differently against law enforcement concerns.[46]

[42] *Id.*

[43] *Id.*

[44] *Id.*

[45] *Id.*

[46] *Id.*

The Draft Memorandum would require federal agencies to embrace several of the principles of the Blueprint and take concrete steps to address algorithmic bias and increase accountability for their use of AI. The Draft Memorandum includes, among other measures:

- Broad application, including to law enforcement uses: The Draft Memorandum applies to all new and existing AI that is developed, used, or procured by or on behalf of covered agencies,[47] and requires federal agencies to take additional steps (discussed further below) to address the risks of "safety-impacting" or "rights-impacting" AI. "Rights-impacting" AI is presumed to encompass technologies that control or meaningfully influence law enforcement and decisions in the criminal legal system; the exercise of protected speech; access to education, including school admissions and student discipline; access to housing, including tenant screening and home valuation; the terms and conditions of employment; and access to financial services and credit.[48] While we believe this list should be expanded, as discussed further below, we applaud the otherwise broad definition of "rights-impacting" AI, particularly the necessary inclusion of law enforcement and criminal legal system technologies. The dangers associated with the use of AI in these contexts are among the most concerning, potentially depriving individuals of liberty and endangering their housing, employment, and their ability to parent their children and care for their loved ones. Because of ongoing systemic discrimination against communities of color by law enforcement and the criminal legal system, Black and Brown communities often bear the brunt of these harms.

- Required risk management practices: The Draft Memorandum requires federal agencies to implement the minimum practices for safety-impacting or rights-impacting AI and to stop using any AI that is not compliant with those practices.[49] These minimum practices include steps such as completing an AI risk assessment that identifies the possible risks of using AI and evaluates the quality and appropriateness of the data used in the AI's design, development, and deployment; conducting real-world testing and independent evaluation of AI documentation; performing ongoing monitoring; and mitigating risks to rights and safety at every stage of design, development, and deployment.[50] Additionally, agencies must take additional steps to ensure that rights-impacting AI do not exhibit algorithmic bias, including by proactively identifying and removing factors contributing to algorithmic discrimination or bias; assessing and mitigating disparate impacts; using representative data; and consulting with impacted communities. Importantly, the Draft Memorandum reiterates throughout that federal agencies should not use AI that cannot meet these minimum requirements.

[47] OMB Memo, *supra* note 1, at 3.
[48] *Id.* at 12-13.
[49] *Id.* at 10.
[50] *Id.* at 15-17.

- Increased transparency: The Draft Memorandum requires federal agencies "to identify and report additional detail on how they are using safety-impacting and rights-impacting AI, the risks—including risks to equity—that such use poses, how they are managing those risks, and any related extensions and waivers granted."[51] The federal government has an obligation to ensure that it can be held accountable for its actions through the democratic process. Yet the public is often not aware of when AI is used or the risks it poses, even if they themselves have been impacted by those systems. Requiring federal agencies to disclose their use of AI and the risks to equity they pose will provide needed transparency.

We applaud OMB for proposing these requirements, which would help the federal government begin to put the Blueprint for an AI Bill of Rights into practice. If strengthened and effectively implemented, the Draft Memorandum would help the federal government fulfill its nondiscrimination obligations and could provide a model for other governments seeking to strengthen their AI governance.

III. To Fully Realize Its Promise and Ensure that Civil Rights Are the Highest Priority, OMB Needs to Tighten Its Guidance and Build Capacity for Implementation.

While the Draft Memorandum includes many important measures, it should be further strengthened in order to help the federal government's use of AI does not violate civil rights and civil liberties. We recommend that OMB: 1. clarify that algorithmic discrimination is unacceptable, but collecting demographic data to assess AI systems for bias and implementing AI systems that effectively increase access to opportunity are not forms of discrimination; 2. increase agencies' budgets to support compliance with testing requirements and other risk-management practices; 3. apply the Final Memorandum to AI systems funded by federal grants and to technology procured from third parties; 4. offer clear guidance to agency staff implementing anti-discrimination testing requirements; 5. mandate that CAIOs have civil rights expertise; 6. expand the definition of what constitutes AI and "rights-impacting" AI; 7. require disclosure of information about waivers granted to specific AI systems and documentation of agencies' risk-assessment procedures; 8. significantly limit when and how waivers can be granted; and 9. ensure that civil rights principles inform agencies' adoption of AI tools, and that federal agencies are required to consult with civil rights organizations and impacted communities on their AI strategies.

A. *Clarify that No Amount of Algorithmic Discrimination is Acceptable, but that Efforts to Assess Bias and Expand Opportunity Are Not Discrimination*

The Draft Memorandum should make clear throughout that no amount of unjustified algorithmic discrimination is acceptable. At the same time, the Draft Memorandum should make clear that federal agencies may collect and use data on race and other protected characteristics to

[51] *Id.* at 4.

assess systems for bias, and that systems that effectively increase access to opportunity do not violate the Memorandum's requirements.

As currently defined, the Memorandum explains that "where the AI's risks to rights or safety exceed an acceptable level and where mitigation is not practicable, agencies must stop using the affected AI as soon as is practicable."[52] The Draft Memorandum also requires that federal agencies assess rights-impacting AI to "determine whether there are significant disparities in the AI's performance across demographic groups, and, consistent with applicable law, appropriately address disparities" and "[w[here sufficient mitigation of [AI-enabled discrimination] is not possible, agencies must safely discontinue use of the affected AI functionality."[53] However, the Draft Memorandum does not define what is an "acceptable level" of risk to rights and safety or "sufficient mitigation" of discrimination. Moreover, the Draft Memorandum does not define what "AI-enabled discrimination" by rights-impacting AI includes.[54]

Federal government use of AI should serve as an example to both state and local governments and the private sector and should be held to the highest standards. Existing civil rights laws should be viewed as the floor but not the ceiling for nondiscrimination protections. The Final Memorandum should make it clear that no amount of algorithmic discrimination is "acceptable." The Final Memorandum should also require federal agencies to identify and adopt less discriminatory alternatives even if those alternatives appear to impose material costs or perform slightly worse.[55] Finally, the Final Memorandum should use the term "algorithmic bias," which is defined in the Memorandum and appropriately includes both disparate treatment and disparate impact,[56] consistently throughout, rather than the undefined term "AI-enabled discrimination."

In addition, the Final Memorandum should also make clear how federal agencies can assess bias and enhance equity in federal systems consistent with its requirements. The Final Memorandum should state explicitly that data on race and other protected characteristics can be collected and used to determine whether a system exhibits algorithmic discrimination. In some cases, this analysis could require federal agencies to collect additional demographic data or improve their methods for collecting such data. Moreover, the Final Memorandum should make clear that AI systems that increase access to opportunity would not violate the memo's requirements provided they are consistent with existing law. For example, a federal agency could

[52] *Id.* at 17.
[53] *Id.* at 18, 20.
[54] *Id.* at 20.
[55] *See* Implementation of the Fair Housing Act's Discriminatory Effects Standard, 78 Fed. Reg. 11,460, 11,473. (Feb. 15, 2013); 88 Fed. Reg. 19450, 19491 (Mar. 31, 2023); codified at 24 C.F.R. 100 (rejecting a proposal that less discriminatory alternatives must be "equally effective.").
[56] OMB Memo, *supra* note 1, at 22 (The term "algorithmic discrimination" has the meaning established in Section 10(f) of Executive Order 14091 of February 16, 2023.); Executive Order 14091 § 10(f) ("The term 'algorithmic discrimination' refers to instances when automated systems contribute to unjustified different treatment or impacts disfavoring people based on their actual or perceived race, color, ethnicity, sex (including based on pregnancy, childbirth, and related conditions; gender identity; intersex status; and sexual orientation), religion, age, national origin, limited English proficiency, disability, veteran status, genetic information, or any other classification protected by law.").

use an AI system to expand the pool of job applicants to ensure that Black people and other people of color have equal opportunity to compete for positions. Alternatively, a federal agency could expand the criteria used to evaluate loan applications in order to ensure that they do not unfairly exclude Black borrowers.[57]

B. *In-house Capacity for Implementation*

The Draft Memorandum imposes needed requirements on federal agencies to ensure that their AI systems comply with minimum risk management practices. These requirements must be met by August 1, 2024, unless the agencies request "an extension of limited and defined duration for a particular use of AI that cannot feasibly meet the minimum requirements in this section by that date . . . accompanied by a detailed justification for why the agency cannot achieve compliance for the use case in question and what practices the agency has in place to mitigate the risks from noncompliance, as well as a plan for how the agency will come to implement the full set of required minimum practices from this section."[58] The Draft Memorandum also encourages agencies to take steps to fill gaps in their AI workforce using available special hiring and retention authorities.[59]

In order to meet the benchmarks and timelines established by the Memorandum, many federal agencies will need to significantly increase their technical capacity. We urge OMB to ensure that future budget requests account for the need to support compliance with the minimum risk-management practices, and that investments in new AI systems do not exceed agencies' capacity to evaluate them. The Final Memorandum should also specify that agencies should seek to hire additional staff with civil rights expertise in addition to technical expertise in order to ensure that the development and implementation of agencies' AI strategy and minimum risk-management practices are informed by experts who understand agencies' legal obligations.

In addition, the Final Memorandum should clarify the circumstances under which agencies can request an extension of the compliance deadline. OMB should only permit agencies to request extensions if AI evaluations are in progress according to a realistic timeline. If agencies do not have the capacity to complete testing requirements, they should not be allowed to keep requesting extensions and to continue to use the AI technology in the meantime. In that case, agencies should

---

[57] For example, both Freddie Mac and Fannie Mae now give borrowers and lenders the option of submitting rental payment history for consideration as part of the entities' automated mortgage underwriting system. *Freddie Mac Takes Further Action to Help Renters Achieve Homeownership*, FREDDIE MAC (Jun. 29, 2022 10:00 ET), https://www.globenewswire.com/news-release/2022/06/29/2471417/0/en/Freddie-Mac-Takes-Further-Action-to-Help-Renters-Achieve-Homeownership.html; *FHFA Announces Inclusion of Rental Payment History in Fannie Mae's Underwriting Process*, FED. The hope is that this additional information will help expand access to credit and homeownership among people of color, whom Fannie Mae found "are disproportionately represented among the 20% of the U.S. population having little to no established credit history." Hugh R. Frater, Fannie Mae, *Helping Renters Unlock the Door to Homeownership* (Aug. 11, 2021), https://www.fanniemae.com/research-and-insights/perspectives/helping-renters-unlock-door-homeownership.

[58] OMB Memo, *supra* note 1, at 14.

[59] *Id.* at 9.

be required to stop using the AI technology until they have capacity to run audits internally or to hire third-party auditors. These third-party auditors must have expertise in civil rights rather than embracing an AI-first approach.

C. *Federal Grants*

The Draft Memorandum currently only applies to AI used by federal agencies. It does not require that AI systems funded with federal dollars or created pursuant to federal mandates comply with the same minimum risk-management practices. However, the Department of Justice has created funding programs such as its "Smart Policing Initiative" (SPI) and provided grants for biased and discriminatory technologies such as predictive policing with little to no tracking.[60]

Federal funding should not be used to support AI systems that the federal government could not itself use. To the greatest extent allowed by law, federal agencies should ensure that grant funding programs such as the SPI and federally-funded AI systems comply with the minimum risk-management practices outlined in the memo. At minimum, federal agencies should consider issuing guidance or best practices to federal funding recipients.

D. *Procurement*

The current Draft Memorandum mandates that, within 180 days, "the [interagency] council described in Section 10.1(a) of the AI Executive Order [which includes the heads of all cabinet-level federal agencies] will provide the Director of OMB with a list of recommended documentation that should be required from a selected vendor in the fulfillment of a Federal AI contract. As part of their recommendation, the council must consider the minimum risk management practices in Section 5(c) and the associated materials that may be required of vendors to demonstrate that they have completed such tasks."[61]

AI used by federal agencies should comply with the same standards regardless of whether it is developed internally or procured from outside companies. In addition to requiring documentation relevant to risk management from third parties, the Final Memorandum must require that technology procured from third parties complies with the outlined minimum risk-management practices.

---

[61] *Id.* at 10.

E. *Anti-discrimination Testing*

Currently, the Draft Memorandum imposes "Additional Minimum Practices for Rights-Impacting AI" only apply to rights-impacting AI, not safety-impacting AI. These additional minimum practices include "tak[ing] steps to ensure that the AI will advance equity, dignity, and fairness,"; "consult[ing] and incorporating feedback from affected groups"; conduct[ing] ongoing monitoring and mitigation for AI-enabled discrimination"; "notify[ing] negatively affected individuals"; "maintain[ing] human consideration and remedy processes"; and "maintain[ing] options to opt-out where practicable."[62] Moreover, the Draft Memorandum appears to leave it to the agencies to decide which agency staff members are in charge of these testing requirements and which testing methodologies to use.

Given that several of the safety-impacting use cases can have serious consequences for the individual and community rights described in the Memorandum's definition of rights-impacting AI,[63] the Final Memorandum should require the additional minimum practices for all safety-impacting AI as well as all rights-impacting AI. At minimum, the Final Memorandum should clarify that, if a technology could be categorized as either rights-impacting or safety-impacting, agencies should apply the additional requirements for rights-impacting systems.

In order to facilitate consistent implementation across agencies, the Final Memorandum should also specify which actors are responsible for completing the testing requirements, and agencies should publicly report which anti-discrimination testing methodologies they are using. Agencies should choose testing methodologies based on input from experts on bias and discrimination in particular contexts in order to account for the ways these issues manifest in different arenas. In addition to assessing whether AI systems produce biased results, the Final Memorandum should also require agencies to assess whether they will deploy AI systems in a way that disproportionately burdens particular communities. For example, surveillance systems that are deployed more frequently in communities of color can chill the exercise of free speech, decrease privacy, and cause other harms in addition to any bias in the results produced by the system. The Final Memorandum should require agencies to mitigate those harms or stop using those systems. Finally, the White House Office of Science and Technology Policy and the National Institute for Science and Technology should provide agency staff responsible for implementing the memo with clear guidance, informed by public input—for example, guidance on acceptable testing and tolerances.

F. *Chief AI Officers*

The current Draft Memorandum requires the head of each agency to designate a CAIO responsible for coordinating agency use of AI, promoting AI innovation, and managing risks from the use of AI. The CAIO "must have the necessary skills, knowledge, training, and expertise to

[62] *Id.* at 18-21.
[63] *Id.* at 24.

perform the responsibilities described,"[64] which include identify rights-impacting and safety-impacting systems and managing the risks of those systems.[65] As such, the Final Memorandum must specifically state that CAIOs should have expertise in civil rights.

G. *AI Use Case Inventory*

The Draft Memorandum currently states that agencies must publicly report AI use cases "to the extent consistent with applicable law and government guidance, including those concerning protection of privacy and of sensitive law enforcement, national security, and other protected information," should make this documentation accessible to potentially impacted communities "where practicable," and should report relevant information to OMB about excluded use cases "as appropriate" and "consistent with applicable law and governmentwide guidance, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information."[66]

We urge OMB to tighten this language lest the exceptions swallow the rule. Law enforcement technologies should be disclosed publicly in the AI use case inventory, information about them should be made explicitly available to potentially impacted communities, and details on excluded use cases should be provided to OMB and should follow transparency requirements. Because law enforcement technologies can cause some of the most significant harms to impacted communities, there is a heightened need for transparency about these systems. As discussed further below, the Final Memorandum should also require agencies to publish additional information about waivers that exempt AI systems from the minimum risk-management requirements. Finally, the Final Memorandum should require federal agencies to publish all documentation produced as part of the minimum risk-assessment procedures (i.e., the impact assessment, results of real-world testing, etc.) as part of their use case inventory.

H. *Definitions*

While the Draft Memorandum's definitions of AI and systems that are presumed to be "rights-impacting" or "safety-impacting" encompass many critical technologies, they also exclude some systems that have significant civil rights implications. We urge OMB to expand and clarify these definitions in the Final Memorandum.

First, the Draft Memorandum uses a different definition of AI than the Executive Order on Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence.[67] OMB should clarify that AI for the purposes of the memo is a machine-based system that can, for a given set of

[64] *Id.* at 4-7.
[65] *Id.* at 6.
[66] *Id.* at 4.
[67] *Compare id.* at 22 *with* Executive Order 14110 on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (Oct. 30, 2023), 88 Fed. Reg. 75191 (Nov. 1, 2023), https://www.govinfo.gov/content/pkg/FR-2023-11-01/pdf/2023-24283.pdf (AI EO).

human-defined objectives, make predictions, recommendations, or decisions influencing real or virtual environments.

Second, the Draft Memorandum "encourage[s]" but does not require elements of the intelligence community to implement the outlined risk management practices for rights-impacting and safety-impacting AI.[68] The Department of Defense and the Intelligence Community are also exempt from submitting an AI use case inventory to OMB and publicly disclosing a version on their website.[69] Under the Final Memorandum, the exclusion of the intelligence community should not be used to dismiss civil rights protections for law enforcement uses of AI.

I. *Waivers*

The Final Memorandum should provide additional constraints on when and how federal agencies can exempt AI systems from the minimum risk-management requirements and should create additional transparency regarding when and how waivers should be granted. The Draft Memorandum currently allows agencies' CAIOs to waive one or more of the minimum risk-management requirements "after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations."[70] Such waivers would be in effect for the duration of the AI's use.[71] This provision creates a significant loophole that could undermine the principles outlined in the Blueprint for an AI Bill of Rights and permit the federal government to knowingly or unknowingly engage in algorithmic discrimination in violation of its statutory and constitutional obligations.

The Final Memorandum should significantly limit when and how waivers exempting systems from the minimum risk-management requirements can be granted. The Final Memorandum should clearly define and limit what constitutes "an unacceptable impediment to critical agency operations" and specify that a waiver should not be granted if there is a risk that such a waiver would create a risk that the agency's use of AI would violate the Due Process Clause, the Equal Protection Clause, or any other constitutional or statutory right. The memo should explicitly require the CAIO to get consent from the Civil Rights Division at the Department of Justice and any relevant civil rights officers at their agency before granting a waiver. Waivers should only be granted for a limited period of time (i.e., one year) and should be periodically reassessed *de novo.* Federal agencies should also be required to publish information in their AI case inventory regarding why a waiver was requested, why it was granted, and when the waiver must be reevaluated.

Finally, the proposed rule permits the CAIO "to determine that an AI application does not match the definitions of 'safety-impacting AI' or 'rights-impacting AI' and is therefore not subject

[68] OMB Memo, *supra* note 1, at 10.
[69] *Id.* at 4.
[70] *Id.* at 14.
[71] *Id.*

to the minimum practices."[72] The Final Memorandum should similarly require the CAIO to get consent from the Civil Rights Division at the Department of Justice and any relevant civil rights officers at their agency before granting a waiver; to periodically review this determination based on information regarding the use of the system; and to disclose regarding why this determination was made and when it must be reevaluated.

J. *AI Strategies*

The Draft Memorandum requires CAIOs to develop AI strategies for each federal agency, and currently places significant emphasis on increasing federal agencies' adoption of AI tools, devoting an entire section to improving their ability to use and procure AI.[73] However, as described in Section I above, AI systems pose significant risks to civil rights and can rapidly harm numerous individuals. As such, the federal government must be thoughtful about AI adoption.

The Final Memorandum should require agencies, as part of the development of their AI strategies, to carefully evaluate whether and how AI tools—particularly safety-impacting and rights-impacting AI—would actually add value compared to a human alternative before adopting them. The Final Memorandum should also make clear that the principles embodied in the minimum risk-assessment requirements are not separate from agencies' AI strategies but should inform those strategies. In order to ensure that federal agencies carefully balance the civil rights risks of AI against any possible benefits, the Final Memorandum should require federal agencies to consult with civil rights organizations and impacted communities as they develop their AI strategies. Finally, the Final Memorandum should ensure that federal civil rights officials play a central role in the development of AI strategies. The 2023 Executive Order on Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence recognizes the importance of civil rights officials in developing AI policy and directs the "Assistant Attorney General in charge of the Civil Rights Division to convene . . . a meeting of the heads of Federal civil rights offices to discuss comprehensive use of their respective authorities and offices to . . . prevent and address discrimination in the use of automated systems, including algorithmic discrimination," among other topics.[74] The results of those conversation should also inform each agencies' AI strategies. In line with the EO, the Final OMB Memorandum should require CAIOs to consult with the Civil Rights Division and federal civil rights offices.

IV. Conclusion

Discrimination due to AI systems is prevalent across a variety of sectors and can cause significant harm to affected communities, the entities that use AI, and society as a whole. We appreciate the OMB Memorandum's provisions to strengthen civil rights protections against AI-related harms, but we urge OMB to tighten its guidance and build capacity for implementation in order for the Memorandum's promises to be fully realized.

Climate Response to EO on AI

Dear President Biden and Vice President Harris

The undersigned organizations are encouraged by the leadership of the Biden-Harris Administration for beginning to take steps to protect the public from harms associated with artificial intelligence (AI), but have many outstanding concerns. Like many technological advancements in the past, AI has the potential to improve health and educational outcomes and access to critical information, goods, and services. Yet, as the recent Executive Order (EO) acknowledges, AI also carries significant risks. As the last month's upheavals at OpenAI shows, the governance and decision making around AI is being developed and decided upon behind closed doors, with dangerously little transparency, or input from the public that will be impacted by it. The latest corporate moves seem to have expanded Silicon Valley's control of AI only to include more of Wall Street, continuing to leave civil society and those representing the public interest outside.

We were disappointed that AI's potential to worsen the climate change crisis, which President Biden himself referred to as "the number one issue facing humanity,[1]" was not addressed as a risk associated with the widespread use of AI in the EO. Our concerns about AI focus on its potential use to spread climate disinformation, and its vastly expanding energy use, both of which require basic transparency rules that are not included in the EO. Unfounded hype from Silicon Valley says that AI can save the planet sometime in the future but research shows the opposite is actually occurring right now.[2]

This week, leaders around the world, including Vice President Harris and Special Presidential Envoy for Climate John Kerry from the Biden-Harris administration, are preparing to attend COP28 to discuss critical carbon-emitting benchmarks necessary to preserve our planet. Without significant progress in carbon reduction, we risk an acceleration of climate disasters, including deadly floods, violent wildfires, famine, drought, and species extinction. Against this dire backdrop, we must carefully consider and mitigate the ways AI might intensify the climate crisis.

The creation and use of AI large language models (LLMs) heightens the risks associated with climate change on two fronts. First, AI LLMs can more quickly, cheaply, and covertly produce and distribute targeted climate disinformation which threatens to perpetuate climate denialism and slow efforts to fight climate change.[3] Second, due to their enormous energy requirements and the carbon footprint associated with their growth and proliferation, the widespread use of LLMs can increase carbon emissions.

Generative AI threatens to amplify the types of climate disinformation that have plagued the social media era and slowed efforts to fight climate change. Researchers have been able to easily bypass ChatGPT's safeguards to produce an article from the perspective of a climate change denier that argued global temperatures are actually decreasing.[4] Elsewhere, studies have documented extensive examples of the harms caused by climate disinformation on social

media in the U.S. that could be further worsened by the onset of AI, including: an overall rise in the amount of climate disinformation presented to users;[5] algorithmically enhanced lies that falsely blamed oil and gas infrastructure failures on wind power;[6] enhancing the monetization of climate disinformation by both social media companies (profit generated via ads) and by climate deniers who create content (via revenue-sharing);[7] false claims linking wind power and whale deaths;[8] and the disproportionate reach and impact of climate denial narratives during global climate negotiations.[9] LLMs are likely to make this problem worse, not only because social media content is used to train such models, but also due to the ease with which people and organizations across the globe can use LLMs to produce vast volumes of climate disinformation that is specifically tailored to mislead unique audiences.

Additionally, but no less important, is the staggering amount of energy and physical resources LLMs consume over their life-cycle. While exact figures are unknown due to the unwillingness of Big Tech companies to release their data to the public, we know that data centers account for as much as 1.5 percent of total global electricity use[10] and U.S. data center consumption is predicted to double by 2030.[11] Data center energy use already exceeds the commercial airline industry.[12] AI search queries could increase energy consumption by as much as five to twenty fold, according to estimates from industry.[13] Many claim AI will reduce energy consumption, citing as much as a 50 percent efficiency gain in data centers.[14] However this is within the context of vastly expanding per-search energy use, and vastly expanding data centers. Simply put, current estimates are that it could more than double energy use.

Given the explosion in use of generative AI—ChatGPT, for example, has grown from 100 million active monthly users to 100 million active weekly users in the year since it launched—it is imperative that we better understand the extent to which it is contributing to the climate crisis.[15]

The recent EO from the Biden-Harris Administration directs the Secretary of Energy, National Climate Advisor, and others to work in collaboration with the private sector and members of academia to support development of AI tools to mitigate climate change risks. We request that this same task force consider how to ensure the AI boom does not contribute to the climate change crisis.

We urge this task force to consider how to leverage the power of the federal government to:

- Require companies to publicly report on energy use and emissions produced by the full life cycle of AI models, including training, updating and search queries.
    - Google's researchers also called for this in a 2021 peer-reviewed paper saying "To help reduce the carbon footprint of ML [machine learning], we believe energy usage and CO_2e should be a key metric in evaluating models, and we are

collaborating with MLPerf developers to include energy usage during training and inference in this industry standard benchmark."[16]

- Study the effect AI systems can have on climate disinformation.
- Implement rigorous safeguards against the mass production of disinformation while preserving free expression and human rights.
- Require companies to provide an explanation to the general public of how generative AI models produce information, how their accuracy on climate change is measured, and the sources of evidence for factual claims they make.

Ryan_Nabil_NTUF_AI Governance (OMB-2023-0020)

December 5, 2023

Office of Management and Budget
Executive Office of the President
725 17th Street NW
Washington, DC 20503

Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Ryan Nabil
Director and Senior Fellow, Technology Policy
National Taxpayers Union Foundation
122 C St NW, Suite 700
Washington, DC 20001

On behalf of National Taxpayers Union Foundation (NTUF), I welcome the opportunity to submit the following written comments in response to the Office of Management and Budget (OMB)'s request for comments on the U.S. government's draft memorandum on advancing governance, innovation, and risk management for agency use of artificial intelligence (AI). [i] Located in Washington, DC, National Taxpayers Union is the oldest taxpayer advocacy organization in the United States. Its affiliated think-tank, NTUF, conducts evidence-based research on economic and technology policy issues of interest to taxpayers, including U.S. and international approaches to artificial intelligence, emerging technologies, and data protection.

NTUF appreciates the recognition by the Biden and Trump administrations of the need to create a well-balanced approach to AI governance that seeks to promote AI innovation while reducing potential AI risks and AI misuse by federal agencies. As the U.S. government seeks to develop the U.S. AI strategy further, it has an opportunity to craft well-designed AI policies that will contribute to America's position as a global center of responsible AI innovation. We believe that the U.S. government's guidelines for agency use of AI would benefit from the following recommendations:[ii]

1. The U.S. government should develop institutional mechanisms to support the implementation of U.S. AI strategy (Question 2). [iii]

2. The U.S. government should design risk assessment and coordinating mechanisms to continuously monitor and mitigate future AI risks. Non-sensitive, non-confidential information from such a framework should be made available to the public (Question 2 and Question 8).[iv]

3. U.S. federal agencies should consider developing artificial intelligence sandboxes to understand context-specific AI risks and promote AI innovation (Question 3).[v]

4. The U.S. government should consider strengthening closer bilateral cooperation and multilateral engagement in AI governance to develop responsible AI norms and rules in the United States and internationally (Question 2).

I. Developing Coordinating Mechanisms to Support the Implementation of the U.S. AI Strategy (Question 2)

The U.S. government should consider developing mechanisms to support the implementation of the U.S. AI framework and help ensure that AI principles and guidelines are applied uniformly across different sectors. While a principles-based, context-specific approach to AI would allow the United States to develop flexible and well-calibrated rules for AI in different sectors, this strategy comes with specific challenges that would need to be addressed in the U.S. AI framework.

A central challenge is that since individual regulators have the flexibility to issue guidelines and adjust rules based on broader AI principles, there is a risk that such guidelines are not applied uniformly across different sectors.[vi] Such differences will not only create market uncertainties but will also pose a particular challenge when certain AI applications come under the jurisdiction of multiple regulators. A hypothetical example would entail the regulation of an AI-enabled investment advisory product dealing with the personal data of users – which could be subject to the overlapping jurisdiction of the Federal Trade Commission, the Federal Deposit Insurance Corporation, the Consumer Financial Protection Bureau, and even state regulators.[vii] The U.S. AI frameworks should, therefore, design preemptive mechanisms to address the potential challenge of regulatory inconsistencies that could arise in a more flexible, decentralized AI governance approach.

The UK's proposed mechanisms for the implementation of its AI framework could provide a useful starting point for U.S. policymakers to think more analytically about such issues and design policies accordingly. The UK's AI White Paper proposes seven supporting mechanisms for the following objectives: i) monitoring the overall effectiveness of the AI framework; ii) supporting the coherent application of AI principles across the economy; iii) assessing and addressing cross-sectoral risks from AI applications; iv) providing support and guidance to businesses; v) improving business awareness and consumer awareness of trustworthy AI; vi) conducting horizontal scanning for emerging risks and regulatory trends; and vii) monitoring global regulatory developments.[viii]

While the precise mechanisms would need to be calibrated and adapted to U.S. policy objectives and regulatory architecture, these proposals point to important challenges that U.S. lawmakers should

consider while pursuing a more decentralized approach to AI regulation. The table below provides some potential mechanisms – based on the UK government's AI White Paper – that Congress and the Biden administration could consider while designing the U.S. AI framework (Table 1).

Table 1. Functions to Support the Implementation of a Potential U.S. AI Framework

Functions	**Potential Activities**
1) Monitoring, Assessment, and Feedback	i) Develop and maintain monitoring and evaluation mechanisms to assess the economic impacts of the U.S. AI framework across different sectors and for the entire economy. ii) Collect data and stakeholder input from regulators, the private sector, think tanks, and academic institutions to evaluate the U.S. AI framework's overall effectiveness. iii) Monitor the framework's effectiveness in maintaining a proportionate approach to AI. iv) Assess the effectiveness of regulatory coordination between different agencies in regulating AI.
2) Coherent Implementation of AI Principles	i) Develop guidelines to support regulators in implementing the U.S. AI framework. ii) Identify potential inconsistencies in the way that different regulators apply AI principles. iii) Create a platform for regulators to discuss and address regulatory inconsistencies. iv) Monitor the continued relevance of the AI principles established in the framework.
3) Cross-Sectoral Risk Assessment	i) Create a risk register of potential AI risks to evaluate different risks and support the development of the cross-sector risk assessment framework. ii) Monitor and review prioritized risks and identify emerging risks. iii) Provide a platform to clarify regulatory responsibilities, issue joint regulatory guidance, and share regulatory best practices.
4) Support for Innovators	i) Identify potential regulatory barriers to AI innovation in different sectors. ii) Assist regulators in creating and monitoring the effectiveness of AI sandboxes.
5) Education and Awareness	i) Provide informal guidance to businesses on navigating the U.S. AI regulatory landscape. ii) Advise start-ups and companies on identifying and applying to the appropriate sandbox. iii) Improve consumer awareness and public trust about how AI is regulated in the U.S. iv) Support the creation of innovation hubs, which are typically launched by regulators to provide start-ups and companies information about AI-related legal obligations, identify business opportunities, and invest in the U.S. AI ecosystem. Innovation hubs can also help start-ups identify and apply to the appropriate sectoral AI sandbox.
6) Horizontal Regulatory Scanning	i) Monitor emerging trends in U.S. and global AI governance, new technological developments, and emerging AI risks. ii) Work with actors from the private sector, universities, and think tanks to identify, prioritize, and mitigate emerging risks.
7) International Regulatory Frameworks	i) Monitor AI-related foreign legislation and global regulatory developments and evaluate potential implications for the U.S. regulatory approach and the broader AI ecosystem. ii) Provide recommendations on improving cross-border regulatory cooperation on AI. iii) Monitor alignment between the U.S. and international AI frameworks developed by multilateral organizations like the OECD and the Global Partnership on AI. iv) Evaluate U.S. compatibility with global AI standards and identify opportunities to harmonize standards and reduce barriers to trade and cross-border data flows.

	iv) Recommend policies to the U.S. regulatory approach based on the successes and failures of regulatory approaches in the EU, the UK, Japan, and other major jurisdictions.

Source: Author based on recommendations by the UK Department of Science and Technology and the Office for AI (2023).[ix]

II. Developing Risk Assessment and Coordinating Mechanisms to Monitor and Mitigate Future AI Risks Continuously (Question 2)

A major challenge in AI governance is to develop and implement a proportionate risk-management framework to identify, prioritize, and mitigate potential risks. The differences in how various jurisdictions seek to evaluate and mitigate such risks can provide insights into how U.S. lawmakers could develop an agile, multi-stakeholder framework to identify and mitigate future risks. At the risk of oversimplification, the EU's proposed AI Act classifies AI systems into four categories of risks i) "Minimal-risk" AI systems, which require AI developers to comply with a code of conduct; ii) "Limited-risk" AI systems that require providers to comply with certain transparency requirements; iii) "High-risk" AI systems that must undergo a more rigorous conformity assessment; and iv) AI systems with "unacceptable risks," which are banned across the EU (Table 2). The EU also provides lists of AI usage that would be classified as "limited" and "high risk." (Table 2). [x]

Table 2. Categories of AI Risks Under the European Union's Proposed AI Act

Category and Requirement	**Examples**	**Statutory Basis**
Unacceptable risk: Prohibited	Social scoring, facial recognition, dark-pattern AI, and manipulation	Art. 5
High risk: Conformity assessment	Education, employment, justice, immigration, and law	Art. 6 & ss.
Limited risk: Transparency	Chatbots, deep fakes, and emotional recognition	Art. 52
Minimal risk: Code of conduct	Spam filters and video games	Art. 69

Source: Lilian Edwards, Ada Lovelace Institute (2022)[xi]

While the European Union's risk-based approach sounds reasonable on a prima facie basis, it has two major problems. First, unlike the UK's context-specific approach, the EU's one-size-fits-all approach to risk assessment fails to distinguish adequately between risks associated with different AI applications within the same sector. For instance, whereas the EU's AI Act would treat all AI-enabled tasks related to the operation and management of critical infrastructure as "high risk,"[xii] the

UK's context-specific approach recognizes that, even within high-risk sectors like critical infrastructure, not all AI-enabled tools carry the same risks and should not be subject to uniform compliance and liability standards.[xiii]

Under the European Union's proposed AI Act, low-risk AI applications within sectors classified as "high-risk" –such as education, employment, and law – would be subject to much more restrictive regulations than would be the case under the UK's AI framework (Table 2). For example, since the EU considers the use of AI in education as high risk, AI-enabled language proficiency examinations by online platforms – which often provide a much cheaper and more accessible alternative to traditional language tests like the TOEFL and IELTS– would be subject to the same compliance standards as the use of AI in other high-risk areas like medical diagnostics and critical infrastructure.[xiv] Such a restrictive approach risks hampering innovation in online learning platforms, legal services, and other areas that the EU classifies as "high risk" under the AI Act.[xv]

Notwithstanding this restrictive approach, the AI Act's risk assessment framework might struggle to be flexible in addressing future risks. Although generative AI applications like ChatGPT have become widespread since the autumn of last year, the pace and scope of their rapid development would have been difficult to predict even five years ago. Likewise, despite the best efforts of lawmakers, regulators, and technologists alike, the business of making predictions about future AI risks remains a highly uncertain one. As such, it is difficult to accurately predict the AI landscape ten years from now and the unique set of risks and challenges such developments will pose. If the U.S. adopts a similar approach of classifying prespecified AI uses as "high risk" in statutes, it risks constraining innovation while remaining less flexible in identifying and mitigating future AI risks.

Compared to the EU's approach, the UK's proposed strategy of continuously monitoring AI risks and enabling public-private collaboration to identify emerging risks represents a more flexible approach to risk management. Instead of classifying a list of AI applications as high risk, the UK has proposed a principles-based risk assessment framework, which sectoral regulators will use to evaluate risks within their regulatory remit. Furthermore, the UK government has proposed the creation of "central risk functions" – separate from sectoral regulators – that would play a central role in monitoring the effectiveness of the AI framework, monitoring current and future AI risks, and providing advice to the government on which risks should be prioritized. With closer regulatory cooperation between the government, regulators, and the private sector, this approach is more likely to enable more robust monitoring of potential AI risks, as well as the introduction or calibration of appropriate statutory instruments to address future risks as they emerge.[xvi]

A comparable U.S. mechanism – involving Congress and the federal government, sectoral regulators, the private sector, and independent risk evaluators – could be designed to identify and respond to future AI risks (Table 3). As part of this arrangement, Congress and the federal government would establish the overall U.S. AI framework and clarify risk management guidelines for sectoral regulators based on the AI framework. In turn, the sectoral regulators would enforce

such guidelines within their regulatory remit, address prioritized AI risks, calibrate rules based on regulatory experience and stakeholder input, and recommend whether the U.S. AI framework should prioritize other emerging risks (Table 3). The central risk function – ideally comprising experts, officials, and private sector representatives independent of the sectoral regulators – would evaluate the effectiveness of this framework, identify emerging AI risks, advise Congress and the federal government whether an intervention is required to address such risks, and if so, which regulators are best suited to address such emerging risks (Table 3).[xvii]

Table 3. Designing a U.S. Central Risk Function Mechanism for Artificial Intelligence Risks

Stakeholder	Identification*	Enforcement	Monitoring*
Congress and the Federal Government	i) Creates the U.S. AI framework to identify AI risks; ii) Decides which risks to tolerate, regulate, and prioritize.	Delegates the enforcement of the AI Framework to sectoral regulators.	Updates the statutory framework to address new risks if identified.
Central Risk Function Mechanism	i) Identifies and prioritizes new AI risks; ii) Provides recommendations if the new risks require government intervention.	i) Recommends which regulator(s) should address those risks; ii) Create overall risk assessment frameworks; iii) Provides advice to regulators on technical aspects of regulation; iv) Shares AI regulatory best practices.	Monitors risks and reports them to Congress and the Executive.
Sectoral Regulators	i) Identifies and prioritizes sector-specific AI risks; ii) Evaluates whether newly identified risks should be prioritized and addressed.	i) Creates regulatory guidance for businesses based on the central risk function's risk assessment framework; ii) Updates regulatory guidelines and rules based on stakeholder feedback on how effectively they are working; iii) Enforces actions against companies for violations.	Reports on the effectiveness of addressing AI risks.
Businesses	Provides information to sectoral regulators and the central risk function, as necessary and appropriate.	Complies with regulatory guidance and rules and incorporates the risk assessment framework in internal practice.	Informs the relevant regulator(s) and the central risk function mechanism if risk mitigation measures fail to address the risks.

* The mechanisms highlighted in gray comprise a regulatory feedback loop between the federal government, sectoral regulators, the central risk function, and businesses subject to the AI framework to identify and mitigate emerging AI risks.

Source: Author based on DSTI and UK Office for AI (2023)[xviii]

While such proposals need to be more carefully evaluated and adjusted to suit the unique features of the U.S. regulatory architecture and policy objectives, they provide a useful starting point for thinking more strategically about ways to address future AI risks while maintaining a flexible regulatory approach. Furthermore, identifying and addressing potential AI risks and developing mechanisms to identify and address emerging risks would help improve public trust in AI.

III. Developing Artificial Intelligence Sandboxes to Understand Context-Specific AI Risks and Promote AI Innovation (Question 3)

The U.S. government should create sectoral AI sandboxes to maximize the benefit of a flexible, innovation-focused approach to AI regulation. Such programs would allow innovative companies to offer innovative AI products under close regulatory supervision for a limited period and receive regulatory waivers, expedited registration, and/or guidance for compliance with relevant laws. Meanwhile, regulators can gain a more in-depth understanding of how emerging AI technologies and business models interact with the existing sectoral rules. Based on such insights, policymakers can craft better rules that help promote AI innovation while minimizing potential risks.[xix]

Recognizing the innovation potential of AI sandboxes, the OECD recommends the creation of such programs at the national level.[xx] Following its recently concluded consultation, the UK government is currently evaluating different models of designing AI sandbox program(s).[xxi] Likewise, as outlined in the draft EU Act, the European Commission encourages the creation of national AI sandboxes in member states (Spain launched the first such sandbox last year).[xxii] However, such programs need to be designed appropriately to maximize their innovation potential, as pointed out in our recent letter to the White House and consultation response to the UK government.[xxiii]

More specifically, U.S. lawmakers should consider creating sector-specific sandboxes to promote AI innovation in specific sectors and update sectoral legal frameworks accordingly. Furthermore, while sandboxes should entail close regulatory supervision and appropriate consumer protection provisions, they must also provide regulatory relief and guidance to make such programs attractive to innovative businesses. Finally, making AI sandboxes open to non-U.S. companies could help attract innovative foreign businesses to the United States and promote AI innovation.[xxiv]

IV. Strengthened Bilateral Cooperation and Multilateral Engagement in Responsible AI (Question 2)

Beyond AI sandboxes, the United States should consider other mechanisms – such as joint declarations, Executive agreements, and joint research programs – to strengthen tech cooperation at the bilateral level. In this context, the Joint U.S.-UK Declaration on Cooperation in AI Research and Development in September 2020 and the Atlantic Declaration in June 2023 were steps in the right direction.[xxv] Likewise, the U.S.-EU Digital Trade and Technology Council represents another forum

through which the United States could pursue closer economic and technological cooperation with the EU and EU member states. Similar opportunities also exist for bilateral cooperation with Switzerland and Japan, which seek to adopt a flexible, light-touch approach to AI governance.[xxvi] Establishing research partnerships – similar to Canada and the UK's arrangements with Japan and the EU–could also help deepen U.S. technology cooperation with like-minded nations.

Ultimately, the U.S. government must look beyond bilateral relationships and strengthen its multilateral engagement in global AI governance. Although the United States is part of several multilateral fora and institutions that are active in AI governance – such as the OECD and the Global Partnership on AI – the U.S. appears to punch below its weight in shaping AI norms through these organizations. By participating more actively in such organizations–-as has been the case with Japan and the UK's multi-stakeholder, multilateralist approach to AI governance–-the U.S. government can more actively contribute to the development of international AI norms and technical standards.[xxvii]

The development of such norms could be particularly beneficial for emerging-market and developing countries, many of which lack a robust AI governance infrastructure and look to international institutions to develop best practices in responsible AI. Along with like-minded partners – such as the EU, the UK, and Japan – the United States could play a more critical role in establishing multilateral platforms for AI governance dialogues between the governments of industrialized and emerging-market countries. As officials and lawmakers in various jurisdictions seek to develop national AI strategies, the United States and partner countries can play a more significant role in advocating a principles-based, innovation-focused AI approach that promotes economic growth and innovation while mitigating current and future AI risks.

Washington, DC 20503

Re: Document No. 2023-24269: Visa's Response to the White House Office of Management and Budget's Request for Comment on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Ms. Martinez:

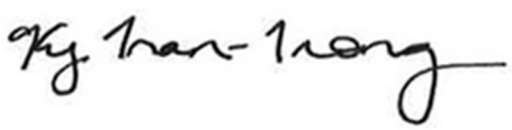
Visa appreciates the Office of Management and Budget's (OMB's) willingness to solicit multistakeholder input on its efforts to implement President Biden's Executive Order (EO) on the *Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence* through new artificial intelligence (AI) governance, innovation, and risk management initiatives. We welcome the opportunity to share our perspectives in response to OMB's Request for Comments (RFC) on the draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence*.

As a trusted network and world leader in digital payments, Visa is committed to uplifting everyone, everywhere by being the best way to pay and be paid. We work to safely and securely connect more people, businesses, banks, and governments to the global economy. AI technologies play a crucial role in helping us achieve our mission.

In this submission, we describe how AI enables and empowers Visa in combatting fraud and facilitating secure payments. We also provide insight on our approach to cross-functional responsible AI governance, offer recommendations on how policymakers can support trustworthy AI innovation, and respond to the second and third questions in the RFC.

As OMB continues working with federal agencies to carry out the directives in President Biden's EO, we would be happy to serve as a resource and share input on federal agencies' responsible AI governance, innovation, and risk mitigation initiatives.

Yours sincerely,



Ky Tran-Trong
Vice President, Global Regulatory Affairs
Visa Inc.

Visa's AI Outlook

Artificial intelligence (AI) technologies have the potential to empower individuals, enhance business operations, boost resource efficiency and economic competitiveness, and advance the pursuit of broader societal benefits. Responsible uses of AI technologies can efficiently and accurately extract valuable insights from large amounts of data, allowing organizations to keep up with the modern demands for data-driven analyses and actionable insights.

Building trust while innovating is at the core of everything we do. Accordingly, Visa is committed to enabling a secure, reliable, and convenient payment experience for all participants in the payment ecosystem. Maintaining trust and adhering to existing laws will be key to harnessing AI capabilities across the private and public sectors. We are optimistic about opportunities for AI technologies to drive economic growth and enable positive social change, and we believe that the right legislative and regulatory safeguards can help us mitigate AI's sociotechnical risks and untap AI's manifold benefits.

How Visa uses AI

Visa has used AI technologies for more than 30 years. We first deployed AI-based technology for risk and fraud management in 1993, pioneering the use of AI models in payments.

Today, we are increasingly harnessing the power of data and data-driven technologies, including AI and machine learning (ML) systems, for a wide variety of purposes across our business, including security, network reliability, product and service delivery, fraud detection, and operational resilience. With models supporting each purpose, AI and ML capabilities at Visa have helped overcome longstanding challenges and pain points for buyers, sellers, and financial institutions in the payments ecosystem.

For example, AI and ML power several of Visa's fraud and risk management services and capabilities, including:

- Visa's Advanced Authorization (VAA) combines Visa's proprietary online authorization model with offline neural network-based ML to evaluate fraud risk in real-time, helping to mitigate potential fraud risk before transactions go through. These efforts have been effective, resulting in the prevention of approximately $27 billion in fraud globally in 2022 alone.

- Visa's Smarter Stand-in Processing (Smarter STIP) uses AI to enable transaction authorization if clients' systems are down, thereby enhancing operational resilience across the network. Smarter STIP uses deep learning methods to help financial institutions increase transaction authorizations during outages caused by natural disasters or other issues.

- Visa Consumer Authentication Services (VCAS) is an Issuer service for frictionless, data-driven authentication of e-commerce transactions. A total of 95% of transactions can be authenticated in the background, without the need for the consumer to take additional steps, creating a smooth customer experience while reducing fraud and false declines.

In the past year, we have seen the transformative potential of AI technologies, and especially generative AI technologies, as they have evolved into accessible tools and systems that businesses and individuals can leverage for various purposes. As a pioneer in AI-enabled services that powerfully combat fraud, Visa is optimistic about the continued potential of AI-for-good with the right oversight.

In the financial services industry, the National Institute of Standards and Technology (NIST) AI Risk Management Framework (RMF) continues to serve as the gold standard model for AI governance. Visa submitted comments to NIST and participated in NIST's workshops, conveying the importance of flexibly guiding organizations' efforts to effectively map, measure, manage, and govern risks, rather than taking a prescriptive, one-size-fits-all approach. As federal agencies consider how best to conduct oversight of AI use cases within their purview, we believe that allowing private-sector organizations the flexibility to customize their AI governance programs according to their individual profiles will continue to be important.

AI Policy Recommendations

Visa supports efforts to develop use-case-specific, outcomes-focused AI standards, risk management frameworks, and regulations that tailor restrictions, requirements, and incentives to potential risks and benefits. Engaging with diverse stakeholders can help policymakers understand and address the full scope of the sociotechnical risks and benefits that AI technologies can produce. Adopting a flexible, outcomes-based approach can also help regulatory frameworks remain relevant as technologies evolve and facilitate both effective risk mitigation and sustainable and scalable innovation.

Furthermore, to support responsible AI innovation, we believe that any new AI governance regulations and frameworks should aim to complement and close gaps in existing laws, rather than create conflicting or duplicative requirements. Outside of legal requirements, industry-led standards, voluntary risk management frameworks, and best practices can encourage multistakeholder collaboration on implementing AI safeguards that are suitable to the organization's sector, resources, and operational capabilities.

Federal policymakers should aim to ensure that U.S. AI regulatory frameworks are interoperable with international frameworks. Supporting interoperability helps U.S. businesses succeed in the global marketplace, given that international cooperation on AI standards and policies will promote global collaboration, consumer trust, and robust compliance.

To that end, we encourage governments and regulators to consider the following policy recommendations:

- New AI laws and regulations should not conflict with existing laws. Before creating any new regulations, policymakers should explore which existing laws could be updated or modified to address AI use cases. We recommend that governments review existing legal frameworks to assess how to apply them to AI governance, with the understanding that laws around employment, lending, and data protection already offer robust protections that may be applicable to the use of emerging technologies. It is important that any new regulations on AI are adaptable and technology-neutral. Any new regulations should also continue to foster responsible innovation, allowing beneficial AI use cases (such as fraud prevention and cybersecurity) to grow with guardrails commensurate to the level of risk involved.

- AI policies should be underpinned by a focus on consistent "good" outcomes, such as accountability, bias mitigation, and sustainable innovation. Applying these outcomes as the

benchmark for AI governance across sectors creates certainty while providing flexibility on how to accomplish the desired outcomes.

- Governments should coordinate on AI governance frameworks in order to avoid regulatory fragmentation. The United States, European Union, Singapore, and numerous other countries have already responded to the calls from civil society to develop AI governance frameworks. As policymakers around the world continue to refine their approaches to AI governance, governments should work together to avoid regulatory fragmentation and empower the private sector to collaborate on beneficial uses of AI technologies, including combatting fraud.

- AI policies should support responsible innovation and be adaptable to changing technologies. The AI space is moving rapidly, and policymakers should avoid technology-specific or prescriptive guidance that could quickly become outpaced by new innovations. Policy frameworks and/or guidance that assess the outcomes of AI use cases should ensure proper risk management, accountability, and responsible use of AI technologies while allowing organizations to operate flexibly and efficiently. This can enable organizations to keep pace with evolving technology and industry best practices. Such an outcomes- and principles-based approach can also address existing challenges effectively without producing a chilling effect on the overall advancement of AI innovation and the benefits it can deliver.

Closing

Visa recognizes the transformative potential of AI technologies. To maintain the trust we have earned from consumers and clients around the world, we are committed to trustworthy and responsible innovation. As an industry leader that continues to see the power of responsibly using AI technologies to combat fraud and build resilience across the payments ecosystem, Visa is committed to working with policymakers and other stakeholders to develop responsible, interoperable AI governance frameworks. Below, we provide our perspectives on selected questions from the RFC.

Response to Selected RFC Questions

Question 2: What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

To facilitate a coordinated approach to AI governance that mitigates risks while maximizing benefits, federal agencies should work to ensure they leverage existing sectoral laws and voluntary, industry-led risk management processes wherever possible.

Civil rights, data privacy and protection, consumer protection, competition, product liability, intellectual property, copyright, and numerous other areas of law already establish restrictions and requirements for AI developers and deployers. Furthermore, payments companies like Visa and other entities in the financial sector already operate within a highly complex framework of national and supranational sectoral laws and regulations that can help govern financial-sector AI use cases. To comply with these existing laws, agencies and the entities they regulate likely have already developed risk management and governance practices that they can use as a foundation for and/or component of AI governance programs.

To help determine whether gaps exist in current regulatory regimes, each agency should comprehensively assess how its existing authority and regulations can help facilitate AI governance. In many cases, and especially in the financial sector and other highly regulated industries, agencies may be able to effectively mitigate risks by simply clarifying or adapting the ways in which existing regulations apply to AI design, development, deployment, and oversight.

Assessing how existing laws and regulations can support trustworthy development, deployment, use, and oversight of AI technologies can help agencies avoid creating AI governance regimes that conflict with or duplicate regimes for data privacy, cybersecurity, other technologies, and other functions. This assessment can also help identify and deconflict areas in which more than one agency may have regulatory authority and facilitate inter-agency collaboration on cross-cutting AI governance priorities. By empowering businesses investing and innovating in the United States to mitigate risks without contending with undue regulatory burdens, efforts to deconflict, de-duplicate, and coordinate AI governance activities across agencies can bolster U.S. leadership in responsible AI innovation. These efforts can also promote efficient use of government resources.

Industry-led and developed standards and voluntary risk management frameworks can help federal agencies and private-sector entities establish a common set of terms and practices. In doing so, using these resources can enable interoperability and more effective collaboration across federal agencies, across private- and public-sector entities operating within the same economic sector, and across economic sectors both within the United States and internationally.

Question 3: How can OMB best advance responsible AI innovation?

OMB can best advance responsible AI innovation by continuing to help agencies develop a coordinated, outcomes-focused approach to AI governance that reflects multistakeholder perspectives. This approach

should build on existing regulations and address the potential risks and benefits that AI use cases can produce. U.S. AI governance regulations should also be interoperable with AI governance regulations in other jurisdictions around the world.

Public trust is essential to driving AI adoption and innovation. Consulting with industry and other stakeholders while developing AI governance frameworks can help ensure those frameworks reflect multiple stakeholders' priorities and conceptions of risk. Consequently, multistakeholder collaboration can help ensure AI governance frameworks build trust across numerous communities. OMB can help coordinate agencies' engagements with diverse stakeholder groups and disseminate relevant information from these engagements across federal agencies.

To promote responsible AI innovation now and in the future, AI governance frameworks also will need to be both robust and flexible, leveraging and complementing existing laws and industry-led standards. Outcomes-focused AI regulatory frameworks that establish baseline obligations, as opposed to specific, process-oriented requirements, can avoid creating conflicting or duplicative obligations and help AI governance regimes remain relevant over time. Leveraging international standards and best practices that are easier to update more frequently can help AI developers and deployers figure out how to achieve beneficial outcomes with appropriate guardrails.

We recommended above that each agency should comprehensively assess how its existing authorities, oversight activities, and procurement policies can support responsible AI governance. In our view, OMB has an important role to play in facilitating this process. For example, OMB could work with agencies to clarify and update existing regulations and help identify where tools like the NIST AI RMF can help promote responsible AI governance in line with existing regulatory requirements and goals. This exercise can also help agencies determine whether any gaps exist in existing regulatory frameworks that merit promulgating new regulations. Additionally, OMB could direct federal agencies to use their procurement policies and research partnership opportunities to incentivize AI developers and deployers to adopt standards, risk management frameworks, codes of conduct, and other best practices.

To enable U.S. AI researchers to collaborate with colleagues around the world and position U.S. companies to compete effectively in international markets, the U.S. government should work with governments around the world to promote global AI regulatory interoperability. A lack of regulatory interoperability can confuse and frustrate consumers and create undue compliance burdens that hinder growth, especially for small and medium-sized businesses. Furthermore, we believe that data governance underpins responsible AI and that promoting interoperability in data privacy frameworks will be important to achieving effective AI governance. By helping to avoid domestic AI regulatory fragmentation and to align the activities of agencies responsible for domestic and foreign policy, OMB can support global regulatory interoperability.

PUBLIC SUBMISSION

As of: March 22, 2024
Tracking No. lps-vtii-yqs8
Comments Due: December 05, 2023

Docket: OMB-2023-0020
Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Comment On: OMB-2023-0020-0001
Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Document: OMB-2023-0020-0125
Comment on OMB-2023-0020-0001

Submitter Information

Organization: Palantir Technologies Inc.

General Comment

On behalf of Palantir Technologies Inc. (“Palantir”), we respectfully offer these comments to the Office of Management and Budget (OMB) regarding the “Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum” (Docket OMB-2023-0020). Palantir welcomes these efforts to responsibly advance AI innovation in government and ensure AI safety, security and trustworthiness. In the attached document, we provide our perspective on questions raised in the RFC and look forward to future opportunities to contribute constructively to this important policy discussion.

Palantir Response to OMB RFI

RE: Response to the Office of Management and Budget on "Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum" (OMB-2023-0020)

To Whom It May Concern:

Palantir Technologies Inc. ("Palantir") is a US-based software company that builds platforms to enable public, private, and non-governmental organizations to integrate, analyze, and collaborate on their data in a secure and privacy-protective way. We are proud to make software that enables the institutions that serve our societies to use their data responsibly and effectively. Palantir was founded in 2003 on the conviction that it is essential to preserve fundamental principles of privacy and civil liberties while using data. It is for this reason that Palantir established one of the world's first Privacy & Civil Liberties Engineering ("PCL") teams more than a decade ago, specifically to focus on the development of privacy-protective technologies and to foster a culture of responsibility around their development and use.

Our response to this Request for Comments ("RFC") is based on insights gathered over 20 years of experience building technology to uphold and enforce ethical and accountable practices in the use of our software products, including Artificial Intelligence ("AI") enablement tools and platforms. Palantir has contributed extensively to the conversation on the rise and appropriate use of AI technology through multiple public forums and responses to other RFCs to the Federal Trade Commission, National Telecommunication and Information Administration, and Office of Science and Technology Policy. In addition to these responses, we have also contributed oral and written responses to the United Kingdom's House of Lords in their Inquiry on AI in Weapon Systems, as well as the U.S. Senate Committee on Armed Services Subcommittee on Cybersecurity.

We are grateful to the OMB for the opportunity to contribute to this important policy discussion. We welcome any request for clarification and look forward to the final memorandum on these critical issues.

Sincerely,

Courtney Bowman, Global Director of Privacy and Civil Liberties Engineering
Arnav Jagasia, Privacy and Civil Liberties Engineering Lead

Responses to Questions

Question 1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

We believe that the decision to require each agency to designate a Chief Artificial Intelligence Officer (CAIO) is a constructive step to ensure the adoption of responsible AI across the Federal government in a manner that contributes to trustworthiness and accountability. Creating appropriately empowered CAIO positions within each existing agency — as opposed to positions with extra-agency authorities — as well as requiring that each CAIO "work in close coordination with existing responsible officials and organizations within their agencies,"[1] offers the best pathway to foster broader alignment with existing agency infrastructure, governance, and institutional mandates.

Based on our years of experience working alongside officials in similar technology positions across the Federal government, we can provide a set of recommendations on how to ensure CAIOs are empowered and effective in their proposed role. While each agency has diverse objectives, structures, and projects, we highlight the following generalized lessons to be considered across the breadth of covered agencies in establishing strong CAIOs:

1. It is of critical importance to imbue the CAIO position with sufficient seniority and operational authority to ensure that functional responsibilities are continually emphasized and that the role is not at risk of devolving into a ceremonial position. To ensure that new CAIOs are both sufficiently empowered and are working on mission-critical projects, it is essential that CAIOs are responsible to and report to the most senior agency officials (e.g. Secretary or Deputy Secretary level), as opposed to merely being accountable to institutional requirements. Wherever the reporting lines are situated, CAIOs should be well placed to substantively inform both technology acquisition and development efforts.

2. For senior technology officer positions more generally, we have noticed that the long-term effectiveness of individuals in these roles is often shaped by the nature and framing of their initial goals. Officers who enter their roles focused exclusively on general, high-level policy objectives are less likely to develop a firm understanding of the operational realities of their agencies' field workers and will therefore be at a substantial deficit in terms of interpersonal credibility and understanding of the specific demands of effective technology tools necessary to drive organizational change. However, those who begin their tenure by managing a very specific project and outcome are more likely able to build vertical trust with individuals across echelons, learn agency-specific knowledge on how to drive explicit outcomes, and gain credibility through tangible early wins. Following this forward-deployed field work, officers can then tackle broader agency objectives with greater authority and operational skill.

[1] See Section 1, "Strengthening AI Governance" of the draft memorandum.

3. While the CAIO will be responsible for ethical AI acquisition, development, and deployment, it is important that the CAIO works hand-in-hand with existing officials and officers who share adjacent and overlapping responsibilities with regards to ensuring programmatic and technological standards for ethics and accountability. For example, Privacy and Civil Liberties Officers will have considerable prior experience understanding the ways that agency programs and technology adoption impact fundamental rights considerations, as well as how institutional and systems capabilities may be implemented to mitigate attendant risks and vulnerabilities. CAIOs (and their counterparts) will greatly benefit from building strong working relationships with these and other officers to execute on their overlapping mission sets. This complementary benefit arises because AI is not a standalone technology, nor can the evaluation of responsible AI systems be isolated from the context of its use. As such, CAIOs will be most effective when their responsibilities are carried out in close coordination and consultation with other officers who carry complementary portfolios.

4. Just as CAIOs can benefit from the flexibility to dive deep into within-agency projects, CAIOs can also collectively benefit from the ability to reflect on the challenges of their agency-specific use cases and subsequently share lessons learned *across* agencies. Creating a forum for CAIOs to hold regular inter-agency meetings can thus be an important mechanism for information sharing, mission accountability, and even cross-agency AI collaboration. Furthermore, while the primary goal of such forums need not be directed at establishing generalized regulatory standards, they may nevertheless help to foster better cross-agency alignment on, and a more consistent outcome for, OMB's desired outcomes across the Federal government.

Question 2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Because AI represents a general class of technologies whose benefits and risks are both tied to their contexts of application and intimately interwoven with other concerns and areas of governance consideration, we advocate against forming novel AI Governance Bodies, and instead focus on bolstering existing agency bodies with the mandate, expertise, and access required to address the implications of AI use by agencies. It is more prudent and advisable to direct efforts towards updating the scope of existing governance entities to include AI governance, as opposed to establishing a whole new body to perform AI governance.

Question 3. How can OMB best advance responsible AI innovation?

Over the last 20 years of building technology for clients across domains and jurisdictions — in both the commercial and government sectors — we offer the following recommendations on how to advance AI innovation responsibly:

- **Expand "field-to-learn" programs in AI:** We observe that the most successful government AI programs tend to succeed in large part because they employ a "field-to-

learn" or "test-fix-test" approach. Such approaches encourage rapid experimentation and iteration by allowing end-users and operators to use AI in the context relevant to their missions. In this manner, AI solutions are tested and improved through direct iteration with operators in the field. This strategy enables both technical innovation *and* ethical boundary-setting by better exposing technologists, ethicists, policy-makers, and end-users to the specific challenges of AI deployment and use, as opposed to more theoretical proposals that are disconnected from the operational setting. By encouraging agencies to adopt these kinds of programs, OMB can advance responsible and iterative AI innovation.[2]

- **Emphasize building a trustworthy data foundation:** All uses of AI will require a core data foundation to train, tune, and test AI models, as well as a software platform to safely deploy these models into production environments. Given the importance of building a strong data foundation for AI program success, OMB should encourage innovation not only in AI models and workflows, but also in core data management and data quality technologies. A trustworthy data foundation is critical for maintaining high quality data, improving information security posture, and governing appropriate use of data, among other similar processes that are necessary pre-requisites for building and using AI in operational settings. Our recommendation to emphasize the importance of building a trustworthy data foundation goes hand-in-hand with OMB's recommendations for removing barriers for responsible use of AI in Section 4(b) of the draft memorandum.

- **Encourage collaboration with multi-disciplinary stakeholders:** AI innovation should not be driven solely by data scientists and machine learning engineers. Rather, AI innovation will be most effective – and more responsible – if OMB encourages agencies to identify a multi-disciplinary set of stakeholders who can shape their strategy and approach. Building on the types of stakeholders outlined in Section 4(b)(iv)'s recommendation about the workforce, we believe relevant stakeholders for AI development, deployment, and use should include government, private sector, academic, non-profit, and civil society actors. In particular, to help identify and resolve multi-disciplinary challenges, we can encourage that stakeholder expansion include the domains of software engineering, data science, systems engineering, product design, social sciences, humanities, and technology ethics, among others.

Much of these recommendations for advancing responsible AI innovation fall within the current minimum practices outlined in Section 5(c) of the draft memorandum, as well as our recommendations for minimum practices in our responses to Questions 5 and 6 below.

Question 4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

When properly and responsibly deployed, generative AI can carry substantial promise for improving the speed and effectiveness of U.S. Government workflows. In our response below,

[2] For more on Palantir's perspective on "field-to-learn" approaches to AI development, see Palantir CTO Shyam Sankar's testimony to the US Senate Armed Services Subcommittee on Cybersecurity, and Palantir Global Director of Privacy and Civil Liberties Engineering Courtney Bowman's appearance before the UK House of Lords.

we will focus explicitly on the responsible use of Large Language Models (LLMs) to advance agency missions and business operations. For example, LLMs can lower the barrier to entry for government personnel using advanced software by allowing users to conduct analysis and give computational commands through natural language (i.e., not code). LLMs can also assist government developers in building new applications and workflows to enable faster iteration and capability development, as well as empower analysts with improved search functionality and information management. From the perspective of citizens as public services consumers, LLMs can also improve the ease with which citizens can query, solicit, and engage with government agencies.

The integration of LLMs into government workflows also carry their own unique risks and challenges. The outputs of LLMs can be complex (e.g., a paragraph-long summary of a longer document), making it difficult or impossible to define exactly what a correct answer looks like, especially when "correctness" can be a matter of opinion, interpretation, or sheer aesthetics. Perhaps most concerning, LLM responses can seem authoritative and persuasive, while still being incorrect and ungrounded in reality. And even when solving traditional supervised learning problems with LLMs, it may be exceedingly difficult to assess precisely where and how outputs deviate from reality if model developers do not start with existing manually curated training data or labels.

Fortunately, while LLM-powered workflows carry notable risks, there are responsible and effective ways to pin-point productive use cases that carry an acceptable balance of operational risk and benefit. Furthermore, there are rigorous methods to determine if and how such risks can be sufficiently mitigated for the operations at hand. More specifically, we believe that agencies can employ thorough and thoughtful Testing & Evaluation (T&E) programming to improve their ability to: (a) Identify in which contexts LLMs can make the most impact, at an appropriate level of risk, for agency personnel; and (b) Ensure that specific LLM-powered workflows are meeting the requisite benchmarks for operational efficacy, safety, security, and ethics. Such an approach combines human-centric system design and risk assessment methodologies, alongside more standard AI T&E and Operational Testing to ensure that deployed systems function accurately, robustly, and safely.

In general, it is neither desirable, nor possible, to evaluate the risks and benefits of LLM-powered workflows in abstraction. This is because the risks and benefits of LLM-powered workflows — and subsequently, decisions on the conditions under which they may be sufficiently ethical, safe, and effective to employ in real-world scenarios — are highly dependent on the context of their use and the workflows in which they are embedded. Still, we can provide some general guidance for identifying the most promising LLM-powered workflows archetypes.

Promising Use Case Archetypes

- **Semantic Search**: Semantic search uses mathematical representations of natural language learned by the LLM during its training to build a search function that reflects a more nuanced understanding of natural language queries, beyond keywords and synonyms. As a system, it is best used to augment more traditional information retrieval methods.

- **Information Extraction**: LLMs can be leveraged to extract structured knowledge from free text. For example, an LLM can be used to extract named entities or even full knowledge graphs from intel reports, as well as more nuanced extractions such as timelines for events alongside summaries of the most relevant information (e.g., converting a full medical record, including doctor notes into a series of diagnosis, treatments, and results).

- **Document Q&A**: LLMs can assist with understanding documents through a Q&A interface. Typically, this is done by adding software or AI layers on top of semantic search to summarize results for the questioner. Although there are instances of LLMs being used as a knowledge store directly, we believe this should never be the case since LLM knowledge stores are particularly and demonstrably prone to "hallucinations" (i.e., when a neural network inserts incorrect, non-factual information into a generated output, or when it produces an output that does not follow the prompt instructions). Hallucinations of this sort are dangerous both because they may appear to be presented in a confident and convincing form, and also because the underlying semantic error may be difficult (even impossible) to systematically debug. Even when extending more basic semantic search workflows, special care should be taken with use case selection, risk assessment, and workflow design in anticipation of model hallucination issues. While the risk of hallucinations makes this LLM-powered workflow too risky for many situations, it can nevertheless be a useful accelerant in lower-risk situations (e.g., allowing users to learn about an API where backing documentation provides a fail-stop way to answer questions).

- **Content Generation**: LLMs or other generative models (e.g., image, audio, multi-modal, etc.) can be utilized to produce creative content. For example, LLMs can be deployed as writing assistants and content strategists to create preliminary drafts of marketing copy and logo design. Depending on the risk profile of the application, drafts will often (or even always) require human review and refinement before extending to production environments to ensure novel content does not reflect problematic confabulations.

- **Hypothesis Generation**: Sometimes cast as "reasoning" capabilities, LLMs can use approximate retrieval and generation capabilities to generate hypotheses and suggested answers to proposed problems. This approach may also be combined with semantic search and document Q&A type workflows. For example, an LLM could be used to propose potential course-of-action (COA) suggestions to military personnel or diagnostic advice to a physician, based on the query, data, and input provided. We intentionally are not referring to this capability as "reasoning," however, because it is critical to acknowledge the fundamental limitations of such a use case, and accordingly construct any such related workflow to include *requisite verification* — through other tools or human review — of proposed answers. This use case is better considered as more of a way to "brainstorm ideas," rather than as an authoritative source of strategic advice, reasoning, or optimized solution.

- **Tool Routing**: One can use an LLM to process requests — from a human in the form of natural language — to engage with or run a specific tool. This may also include engagement with sub-components of tool selection, extraction of data for the tool, formatting data for the tool, and presenting results from the tool. Tool routing can be used to lower the barrier to entry for tool usage since end-users do not need to understand the technical details on how to find and run the tool. At the enterprise level, tool routing can enable dynamic use of information infrastructures, as well as the combining of disparate systems to create a seamless experience for the end-user.

- **Agents**: Similar to tool routing, an LLM "agent" takes machine-driven input and based on this input, can be tasked with taking an automated action. However, since full agent autonomy is rarely advisable and especially in highly consequential settings, can be explicitly prohibited or circumscribed by law or policy, hybrid situations with human oversight should be considered the most standard and defensible agent deployment use cases. A typical example here is where you have a state space model of some workflow and agents are used to manage transitions between states. Guardrails, a strong security model, and active monitoring are key design principles to constrain agent actions allowing for safe operations.

While the above use cases serve as potential archetypes for successful LLM-powered workflows, we can also highlight several common mistakes that lead to unsuccessful and/or irresponsible LLM use cases — especially when the appropriate T&E processes are not completed before real-world use.

- **Overestimating LLM Capabilities:** A primary mistake that is often made in pursuing LLM applications is the overestimation of a given LLM's capabilities. LLMs produce results that are often anthropomorphically tuned to appear to carry the voice of understanding, reasoning, and authority of human actors, when in fact the actual internal mechanics – statistics, algorithmic processes, and encoded software functions – reflect none of the actual defining characteristics of real human agents. T&E processes can help us understand the strengths, and most importantly, the weaknesses and limits of given models — the success of any use case is reliant upon an understanding and accounting of what a given LLM is (not) capable of doing.

- **Treating Models as Factual Oracles:** The process of training an LLM — which combines learning both language syntax and content from training data — can lead to content being imperfectly recalled at inference time (so called "hallucinations"). As an imperfect database, one cannot – with any reasonable degree of fidelity or reliability – apply an LLM expecting it to consistently "know" and reveal factual information. Absent other design guardrails that explicitly inhibit models from producing authoritative-sounding pronouncements, LLMs are prone to misleading the end-user by presenting factually unmoored strings of text as seemingly coherent statements.

- **Premature Automation:** A related concept to overestimating LLM capabilities involves misguided attempts to prematurely automate a process that is not sufficiently developed

or conditioned for automation. For example, consider trying to build a no-code application for executives to answer questions about their business and make decisions based on their findings. Behind the scenes, a fully-automated approach to this solution might rely entirely on an LLM to translate the executive's requests into database queries and calls to external systems to take AI-generated actions. While the use of an LLM for tool routing is appropriate in certain well-understood and -constrained contexts, completely automating this workflow might lead to risky outcomes. For example, the executive may not have the requisite technical skill to evaluate the generated database queries, both in terms of syntax and how it actually corresponds to the business question. Moreover, the AI-generated actions against external systems may not be what the executive intended. Instead, those actions could be suggested and queued for review, and then executed only once approved by a domain expert. As such, it would be irresponsible to automate the entire end-to-end workflow. Instead, intermediate workflow accelerators (e.g., tool-routing, suggested action recommendation, etc.) should be considered as more plausibly reliable applications.

Question 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

We commend OMB for identifying critical applications of AI that should require closer consideration, especially those that might harm the safety or rights of individuals. It is possible, however, that drawing a distinction between rights-impacting and safety-impacting categories of AI applications may detract from a shared level of scrutiny and common mitigation these categories of use cases both require. As such, we propose that OMB consider a single category of "high-risk" applications of AI that encompasses use cases of AI that may cause harm to individuals. A combined "high-risk" assessment framework is advisable for the following reasons:

- **Simplifying the identification of high-risk use cases:** Creating one set of minimum practices for AI applications that impact safety or rights – or both – will simplify the identification of high-risk use cases. In the current framework, agencies may weigh whether safety-impacting AI also impacts rights in order to determine what minimum practices are relevant. The task of distinguishing between two related categories — with different assigned minimum practices — may detract from the primary objective of identifying AI applications that cause serious harm and thus deserve extra scrutiny. Unifying the categories for minimum practices will offer an easier, single threshold question to determine whether the minimum practices are relevant.

- **Reducing administrative complexity:** Currently, Section 5(c)(iv) outlines minimum principles that apply to both safety-impacting and rights-impacting AI, and Section 5(c)(v) outlines minimum practices that apply to *just* rights-impacting AI. As such, the draft as written will require agencies to keep track of two different categories of high-risk AI and two different sets of minimum best practices. This increased complexity translates to increased administrative overhead, as well as increases the likelihood for administrative and compliance error. By combining safety-impacting and rights-impacting assessments of AI — and subjecting both to the most stringent minimum practice standards — OMB can both streamline the application and accountability for

minimum practices, while bringing higher standards for responsible AI practice to more use high-risk uses cases.

- **Improving rights-protective outcomes:** Applying all minimum practices in 5(c)(iv) *and* 5(c)(v) to both safety-impacting and rights-impacting uses of AI would improve rights-protective outcomes for uses of AI that may indirectly harm individuals' rights. Moreover, the minimum practices in 5(c)(v) are helpful even for purely safety-impacting uses of AI. For example, if an agency is developing an AI tool for emergency services, which is safety-impacting per Section 5(b)(i)(A), it could also be important to notify negatively impacted individuals of adverse AI impact — a requirement that is currently only a minimum practice for rights-impacting AI as specified in Section 5(c)(v)(D). Applying the minimum practices for rights-impacting AI to all high-risk applications of AI extends these considerations of accountability and equity more broadly and can more consistently ensure that AI is used responsibly.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum practices identified for safety-impacting and rights-impacting AI comprise a helpful baseline for encouraging and enforcing the responsible adoption and use of AI by government agencies. Below we highlight several particularly helpful aspects of these minimum practices that we hope will remain in subsequent versions of OMB guidance, as well as suggested improvements to the minimum best practices.

Strengths of the current minimum practices

- **Concrete Suggestions:** In promoting Responsible AI, many organizations and agencies have produced Responsible AI "principles" that describe matters at a high-level, but often abstract away from specific values and benchmarks for responsible AI use.[3] Such value-oriented principles are helpful guidance for directing AI strategy, but they often remain too abstract for immediate adoption and implementation. As such, it is helpful that the minimum practices described in the draft memorandum present concrete, tactical suggestions that domain experts, practitioners, and engineers can implement and measure.

- **Operational Focus:** Based on our experience developing and deploying AI/ML technology, we know first-hand the importance of an "operational" focus on Responsible AI.[4] It is crucial to emphasize the operational context in which AI is used, as well as practical considerations of AI deployment such as release management, version control, and manual fallbacks, among similar tools that may not be as relevant in an academic or

[3] For examples of such value-oriented RAI principles, see those included in the Department of Defense's Responsible AI principles or the Blueprint for an AI Bill of Rights.
[4] See Response to Question 3 ("Expand 'field-to-learn' programs in AI") as well as Palantir blog post *The Efficacy and Ethics of AI Must Move Beyond the Performative to the Operational*.

research context. The focus of the minimum practices on "Operational AI," with requirements for testing in real-world contexts[5] or ensuring that there is a "human in the loop"[6], will help emphasize the considerations required for deploying AI in mission-critical, production environments.

- **Rights-Protective Approach:** Palantir has long-held that AI is both most effective and responsible when employed to assist and enhance human interests, actions, and decision-making, rather than replacing them.[7] The focus on rights-impacting AI and the minimum practices suggested are a crucial step toward advancing this shared viewpoint that AI — across all agencies and use cases — should be leveraged foremost for rights-protective outcomes. In line with our response to Question 5, we advocate that OMB propose a common set of minimum practices for all safety *or* rights impacting uses of AI. This will encourage agencies to consider rights impacts more broadly, whenever AI is used for consequential decision-making or other human-directed outcomes.

Suggested improvements to the current minimum practices

Over the past two decades of experience building technology to uphold and enforce ethical and accountable practices in the use of our software products, Palantir has built tools and helped our customers implement several workflows similar to the minimum practices outlined in the draft memorandum. Based on this experience implementing the practices of Responsible AI in our software platforms, we propose a few recommendations to bolster the minimum practices:

- **Clarify the AI Impact Assessment minimum practices.** Section 5(c)(iv)(A) outlines a minimum practice for AI Impact Assessments ("AIA"). We strongly advocate for the thorough examination of how AI is used to solve operational problems, especially for those that impact safety and human rights. For agencies to carry out these impact assessments efficiently and with the desired results, we recommend clarifying a few aspects of this requirement.

  First, when should the AIA be performed and what data is required to perform it? The memorandum requires agencies complete an AIA that documents "the intended purpose for the AI and its expected benefit, supported by specific metrics or qualitative analysis." Defining the scope of the modeling problem at the outset is crucial, but it would be beneficial to also clarify what kinds of metrics are required at this early stage. Most quantitative metrics for evaluating AI come from rigorous testing, which is only possible to carry out after the modeling problem is defined and models are developed or procured.

[5] See the "Test the AI for performance in a real-world context" minimum practice in section 5(c)(iv)(B) of the draft memorandum.
[6] See the "Provide appropriate human consideration as part of decisions that pose a high risk to rights or safety" minimum practice in section 5(c)(iv)(G) of the draft memorandum.
[7] As a recent example, see Palantir's response to the National Telecommunications and Information Administration's AI Accountability Policy RFC and related blog post, *Palantir's Response to NTIA on AI Accountability Policy*.

Second, how often should AIAs be performed? We recommend that AIAs should not be a one-time, high-investment exercise. Instead, we advocate for the continuous evaluation of the scope of the modeling problem and the suitability for an AI/ML solution throughout the entire AI lifecycle. It is sufficient to require a single AIA as a *minimum* practice, but encouraging the repeated consideration of the scope of the AI problem and solution may help guide agencies to a more iterative form of AI/ML development, which is better in line with other minimum practices, such as ongoing monitoring.[8]

Overall, it is crucial to balance the importance of conducting parts of the proposed AIA at the outset, with (1) the practical reality of when agencies will have the data required to answer those questions, and (2) the need for the AIA to stay current and not become stale. As one potential proposal, we recommend requiring a lighter-weight AIA at the outset, which would include a statement of the modeling problem, the expected benefit, and how the agency will be able to measure the success of the AI solution. Then, in subsequent minimum practices for evaluation and monitoring,[9] agencies can validate their initial AIA hypothesis and supplement it with further empirical results, or later, with the impact or outcome details tracking the AI solution's deployment in the production environment.

- **Require that agencies consider the impact to privacy of safety-impacting and rights-impacting AI.** The memorandum requires that agencies take steps to ensure that "AI will advance equity, dignity, and fairness."[10] As part of this minimum practice, we recommend that OMB require that agencies also ensure that AI will not infringe on the privacy of users or data subjects.

  Strong privacy protections are critical for the responsible use of AI. The memorandum highlights the potential risks of AI to privacy in calling out AI that has a "significant effect on [...] civil rights, civil liberties, or privacy" as rights-impacting.[11] Other government documents on Responsible AI also specifically call out the importance of privacy.[12]

  As part of the proposed minimum practices, agencies should consider how they can use data protection best practices to ensure that data or models in an AI solution do not have an adverse impact on data privacy.

Suggested additions to the current minimum practices

We also recommend that OMB consider including two additional minimum practices that address critical concerns that arise when deploying AI into operational settings:

[8] See the "Conduct ongoing monitoring and establish thresholds for periodic human review" minimum practice in section 5(c)(iv)(D) of the draft memorandum.
[9] For example, this could be a part of the "Conduct ongoing monitoring and establish thresholds for periodic human review" minimum practice in section 5(c)(iv)(D) of the draft memorandum.
[10] Section 5(c)(v)(A) of the draft memorandum.
[11] See the full definition of Rights-Impacting AI in Section (6) of the draft memorandum.
[12] For example, Data Privacy is one of the five principles of the Blueprint for an AI Bill of Rights.

- **Plan for limited releases, upgrades, downgrades, and replacements of the AI system.** As described in our Response to Question 3, we believe that AI is best developed using a "field-to-learn" methodology. This methodology, however, must be paired with rigorous pre-deployment testing, rollout, and post-deployment monitoring procedures. We recommend that as part of the minimum practices, agencies describe plans that explain how they will release and rollout AI systems to limited environments and handle upgrades, downgrades, replacements, or fallbacks on non-AI options in the event of AI failure.

  Such a release and rollout plan should entail where and when AI can be evaluated in a "limited" setting, for example in a staging or development environment. In addition, a release and roll-out plan should describe how models can be upgraded, downgraded, or replaced in the event of AI failure. Mission critical applications of AI, such as those used in some medical situations, power plant operations, and battlefield targeting, must have manual fallback workflows that meet mission requirements (i.e., "fail safe" design). By making this a minimum practice, OMB can encourage agencies to actively consider mitigations and strategies to handle AI failure proactively.[13] This is necessary to support minimum practices that mitigate emerging risks,[14] so in the event an AI model is discovered to cause adverse impacts, it can be safely rolled back and replaced with a patched model or fall back on a human solution as users encounter scenarios where AI fails or otherwise undermines operator trust.[15]

- **Plan for how to discontinue the AI system.** Agencies should be prepared to discontinue an AI system safely. When an AI system is discontinued, it should be noted as such in an agency's annual use case inventory.[16]

  We recommend that OMB consider this as a minimum practice for two reasons. First, from a governance and transparency perspective, if an AI system from production is decommissioned, it is helpful for the agency – and even the public – to know what AI approach was tried and why it failed or was otherwise deemed inappropriate or unworkable. For example, if an AI model fails because neither the model developed nor the testing conducted accounted for drift in the model inputs over time, this becomes helpful to consider for future model developers working on similar problems. Second, from a data protection perspective, if data was collected for the purpose of only building or testing an AI system, it should be deleted as appropriate, since it might no longer be

[13] It is a well-known fallacy to disregard cases where AI might fail, so agencies should account for AI failure as part of their planning. For more, see Raji, Inioluwa Deborah, et al. "The fallacy of AI functionality." *Proceedings of the 2022 ACM Conference on Fairness, Accountability, and Transparency*. 2022.

[14] See the "Mitigate emerging risks to rights and safety" minimum practice in section 5(c)(iv)(E) of the draft memorandum.

[15] See the "Maintain options to opt-out where practicable" minimum practice in section 5(c)(v)(F) of the draft memorandum.

[16] See the "Provide public notice and plain-language documentation through the AI use case inventory" minimum practice in section (5)(c)(iv)(H) of the draft memorandum. This documentation should be updated when an AI system is discontinued.

needed. By developing a process for discontinuing an AI system, an agency can consider downstream impacts of discontinuation like data deletion.[17]

Discontinuation of AI is mentioned throughout the draft memorandum,[18] so by specifically requiring agencies to plan for AI discontinuation and any downstream impacts, agencies can better uphold governance, traceability, collaboration and privacy – all key facets of Responsible AI.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The purpose of agency reporting, as part of the annual use case inventory, should be to increase transparency and demonstrate accountability. This is crucial for collaborative, responsible development of AI across the Federal government and for the public to understand how government use of AI might impact them.

There is a comprehensive literature on best practices for AI documentation,[19] so we do not provide an exhaustive list of recommendations. Rather, we offer a sample of the types of information that can increase transparency and improve accountability:

- **Use Case Description:** Overview of AI use cases including who the end users are, how many times the system is used, and an articulation of the primary benefits of the AI system over alternatives. This could be similar to – or the same as – the AI Impact Assessment minimum practice.[20]

- **Data Governance:** Description of data governance plan for the data used to train and test the AI system, as well as any data produced by use of the AI system. This may include data protection and privacy considerations that we proposed be added to the minimum practices in our Response to Question 5.

[17] We recommend that systems are proactively designed to handle requirements like granular or systematic deletion. For more, see our blog post, *Designing for Deletion (Palantir Explained, #6): Tactics for building an effective framework*.

[18] Section (5)(c)(v)(C) of the draft memorandum requires agencies to "safely discontinue use of the affected AI functionality" if mitigation for discrimination is not possible. Footnote 31 of the draft memorandum also requires agencies to consider how to decommission AI ("Agencies are responsible for determining how to safely decommission AI that was already in use at the time of this memorandum's release without significant disruptions to essential government functions.").

"Nutritional Labels for Data and Models." *A Quarterly bulletin of the Computer Society of the IEEE Technical Committee on Data Engineering* 42.3 (2019).

[20] Section 5(c)(iv)(A) of the draft memorandum.

- **Risk Assessments:** Any risk assessments conducted by agencies when considering the development or deployment of their AI system should be made available as part of the use case inventory. This could include analysis of the problem AI is trying to solve, privacy or data protection impact assessments, and security assessments, among others.

- **Audit Results:** Internal and external audits of AI systems are crucial for improving accountability and ensuring that AI is used effectively and responsibly. The results of these audits should be made available for review.

- **Security Incidents and Mitigations:** Agencies may discover security incidents with the development or deployment of their AI systems. Agencies should provide reports of these incidents, as well as any mitigation efforts agencies have put in place to address such incidents.

Information provided for each agency's use case summary should not be compiled only once a year. Rather, we recommend that stakeholders in any AI project's lifecycle continuously collect and update this information throughout the development, deployment, use, maintenance, and potential discontinuation of their AI systems. While agencies can submit an annual "snapshot" of these results for their use case inventory, incorporating continuous reporting practices into the culture of AI development will best promote responsible AI innovation.

Indeed Comments - OMB AI Guidance

December 5, 2023

Office of Management and Budget
725 Seventeenth Street, NW
Washington, D.C. 20503

RE: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Indeed appreciates the opportunity to provide comments on the Office of Management and Budget's (OMB) draft memorandum ("Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"). Indeed is a global leading job search site, which develops and deploys responsible AI tools to help people get jobs. Indeed looks forward to being a resource in the creation and implementation of AI laws and regulations, from the perspective of the impact of AI on the labor market, as well as in the responsible development and deployment of AI.

At Indeed, our mission is to help all people get jobs. Our technology solutions, policies, and partnerships empower both job seekers and employers to improve and speed up the hiring process and help to reduce inequality and inequity in hiring. As a global leading job site, with over 350 million monthly unique visitors, we want our platform to help eliminate biases and ensure all people have access to quality work. So much so that we have publicly declared a commitment to helping 30 million job seekers who face bias and barriers in the job search process and get hired by 2030. AI is absolutely essential for large scale matching problems like employment. Thanks to AI, someone gets hired on Indeed every three seconds.

We greatly appreciate the Administration's ongoing efforts to create a risk-based approach to regulating AI, to facilitate innovation and growth, while at the same time protecting consumers against potential harms and abuses. As we believe to be the intent of the Administration's efforts, we stand at the crossroads of extraordinary innovation and disruption. With great power comes great responsibility. If we want to ensure that AI will benefit all humanity, we need to embrace our responsibility and put humanity at the center.[1]

[1] https://fortune.com/2023/09/21/indeed-ceo-ai-jobs-work-alone-making-decisions-affect-millions-people-unemployment-bias-careers-chris-hyams/

AI and the Labor Market

There is no bigger question in the world of work today than whether AI will create or destroy jobs, and what form that disruption might take. In September, Indeed Hiring Lab economists[2] published our first round of research[3] on which industries are most likely to be impacted by generative AI technologies like ChatGPT. We analyzed 2,600 skills from more than 55 million Indeed job listings to assess ChatGPT's ability to perform each task. Nearly 20%[4] of jobs were found to have "high exposure," with generative AI rated as "good" or "excellent" at performing 80% or more of the skills required by that job. Another 45% of jobs had "moderate exposure," with AI effectively performing 50% to 80% of the necessary skills. In all, more than half of required skills for nearly two-thirds of all jobs can potentially be done, at least reasonably well, by generative AI.

Jobs in fields such as child care, construction, and driving appear least impacted since they typically require physical or face-to-face interactions, for which generative AI adds little value. Sectors like legal, finance, and software development are more likely to see significant impact. In general, our research showed that generative AI is poised to impact remote jobs more than in-person jobs. Ultimately, generative AI, in the short term, is more likely to remain only decent (at best) at performing most tasks, rather than truly masterful, and is currently bad at more skills than it is good. So while virtually all jobs will be exposed to generative AI, few will be fully replaced. This does indicate that the labor market is poised to dramatically change in the coming years.

Furthermore, our latest research[5] on generative AI's impact on people shows that jobs that employ a large share of young workers aged 16-24, including food preparation & service, generally have less exposure to generative AI. As workers age into their mid-career years, they tend to move into roles that require skills that are more exposed to generative AI. Women tend to work in jobs with slightly more exposure to generative AI than men, but the differences are minor. The biggest demographic differences in exposure to generative AI are by race and ethnicity. Asian American/Pacific Islander workers tend to be more represented in jobs with the highest potential exposure to generative AI, while Latine workers are employed in occupations with the least potential exposure. Awareness of these facts is important, particularly as we weigh bias in AI.

Indeed's findings around the fields most- and least-exposed to potential GenAI-driven change clearly illustrate the different challenges posed by GenAI relative to earlier

[3] https://www.hiringlab.org/2023/09/21/indeed-ai-at-work-report/

[4] https://www.hiringlab.org/wp-content/uploads/2023/09/Indeed-HiringLab-AI-04.pdf?isid=hiringlab_us&ikw=hiringlab_us_2023%2F09%2F21%2Findeed-ai-at-work-report%2F_textlink_https%3A%2F%2Fwww.hiringlab.org%2Fwp-content%2Fuploads%2F2023%2F09%2FIndeed-HiringLab-AI-04.pdf

[5] https://www.hiringlab.org/2023/10/26/indeed-ai-at-work-report-people/

industrial and commercial automation efforts. Many of the jobs most in demand from employers in today's tight labor market are among those with the least potential exposure

to GenAI-driven change. Unlike earlier advances in robotics and computing that largely impacted and replaced manual labor, it is knowledge workers who are more likely to be impacted by this evolution in GenAI technology. As the labor market continues to adjust to the rise of remote work, the higher the odds are that a job can be done remotely, the greater its potential exposure is to GenAI.

How people work will inevitably change as GenAI gains wider adoption, with GenAI tools augmenting or replacing certain tasks and forcing a rethink of some traditional work profiles. The most automatable tasks—debugging code, documenting work, and identifying relevant data for a diagnosis—will be replaced/supported by GenAI. But as we've seen, at its best GenAI is generally good but not great at certain tasks, and at its worst is simply bad. As such, it's likely that deep, diverse, expert, and uniquely human knowledge will stay in high demand. A person's capacity for on-the-job adaptation and lifelong learning, already critical today, will only become more important tomorrow.

AI Constraints

AI is powered by data, data comes from humans, and humans are far from perfect. This is especially true in employment: in a well-known 2003 study,[6] candidates with Black-sounding names required 50% more applications to receive the same number of callbacks for interviews than those with white-sounding names for identical resumes. A 2016 study[7] from the Institute of Labor Economics (IZA), found that job applicants with a Turkish name wearing a headscarf had to send 4.5 times as many applications as identical applicants with a German name and no headscarf for the same results. When AI models are built from data with embedded bias, the resulting models encode, replicate, and scale that bias.

A recent study[8] graphically represented this phenomenon. When asked to create images related to job titles and crime, generative AI consistently amplified stereotypes about race and gender. White Americans make up 70% of fast-food workers, but 70% of image results depicted workers with darker skin tones. Women make up 39% of doctors in the U.S., but only 7% of the image results. Throughout the study, higher-paying roles were represented primarily by perceived male workers and those with lighter skin, while lower-paying jobs were dominated by perceived female workers and those with darker skin. Images generated for "inmate," "drug dealer," and "terrorist" likewise amplified stereotypes.

[7] https://www.iza.org/publications/dp/10217/discrimination-against-female-migrants-wearing-headscarves

[8] https://www.bloomberg.com/graphics/2023-generative-ai-bias/

In addition to potentially harmful factual knowledge, there are numerous examples of how generative AI can be "tricked" into revealing its inherent bias.[9] These problems become considerably more urgent when AI is applied in life or death arenas like medicine, criminal justice, and national defense.

Despite the staggering innovation all around us, AI is still in its infancy. If we hope to continue to benefit from the promise of AI, we need to focus considerable time and energy on addressing the risks.

Governance

Indeed's development and use of AI tools and services are centered around key guidelines and principles,[10] which, in conjunction with existing laws, regulations, and best practices, help to guide our responsible use of AI:

Job seeker first. Indeed's mission is to help people get jobs. We work hard to open access to opportunities for all job seekers. No job seeker pays for access to the jobs found on Indeed. The development, management, and use of AI is guided by our mission and this principle above all others.

Center fairness and equity. Talent is universal, but opportunity is not. Without proper care, the unfair biases and barriers that job seekers face can be reinforced or amplified at the scale that AI enables. Appropriate controls and oversight, including the principles of data protection described in Indeed's Privacy Policy, are essential to the success of AI systems and important for the protection of the people that depend on Indeed to find meaningful employment. We are committed to fairness and equity in our products, to building products that enable job seekers to benefit from AI, and to building a team that is diverse and representative of job seekers.

Listen and learn. A commitment to fairness and equity requires nuance, expertise, and commitment. These concepts are highly contextual and vary within and between cultures. There is no single or settled definition of fairness or equity. We use data, both quantitative and qualitative, to rigorously evaluate our products' fairness from initial design onward. We incorporate the lived experiences of job seekers. We know that learning is a journey and that this work is never done.

Hiring is human. AI provides exciting opportunities to augment, assist, and support people in doing their best work. However, hiring is a fundamentally human process, and humans will always have vital roles to play in job seeking and hiring. Decisions about jobs and hiring are among the most important in peoples' lives, and we want to preserve the

[9] https://www.thedailybeast.com/openais-impressive-chatgpt-chatbot-is-not-immune-to-racism

[10] https://www.indeed.com/esg/ai-ethics

human element in those decisions while continuing to improve and simplify the experience of finding the right job or candidate.

Innovate responsibly. The rapid development of AI has opened many exciting new doors for job seekers and employers. However, embracing these developments responsibly will require care, consideration, and clear-eyed assessment. It's important that we work to make these systems accountable for the outcomes, transparent in clear and simple ways how they impact people and well-governed with robust security and safety described in Indeed Safety, ensuring they respect human rights, and carefully considering the risks and potential benefits that they may bring. We welcome open dialogue about the uses of AI in the job -seeking, advertising, and hiring space.

To create truly responsible AI systems, developers and deployers need to fundamentally change the way AI systems are built. To start, we need to prepare the current and next generation of tech workers for the profound implications of technology and its impact on people's lives. Along with statistics and linear algebra, technologists should be required to study history, philosophy, ethics, and literature. A formal code of ethics for AI practitioners, such as an adaptation of the physician's Hippocratic oath,[11] would be an important starting point.

Critically, we also need to change who is building these systems. Every day, people are making vital decisions in rooms with little to no representation from marginalized groups—those that are most likely to be negatively impacted by those decisions. Women make up roughly 20% of recent Computer Science Ph.D.s—and barely 6% of Ph.D. holders are Black or Latine.[12] Representation on its own will not solve the fundamental challenges facing AI, but we will not overcome those challenges if marginalized groups do not have an equitable seat at the table.

Regulation

Any approach to regulating AI should protect and empower vulnerable and marginalized populations, encourage responsible innovation and competition, and be flexible enough to address the rapidly changing technological landscape, while also mitigating against a patchwork of inconsistent laws and regulations. Existing laws and regulations, including standards in the White House Executive Order on AI, present a strong baseline whereby developers and deployers of AI can operate in a responsible manner. Indeed looks forward to continuing to be a resource in the development of AI regulation, legislation, and best practices.

[12] https://aiindex.stanford.edu/wp-content/uploads/2021/03/2021-AI-Index-Report-_Chapter-6.pdf

Indeed was pleased to join the Future of Privacy Forum and industry partners in releasing Best Practices for AI and Workplace Assessment Technologies.[13] The opportunities for AI in hiring and employment are immense, and so are the opportunities to align on the right controls for responsible development and deployment of such systems. On behalf of Indeed, we advocate for the following principles in any legislative or regulatory framework as we believe it will support a thriving American workforce and enable technology innovation for years to come:

1. Human Involvement - AI provides exciting opportunities to augment, assist, and support people in doing their best work. AI tools with consequential impacts should be designed and operated with informed human oversight and engagement.

2. Consistent Standards for Governance - Standards for internal governance policies, procedures, and testing should be established, where reasonably feasible, to mitigate against unfair bias, protect civil rights, accommodate the lifecycle of the AI system and any variations of the system which might occur, and where applicable and appropriate allow for internal and external feedback on the development and deployment of such AI systems. We advocate for a single standard, which will allow for ease of implementation for all sizes of companies, across relevant jurisdictions.

3. Transparency and Protection - Users or consumers of AI systems should have a reasonable opportunity for understanding of the AI systems they experience. Personal data should be protected and appropriately controlled. At the same time, developer and deployers' proprietary information should be appropriately protected in any such disclosure.

We look forward to working with you on the implementation of responsible AI policy and appreciate the opportunity to share our perspective, as a developer and deployer of AI systems, and as a thoughtful leader in labor market insights. We are available as a resource at your convenience – thank you for your consideration and interest in our perspective.

Google Comments - OMB AI RFC - 12-05-2023

Office of Management and Budget
Response to Request for Comment:
Advancing Governance, Innovation, and Risk Management
for Agency Use of Artificial Intelligence Draft Memorandum
88 Fed. Reg. 75625 (Nov. 3, 2023)
Docket No. OMB-2023-0020
December 5, 2023

Google welcomes the Office of Management and Budget's (OMB's) request for comment on a draft memorandum that would establish new agency requirements on minimum risk management practices for procuring AI (Draft Memorandum).[1] OMB's Draft Memorandum is timely and important, and we appreciate the opportunity to provide suggestions on how OMB can support U.S. innovation and leadership in the development and deployment of trustworthy AI systems in support of critical government missions.

Executive Summary

The Draft Memorandum provides a strong foundation for federal agencies to deploy AI technologies to advance and protect vital public interests. Broad adoption and implementation of responsible practices for the procurement of trustworthy AI technologies will help advance U.S. leadership in AI, improve government functions, reduce costs, and ensure accountability. Below, we summarize the objectives that we recommend OMB consider when finalizing its guidance. We also provide responses to each question posed in OMB's request for comment.

Facilitate Government Adoption of AI. Government agencies and the public interest that they serve stand to gain from adopting AI in at least two ways. *First*, governments can leverage AI to improve the delivery of services to citizens, which has the additional benefit of familiarizing people with the underlying technologies and building trust that AI can be used in helpful ways. *Second*, by adopting AI, government agencies can model a forward-looking approach to the private sector and other organizations for the bold and responsible adoption of AI. The scale of government deployment and investment can ultimately help further catalyze a domestic AI ecosystem and, by requiring standards in terms of AI system performance, also help enhance the quality and safety of commercial and enterprise AI products.

Ensure a Risk-Based Approach that Supports AI Adoption and the Delivery of Government Services. Agencies should take a risk-based approach to AI procurement and deployment, which factors in AI's tremendous public interest benefits while balancing the need to mitigate potential risks. The Draft Memorandum defines a comprehensive list of Minimum Practices for agencies to adopt before and when using "safety-impacting" and "rights-impacting" AI. Less helpfully, "safety-impacting" and "rights-impacting" AI are defined so broadly as to capture a wide range of AI applications, including potentially many

[1] *Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum*, OMB, 88 Fed. Reg. 75625 (Nov. 3, 2023).

well-established tools, such as mapping technologies, spam filters, and search tools, that have been incorporating AI for many years to the benefit of American businesses and consumers. Unless those requirements are defined more specifically and applied carefully, they could unduly limit the government's deployment of AI in ways that would support the delivery of government services to citizens.

We appreciate that the Draft Memorandum recognizes this range of risk profiles to some extent by allowing agencies to waive certain requirements for a specific AI application or component. But this creates a default presumption against deploying, rather than encouraging agencies to deploy AI where it is in the public interest. We also urge OMB to make explicit in the Draft Memorandum that agencies should not take a one-size-fits-all approach but should instead implement the Minimum Practices in Section 5 based on any specific risk of the intended application.

Clarify Roles and Responsibilities to Ensure Agency Alignment and Transparent Processes. To ensure that the regulatory and procurement processes are fair, scalable, and repeatable, agencies need to communicate clear and detailed documentation requirements and details of the agencies' own risk assessment reviews (e.g., when and how reviews are conducted, on what cadence, and with whom the results will be shared), ideally in a machine-readable and extensible way (e.g., with structured content within documentation, reflecting consistent definitions and metrics). *Recommendations*:

- Call for agencies to clarify whether and to what degree vendors or agencies will be held accountable if new issues are identified following deployment. In general, liability and accountability should be assigned to the actor that has the most information about the intended use and potential forms of abuse.
- Clarify the extent to which AI vendors, rather than the agencies themselves, will be expected to perform some or all of the Minimum Practices for safety-impacting and rights-impacting AI that OMB would require agencies to implement. This point is particularly important to clarify for practices in the pre-deployment phase and as agencies build capacity to test AI performance and to "independently evaluate the AI."
- Refine the descriptions of some of the purposes presumed to be safety-impacting AI to focus on use cases that are reasonably likely to be unsafe.

Support U.S. Competitiveness and Innovation. OMB should guide agencies to regulate or procure AI in ways that support U.S. competitiveness and innovation leadership. Government should promote public-private partnerships that build a robust, responsible AI ecosystem and enhance the public sector's ability to deliver critical services. The U.S. government should also protect U.S. companies' valuable sensitive and proprietary intellectual property, carefully protecting any companies' AI information it obtains as part of its regulatory processes, and enforcing federal laws protecting companies against economic espionage and theft of trade secrets. *Recommendations:*

- Encourage different types of safety testing appropriate to the risk presented by the application and reflective of existing capabilities—including recognizing the role of internal red-teaming. For example, the Draft Memorandum's endorsement of "external AI red-teaming" should be expanded to internal *and* external red-teaming, which would

also align with the voluntary commitments made by Google and other AI companies in conjunction with the Biden-Harris Administration.

- Encourage agencies to replicate and expand public-private partnerships like the AI Village DefCon Generative AI Red Team events and the Defense Advanced Research Projects Agency AIxCC Grand Challenge to explore important and novel use cases for AI, which will benefit the public and private sectors.
- Protect sensitive and proprietary information and intellectual property developed by the private sector by guiding agencies to ask for only the information they need (minimizing federal access to sensitive trade secrets), providing agencies with the authority to withhold such information from public disclosure and enforcing federal laws protecting companies against economic espionage.

Focus on System Performance. OMB should ensure that agencies have adequate governance structures and implementation mechanisms (overseen by OMB through means like the cross-agency priority goal framework) to enable repeatable, scalable, efficient, and effective use of AI to produce optimal outcomes for the public. *Recommendation:*

- Focus on outputs rather than inputs, avoiding requirements for access to vendors' AI training data (which may include competitively sensitive trade secrets and generally will not explain the outputs of AI systems). OMB should also clarify that data input access requirements do not apply to vendor training of the base or foundation model but to agency management of federal data used by the agency to fine-tune the base models provided by vendors.

Encourage Security-by-Design. OMB should prioritize national security by ensuring that agencies embed "security-by-design" principles in their AI procurement policies, including using cybersecurity as a factor in selecting vendors. The Draft Memorandum should be clear that security must be a shared responsibility between agencies and AI providers. *Recommendation:*

- Advise agencies to monitor how AI product vendors manage security issues. Agencies should consider requiring mitigation plans from vendors to ensure that underlying security weaknesses in the product are comprehensively addressed.

* * *

Question 1. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

Chief AI Officers (CAIOs) will be vital to overseeing AI policy within their agencies and coordinating AI policy across other agencies. Given the importance of this role, OMB should adopt measures that hold CAIOs to the highest standards of leadership and accountability, and agencies should be transparent in providing information about CAIOs and their qualifications.[2]

[2] The Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (AI EO) directs OMB to specify the requirement that agencies appoint CAIOs and specify

The Draft Memorandum outlines some minimum qualifications for CAIOs based on seniority and authority[3] and establishes a procedure for agencies to identify their CAIOs.[4] Information about the CAIOs should also be publicly available, as such transparency can instill further trust in agencies while helping members of the private sector understand the type of individuals that could fulfill such a role for their organization. Accordingly, OMB should require agencies to publicly list their CAIOs' backgrounds and qualifications. These actions will keep constituents informed and align with the current approach that some agencies take with regard to posting information about members of leadership.[5] It would also be useful for OMB to consider how Chief Data Officers, Chief Information Security Officers, and Chief Information Officers will interoperate with the new CAIOs, as AI development is a cross-cutting issue.

Question 2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

An AI Governance Body, or AI Governance Board, can play a substantial role in shaping agency actions on AI. Such a governance Body or Board can be particularly effective if it ensures transparency and leverages existing frameworks and resources from government and industry. Further, in many cases, agencies have existing internal governance bodies that consider the agencies' use of AI in their specific remit. These existing, expert entities should be tasked with assessing, enabling, and promoting broader AI tools rather than tasking a new body to perform AI governance. We offer the following suggestions to help OMB establish coordination mechanisms that facilitate the continued adoption of AI in the federal government.

Emphasizing Transparency and Engagement with Stakeholders

Government transparency is crucial to promoting trust. Accordingly, agencies' AI development and deployment efforts should be made public as much as possible. For example, an AI Governance Board can hold open meetings, share meeting minutes and outputs, and host listening sessions to permit the public and the AI community to share ideas and concerns at a regular cadence. It could also report annually on its efforts.[6] Such operational transparency will

---

the "roles, responsibilities, seniority, position, and reporting structures" for these officers. Executive Order No. 14110, Sec. 10.1(b)(i) and (b)(ii).

[3] CAIOs for CFOs Act agencies would need to "be a position at the Senior Executive Service, Scientific and Professional, or Senior Leader level, or equivalent." and for other agencies "be at least a GS-15 or equivalent." Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence, OMB, Sec. 3(b)(iii) (Nov. 1, 2023) ("Draft Memorandum"). CAIOs must also have sufficient authority to execute their responsibilities under the Draft Memorandum.

[4] Draft Memorandum Sec. 3(a)(i).

[5] *See, e.g.*, *Members and Leadership*, U.S. Chief Information Officers Council (last visited Dec. 2, 2023); *Council Members*, Federal CDO Counsel (last visited Dec. 2, 2023).

[6] For example, Google annually releases AI Principles progress reports to share lessons learned on issues such as responsible AI, algorithmic transparency, privacy-enhancing technologies, and AI R&D. *See* *Implementing Our AI Principles*, Google AI (last visited Dec. 4, 2023).

allow the public to understand how agencies adopt AI and enable industry and academia to lend their expertise to support consistent government practices.

An AI Governance Board can enhance transparency further by allowing the AI community to participate in the development of documentation requirements and agency compliance plans. By publishing drafts for public comment and holding listening sessions, agencies can identify their specific information needs and capitalize on the AI community's specific domain knowledge and experience to create effective policies that are quick to implement, consistent across agencies, and enable secure, scalable adoption of AI. Public-private working groups and other public proceedings can also create opportunities for widespread participation. Indeed, the government successfully employed these approaches in creating one of its foundational AI guidance documents, the National Institute of Standards and Technology's (NIST's) AI Risk Management Framework (AI RMF).[7] Meaningfully involving interested constituents and industry stakeholders in agencies' internal governance of AI should lead to more beneficial outcomes.

OMB should also support federal participation in non-federal settings that involve AI innovation, including allowing federal employees to do outside work in academic or research settings, allowing federal employees to participate in nonprofit organizations' activities or discussion fora, and enabling specific Public-Private Talent Exchanges such as the Department of Veterans Affairs VHA Executive Management Fellowship,[8] military and civilian fellowships with Federally Funded Research and Development Centers and industry, and the Department of State's Eagleburger Fellowship.[9]

Encouraging Alignment with Well-Developed Frameworks

To promote a cohesive agency approach to AI and leverage existing resources, OMB should recommend that agency-adopted policies align with established, effective risk management frameworks and best practices currently in use by the industry. For example, we recommend encouraging agency policies to mirror the AI RMF,[10] which is already being incorporated by industry and other organizations into their AI policies and principles.[11] Notably, the AI RMF complements the cybersecurity and privacy frameworks previously developed by NIST that have been voluntarily and widely adopted in the U.S. and abroad.[12]

Industry-developed policies and frameworks can also provide useful starting points for agency policies, and we recommend alignment with these types of resources as well. For example, Google's Secure AI Framework (SAIF), which is inspired by security best practices and supports AI risk mitigation and scale protections, offers a practical approach for public and

[11] *See The public sector guide to getting started with generative AI*, Google, at 57 (2023) ("[Google's AI Principles] guide our work including how we map to key frameworks, like the [NIST] AI Risk Management Framework.") ("GAI Public Sector Guide").
[12] *See NIST Cybersecurity Framework*, NIST (2023); *NIST Privacy Framework*, NIST (2020).

private sector users to address security trends and risks specific to AI systems.[13] Similarly, Google's AI Governance reviews[14] and Responsible AI Practices[15] provide a model for responsible AI.

Drawing on Existing Expert Governance Bodies

OMB asks about the benefits and drawbacks of having agencies establish new bodies for AI governance versus relying on existing groups.[16] We urge agencies to use their existing groups (e.g., bodies focused on information technology and cybersecurity) where possible to consider AI within that specific context. Using existing bodies will help ensure that domain experts integrate AI into their work. It will also avoid overlapping governance mechanisms and needless bureaucracy or red tape that could otherwise make it more difficult to deploy new tools.

Question 3. How can OMB best advance responsible AI innovation?

As agencies expand their AI use, they can foster responsible innovation by adopting policies that encourage competition, prioritize security, and provide developers with the tools necessary to confront society's greatest challenges. We believe that the following measures will help agencies lead on this front.

Interoperability and Access to Data and the Tools for Innovation Will Support Responsible AI Development

As the government seeks to implement AI technologies, it should do so in a way that establishes a level playing field for existing vendors and new market entrants. *First*, to support robust competition and innovation, we recommend that agencies prioritize interoperability and commercially available infrastructure as they adopt AI technologies. Doing so will support a vendor-agnostic environment, permitting new or competitive technologies to be slotted in seamlessly as they become available. Exceptions from this approach should be rare, with well-documented justification. If an agency cannot integrate technology from new vendors, it will miss opportunities to adopt superior technologies as they become available. This risks impeding the agency's mission and exposing the agency to security risks if the incumbent technology becomes compromised. It also excludes other vendors from competing fairly to serve agencies, thus distorting the innovation ecosystem and potentially undermining the country's competitive edge.

Further, tools exist today that can assist agencies with adopting an interoperable approach. For example, Google Cloud Platform offers developer-friendly hybrid/open solutions, providing

[13] *Introducing Google's Secure AI Framework*, The Keyword (June 8, 2023).
[14] *See AI Governance reviews and operations*, Google AI (last visited Dec. 2, 2023).
[15] *See Responsible AI practices*, Google AI (last visited Dec. 2, 2023) ("Google Responsible AI Practices").
[16] *Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum*, OMB, 88 Fed. Reg. 75625, 75625 (Nov. 3, 2023).

access to public datasets, Anthos, Apigee, Kubernetes, and more.[17] These kinds of resources democratize access to important tools, sparking innovation and accelerating growth.

Second, we encourage OMB to advise agencies to make government data (e.g., scientific data) available where possible and to enable data portability. These actions will ensure that government data can be used to develop beneficial AI applications, that the public can learn and benefit from data, and that datasets can be easily used by different vendors (while including safeguards to respect vendors' intellectual property rights).[18] This approach bolsters competition and enables widespread research and innovation.

Third, we recommend that the guidance promote equal access to the tools for innovation. The Draft Memorandum instructs agencies to "ensure adequate access for AI developers to the software tools, open-source libraries, and deployment and monitoring capabilities necessary to rapidly develop, test, and maintain AI applications."[19] We applaud this approach, which will accelerate innovation, expand opportunity on an equitable basis, create jobs, and offer agencies access to the best possible technologies to serve their missions.

To maximize these benefits, OMB should promote and provide the resources necessary for agencies to set up "sandboxes" or "Discovery Zones" as spaces for innovation. These environments, which might be modeled on Google's Vertex AI Discovery Zone, would allow for testing and running a proof of concept or prototype as research and development.[20] They would also give developers the flexibility needed to test a solution and measure the potential impact before triggering risk-mitigation requirements.

Clear Expectations for Procured AI Will Promote Competition and Encourage Responsible Development

At the outset, in assessing whether to use AI tools, agencies should undertake a holistic assessment. Such an assessment would factor in the resources and costs that would otherwise be incurred to perform the same tasks without using AI. Specifically, a holistic assessment would weigh: (1) the risk of unlawful discrimination and harmful bias from using non-AI methods, and the costs to mitigate those risks; and (2) the risk of unlawful

---

[17] *See* Datasets, Google Cloud (last visited Dec. 2, 2023); Apigee API Management, Google Cloud (last visited Dec. 2, 2023); Hybrid and Multi-cloud: Anthos and Google Kubernetes Engine, Google Cloud Learn (last visited Dec. 2, 2023); Why Open Cloud?, Google Cloud (last visited Dec. 2, 2023).

[18] Google's Data Commons project synthesizes publicly available data from government agencies and other authoritative sources into an open source, API-accessible knowledge graph available to everyone. It links references to unique entities (e.g., cities, counties, and organizations) that exist across different datasets to nodes on the graph, such that users can access data about a particular entity aggregated from different sources without the significant data wrangling procedures required to clean or join records. Data Commons is also now using LLMs to create a natural language interface that allows users to ask questions, making it even more useful. *See* About Data Commons, Data Commons (last visited Dec. 2, 2023).

[19] Draft Memorandum Sec. 4(b)(i).

[20] As a roadmap for creating Discovery Zones, an agency might start with a project kickoff and follow through with use case exploration, pre-built demos, workshops, a secure enterprise-wide sandbox environment, training programs, and professional services for "jumpstart" offerings focused on discovery via search, summarization via conversational AI, and automation via classification/summarization.

discrimination and harmful bias from using AI methods, and the costs to mitigate those risks. Using holistic assessments will help agencies to make the most of AI's cost-saving potential on behalf of the public.

There are two items in the draft that should be clarified to promote careful evaluation of AI systems and robust competition among vendors:

- OMB should clarify the meaning of Sec. 5(d)(ii)(A), which states that agencies should obtain "*adequate documentation* of procured AI" to "ensure transparency and adequate performance."[21] New entrants and competitors should know upfront what documentation agencies require under this provision. Otherwise, incumbents would have a leg up in designing technology that can meet the agency's standards.
- OMB should also clarify the meaning of Sec. 5(d)(v)(a) to ensure that it does not advantage incumbents. This provision recommends that, in their procurement contracts, agencies require "adequate testing and safeguards" for generative AI.[22] Through contracting, incumbents could scope the meaning of "testing and safeguards" to be narrowly tailored to their existing processes, leading to requirements that would be unnecessarily costly or difficult for others to achieve. OMB should advise agencies to adopt contracting policies that help avoid such conduct, perhaps by allowing vendors to satisfy "adequate testing and safeguards" requirements in varied ways.

Agencies and vendors should also have a shared understanding of the allocation of accountability. The guidance should recommend that agencies clarify whether and to what degree vendors or agencies will be held accountable if risks that were not identified in the pre-deployment phase are identified in the post-deployment phase. For example, if vendors take appropriate precautions to avoid reasonably foreseeable harms, they should not be held liable for events that cause harm after completing pre-deployment risk mitigation. This approach makes sense because agencies will have superior information about the intended use of procured technology and potential forms of abuse. The agency's pre-deployment requirements for risk mitigation will be the best method for vendors to verify that their products are safe for use as the agency intends.

Finally, agencies should evaluate the security of their AI solutions. Security is a shared responsibility between agencies and vendors, and the OMB guidance should reflect this. It is important that agencies monitor how AI product vendors manage security issues. Vendor products with a history of exploitation present a heightened risk for agency use, and when problems arise, agencies should evaluate whether to continue using such vendor's products.

Existing Statutes and Regulations Establish a Solid Framework for Responsible AI Use

We recommend that agencies prioritize relying on existing statutes and regulations for regulating technology, rather than assuming a completely new regime is needed to address AI. This approach mirrors the U.S. government's approach to other new technologies and has a proven record of enabling responsible innovation.

[21] Draft Memorandum Sec. 5(d)(ii)(A) (emphasis added).
[22] Draft Memorandum Sec. 5(d)(v)(a).

Many issues around responsible AI are also common to the operation of complex software already used by retailers, banks, insurance companies, manufacturers, and others. For example, cybersecurity frameworks and best practices such as the NIST Cybersecurity Framework,[23] which have been used to secure critical infrastructure and valuable financial, health, and national security information, can also be used to secure AI systems. Expanded use of existing anti-fraud measures can help AI systems maintain accuracy and protect against inaccuracies. Appropriate enforcement of economic espionage and trade secrets laws can protect sensitive intellectual property and encourage innovation. And established intellectual property law (particularly the doctrine of fair use) provides a framework for balancing the interests of existing and new creators and inventors.

Question 4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Generative AI can unlock efficiencies in data processing and analysis and service provision, accelerate scientific research, and develop new groundbreaking technical and policy solutions.

Core Capabilities and Applications

The core capabilities of generative AI are **creation** (bringing thoughts and ideas to life), **summarization** (condensing and summarizing large quantities of knowledge into an understandable format), **discovery** (helping users find what they are looking for), and **automation** (automating services across multiple channels). These capabilities give agencies powerful tools like **chat** (a natural way to interact with AI models suitable for improving user interactions, enhancing product capabilities, training employees, and more), **search** (allowing users to draw from across a specific knowledge base for tailored and targeted interactions), **content generation** (creating high-quality text, images, speech, and code), and **associative reasoning** (the ability to suggest associations in information based on context, frequency, or proximity, bringing new ways to interpret data).

Roadmap for Maximizing Generative AI's Capabilities

Agencies may find this roadmap useful for deciding how to maximize generative AI's core capabilities.[24]

[23] *NIST Framework for Improving Critical Infrastructure Cybersecurity*, NIST (2018).
[24] GAI Public Sector Guide at 12.

STRATEGY FOR FIRST 30 DAYS		**Step 1**: Identify a specific domain.
Step 2: Select a job or function in that domain.	**Step 3**: Determine data sources needed for job or function.	**Step 4**: Assemble "tiger team," including mission or key stakeholder, prompt engineer, IT operations lead, and data owner.
Step 5: Define intentions, objectives, and outputs.	**Step 6**: Design prompts for model with tiger team.	**Step 7**: Build user experience and user interface.
Step 8: Expand access to more individuals.	**Step 9**: Build a "Language Model operations plan."	**Step 10**: Expand usage to additional cases within the same domain.

STRATEGY FOR DAYS 30-90	**Step 1**: Host a hackathon.
Step 2: Spread the word through innovation challenges or accelerators.	**Step 3**: Encourage civic engagement.
Step 4: Create a center of excellence.	**Step 5**: Bring in partners.

Identifying Opportunities and Use Cases

Agencies should adopt recurring processes to consider where generative AI may be advantageous and which new generative AI technologies may be more effective than current approaches. These processes should be open to the public, and agencies should invite industry to share information that will assist decisionmaking.

Agencies should also consider priority use cases, such as:

- **Improving agency operations** – Technologies that summarize and derive insights from data banks are enormously useful for government agencies, whose employees often need to look through hundreds of pages of documentation for policy questions.[25]

[25] For example, Google's "Vertex AI Search for Government" uses the same semantic search technology as Google Cloud Search to search across an entity's Google Workspace data as well as third-party data sources, but with greater control over the way the search engine is configured. It uses Google's search technology to deliver relevant results, and it can be customized to meet agencies' specific needs. *See* GAI Public Sector Guide at 33.

- **Enhancing constituent services** – Agencies can also leverage AI to answer stakeholders' questions whenever and wherever.[26]
- **Improving accessibility** – Generative AI technologies can also assist agencies with receiving stakeholder input, making agencies more accessible and responsive and furthering compliance with the Americans with Disabilities Act.[27]

Targeted Red-Teaming

AI risk-management requirements should be tailored to the specific application of AI technology. This approach would align with OMB's guidance that "[a]gencies are encouraged to include tailored risk management requirements in contracts for generative AI, and particularly for dual-use foundation models."[28] Tailoring means that external red-teaming should be required only where "appropriate and technologically feasible." It would also accord with OMB's language for other requirements in this subsection of the Draft Memorandum[29] and properly narrow the scope of the requirements.

OMB should also recommend that agencies use different types of safety testing to reflect both the potential risk presented by the application and existing capabilities—including recognizing the role of internal red-teaming. For example, the Draft Memorandum's inclusion of "external AI red-teaming" as a risk management requirement should be revised to cover internal and external red-teaming, which would also align with the White House voluntary commitments.[30]

Question 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

We appreciate OMB's focus on AI use cases that may affect safety and rights. That said, the Draft Memorandum's broad scoping of "safety-impacting AI" and "rights-impacting AI" may preclude the adoption of AI tools that could advance the public interest. OMB should instead provide for more fine-grained multi-factor assessments of AI tools that balance a variety of use case-specific considerations, with a significant role in this for the CAIO and consistent with a risk-based approach. We thus suggest tailoring the definitions of safety- and rights-impacting AI to target high-risk systems and removing the general presumption that a specified list of AI use cases should trigger full risk assessments while also ensuring that such a

[26] For example, agencies could use Google's "Vertex Conversation for Government" to deploy multilingual virtual agents that draw on agency data to answer questions in real time. *See* GAI Public Sector Guide at 34.

[27] Google's "Multilingual Chat" offers several solutions to help agencies interact with constituents across language barriers and cultural differences. And Google Cloud's "Natural Language API" provides rapid insights based on large sets of text, such as call center logs, comment fields in surveys, or internet content, including social media posts and news stories. *See* GAI Public Sector Guide at 35; Americans with Disabilities Act of 1990, Pub. L. No. 101-336, 104 Stat. 328 (1990).

[28] Draft Memorandum Sec. 5(d)(v).

[29] Draft Memorandum Sec. 5(d)(v) (Generative AI models should "have capabilities, *as appropriate and technologically feasible*, to reliably label or establish provenance for their content as generated or modified by AI." (emphasis added)).

[30] See *Fact Sheet: Biden-Harris Administration Secures Voluntary Commitments from Leading Artificial Intelligence Companies to Manage the Risks Posed by AI*, The White House (July 21, 2023).

list of use cases does not result in additional hurdles to the procurement process particularly and adoption of AI generally. Doing so will help ensure that procurement policies facilitate use of trustworthy technology and AI's benefits can be fully realized.

Refining the Scope of Technologies Covered by "Safety-Impacting AI"

AI is a valuable tool that can enhance human safety at the workplace, on the roads, and beyond.[31] Any requirements adopted by OMB should enable AI systems to advance the public interest while also taking appropriate steps to address risks to safety.

Section 5(b)'s broad definition of safety-impacting AI[32] should be revised to align with American tort law's focus on the material risks of direct injury to people.[33] Many existing technologies that use AI (e.g., search, mapping and geolocation, translation, spam-filtering) could have hypothetical impacts on "safety" if misused, and the current definition would discourage, if not block, federal agencies from using them.

Below are some examples of specific areas where current definitions are overbroad—but we urge a careful look at the entire list.

- Not all "physical movements" are safety-impacting. Instead, this section should be narrowed to prosthetics or robotic appendages that can cause significant physical injury or transport heavy or hazardous materials.
- "The movement of vehicles" should be changed to "the autonomous operation of vehicles under conditions in which human operators cannot take control of the vehicle or other automatic safety mechanisms are not in place." This targets the systems that present the highest safety risk if an error occurs, as the human operator would be unable to take control of the vehicle.
- "Responses to insider threats" should be clarified to identify what activities would be covered, as not all responses would necessarily impact safety.

Improving the Scope of Technologies Covered by "Rights-Impacting AI"

We believe that AI can also be a powerful accelerant to progress in civil and human rights. We recommend that agencies actively look for ways to leverage AI to progress civil and human rights, such as rights to civic participation, education, and work. Examples of AI use cases addressing human rights challenges include: classifying the effects of 71 million genetic mutations to pinpoint the cause of diseases;[34] broadening access to important

[31] *See, e.g.*, *How AI Is Helping To Improve Transportation Safety On A Global Scale*, Forbes (May 12, 2023); *Artificial intelligence and on-the-job safety*, Safety and Health Magazine (Dec. 19, 2021).
[32] *See* Draft Memorandum Sec. 5(b)(i), Sec. 6.
[33] *See e.g.*, Dan B. Dobbs, et al., *The Law of Torts* § 161 (2d ed. 2023) ("Courts routinely apply some form of risk-utility weighing as a means of determining whether conduct was negligent.").
[34] *See e.g.*, *A catalogue of genetic mutations to help pinpoint the cause of diseases*, Google DeepMind (Sept. 19, 2023).

health-scanning technology[35] and improving clinician access[36] to patient health data; and building new technologies that serve diverse users.[37]

As with its overly broad definitions of "safety-impacting AI," Section 5(b)'s definitions of "rights-impacting AI" could inadvertently discourage the adoption of AI tools that promote the interests of historically overburdened and underserved communities. The breadth of the current definitions also makes it hard to properly anticipate the range of potential agency actions that could be covered by OMB's guidance. As discussed below, we recommend aligning the scope with a risk-based approach that facilitates the adoption of beneficial AI tools while dedicating agency resources to assessing and mitigating the risk of higher-risk applications.

Avoiding Unnecessary General Presumptions About AI Technologies

OMB should focus on anticipating what civil and human rights risks may surface from AI products. Rather than presuming at the outset that a specified list of AI use cases impacts rights and safety (automatically triggering a full set of assessments),[38] agencies could undertake a pre-procurement review of whether an AI use case is actually likely to materially impact rights or safety. OMB has already effectively authorized this approach by allowing CAIOs to issue waivers.[39] But putting the burden on agencies to conduct a full assessment for each of the listed use cases assumes the existence of a problem until proven otherwise and is likely to slow federal agency adoption of many beneficial tools. Many AI applications developed to date have widespread and inclusive benefits that significantly outweigh their risks, and agencies should be free to use them.

OMB's guidance should start by aligning requirements for documentation, risk assessment, and management practices with relevant and evolving standards, frameworks, and industry best practices.[40]

OMB can look to industry for models on how to assess the impact of an AI use case. Google, for example, has implemented scalable frameworks to conduct due diligence throughout the product development lifecycle. Teams consider relevant rights, such as non-discrimination, accessibility, privacy, bodily autonomy, and access to information on a continuous basis as well as at three key inflection points:

- **Data** – AI models may replicate (or correct) biases present in the data they were trained on, so Google invests in diversifying and debiasing training datasets as appropriate.

[38] *See* Draft Memorandum Sec. 5(b).
[39] *See* Draft Memorandum Sec. 5(c)(iii).
[40] *See e.g.*, NIST AI RMF; *Artificial Intelligence Management System*, ISO/IEC FDIS 42001 (2023); *Requirements for bodies providing audit and certification of artificial intelligence management systems*, ISO/IEC DIS 42006 (last visited Dec. 2, 2023).

- **Model development** – Google takes great care to test, revise, and deploy AI models that are fit for global users. Essential parts of model development that help Google mitigate the potential adverse human and civil rights impacts of an AI tool include: development of algorithmic refinements; fine-tuning; adversarial testing; safety filters and feedback features; and involvement of external stakeholders in testing. The iterative nature of this process leads to continuous improvement.
- **Product application** – To maximize a product's potential for societal benefit while minimizing the potential for negative impacts, Google employs strategies such as controlling product availability through licensing, sign-ins, and allow-listing; monitoring use patterns; and enforcing Acceptable Use Policies that prioritize the protection of vulnerable groups like children, people with disabilities, and communities disproportionately targeted with hate speech.

We also consider the societal impacts that are surfaced in our own research and feedback from external partners as a regular part of bringing new and enhanced products to market. We evaluate whether products are safe and if they are likely to lead to harms, such as discrimination, violence, unfair stereotyping, and deep fakes. As one example, Google's decision not to make facial recognition AI available for law enforcement or any public use reflects how seriously we consider such impacts. OMB can look to industry best practices as a model for assessing the risk of an AI use case. Adopting a risk-based approach conserves limited agency resources by requiring assessments only on high-risk AI systems and enables agencies to adopt lower-risk AI systems that can meaningfully support the delivery of government services to citizens.

Question 6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

We applaud OMB's efforts to set rigorous standards for responsible AI use; indeed, several of the Draft Memorandum's Minimum Practices align with Google's own approach to the responsible development and deployment of trustworthy AI tools.[41] For example, Google's Responsible AI Practices include assessing the human impact of AI systems during development, evaluating the model via multiple metrics, examining the raw data, rigorously testing the system, and monitoring and updating the system post-deployment. Encouraging the use of best practices for responsible AI helps ensure AI development and use properly accounts for risk. We recommend the following modifications to OMB's proposed Minimum Practices.

[41] *Compare* Draft Memorandum Sec. 5(c), *with* Google Responsible AI Practices (assessing the human impact of AI systems during development; evaluating the model via multiple metrics; examining the raw data; rigorously testing the system; monitoring and updating the system post-deployment). Since we launched our AI Principles in 2018, we've built and tested an industry-leading governance process to align AI projects across the company with those Principles. *See generally* Our Principles, Google AI (last visited Dec. 2, 2023).

First, OMB should clarify the extent to which AI vendors, rather than agencies, are expected to implement some or all of an agency's Minimum Practices for safety-impacting and rights-impacting AI. This is especially critical in the pre-deployment phase and as agencies build capacity to "test the AI for performance" and "independently evaluate the AI."[42]

Second, OMB should ensure that agencies are clear about the documentation required to evaluate outputs (while safeguarding vendors' intellectual property).[43] In the post-deployment phase, vendors cannot typically monitor the use of their tools due to security and privacy considerations.

Third, OMB should urge agencies to ensure that any AI opt-out mechanisms, such as those discussed in Section 5(c)(v)(F), do not undermine the use of AI tools. An opt-out mechanism that effectively requires agencies to maintain duplicate functionality between AI tools and non-AI operations would likely increase costs, lower effectiveness, and increase confusion. Human review should be available in appropriate cases but should not create parallel AI and non-AI tracks.

Fourth, the Draft Memorandum should clarify how certain obligations would work in practice. For example, it is unclear whether fine-tuning a model would be considered the development of a new model. Would a general-purpose AI tool (i.e., one that is not itself rights- or safety-impacting AI) that is then fine-tuned and integrated into a rights-impacting application constitute a newly developed AI system? This lack of clarity could lead an agency to insist that it needs information on the copious data underlying a general-purpose model (which would likely be of little or no value to it) when, in fact, it needs information only regarding the data used to fine-tune the specific model used to deliver the services procured.

Fifth, we recommend encouraging training for employees on the deployment and use of AI tools. Proper training will be crucial for the responsible use of rights- and safety-impacting AI tools, to address potential biases, and to uphold transparency standards.[44]

Sixth, OMB should refine the scope of the impact assessments that agencies must complete before using new or existing safety-impacting or rights-impacting AI. Section 5(c)(iv)(A)(3) should shift focus to evaluating *outputs* rather than data *inputs*. Its present emphasis on evaluating the "quality and appropriateness of the relevant data" is an increasingly outdated approach.[45] Rapid advances in computer science are finding new ways to extract greater value from smaller datasets by using algorithmic improvements to make up for and even learn from imperfections in datasets. For example, the best way to teach a large language model not to

---

[42] *See* Draft Memorandum Sec. 5(c)(iv)(B) and (C).

[43] *See* Draft Memorandum Sec. 5(c)(iv)(C) (requiring agencies to "review relevant AI documentation to ensure that the system works appropriately and as intended, and that its expected benefits outweigh its potential risks").

[44] Agencies might consider Grow with Google, which offers a comprehensive suite of training programs to develop essential skills and knowledge. For example, our responsible AI course provides a framework for organizations aiming to operationalize responsible AI practices. With courses covering AI fundamentals, ethics, and practical implementation, Grow with Google empowers employees to harness the benefits of AI responsibly. *See* *Responsible AI: Applying AI Principles with Google Cloud*, Google Cloud (last visited Dec. 2, 2023).

[45] *See* Draft Memorandum Sec. 5(c)(iv)(A)(3).

create Nazi content is not to remove all Nazi content from training data (which would mean that it could not describe what happened in 1930s Germany), but to expose it to such content and teach it to avoid generating similar material without appropriate social and historical context.

If specific requirements for data inputs are imposed, they should pertain to the agency's use of the data (i.e., for agency fine-tuning of vendor models) rather than be imposed on vendors. Additionally, this assessment should not require vendors to disclose base model AI training data, which may be competitively sensitive and present security issues.

Question 7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Agencies should leverage existing resources to incorporate the OMB guidance into their contracts—and ground their agreements in existing laws and best practices that have worked well for procuring innovative technologies. Federal acquisition law prioritizes the prompt, efficient, and cost-effective acquisition of commercial products and services needed to meet government requirements. This approach makes particular sense for AI, which has been largely developed and deployed by the private sector. OMB should ensure that agencies have the authority and direction to procure AI through commercial acquisitions, and it should also encourage agencies to pursue acquisition of commercial AI through non-traditional means, such as Other Transaction Authority[46] and Commercial Solutions Opening[47] agreements.

Further, we recommend that the guidance identify ways to build capacity and capability for commercial acquisition that leverages AI innovation. Agencies will need to procure AI under commercial terms that balance an agency's interest in licensing AI with the commercial firm's interest in making broader commercial use of its products. Additionally, in drafting contracts for AI services, agencies should clearly articulate their requirements for outcomes (e.g., optimization of air traffic or management of waste, fraud, and abuse in tax filings). This focus on outcomes will promote collaborative engagement with industry to identify solutions that achieve those goals.

OMB should also equip agencies with the authorities and tools necessary to ensure the protection of companies and their intellectual property. This includes adequate bases in Federal Acquisition Regulation (FAR) clauses and agency acquisition clauses for the submission of any information regarding AI models under an agency assurance of confidentiality, such that this information will be exempt from Freedom of Information Act disclosure. These authorities should be reflected in any agency contract to ensure that private entities have legal recourse against the government in the event of a breach. Agencies should also have adequate information technology and security tools to protect such information from theft, insider threats, and accidental disclosure, among other risks.

---

[46] "Other Transaction Authority" was first created in 1958 for NASA, and has since been expanded by Congress to at least 11 other federal agencies, including the Department of Defense (10 U.S.C. §§ 4021 and 4022), the intelligence community (50 U.S.C. § 3024(n)), the Department of Energy (42 U.S.C. § 7256 and 42 U.S.C. § 16538(f)), and the National Institutes of Health (42 U.S.C. § 282(n)).

[47] *See* *Commercial Solutions Opening (CSO) Guide*, Procurement Innovation Resource Center (June 1, 2018).

Question 8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

In general, the public should have access to the same information about government use of AI as it does to information about other government uses of technology. AI represents an enormous opportunity, and the government should consider publicizing its use of AI to demonstrate this technology's potential to other public and private sector entities. This may also inspire AI developers to find ways to make this technology even more useful.

At the same time, OMB should advise agencies to balance the need to inform the public about agency operations with the need to protect sensitive and proprietary information. The private sector will not be incentivized to partner with agencies if doing so means exposing their intellectual property. Agencies should also be prohibited from requesting information unnecessary to meet federal needs.

* * *

Google believes in AI's tremendous potential and supports OMB's efforts to establish new agency requirements and policies on the responsible development and use of trustworthy AI tools to support crucial agency missions. We look forward to continuing to work with OMB on these important matters.

General Comment

Our organizations submit these comments in response to President Biden's Executive Order of October 30, 2023 for Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (AI Executive Order, AI EO) and subsequent draft guidance promulgated by the Office of Management and Budget (AI OMB).

The signatories to this letter include organizations who have deep experience in advocating to protect and expand rights of immigrants. This includes decades-long expertise in immigration law (particularly at the intersection of criminal justice and immigration law), as well as our work in protecting the rights of communities from the harms of policing by the immigration policing components of the Department of Homeland Security (DHS). Our collective constituencies represent millions of people who have been harmed by or face significant risk of harm due to DHS use of technology. For decades, we have tried to increase transparency and hold DHS accountable for violations of rights—including through its Office of Civil Rights and Civil Liberties. We have advocated against the use of "smart" border technologies that exacerbate migrant deaths, facial recognition technologies that reinforce systemic bias, and automated decision systems that are rigged to deny liberty. We have pushed for limits on widespread data collection without meaningful consent—including the collection of DNA at the border and in ICE detention—and DHS reliance on corporate data brokers that collect, aggregate, and share highly sensitive data.

OMB AI Comments - DHS and law enforcement

To: Office of Budget and Management
Re: Submission to Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, OMB-2023-0020-0001
Date: 12/5/2023

Our organizations submit these comments in response to President Biden's Executive Order of October 30, 2023 for Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (AI Executive Order, AI EO) and subsequent draft guidance promulgated by the Office of Management and Budget (AI OMB)[1].

The signatories to this letter include organizations who have deep experience in advocating to protect and expand rights of immigrants. This includes decades-long expertise in immigration law (particularly at the intersection of criminal justice and immigration law), as well as our work in protecting the rights of communities from the harms of policing by the immigration policing components of the Department of Homeland Security (DHS). Our collective constituencies represent millions of people who have been harmed by or face significant risk of harm due to DHS use of technology. For decades, we have tried to increase transparency and hold DHS accountable for violations of rights—including through its Office of Civil Rights and Civil Liberties. We have advocated against the use of "smart" border technologies that exacerbate migrant deaths, facial recognition technologies that reinforce systemic bias, and automated decision systems that are rigged to deny liberty. We have pushed for limits on widespread data collection without meaningful consent—including the collection of DNA at the border and in ICE detention—and DHS reliance on corporate data brokers that collect, aggregate, and share highly sensitive data.

Given the challenges we have faced in accessing meaningful transparency or accountability from DHS—an agency whose core mission is grounded in policing, incarceration, and exclusion of those who have minimal legal protections—we have grave concerns about the governance framework proposed by the OMB guidance.

- First, we cannot trust DHS or other agencies with track records of rights violations to implement and self-police the guidance. Key policing agencies of DHS, such as Immigration and Customs Enforcement (ICE) and Customs and Border Protection (CBP), have a well-documented track record of violating civil and human rights.[2]

https://www.hrw.org/news/2019/07/12/ice-raids-us-immigrant-families-risk-serious-abuses-0

- Second, the minimum standards for the AI certification process provided in the OMB guidance are not sufficient to curb the risks to privacy and civil rights abuses in the immigration system, especially those who are targeted by DHS at the nexus of the criminal and immigration systems.
- Third, we are concerned that intelligence and law enforcement-related technologies will fall under "critical agency operations," allowing agencies to avoid scrutiny, and enabling the procurement and implementation of harmful technologies that do not meet minimum standards. We are additionally concerned about these issues being relegated to the National Security Memo where they could receive even less public scrutiny.

Since its founding, DHS has grown substantially and is now one of the largest federal agencies in the United States, with nearly 200,000 employees. The agency has broad jurisdiction over all noncitizens within the United States, and its actions have significant impacts on all residents, including citizens, as well as at the country's borders and beyond. Nearly half of full-time federal law enforcement agents—whose primary function is criminal investigation and law enforcement—work for DHS, making it the largest federal police agency in the United States.[3] DHS is also one of the biggest jailers in the United States—since January, DHS has booked over 250,000 people into detention[4] and as of November 18, supervising over 189,000 people under its Alternatives to Detention program[5]—more people than in the custody of the Bureau of Prisons or incarcerated in Texas state prison.[6]

For years, we have seen how the agency's use of AI tools has obfuscated and enhanced discriminatory and expansive policing, detention, and exclusion practices. For example, in 2020 a lawsuit in New York revealed that ICE had been using a data-driven (or "AI") system to inform decisions about whether ICE should release or detain someone who had been arrested.[7] Disclosures about how the tool was programmed revealed that before Trump took office, 53% of people labeled "low risk" were recommended for detention without bond by the tool but from June 2017 through September 2019, the tool recommended that 97% of "low risk" individuals still be detained. The tool effectively offered the Trump administration a means through which to launder their "no release policy" while continuing the appearance of considering a complex set of factors.

In addition, we remain disappointed seeing a continuation in prioritizing AI for good. Between the President's Executive Order and the OMB draft policy, AI innovation is consistently listed ahead of protecting against AI harms. We must leave open the possibility to question whether AI should be used at all, and be careful not to gloss over the current harms of AI systems—including widespread data harvesting of people with few legal protections (including biometrics) and government use of social media surveillance targeting people engaged in activities protected under the First Amendment. We are also disappointed that the OMB guidance does not cover how grant funding from federal agencies is then used to procure technology at the local level. This is especially problematic when local law enforcement agencies use federal funding to procure technologies for which the harms of police use on the civil and human rights of the most marginalized has been well documented.[8]

The following content in this comment explains more about DHS's poor record on privacy and technology surveillance and further elaborates on our recommendations. A summary of recommendations are below the comment.

I. Background on the Department of Homeland Security's Poor Record on Privacy and Technology Surveillance

The OMB guidance governance framework will perpetuate civil rights harms of communities most impacted by criminalization and deportation because it relies on federal agencies, including DHS, to police themselves.

The President's AI governance strategy articulated by the EO and the OMB guidance are unsatisfactory. We are deeply concerned that the EO and OMB rely on a self-policing framework, where "responsible AI" will be best achieved by internal governance boards that are staffed by agency employees and agency-embedded Chief Artificial Intelligence officers (CAIOs).[9] A framework that relies on employees to enforce safeguards that were created by the very same employees raises classic accountability concerns—such as lack of transparency, bias and abuse. Even more damaging are self-policing frameworks in law enforcement and intelligence agencies, such as DHS or the DOJ, because of the particularized risk of creating and/or exacerbating harms to "affected groups" and "underserved communities," such as immigrant communities and communities of color.[10]

---

[8] For example, the Electronic Privacy Information Center wrote a letter to the Department of Justice asking them to review their grant funding to SoundThinking, formerly know as ShotSpotter. EPIC's letter can be referenced here https://s3.documentcloud.org/documents/24034716/epic-letter.pdf and highlights the ways that ShotSpotter as a technology discriminates against people of color. Similarly, research and reporting from the Center for Democracy & Technology found that Housing and Urban Development grants were being used by local public housing to install facial recognition equipped surveillance cameras. Video footage from some of these surveillance cameras were then that were then used to harass and surveil tenants. CDT's research and reporting on this topic can be found here https://cdt.org/insights/taken-for-granted-wheres-the-oversight-of-ai-and-federal-funding/.

[9] Executive Order, Section 10(b); OMB Guidance Sec 3.a.

[10] See OMB Guidance 5(iv)(5). E.O. 14091 of Feb 16, 2023 defines "underserved communities" as:

DHS' recently released AI protocols and policies do not follow risk mitigation practices named in the OMB guidance.

DHS has been an early adopter of powerful and invasive surveillance technologies, usually technologies outsourced from corporations that raise serious questions about their compliance with privacy, data protection, and 4th amendment rights. Earlier this year, DHS released a department-wide policy "Acquisition and Use of Artificial Intelligence and Machine Learning Technologies by DHS Components (DHS AI Policy)."[11] Despite commitments to civil rights and privacy in the policy, DHS continues to rapidly integrate AI products, even though this culture of fast track deployment has hurt communities people most vulnerable to racial profiling, criminalization and deportation. The most recent directive on facial recognition does not appear to ameliorate risks presented by these technologies, while also evading public scrutiny. It also exacerbates retaliation and surveillance harms to immigrants engaged in protected First Amendment activity.

DHS is already using machine learning technologies, such as facial recognition technologies, without mitigating risks to rights and safety that are described in the OMB guidance. One disturbing example is the "Use of Face Recognition and Face Capture (FR/FC) Technologies" directive issued by DHS.[12] For many years, FR/FC technology has been used extensively by DHS in enforcement operations at the border and in the interior. In addition to many advocates, the GAO has issued several reports raising concerns over DHS oversight, use of and agency training on FC/FR technology, and bias against people with darker skin tones.[13] The policy fails to include stronger mitigating practices recommended by the OMB guidance even though DHS specifically identified FC/FR technologies as "privacy sensitive."[14]

For instance, advocates discovered that ICE holds contracts with Clearview AI only after protracted research and litigation.[15] Clearview AI has built the most dangerous facial recognition database in the country and allows law enforcement, government, and private companies to identify, locate, and track people—where they go, who they're with, and what they say—at the touch of a button on a mobile device. DHS contracted with Clearview AI services, even though Clearview AI has come under worldwide criticism, incurred significant fines and penalties worldwide, and has been known to extract pictures and

(b) The term "underserved communities" refers to those populations as well as geographic communities that have been systematically denied the opportunity to participate fully in aspects of economic, social, and civic life, as defined in Executive Orders 13985 and 14020.

information from the internet without consent.[16] Several lawsuits have been brought against Clearview AI in the United States for violations of federal and state statutes.[17] Over several years, scholars, advocates, and privacy agencies around the world have raised concerns over face-matching errors, algorithmic bias and discrimination, and its use against protesters engaged in First Amendment protected activity. Multiple legal scholars have also shared concerns over Clearview AI, specifically around social media scraping without consent.[18] Still, DHS continues to contract with Clearview AI, despite worldwide calls to freeze the Clearview AI contracts. Despite these problems, the DHS FC/FR policy failed to include basic protections such as notice to the individual (beyond opt outs for US citizens for non law enforcement use) or options for meaningful redress for individuals who are injured by these systems.[19] In short, the directive repeatedly claims that they will comply with civil rights and civil liberties but without sharing specifics with the public about how they will do that and whether their methods will be transparent and effective. The directive also does not provide additional protections for data collected or used through FC/FR, beyond "applicable authorities, statutes, regulations, information sharing and access agreements (ISAA), and policies."[20] DHS frequently includes this disclaimer in all its guidance and it has failed to protect the rights of affected groups, particularly around privacy and consumer protection. Lastly, DHS did not incorporate feedback from affected groups before releasing this guidance.

DHS already uses powerful social media surveillance tools, such as Babel X, designed for large scale monitoring of US citizens and immigrants.[21] Federal immigration officers have long engaged in a pattern of surveillance of—and outright retaliation against—individuals advocating for immigrants across the country.[22] A 2020 study identified over a thousand instances of alleged retaliation by government

officials against immigrant organizers during the Trump administration.[23] Federal agents, including DHS agents, in Portland, Oregon used social media programs on activists and protesters suspected of engaging in Black Lives Matter protests.[24] Many more activists, particularly activists advocating for Black Lives Matter, have been subjected to these technologies in many other states. These technologies are also not included on the AI inventories nor were affected and underserved groups consulted before their use and deployment.

For over 20 years, DHS has enrolled hundreds of thousands of people into mobile monitoring systems in their so-called "Alternatives to Detention" program but only released a privacy impact assessment in 2023.[25] Through a combination of ankle shackles and a digital shackling program, SmartLink DHS has enrolled nearly 200,000 immigrants, collecting "a trove of sensitive information, including personally identifying information, geolocation data, phone numbers of contacts, and vehicle and driver data."[26] This 20 year delay is unacceptable. Data about the ATD program is hard to find, and it is difficult to discover how the program operates.

Despite evidence of widespread misuse and privacy concerns, DHS routinely contracts with corporations that collect, use, sell or share personal and sensitive data of immigrants, their families, friends and communities.[27] Companies like RELX and Thomson Reuters possess dossiers on millions of people,

[27] *LexisNexis Under Growing Pressure to Sever Ties with ICE*, Chris Mills Rodrigo, The Hill, July 17, 2022. https://thehill.com/policy/technology/3564893-lexisnexis-under-growing-pressure-to-sever-ties-with-ice/(last visited Nov. 28, 2022); "How Data Brokers Assist ICE in Cook County," Mijente and Just Futures Law Fact Sheet, 2023, Available at: https://static1.squarespace.com/static/62c3198c117dd661bd99eb3a/t/65283e83622fff1ee8837590/1697136260425/Final+Cook+County+Fact+Sheet+and+Graphic+2.pdf; "American Dragnet - Data Driven Deportation in the 21st Century," Center for Privacy and Technology, Georgetown Law (2022), https://www.americandragnet.org/ (last visited December 4, 2023).

including more than two-thirds of U.S. residents.[28] Because AI/machine learning systems require vast amounts of data, DHS continues to procure data broker services despite concerns around improper or illegal data sharing or selling. In fact, DHS currently contracts with data brokers like Lexis/Nexis that collate and collect information from thousands of commercial data companies to create a suite of powerful surveillance tools that include "email addresses and IP address locations, real-time jail booking data, facial recognition services, and cellphone geolocation data analysis tools."[29]

DHS also lacks an internal enforcement body for civil rights compliance. As a law enforcement agency that conducts a blend of criminal and civil enforcement actions, DHS employees will use law enforcement and national security exemptions to escape civil liberties and civil rights oversight. Recently released AI policies reiterate a commitment to civil rights, but do not contain mechanisms on how those rights will be enforced. This is no different than what DHS does right now—a circular process that does not allow AI technologies to receive an independent review that assesses the rights of communities most impacted by these technologies.

The OMB guidance allows federal agencies to use the National Institute of Standards and Technology (NIST) or any "other appropriate agency office with existing test and evaluation responsibilities" for third party evaluations.[30] In the case of DHS, the DHS announced the Science and Technology Division of DHS, not the NIST, will lead AI evaluations and recommend mitigation practices.[31] The OMB guidance should prevent DHS S&T from developing an entirely new risk framework outside of the NIST framework, especially the requirement for independent evaluations.

Over its 20 year existence, we have seen DHS protocols and practices on raids, detentions, profiling, and surveillance radically shift administration to administration. This indicates that little to no meaningful infrastructure exists to address civil rights concerns and provide redress to affected groups and individuals that have suffered harm from these violations.[32]

II. Recommendations to OMB on the proposed guidance

1. The risk assessment framework is fundamentally flawed, and should be abandoned if the government's intention is to provide the strongest risk mitigation and rights protections.

---

[29] US Border Agency's Data Broker Deal Masks Spy Tools, Critics Say, Tonya Riley, Bloomberg Law, November 16, 2023. https://news.bloomberglaw.com/privacy-and-data-security/us-border-agencys-data-broker-deal-masks-spy-tools-critics-say (last visited November 26, 2023). Also, see articles and research on Lexis/Nexis at https://www.justfutureslaw.org/fighting-data-brokers.

[30] OMB guidance Sec 5(c)(iv)(C)

[31] See "Artificial Intelligence" website for DHS. https://www.dhs.gov/science-and-technology/artificial-intelligence

[32] See multiple reports on how DHS exploits data that are bought or shared by commercial entities, raising serious questions of civil rights, privacy, and confidentiality problems. Reports in multiple jurisdictions can be viewed here: https://www.justfutureslaw.org/take-back-tech-fellowship.

Alternatively, short of abandoning this framework, we suggest that you adopt recommendations 2 through 10.

The minimum practices mitigation tools outlined by OMB, including the additional minimum requirements for rights-impacting AI, have similar structural deficiencies as DHS's risk assessment tools that have been used by DHS and other law enforcement bodies for many years—and both purportedly aim to reduce civil rights violations and abuse in immigration enforcement and detention. Because law enforcement interests are deferred to in both, the calculus of civil rights abuses against the value of the technology defaults to favor technology. DHS has repeatedly demonstrated their ability to avoid these known risks in the field (e.g.privacy impact assessments are ineffective) and in the immigration courts, i.e. Executive Office for Immigration Review. Additionally, the risk assessment methodology forecloses the option of reviewing whether AI is even necessary at the outset.

For example, DHS routinely utilizes law enforcement exemptions to prevent the disclosure of vital information to an individual or their attorney, let alone the public, about what information is used by a data-driven system to result in an unfavorable outcome. This means the person has never been able to receive or contest information that has been used to make critical decisions in their case. DHS often releases privacy impact assessments (PIAs) to the public; however, PIAs do not contain enforcement mechanisms or meaningful requirements about how a person can correct or obtain the information. Several reports have examined DHS risk assessment tools, noting that they have failed to reduce the number of people in detention.[33] As a result, under these technology-use PIAs and risk assessment tools, prisons have expanded, police have become more militarized, and surveillance more invasive.

These problems necessitate incorporating the following set of recommendations if the OMB determines that the risk assessment framework is viable.

2. **The OMB guidance must further limit exemptions and waivers for intelligence and law-enforcement related AI technology and agencies, especially for DHS, and must release their decision-making on exemptions and waivers to the public.**

Under the OMB guidance, agency CAIOs carry enormous power to determine what risks matter and how they will be mitigated—this weakens accountability and threatens implementation of effective risk mitigation practices. DHS, like many law enforcement agencies, often avoids accountability mechanisms and procedures through routine use of law enforcement and national security exemptions, making DHS one of the least transparent federal agencies.[34] ICE refers to its "mission critical" use of the technologies

[33] Mary Ellen Callahan, U.S. Dept. of Homeland Sec., Privacy Impact Assessment Update for the Enforcement Integrated Database (EID) at 4 (Apr. 6, 2012), https://www.dhs.gov/xlibrary/assets/privacy/privacy_piaupdate_EID_april2012.pdf [https://perma.cc/4XLC-X6YS]

[34] "While many agencies use the exemption, the Department of Homeland Security uses it far more frequently than any other agency. In the last 10 years the department was responsible for more than half of the government's use of Exemption 5, ranging from a low of 54% in 2018, when the agency cited it 32,962 times, to a high of 83% in 2009, with 59,510 instances." "Information Act Exemption Still Needs to be Reined In," Nick Schwellenbach, POGO,

delivered by RELX and its subsidiary LexisNexis, Thomson Reuters, and other data collection companies; subsequently, ICE has not released details regarding the full extent of those services and how the agency employs them.[35] There is little reason to believe that DHS would comply with OMB draft policy and stop the use of FR systems like Clearview AI even if they fail to meet minimum standards. More likely, DHS will exploit the loopholes of the current OMB draft policy to ask for indefinite extensions and exemptions for the use of any of their AI technologies, even though their use of AI technology is among the most harmful use cases for right-impacting AI. The self-policing process helmed by the CAIO will only perpetuate problems around bias and discrimination.

3. **The OMB guidance should amend the purposes that are presumed to be rights impacting in Sec 5.b.ii.C:**
   More specifically, the OMB policy must:

- **Strike "[D]eciding immigration, asylum, or detention status" and add "[P]re-investigation, investigation, identification, assessment, review, determination, or adjudication of any immigration status, immigration benefit, federal benefit, asylum, detention, removability, exclusion, or for the purpose of immigration enforcement, including surveillance;"**
- **Add to end of Sec 5.b.ii.C: "Biometric collection (including face, iris, fingerprint, voice, gait, DNA) for immigration purposes**
- **Add a new category to Sec.5.b.ii. "Consumer products or information that are used, accessed or produced by credit bureaus or agencies, including consumer credit reports, credit ratings, credit header data, and credit reporting methods."**

The OMB guidance identifies and suggests mitigation protocols for certain AI technologies, including the risks for surveillance and violations of rights of communities impacted by policing or immigration.[36] We recommend adding the suggested language because it better captures outcomes or processes in the immigration system—from applying for a work permit to initiating an investigation for removal proceedings. Immigration enforcement has profound impacts on individuals, communities and children because of the scenario that people could be separated from their loved ones or family, which impact civil rights and familial rights. Moreover, it will better protect people who fall under statutory protections of asylum law and the Convention Against Torture.

Additionally, the OMB neglected to include biometrics, a core data collection item for most law enforcement and immigration functions. Most immigration enforcement tools, especially the AI tools, are procured to identify, surveil, monitor, track, detain and monitor noncitizens, their family members, or their associates and friends. Biometrics are some of the most personal and sensitive data and any use

[35] Ramirez et. al v. LexisNexis Risk Solutions, (N.D. IL 2022) 1:2022cv05384 https://static1.squarespace.com/static/62c3198c117dd661bd99eb3a/t/635c14235d4769714665c318/1666978851837/Castellanos+et+al.+v.+LexisNexis+Risk+Solutions+-+Complaint+%5BFor+Filing%5D.pdf

[36] OMB Guidance Section 5(b)(ii)

or collection should be designated as rights-impacting. DHS collects a huge amount of biometrics as part of routine immigration processing. For example, CBP has implemented a nationwide DNA Collection program that could be used to detain or separate family members. CBP is also incorporating AI for language access. This could impact how arriving persons access asylum-related protections or are charged with criminal offenses.[37] The ramifications of this collection and its incorporation into AI systems necessitates that biometric collection be viewed as risk-impacting.

Credit bureaus are of particular concern as the unregulated trade in credit header data facilitates data brokers' aggregation of data about particular consumers from a wide variety of data sources by enabling them to triangulate between the credit header data points and untold other sources. For example, a Big 3 credit agency like Experian may provide this data to another data broker and so on, until it flows together to one of the two major data brokers that aggregate data from thousands of sources, RELX and Thomson Reuters. These companies then sell access to hundreds of millions of comprehensive dossiers—which may contain errors about consumers—to public and private entities that may use them to deny a consumer access to housing, employment, or even to subject them to criminalization and deportation. Advocates have discovered ICE has contracts with many types of databrokers who obtain information from credit bureaus.[38]

4. **The OMB guidance should place the burden on the agency to demonstrate good faith efforts to implement the minimum practices and disclose those efforts to the public before obtaining a waiver, extension or exemption from the August 1, 2024 deadline for minimum practices compliance.**

Because the CAIO holds enormous discretion over what minimum standards can be waived or delayed, agencies can continue procuring AI technologies without meeting minimum standards. Moreover, the thresholds for acquiring a waiver are quite low. For example, the CAIO can waive a requirement if the requirement "presents an unacceptable impediment to critical agency operations."[39] A declaration from an ICE or CBP agent that the waiver would potentially interfere with any law enforcement or investigatory purpose could easily constitute an unacceptable impediment. DHS law enforcement related technologies are often characterized as necessary or critical to agency operations. DHS has already stated that AI will "greatly augment the arsenal of tools available to succeed against new and existing threats."[40] We believe the OMB guidance must do more to ensure that DHS' immigration enforcement tools do not evade minimum practices requirements.

[38] See letters to the Consumer Financial Protection Bureau and members of Congress on the troubling use of credit header data by ICE. https://www.justfutureslaw.org/fighting-data-brokers

[39] OMB Guidance Section 5(b)(iii).

[40] "Acquisition and Use of Artificial Intelligence and Machine Learning Technologies by DHS Components (DHS AI Policy)," Sec. II, Policy Statement 139-06 at 1, August 8, 2023. https://www.dhs.gov/sites/default/files/2023-09/23_0913_mgmt_139-06-acquistion-use-ai-technologies-dhs-components.pdf

5. **The OMB guidance should expand the list of risk considerations for "rights impacting artificial intelligence" to include broader definitions of privacy and consumer protection rights.[41] It should also recognize harms created by federal agency use of commercial data for AI/machine learning systems. The OMB guidance should explicitly recommend that minimum practices apply whether or not the subjects are non-citizens.**

Data brokers have incredible reach into the personal lives of affected and impacted communities and consumers. As data brokers employ more machine learning tools and algorithms, the harm created by unregulated data collection and sharing must be specifically addressed by the OMB guidance. Harmful and abusive practices by these data brokers violate consumers' financial rights, privacy, and civil liberties—prioritizing profit above consumer protection. For example, data brokers buy and sell hundreds of millions of names and addresses gathered by essential utilities companies without consumers' knowledge or consent—often in violation of consumer protection laws. Specifically, the guidance should recognize harms from 1) data harvesting from impacted communities, 2) third party data selling and sharing of commercial data by federal agencies, 3) unfettered use of biometrics collected by federal agencies, and 4) social media surveillance and collection, particularly against people engaged in First Amendment protected activities.

The first change that OMB must make to their draft policy is that OMB must add *consumer protection harms* among the list of harm considerations is one way to address the harms caused by data harvesting. For example, DHS runs millions of searches to generate target lists for deportation, under contracts with data broker companies like Lexis/Nexis or Thomson Reuters.[42]

Second, OMB should consider including the concept of collective privacy because worker and labor organizing or immigrants rights advocacy often mean that individual privacy and collective privacy are intertwined. Reducing the risk of retaliation against labor organizing or people engaged in protected First Amendment activity requires assessing the needs of organizing collectives engaged in that enterprise.[43]

Third, the OMB guidance should explicitly recommend that minimum practices apply whether or not the subjects are non-citizens. This is necessary because noncitizens and citizens alike are protected under the First Amendment. However, privacy law protections cover US citizens and Legal Permanent Residents; each administration elects to use or not use their discretion to extend privacy law protections to other noncitizens. This recommendation may reduce inadvertent exclusions of noncitizens, such as people who have been granted Temporary Protected Status holders, Deferred Action for Childhood Arrival, withholding of removal or Convention Against Torture relief.

[43] "Weaving Privacy and Power: On the Privacy Practices of Labor Organizers in the U.S. Technology Industry," Sayash Kapoor, Matthew Sun, Mona Wang, Klaudia Jazwinska and Elizabeth Anne Watkins, Center for Information Technology Policy, Princeton University. P. 23

6. **The Administration's reliance on artificial intelligence impact assessment (AIIA) tools as a core minimum standard certification requirement is short-sighted and should be abandoned. If AIIAs are used, the agencies should publicly disclose all data sharing agreements, including information sharing access agreements (ISAAs.)**

History has shown that privacy impact assessments have been ineffective in reducing privacy violations because law enforcement agencies have found ways to avoid privacy laws. Artificial intelligence impact assessments run the risk of following the same trend. Most AI technologies will be developed by vendors contracted by DHS. DHS has been unable to control how vendors collect, use or share sensitive data. Data may be shared with other commercial entities or other law enforcement bodies. In some cases, the data is not owned by DHS. Furthermore, redress options are opaque and inaccessible to the public. As a result, DHS sub agency privacy protocols have come under intense criticism by advocates and oversight bodies.[44]

One illustrative example is the Homeland Advanced Recognition Technology (HART), a next-wave biometric repository and data platform that would utilize artificial intelligence and machine learning technologies. Initially projected to cost $4.3 billion and years behind schedule in completing its first phase,[45] the Government Accountability Office and advocates criticized HART for significant privacy and civil rights implications for hundreds of millions of people. DHS has shrouded HART in secrecy with little oversight and few accountability mechanisms. The HART PIA included a handful of weak mitigation measures.[46] For example, US citizens and legal permanent residents could file a Privacy Act request under the Judicial Redress Act to learn more about their entry in HART.[47] Instead of disclosing data sharing agreements, DHS elected to refer to other use technology PIAs to explain how commercial data was to be used.[48] These measures were unproductive and worked against the principle of transparency.

7. **When the OMB develops "an initial means to ensure that AI contracts align with the guidance," the OMB should specifically elaborate when and how contracts are terminated or altered if they cannot meet the August 1, 2024 deadline or the rights-mitigating practices. OMB should require that federal agencies make public the process they will use for**

terminating or suspending AI products if the agency fails to meet rights-impacting mitigation practices.

We strongly recommend DHS terminate the Clearview AI contract and Lexis/Nexis contracts because these contracts fail to meet basic rights-mitigation practices.[49] The current guidance currently disincentivizes corporations contracting with federal agencies to follow the "minimum standards" because it does not specifically include federal procurement enforcement mechanisms, such as contract termination, for failing to meet the "minimum standards."[50] This means that federal agencies can continue to procure technologies that fail to meet minimum civil rights standards.

8. **The OMB guidance must (1) narrowly apply the law enforcement privilege to the AI inventory of federal law enforcement agencies such as DHS and DOJ, (2) enforce proposed reporting requirements for changes to the AI inventory and update them quarterly, and (3) require agencies to identify vendors in the AI inventory. Without these measures, technologies presenting the highest risks to rights will continue to face limited scrutiny by the public.**

Executive Order 13690 established requirements for federal agencies to set up AI product inventories.[51] Under this EO, federal agencies are required to "make their inventories available to the public, to the extent practicable and in accordance with applicable law and policy, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information." Subsequently, the OMB issued a circular providing more detailed guidance on inventory requirements and now recommends annual updates.[52] DHS has removed, re-inserted, and simply failed to include many AI technologies. DHS should follow the new OMB requirements and regularly report out, in a quarterly fashion, "additional detail on how they are using safety-impating and rights-impacting AI, the risks—including risks to equity—that such use poses, how they are managing those risks and any related extensions and waivers granted under Section 5 of this memorandum."[53] We believe this frequency is needed because of the scale and frequency of AI procurement within the agency. Moreover, this requirement will facilitate the ability of affected groups to engage with DHS on oversight over these technologies if they are aware of these changes. For example, data broker technologies and certain social media meta-analysis products, such as Babel X, have not been included. When DHS adds or updates technologies, the inventory should be promptly updated. Moreover, we strongly recommend including names of vendors in the AI inventory. This gives added transparency, which is necessary to move towards harm reduction in the use of AI by the federal government. Moreover, it is possible that a product from one vendor may be more harmful than another.

[53] OMB Guidance, Section 3a(iv).

9. DHS's role in the President's responsible development of AI requires strict oversight because of its poor record in civil rights, privacy and transparency.

DHS has set up a confusing series of accountability measures for so-called "responsible AI." The information regarding leadership and accountability measures are difficult to find on the DHS website. DHS established several task forces such as the AI Task Force[54] and the AI Policy Working Group[55] to advance and coordinate the deployment of AI. The documents are difficult to find and it is not clear how to identify locus points for accountability. However, civil rights agencies within DHS simply do not have enforcement authority under their own statutory mandates, making enforcement of civil rights violations in DHS unlikely.

Moreover, DHS is structurally ill-equipped to assume a leadership position[56] in the President's AI strategy for "responsible and ethically developed AI." DHS has an abysmal record of safeguarding privacy and protecting civil rights.

- Their own internal processes failed to protect immigrant communities and US citizens from a myriad of DHS programs widely recognized to systematically violate civil and human rights, such as the discriminatory travel ban called the Muslim Ban[57] and the separation of children from their families during the "zero tolerance policies" of the Trump Administration. As DHS grew to one of the largest jailers in the United States, its record of abuses within immigration detention centers have also grown—such as abusive detention conditions at the border through

[54] The AI Task Force (AITF) which will advance and integrate AI into DHS missions. The AITF includes a Responsible Use Group (AITF RUG) which is led by the DHS Office of Civil Rights and Civil Liberties (DHS OCRCL)."Establishing a DHS Artificial Intelligence Task Force," DHS, April 20, 2023. https://www.dhs.gov/sites/default/files/2023-04/23_0420_sec_signed_ai_task_force_memo_508.pdf. [57] "Five years after Trump's "Muslim Ban"," NPR, March 4, 2022. https://www.npr.org/2022/03/04/1084565893/five-years-after-trumps-muslim-ban (last visited November 26, 2023)

"hieleras,"[58] or sterilization procedures at the notorious Georgia prison, Stewart Detention Center.[59]

- Privacy controls within DHS fail to provide strong oversight of department wide privacy initiatives in DHS, especially when it comes to data flows and use within the agency.[60] In September 2023, it was discovered that DHS ignored privacy protocols involving commercial telemetry data and often did not protect against unauthorized access to sensitive and personal data.[61]

10. **Because DHS OCRCL has a poor record remediating civil rights abuses, OMB must strengthen civil rights protocols used by OCRCL.**

More specifically, the OMB must strengthen civil rights protocols used by OCRL, such as:

- **As a threshold measure, DHS OCRCL must provide a clear map of decision-making around the designation process for "risk-related" artificial intelligence and release their findings to their public, including the process they used to decide to "approve" an AI technology.**
- **DHS OCRCL should be required to release civil rights assessments on current AI products in use at DHS, focusing on facial recognition, risk assessment algorithms used in ATDs, and data broker systems.**
- **OCRCL must consult with affected groups before making a decision on procurement or use of AI/machine learning technologies, particularly in procurement decisions or ongoing monitoring of such products.**

We are deeply troubled that the DHS Chief Artificial Intelligence Office (CAIO) will rely on the DHS Office of Civil Rights and Civil Liberties (OCRCL) to mitigate the harms presented by AI technologies[62] because they are ineffective, weak and have failed to effectively intervene in major civil rights events through

DHS' 20 year existence.[63] Limited to policy development, OCRCL has *no* enforcement authority and has limited jurisdiction over enforcement actions, especially on matters where DHS coordinates with state and local law enforcement authorities.[64] Because it can only *suggest* policy to DHS, it is unlikely OCRCL will succeed in making DHS comply with civil rights and civil liberties mandates. Disturbingly, DHS' most recent AI policy articulates roles that OCRCL plays but does not disclose any decision-making so that the public can better understand why DHS OCRCL greenlit policies. Moreover, OCRCL's work and efficacy entirely depends on DHS priorities, which shift with each presidential administration.

OCRCL has also failed to surface concerns or rights violations in newly issued DHS directives and policy on AI, such as the "Use of Face Recognition and Face Capture (FR/FC) Technologies."[65] DHS OCRCL has failed to protect activists and organizers engaged in protected First Amendment activities, even when DHS used aggressive technology surveillance tools, such as social media scraping, against people who have fought for immigrant rights and civil rights.[66]

Conclusion

Our organizations represent a substantial constituency. Forty-six million people in the United States are foreign-born[67], with an estimated 16.2M in mixed-status families (a mix of US citizens, legal permanent citizens, other regularized statuses such as Deferred Action for Childhood Arrivals or Temporary Protected Status, asylum seekers, and undocumented people).[68] Immigrant communities are "underserved communities" per the Executive Order on Advancing Racial Equity, EO 14091, which defines "underserved communities" as populations as well as geographic communities that have been systematically denied the opportunity to participate fully in aspects of economic, social, and civic life.[69]

Voces Unidas RGV

Appendix: Summary of Recommendations

1. The risk assessment framework is fundamentally flawed, and should be abandoned if the government's intention is to provide the strongest risk mitigation and rights protections. Alternatively, short of abandoning this framework, we suggest that you adopt recommendations 2 through 10.
2. The OMB guidance must further limit exemptions and waivers for intelligence and law-enforcement related AI technology and agencies, especially for DHS, and must release their decision-making on exemptions and waivers to the public.
3. The OMB guidance should amend the purposes that are presumed to be rights impacting in Sec 5.b.ii.C:
    a. Strike "[D]eciding immigration, asylum, or detention status" and add "[P]re-investigation, investigation, identification, assessment, review, determination, or adjudication of any immigration status, immigration benefit, federal benefit, asylum, detention, removability, exclusion or for the purpose of immigration enforcement, including surveillance;"
    b. Add to end of Sec 5.b.ii.C: "Biometric collection (including face, iris, fingerprint, voice, gait, DNA) for immigration purposes
    c. Add a new category to Sec.5.b.ii. "Consumer products or information that are used, accessed or produced by credit bureaus or agencies, including consumer credit reports, credit ratings, credit header data, and credit reporting methods."
4. The OMB guidance should place the burden on the agency to demonstrate good faith efforts to implement the minimum practices and disclose those efforts to the public before obtaining a waiver, extension or exemption from the August 1, 2024 deadline for minimum practices compliance.
5. The OMB guidance should expand the list of risk considerations for "rights impacting artificial intelligence" to include broader definitions of privacy and consumer protection rights. It should also recognize harms created by federal agency use of commercial data for AI/machine learning systems. The OMB guidance should explicitly recommend that minimum practices apply whether or not the subjects are non-citizens.
6. The Administration's reliance on artificial intelligence impact assessment (AIIA) tools as a core minimum standard certification requirement is short-sighted and should be abandoned. If AIIAs are used, the agencies should publicly disclose all data sharing agreements, including information sharing access agreements (ISAAs.)
7. When the OMB develops "an initial means to ensure that AI contracts align with the guidance," the OMB should specifically elaborate when and how contracts are terminated or altered if they

cannot meet the August 1, 2024 deadline or the rights-mitigating practices. OMB should require that federal agencies make public the process they will use for terminating or suspending AI products if the agency fails to meet rights-impacting mitigation practices.

8. The OMB guidance must (1) narrowly apply the law enforcement privilege to the AI inventory of federal law enforcement agencies such as DHS and DOJ, (2) enforce proposed reporting requirements for changes to the AI inventory and update them quarterly, and (3) require agencies to identify vendors in the AI inventory. Without these measures, technologies presenting the highest risks to rights will continue to face limited scrutiny by the public.
9. DHS's role in the President's responsible development of AI requires strict oversight because of its poor record in civil rights, privacy and transparency.
10. Because DHS OCRCL has a poor record remediating civil rights abuses, OMB must strengthen civil rights protocols used by OCRCL, such as the following
    a. As a threshold measure, DHS OCRCL must provide a clear map of decision-making around the designation process for "risk-related" artificial intelligence and release their findings to their public, including the process they used to decide to "approve" an AI technology.
    b. DHS OCRCL should be required to release civil rights assessments on current AI products in use at DHS, focusing on facial recognition, risk assessment algorithms used in ATDs, and data broker systems.
    c. OCRCL must consult with affected groups before making a decision on procurement or use of AI/machine learning technologies, particularly in procurement decisions or ongoing monitoring of such products.

Re. Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum (Docket OMB–2023–0020)

Dear Ms. Martorana,

On behalf of Asian Americans Advancing Justice | AAJC, we submit our views on the request for comments on advancing governance, innovation, and risk management for agency use of Artificial Intelligence (A.I), docket No. OMB-2023-0020.

Asian Americans Advancing Justice | AAJC ("Advancing Justice | AAJC") is dedicated to furthering civil and human rights for Asian Americand and to promoting a fair and equitable society for all. We provide the growing Asian American community with multilingual resources, culturally appropriate community education, and public policy and civil rights advocacy. In the communications field, Advancing Justice | AAJC works to promote access to critical technology, services, and media for our consumers.

Question 3: How can OMB best advance responsible AI innovation?

Automated decision-making practices can be highly invasive and discriminatory towards communities of color, including Asian Americans. These processes may introduce bias into decision making processes, when it shows individuals different options for housing, employment, and credit opportunities or reproduces historical patterns of bias, it can result in illegal discrimination.[1]

For Asian Americans and other communities of color, the harms of automated decision-making practices are especially magnified for those who have Limited English Proficiency (LEP) or have been historically monitored and surveilled. Such individuals are vulnerable to privacy invasions, data breaches, and targeted disinformation. It is crucial that OMB consider how data collection and use practices have been

[1] https://www.brookings.edu/articles/fairness-in-algorithmic-decision-making/

intentionally manipulated, misused, and biased against these populations throughout history when developing guidelines for government agencies.

Data is not neutral and when decisions are made without addressing the discrimination embedded in the data, the results are inevitably also discriminatory. Many studies and and other data collection methods throughout history exclude Asian Americans, Native Hawaiian, and Pacific Islander (AANHPI) communities entirely from the data collection, limit data collection populations to only those who speak English, or fail to disaggregate any of the data. Up to 50% of AANHPIs have Limited English Proficiency (LEP)[2], and these populations are often in greatest need of protections and services. Any data collection methods that fail to reach and accurately represent the metrics of these communities excludes AANHPIs as a demographic group[3] and/or skews the data significantly by oversampling the most convenient groups (those that speak English proficiently). Even through the AANHPI communities are one of the most diverse and complex[4], data sets rarely ever disaggregate the data. For example, disaggregated data shows that LEP rates among Asian Americans and Pacific Islanders vary significantly:

- Among Asian Americans, nearly 12.3% of Japanese Americans have LEP while 57.6% of Burmese Americans have LEP.[5]
- The average LEP rate among Pacific Islanders also varies among different ethnic groups, from 14% of Micronesian Americans to 2.3% of Native Hawaiians.

Instead of documenting these differences these discrepancies are disregarded and Asian American, Native Hawaiian, and Pacific Islander demographics and experiences are conflated, lumping immensely different people into one group.

We have also seen how AI can reinforce and perpetuate existing biases in data. Recent studies on large language models found a disproportionate association made between Muslims and violence when using tools like GPT-3,[6] presenting an extreme risk in the use of AI when making decisions and determinations about individuals and groups of people. Until more research is done to debias AI tools that draw from inherently non-neutral data, the probability of discriminatory outcomes when using AI applications remains problematically high.

The data used to make automated decisions for many AANHPIs fails to accurately represent them, acknowledge, or include them at all. Representative data is necessary because omitting models' access to race or other protected categories can make discrimination harder to detect. Many variables are highly correlated with race, ethnicity, and gender making them proxy variables that models can still learn to discriminate based on. This means that even if the social identifiers were intentionally removed from the database, models that are not intentionally designed to avoid discrimination may still produce biased outcomes. Without contextualizing, fixing, and augmenting data with more accurate metrics, the data used to make decisions for the AANHPI community will continue to be inaccurate, biased, and ultimately

harmful. Data sets must be audited for fairness, inclusivity, accuracy, and transparency before they are used to make significant decisions for individuals.

Question 5: Are there use cases for presumed rights-impacting A.I that should be included, removed, or revised?

1. **Education**

AI plagiarizing-detecting tools are already widely integrated into schools and universities. For example, over 16,000 academic institutions rely on Turnitin to detect plagiarism. However, "Turnitin's tool was much more likely to flag international students' writing as AI-generated."[7] Flaws and biases in plagiarizing-detecting tools constitute genuine threats to international or ESL students' academic reputations and visa statuses. Beyond Turnitin, early research shows that AI generators in general are more likely to flag English as a second language (ESL) students' work as plagiarized, a high number of which are Asian American students. A Stanford study found that the plagiarism-detection software "...exhibit[s] significant bias against non-native English authors, as demonstrated by their high misclassification of TOEFL essays written by non-native speakers."[8] Importantly, these biased flaws in plagiarizing-detecting tools can harm academic reputations and even the security and safety of ESL learners and international students; A charge of academic misconduct, even one backed by false results from a plagiarizing-detecting tool, could lead to expulsion or suspension. For international Asian American students, this could threaten their visa status.[9] When assessing and mitigating disparate impacts, it is essential to recall that plagiarism-detecting AI tools have shown significant bias toward Asian American ESL students.

AI performance reflects and amplifies the conscious or unconscious bias of humans who code it and the data it draws from. This phenomenon is particularly alarming when integrating AI into college admissions processes. AI will often draw from stereotypes or use flawed data to make biased conclusions about applicants: "If success standards are defined by the data of a majority group, then the AI will have an implicit bias and default to excluding minority groups."[10] Moreover, the use of AI in admissions presents an issue of efficacy; there is a risk that AI fails to distinguish between cultural differences, putting minority applicants at a disadvantage and altering admissions unfairly. Specifically, drawing on stereotypes of Asian Americans poses a particularly harmful threat. The model minority myth or misconceptions of Asians as a racial monolith may lead AI to unfairly rate Asians as unsuitable candidates for admissions.

Schools integrate self-harm monitoring technologies into virtual classes with the intent of protecting students and flagging any behavior seen as a threat to one or many students' well-being. However, Black and other disadvantaged groups such as low-income students and other students of color, may experience

---

[8]https://www.cell.com/patterns/fulltext/S2666-3899(23)00130-7?_returnURL=https%3A%2F%2Flinkinghub.elsevier.com%2Fretrieve%2Fpii%2FS2666389923001307%3Fshowall%3Dtrue

[9]https://themarkup.org/machine-learning/2023/08/14/ai-detection-tools-falsely-accuse-international-students-of-cheating

[10] https://www.ism.edu/ism-insights/ai-and-bias-in-university-admissions-3.html

this form of monitoring as surveillance. As students whose racial identities are subjected to existing undue scrutiny, AI-based surveillance may be an additional resource for teachers and administration to target students unfairly. Moreover, with privacy concerns, LGBTQ+ students face a particular threat in that they may intentionally hide their identity for safety reasons. LGBTQ+ students may also be less likely to report incidences of abuse or hate, rendering these systems ineffective at preventing bullying and harassment.[11] The model minority myth may disadvantage Asian American students' well-being if AI fails to acknowledge or even consider warning signs in Asian American students. The model minority myth may lead AI to disassociate Asian Americans students with mental health struggles, leaving them undetected.

Despite misconceptions of AI and machine learning tools' objectivity and accuracy, these technologies rely on human programming and human data, both of which are inherently flawed and contain both conscious and unconscious bias. As a result, AI can make flawed assumptions based on stereotypes and therefore limit or misdirect students' access to education resources or programs. A Princeton University found that "For just about every kind of bias that's been documented in people, including gender stereotypes and racial prejudice, we were able to replicate it in today's machine-learning models."[12] Not only are these stereotypes replicated but certain AI models exacerbated stereotypes.[13] Given the proven potential bias of AI, it is plausible that in the education world, AI could unfairly dictate the educational resources students are available to. For example, in utilizing AI to aid students' access to educational programs, AI could disproportionately place male students in STEM programs or recommend students of color to take race-specific studies rather than cater to students' genuine interests. Integrating a biased AI model into schools could result in limiting the educational resources available to marginalized groups, such as women, low-income students, and students of color. AI may unfairly lead Asian Americanstudents to pursue stereotypically Asian-dominated programs/majors such as STEM majors. By limiting the resources available to Asian American students based on bias and stereotypes, AI will disadvantage Asian American students' autonomy over their education. AI may also connect Asian students with Asian language classes, inhibiting their ability to explore more diverse topics.

2. Immigration

While the OMB memo purports to lay out minimum practices as guide rails for the use of AI in safety-affecting or rights-affecting situations, the use of AI to make legal determinations raises particular concerns given the possible consequences of those legal determinations. The following information must be taken into consideration as part of the minimum practices outlined in the memo when it comes to immigration and education-related rights-affecting use of AI.

The OMB memo correctly identifies decisions about immigration, asylum, or detention status as a rights-affecting use of AI. Whether someone is a citizen, for example, has immense consequences for someone convicted of a crime. Unfortunately, existing databases are often inaccurate about immigration or detention status. ICE and CBP officers relying on such databases have previously detained and arrested U.S. citizens.[14] One contributing factor for these errors is that it is not always easy to determine whether

[11] https://studentprivacycompass.org/resource/self-harm-monitoring/
[12] https://www.cs.princeton.edu/news/bias-machine-internet-algorithms-reinforce-harmful-stereotypes
[13] https://www.bloomberg.com/graphics/2023-generative-ai-bias/
[14] https://www.gao.gov/assets/gao-21-487.pdf.

someone is a U.S. citizen, due to complexities in U.S. immigration laws.[15] The use of AI to make those complex legal decisions would be disastrous. Lawyers using AI in legal settings have been sanctioned for failing to meet the ethical standards for accuracy,[16] which indicates that it should not be used to make legal judgments.

We are significantly concerned about the use of AI to make risk assessments about individuals who intend to travel, or have already entered, the U.S. or its territories. Experts have noted the difficulties in precisely identifying what "risk" is in the context of AI vetting.[17] In the context of the "Extreme Vetting Initiative" proposed by the previous administration, experts noted that: 1) a lack of clear definitions would allow the government to arbitrarily flag individuals as risks; 2) even the best algorithms show an unacceptable rate of error when predicting rare events like crime and terrorism; and 3) such error (false positives) would have serious repercussions.[18]

The use of AI to control border access, including the use of facial recognition technology, raises similar problems, and already has shown bias toward certain populations.[19] The data sets used to train such technology are likely to further exacerbate existing disparities and biases, especially among communities of color, including people of Asian descent. The lack of diversity and representation in training data is evident in the data used in facial recognition technology. Machine learning modules learn based on the data they are given, and the majority of open-source facial image datasets are dominated with images of white men. According to a report by the National Institute of Standards and Technology (NIST), facial recognition systems were 100 times more likely to falsely identify West and East African faces and East Asian faces when compared to Eastern European faces.[20] This is especially concerning as immigration and federal law enforcement agencies use artificial intelligence and facial recognition technology for the purpose of monitoring and tracking migrants and other marginalized communities.

The use of AI tools in the "alternatives to detention" setting, or specifically as related to "physical location-monitoring devices" faces the same concerns as other uses of AI in this context. Since 2004 Immigrations and Customs Enforcement (ICE) has enrolled incoming migrants and asylum seekers into an alternative to detention program. While advertised as a humane solution to detention centers, reports suggest that this program causes migrants physical and psychological harm.[21] One of the most prevalent alternatives to detention is SmartLink, a phone application equipped with facial recognition technology (FRT). SmartLink requires that those enrolled in the program upload a photo of themselves during check-ins which is then matched to an existing photo on file using FRT, which raises the concerns mentioned above. In addition, the collection of location data can easily be used alongside other algorithms designed to predict the likelihood of criminal activities.[22] While predictions and decisions made by

[22] https://www.ojp.gov/pdffiles1/nij/grants/249888.pdf

artificial intelligence are perceived as objective, it's important to note that these models reflect the sentiments of society. For example an algorithm used to determine how likely a given defendant is to commit another crime for probation and parole, was twice as likely to incorrectly predict Black defendants as high risk than white defendants.[23]

Finally, the use of AI in translation should be approached with great caution. We recommend that no AI tools be used for interpretation, because of the undeniable propensity and gravity of consequences for mistranslated testimony and documents. As just one example, the use of AI translation to translate Pashto and Dari has had negative effects on asylum applicants from Afghanistan.[24] A report from the Guardian found that AI-powered tools are particularly unreliable for languages that are considerably different from English or less comprehensively documented.[25]

OMB should additionally establish further privacy protections to protect individuals and communities from having their personal data from being collected, stored, and sold without meaningful consent or explicit and limited acceptable use cases. OMB should use this guidance as an opportunity to establish data privacy policies for when government agencies develop, procure, or use artificial intelligence.

Question 6: Do the minimum practices identified for rights-impacting A.I set an appropriate baseline that is applicable across all agencies?

Due to language issues it can be more difficult for individuals with LEP to fully understand and exercise their privacy rights, making opt-out choices inadequate in ensuring consumers are protecting their data and instead puts them at increased risk to digital privacy threats. This poses a particular issue for the six million LEP AANHPIs who speak over 100 different languages other than English and who must navigate terms and services, privacy notices, and cookie settings that are laden with technical jargon and often inaccessible for English proficient users. This means that opt-out choices are ineffective in protecting those with limited English language abilities, who likely cannot understand the language used in cookie notices well enough to refuse data collection. In instances where translations exist, notices are difficult to comprehend, as they are often written in technical jargon or grammatically incoherent without review by a native speaker.

Language access is critical to address this problem because it would allow people in these communities to better understand what rights they have. Information centers, learning modules, notices, and other consumer resources must be available in non-English languages, publicized in-language with trusted community members and centers, and tested with users to ensure intended audiences can actually use the systems that are built for them. Translations must be accessible and understandable to individuals, especially those with lower digital literacy abilities. Opt-outs are only useful if users actually have the knowledge and ability to control their options.

[23]https://sitn.hms.harvard.edu/uncategorized/2020/fairness-machine-learning/
[24] https://restofworld.org/2023/ai-translation-errors-afghan-refugees-asylum/
[25] https://www.theguardian.com/us-news/2023/sep/07/asylum-seekers-ai-translation-apps

Federal agencies should ensure that all materials and communications, including communications regarding the use and implementation of A.I and any official agency communications, are written in simple English that can be easily translated. Only native-level speakers with deep knowledge of the community, cultural context, and familiarity with the vernacular should be utilized for translations. Community groups and leaders should be consulted before translations are published to ensure they are accessible and understandable to the target audience. Furthermore, some languages do not have written alphabets, posing unique challenges for groups like Rohingya refugees who do not have a universally accepted script and require additional in-language audiovisual support. Translations should also include PSAs on local ethnic broadcast stations and resources that community organizations can easily distribute to clients. It is critical that OMB establish guidelines that prevent agencies from using A.I to translate official communications and require that agencies use a native speaker for these translations to ensure accuracy and readability.

Provide further guidance to agencies on steps to assess and mitigate bias. 9
Strengthen and concretize the waiver process to clarify when waivers may be granted and increase transparency. 12
RFC Question 7: What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts? 13
Guide agencies towards AI-specific procurement policies that provide for pre-award vendor evaluation and post-award governance. 13
RFC Question 8: What kind of information should be made public about agencies' use of AI in their annual use case inventory? 18
Clarify guidance to ensure agencies' compliance with disclosure obligations. 18
Ensure the inventories' utility by establishing submission standards, quality checks, and a centralized inventory. 20
Establish AI inventories as the central place to report whether a use-case is deemed safety- or rights- impacting; whether a waiver was secured; and to publish any AI Impact Assessment 22
Prepare agencies for public requests for information 24
Conclusion 24

Introduction

The Center for Democracy & Technology (CDT) respectfully submits these comments in response to the Office of Management and Budget (OMB) Request for Comments regarding the draft memorandum for agency use of Artificial Intelligence (hereinafter "draft Memo"). CDT is a nonprofit 501(c)(3) organization that works to advance civil rights and civil liberties in the digital age. Among our priorities, CDT advocates for the responsible and equitable use of technology by government agencies, and promotes the adoption of robust, technically-informed solutions for the effective regulation and governance of AI systems.[1]

We commend OMB for its leadership in setting AI accountability policy. The draft Memo shows a continued commitment to advancing equity, civil rights, and innovation, and recognizes the importance of providing implementing guidance to ensure that commitment is carried out effectively and consistently across the federal government. CDT welcomes OMB's incorporation of key elements from the Administration's Blueprint for an AI Bill of Rights in the draft Memo's required minimum practices, such as requiring AI impact assessments, human consideration

[1] Center for Democracy & Technology, *Comments to Office of Science and Technology Policy on National Priorities for Artificial Intelligence* (Jul. 7, 2023), https://cdt.org/wp-content/uploads/2023/07/CDT-comment-to-OSTP-on-national-AI-strategy23.pdf.

and accountability, and notice and plain language documentation, as well as heightened requirements for uses impacting people's rights such as disparate impact assessments, opt-outs, and consultation with affected groups. These requirements are essential to effectuating the Administration's guiding principles for AI as set forth in the Executive Order on Safe, Secure & Trustworthy Development and Use of Artificial Intelligence.

Despite the strength of the Memo's guidance, there are several places where it should be bolstered to increase transparency to help agencies and the public better understand federal uses of AI systems, and to improve consistency and ease agencies' burden in interpreting the Memo. In addition, OMB must act quickly to issue further guidance on the key work streams needed to achieve the Memo's goals, including more detailed guidance on AI use case inventories, disparate impact testing, and the waiver process, as well as necessary updates to federal procurement processes and guidance.

RFC Question 1: *Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?*

Recommendation #1

The Chief AI Officer should have responsibility for, and issue guidance for, agencies' grantmaking for AI uses.

The draft Memo does not extend to grants and federal financial assistance, and in so doing fails to provide guidance on a central way in which federal agencies cause the development and use of AI systems. Already, federal agency grantmaking has directly led to AI misuses: for example, when public housing authorities used funding from the Department of Housing & Urban Development to purchase surveillance cameras not only to monitor crime–as HUD intended–but also to monitor and discipline residents.[2]

OMB should clarify that the responsibilities of the CAIO includes managing risks and providing resources for responsible grantmaking with respect to AI, and provide agencies with guidance to mitigate these risks. For example, OMB could:

- clarify that Chief AI Officers' responsibilities include managing risks from the use *"and federal funding of"* (draft Memorandum sections (3)(b)(ii)(J); (3)(b)(ii)(L));

[2] Dan Bateyko, *Taken for Granted: Where's the Oversight of AI and Federal Funding?,* Center for Democracy & Technology (Aug. 7, 2023), https://cdt.org/insights/taken-for-granted-wheres-the-oversight-of-ai-and-federal-funding/.

- clarify that the Chief AI Officer's responsibility to "maintain awareness of agency AI activities" includes AI-related grantmaking activities (section (3)(b)(ii)(B));
- clarify that agencies' compliance plans under the draft Memorandum should include grantmaking programs (section(3)(b)(ii)(C));
- provide, or direct a relevant office (such as 18F or USDS) to provide, guidance on supporting responsible AI development and use for agency grantmakers – for example by directing agencies to work with legal counsel to review grants that implicate AI before the award of funds using the substantive practices set forth in the draft Memorandum, and convening experts to grant review boards.[3]

Translating OMB's guidance on AI Accountability policy to grantmaking is in keeping with the Executive Order on Further Advancing Racial Equity,[4] which aims for agencies to have comprehensive equity strategy in their programs and policies, and OMB M-21-27, which urges the use of high-quality evidence in government decision-making.[5] Such guidance would reduce information silos and support grant reviewers that welcome timely consideration of grant applications by other agency staff.[6]

RFC Question 5: *Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?*

Recommendation #1

Periodically review the presumed use cases; provide clearer guidance for agencies to use the list.

The current list of presumed use cases is effective, and should not be altered by removing any items (we recommend several additions and clarifications below). The list reflects the Administration's extensive work and public consultation in developing the Blueprint for an AI Bill

[3] *Id.*
[4] The White House, *Executive Order on Further Advancing Racial Equity and Support for Underserved Communities Through The Federal Government* (2023), https://www.whitehouse.gov/briefing-room/presidential-actions/2023/02/16/executive-order-on-further-advancing-racial-equity-and-support-for-underserved-communities-through-the-federal-government/.
[5] Office of Management and Budget, M-21-27, EVIDENCE-BASED POLICYMAKING: LEARNING AGENDAS AND ANNUAL EVALUATION PLANS, (2021), https://www.whitehouse.gov/wp-content/uploads/2021/06/M-21-27.pdf.
[6] For more on agency grantmaking reforms, *see, e.g.* Eloise Pasachoff, *Federal Grant Rules and Realities in the Intergovernmental Administrative State: Compliance, Performance, and Politics*, YALE J. REGUL. (2020), https://openyls.law.yale.edu/handle/20.500.13051/8307.

of Rights, and is backed by a strong evidence base of harms documented in news coverage, policy reports, court cases, and academic literature.[7]

However, OMB should take further steps to ensure that agencies are consistently and appropriately interpreting the Memo. Specifically, OMB should:

- **Revisit and update the list of presumed use cases regularly**, with an opportunity for relevant experts and the public to recommend changes and provide comments (see further response on the process for soliciting public input in Q6).
- **Underscore that the list of presumed safety- and rights- impacting uses is not exhaustive** in any guidance, training, or other interactions, , and that agencies must conduct their own assessments to ensure that uses are appropriately designated.
- **Include specific examples of the presumed use cases** to help agencies understand them and recognize uses raising similar concerns (this could leverage the list of examples documented in the Administration's Blueprint for an AI Bill of Rights).[8]
- **Provide examples of how data that implicates protected characteristics – like disability or race – can be processed in ways that create rights-impacting concerns**, even when that data is not ultimately used in a decision-making context. Such examples would clarify to agencies how AI systems that seem to function in a facially neutral way may in fact harm particular marginalized communities, and would affirm that agencies are obligated to scrutinize such AI uses for unanticipated harms.[9]
- **Require that agencies identify in their AI inventories whether or not a use case has been deemed safety- or rights-impacting in its AI inventory, with a justification, by making this a mandatory field in the AI inventory**. This requirement would build off existing reporting by agencies, which already must report on outcomes of stakeholder

Brown et al., Center for Democracy & Technology, *Challenging the Use of Algorithm-Driven Decision-Making in Benefits Determinations Affecting People with Disabilities* (2020), https://cdt.org/insights/report-challenging-the-use-of-algorithm-driven-decision-making-in-benefits-determinations-affecting-people-with-disabilities/; Hannah Quay-de la Vallee, Center for Democracy & Technology, *Public Agencies' Use of Biometrics to Prevent Fraud and Abuse: Risks and Alternatives* (2022), https://cdt.org/insights/public-agencies-use-of-biometrics-to-prevent-fraud-and-abuse-risks-and-alternatives/.

[8] Office of Science and Technology Policy, *Blueprint for an AI Bill of Rights: Examples of Automated Systems* (2022), https://www.whitehouse.gov/ostp/ai-bill-of-rights/examples-of-automated-systems/.

[9] For example, the guidance lists "detecting or measuring emotions, thought, or deception in humans." An AI system might perform such functions to help detect and prevent suspicious behavior based on speech, eye contact, bodily movements, and similar data points. Because of how the system might be designed and how its outputs might be used, it could adversely affect people with disabilities, Black and brown people, and transgender people.

engagements that identify AI applications that are within the agencies' regulatory authorities.[10] Agencies' AI inventories should cite the regulatory authorities that apply to each use case, as this will provide further insights into whether the use case meets the guidance's definitions of rights- or safety-impacting AI.

Recommendation #2

Clarify the list of presumed rights-impacting use cases to include further law enforcement-related activities in immigration; uses in public housing; and uses targeting labor and collective bargaining.

OMB should clarify the draft Memo's application to certain AI uses in the immigration system which raise similar concerns to the use-cases listed in paragraphs 5(b)(ii)(B) and (C) but are not squarely covered by either paragraph. Immigration and Customs Enforcement (ICE) engages in law enforcement activities to investigate not just criminal, but civil and administrative law violations:[11] These activities include the use of AI for surveillance through license plate recognition, face recognition scans, DNA testing, and other functionalities.[12] Such uses are rights-impacting and far-reaching: one report finds ICE has used facial recognition technology on driver's license photographs belonging to 1 in 3 adults in the U.S.[13] The draft Memo should be amended to include the proposals in Just Futures Law's comment for Section 5(b)(ii) to expressly include processes in the immigration system, biometric collection, and the use of credit bureaus.[14]

The draft Memo should also expand to cover uses in public housing, such as the surveillance of tenants. Earlier this year, investigative reporting revealed that public housing authorities used "Emergency Safety and Security Grants" administered by the Department of Housing and Urban Development to purchase surveillance cameras—many equipped with face surveillance technologies. Those cameras were then used by housing authorities to surveil tenants, detect violations of lease terms (including those unrelated to tenant safety), and evict tenants.[15] As HUD has since advised, such uses were not eligible for the emergency grants.[16]

OMB should also amend the list of rights-impacting use cases to include "collective bargaining, workplace organizing, union membership, or concerted activity" in part G to further ensure the protection of workers from the use of automated worker surveillance systems that interfere with the right to organize for better and safer working conditions.[17]

RFC Question 6: *Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?*

Recommendation #1

Issue public guidance on analyzing AI risks to identify, evaluate and mitigate safety- and rights- impacting use cases, subject to stakeholder input.

The minimum practices require agencies to identify and analyze safety- and rights-impacting use cases. This welcome policy will face a persistent challenge: people fail to recognize high-risk AI uses. Even experts struggle. In one study, graduate-level computer scientists asked to pinpoint risks in an AI system made poor judgment calls over who was at risk, what the harms were, and what caused the harm.[18]

Agencies need to rely on more than their best guesses when identifying AI risks. Compounding the problem, agency officials have been given mixed signals through varying government definitions of what counts as "AI." Without good, consistent guidance, agency officials will struggle to classify AI,[19] as an Inspector General's report on NASA's AI management strategy illustrates:

> "Personnel we interviewed stated *they reported AI based on their own individual understanding of what the term means rather than a formal definition* provided by the

[17] *See* Center for American Progress's regulatory submission in response to this RFC for further detail.

[19] Chloe Autio et al., *A Snapshot of Artificial Intelligence Procurement Challenges* (2023), https://files.thegovlab.org/a-snapshot-of-ai-procurement-challenges-june2023.pdf (finding, e.g. "Civilian agencies like the Department of Transportation (DOT) describe a more conservative approach to AI procurement, given the agency's mandate to protect public safety.")

> Agency. As a result, NASA does not have a singular designation or classification mechanism to accurately classify and track AI or to identify AI expenditures within the Agency's financial system, making it difficult for the Agency to meet federal requirements to monitor its use of AI."[20] (emphasis added)

OMB should issue further guidance, provide support and establish oversight mechanisms to help agencies accurately categorize their uses. Any such guidance should be publicly available, and agency AI system classification accuracy should be regularly reviewed to evaluate the guidance's effectiveness. Additionally, OMB should implement any of the following to further support agency staff:

- **Stand up a cross-agency working group.** A working group, supported by OMB, can discuss implementation across agencies. Cross-agency information sharing will be vital, especially with statistical, scientific, and cybersecurity agencies with experience in managing datasets, AI tools, and their attending cybersecurity risks. Any products from these working groups could be made accessible to all agencies.
- **Designate a point-of-contact at OMB in charge of compliance and support for agencies in determining AI use cases.**
- **Consult with NIST on a standard for Algorithmic Impact Assessments (AIA).** There is no formal standard for an AIA. NIST could help develop and define this standard based on the level of risk presented, similar to how NIST established federal standards for information processing to determine whether risks have low, moderate, or high security impacts.[21] Agencies should be encouraged to add sector-specific additions to the AIAs. Such a standard, too, must be open to stakeholder feedback.
- **Improve guidance through public consultations and workshops inviting academics, civil society, and other impacted members of the public**. When engaging with those affected by an AI use case, OMB must meet them where they are by providing multiple ways to provide input.
- **OMB should provide clearer guidance to help agencies interpret the list of presumed safety- and rights-impacting use cases,** and **require agencies to disclose in the AI inventory whether an AI use case has been designated safety- or rights-impacting, with an explanation,** to help OMB and the public ensure consistency across agency interpretations.

Recommendation #2

Require AI Impact Assessments to document agency justifications for their AI uses *relative to non-AI options.*

The draft Memo requires agencies to document the expected benefit of an AI system, supported by specific metrics or qualitative analysis. This appropriate requirement pushes agencies to provide evidence that the AI system is a good fit to accomplish agency goals and related tasks. **To build on this culture of evidence,[22] OMB should require agencies to document the expected benefit *relative to other, non-AI options*.**

Documenting the benefit of AI relative to non-AI options has several upsides. First, agencies that document alternative options in an AI Impact Assessment will be prompted to consider efficacy risks particular to AI.[23] Second, agencies would provide a useful baseline to compare the AI's benefits and drawbacks for any affected groups providing feedback on whether to remove the AI from use when called for consultation under Section 5(v)(B). Lastly, instead of simply determining whether an AI system achieves its goal, having this additional point of comparison would allow agencies and people to determine if the goal could be better accomplished without AI.

This recommendation may require only a simple change to AI or Algorithmic Impact Assessments: for example, the Algorithmic Impact Assessment questionnaire hosted at CIO.gov asks respondents what other approaches to solving the problem were considered.[24] This and any similar sections should be amended to ask agencies to provide details about any non-AI approaches that were considered.

Recommendation #3

Provide further guidance to agencies on steps to assess and mitigate bias.

As part of the additional minimum practices required for rights-impacting AI, agencies must take steps to ensure that the AI will advance equity, dignity, and fairness, including proactively identifying and removing factors contributing to algorithmic discrimination; assessing and

[22] M-21-27, *supra* note 5.
[23] For risks particular to AI, *see, e.g.* Inioluwa Deborah Raji et al., *The Fallacy of AI Functionality*, in *2022 ACM Conference on Fairness, Accountability, and Transparency* 959 (2022), https://dl.acm.org/doi/10.1145/3531146.3533158.
[24] Federal Chief Information Officers Council, *Algorithmic Impact Assessment*, https://www.cio.gov/aia-eia-js/#/ (last visited Nov 29, 2023).

mitigating disparate impacts; and using representative data. For many agencies, these steps will involve creating wholly new processes requiring additional support from OMB.

For example, **OMB should issue guidance to agencies to address the lack of adequate demographic data used in identifying and removing algorithmic discrimination**. The Racial Equity EO 14091 directed agencies to create Equity Action Plans and for OMB to consider how the President's Budget can support these plans. One review of those plans found that 21 out of 25 agencies saw their lack of demographic data as a barrier to implementation.[25] While navigating this challenge is not unfamiliar in regulated and sensitive contexts such as employment, credit, and healthcare,[26] agencies have incentives not to collect demographic data or correct bias. In a Government Accountability Office report, one testimonial reflects how employees "prefer to remain unaware [of bias] because they consider this the safest way of proceeding" given risks of litigation and other anti-discrimination liabilities.[27] OMB guidance may help to structure and place appropriate guardrails around the gathering of demographic data to alleviate these concerns. To this end, a policy report from the Stanford Institute for Human-Centered AI offers OMB-relevant proposals, including:

- **Interpreting the Paperwork Reduction Act to speed up the gathering of demographic data** on surveys,[28]
- **Interpreting The Privacy Act to exempt bias assessments**, which fall under the exempt "statistical research" category,[29] and
- Promulgating **guidance for agencies around how to place technical and institutional protections around demographic data** to ensure it is only used for bias measurement and lawful bias mitigation efforts, and to build agency personnel's confidence in using the data safely.[30]

OMB should consider **providing advice on when agencies or their vendors should consider the use of imputation techniques such as BISG** (Bayesian Improved Surname Geocoding)[31] or

[25] Arushi Gupta et al., *The Privacy-Bias Tradeoff: Data Minimization and Racial Disparity Assessments in U.S. Government*, in 2023 ACM Conference on Fairness, Accountability, and Transparency 492 (2023), https://dl.acm.org/doi/pdf/10.1145/3593013.3594015.

[30] *Id.*
[31] *See, e.g.* Marc N. Elliott et al., *A New Method for Estimating Race/Ethnicity and Associated Disparities Where Administrative Records Lack Self-Reported Race/Ethnicity*, 43 HEALTH SERV. RES. 1722 (2008), https://pubmed.ncbi.nlm.nih.gov/18479410/; Kosuke Imai et al., *Addressing Census Data Problems in Race Imputation via Fully Bayesian Improved Surname Geocoding and Name Supplements*, 8 SCI. ADV. eadc9824 (2022), https://www.science.org/doi/10.1126/sciadv.adc9824.

proxies such as zip code to conduct bias analyses, taking into account the benefits and limitations of such approaches.[32] For some protected characteristics (such as race and ethnicity), such techniques may be readily available due to established use by industry and regulators for nondiscrimination purposes, while for others (such as sexual orientation or religion) there may be compelling reasons to avoid such an approach.[33]

Additionally, OMB should consider adding force to the requirement that **agencies test AI for significant disparities by requiring agencies (or their vendors) to search for a "less discriminatory algorithm" (LDA).**[34] Current computer science findings suggest that an "equally accurate, but less discriminatory alternative algorithm almost always exists."[35] These alternative algorithms are not apparent without proactive testing, but such testing generally imposes little cost, as the steps taken to compare model candidates before selecting one for use are already standard in the development of AI systems.[36] Agencies looking for mitigations to disparate impact might start by performing such a search or requiring an AI vendor show sufficient proof that such a search has been conducted.

In no case should a lack of demographic data be considered a free pass for agencies to avoid confronting potential discriminatory treatment or impacts of a system. **Agencies should be obligated to make best efforts to understand whether such impacts are likely**, even if doing so requires manual review of input data for obvious proxies or for qualitative analysis to identify potentially detrimental outcomes likely to fall most heavily on marginalized communities. In clarifying these minimum practices further, OMB will be following its concurrent obligation under the Racial Equity EO 14091 to embed equity into government-wide processes.[37]

Recommendation #4

---

[32] Under some conditions, methods like Bayesian Improved Surname Geocoding (BISG) may over- or under-estimate demographic disparities, but they are still useful in identifying directional disparities. See, e.g. Aaron Rieke et al, *Imperfect Inferences: A Practical Assessment,* ACM Conference on Fairness, Accountability, and Transparency (2022), https://dl.acm.org/doi/10.1145/3531146.3533140. However, improper use of imputation approaches can risk misrepresentation and reinforcement of social categories. [37] *Executive Order on Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government*, *supra* note 4.

Strengthen and concretize the waiver process to clarify when waivers may be granted and increase transparency.

Under the draft Memo, an agency may request a waiver to the minimum practices through its Chief AI Officer if fulfilling the minimum practices "would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations." Without further checks, such a waiver incentivizes agencies to skip the procedural requirements of the draft Memo. OMB can look to existing laws and practices for examples of how to improve the waiver process.

OMB can look to principles from administrative law for standards to review waivers. In reviewing agency justifications for skipping rulemaking procedures due to "good cause" or emergencies, courts have rejected certain arguments that would incentivize end-runs around procedural requirements. Those arguments include bald assertions of an emergency, the need to meet an agency's own efficiency goals, and the agency's aim to comply with a statutory deadline.[38] An agency-induced delay to meet its mission should not be cause for a waiver. OMB can also look to the Federal Communications Commission (FCC)'s forbearance rules. Under these rules, the FCC reviews telecom carriers' petitions asking the FCC to waive enforcement of its regulations, and will grant those petitions only if all requirements are met, including meeting the three statutory requirements.[39] The forbearance rules enumerate procedural requirements[40] relevant to waivers submitted to OMB.

OMB should further clarify its process for granting waivers and provide transparency into the process. The review process should include a **strong presumption against issuing waivers**. Further, OMB should provide **strong and clear standards for bulk waivers** contemplated at Footnote 25 of the draft memo, such as granting them only in extraordinary circumstances.

A related exclusion that requires further guardrails is the one allowing AI research and development to skip the minimum practices. Agencies that conduct **research and development**

that involves human subjects should not skip the minimum practice, given that such research may affect the welfare of human subjects.[41]

RFC Question 7: *What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?*

Recommendation #1

Guide agencies towards AI-specific procurement policies that provide for pre-award vendor evaluation and post-award governance.

Modern federal procurement policy is inadequate to ensure responsible AI practices. Improving contracting will necessarily involve improving acquisition planning.

The comments below begin with an illustrative table of how AI-specific risks will require the procurement process to change. We next present some high-level considerations for pre-award vendor evaluation and post-award governance. These **acquisition planning considerations can be implemented by formal changes to the Federal Acquisition Regulation (FAR), OMB central guidance, or at the discretion of individual agencies**.

The following chart from CDT's forthcoming report, *How to Not Buy Magic: Updating Procurement Policies to Support the Federal Government's Responsible Use of AI*, is illustrative of how procurement processes will need to change to manage AI-specific risks, as characterized by NIST.[42]

How NIST characterizes the AI-specific risk	How the risk might affect the procurement process
The data used for building an AI system may not be a true or appropriate representation of the context or intended use of the AI system, and the ground truth may either not exist or not be available. Additionally, harmful bias and other data quality issues can affect AI system trustworthiness, which could lead to negative	A hallmark principle of public procurement is that up-front competition will lead to the best vendor selection, but **adequate testing and monitoring of a solution in production will need to be built into procurement processes** because full evaluation is not possible *ex ante.*

[41] For how research may impact welfare, *see, e.g.* Office for Human Research Protections, *Dept. of Health and Human Services*, *The Belmont Report* (1979), https://www.hhs.gov/ohrp/regulations-and-policy/belmont-report/index.html.

[42] How to Not Buy Magic: Updating Procurement Policies to Support the Federal Government's Responsible Use of AI, (Center for Democracy & Technology, Forthcoming).

How NIST characterizes the AI-specific risk	How the risk might affect the procurement process
impacts.	
Intentional or unintentional changes during training may fundamentally alter AI system performance.	Procurement rules require formal processes (such as change orders or modifications) to address changes after "acceptance" of a service or supply. These **processes should be triggered when intentional changes are made, and when unintentional changes are detected or suspected** due to system performance.
Datasets used to train AI systems may become detached from their original and intended context or may become stale or outdated relative to deployment context.	Procurements are often structured toward the creation of long-term contracts (typically, 5 years). **Retraining AI will need to be built into procurements**.
AI systems may require more frequent maintenance and triggers for conducting corrective maintenance due to data, model, or concept drift.	Without effective management practices, there is a significant likelihood that "Operations and Maintenance" budgets will compete with "Development, Modernization, and Enhancement" budgets or incentivize **agencies to underinvest in post-award monitoring and improvement**.
Increased opacity and concerns about reproducibility.	A lack of transparency can create distrust and prevent accountability between government and industry and harm the public's trust in government. Appropriate **transparency and explainability requirements will need to be built into contracts** with internal technical expertise to analyze disclosures.
Difficulty in performing regular AI-based software testing, or determining what to test, since AI systems are not subject to the same controls as traditional code development.	Structuring procurements with appropriate evaluation criteria is already difficult. **Developing and tailoring appropriate evaluation criteria for AI will require additional technical capacity** within the government.
Inability to predict or detect the side effects of AI-based systems beyond statistical measures.	Without mature post-award governance models, it may not be clear **who has the legal and financial burden to deal with unintended consequences**.

i. Pre-award vendor evaluation

Agencies rely on vendors to evaluate performance, but vendors are exploiting confusion over what AI can accomplish.[43] The market for AI tools, particularly in the generative AI space, is filled with hyperbole.[44] In light of the unique risks from AI-based systems and the challenging market, OMB guidance should help prepare agencies for acquisition planning.

1. Advise agencies to prepare a template RFI or questionnaire in advance for market research.

OMB should lead in publishing a template questionnaire which would lay out requirements for responsible AI that agencies could then adapt according to their assessment of the needs they want an AI tool to meet. Such a template would serve two purposes: a template will help government agencies evaluate the market and signal to industry the government's goals for responsible AI. For example, the questionnaire could require vendors to explain:

- Their procedures for assessing and documenting their products' accuracy rates and disparate outcomes for marginalized groups
- Their governance over how their systems are used, and the systems' reliability for intended and likely actual uses
- The sourcing of training data and actual inputs, and representation of different demographics in this data
- Data minimization and other data protection measures applied to their systems, and how vendors provide for agencies to have and retain control over the data
- Procedures for monitoring and improving system performance, including through stakeholder engagement, as well as processing of complaints and appeals.[45]

Including such requirements in the template questionnaire would give agencies insight into vendors' practices that would streamline agencies' implementation of minimum practices when proceeding with a chosen system. Agencies would use responses to the questionnaire to refine their request for proposals (RFPs) and contracts. **OMB should lead not only by publishing this**

[43] *Id.*

[44] Sharon Goldman, *Princeton University's 'AI Snake Oil' Authors Say Generative AI Hype Has 'Spiraled Out of Control,'* VENTUREBEAT (Aug. 23, 2023), https://venturebeat.com/ai/princeton-university-ai-snake-oil-professors-say-generative-ai-hype-has-spiraled-out-of-control/.

[45] For further detail about these and other requirements agencies should consider, *see* Hannah Quay-de la Vallee and Natasha Duarte, Center for Democracy & Technology, *Algorithmic Systems in Education: Incorporating Equity and Fairness When Using Student Data* 27 (2019), https://cdt.org/wp-content/uploads/2019/08/2019-08-08-Digital-Decision-making-Brief-FINAL.pdf.

template, but also by educating agencies in how to use and evaluate responses to the questionnaire for AI procurement.

2. Empower agencies to use their authority to test systems before purchase.

Unlike in traditional procurement, vendor evaluation of AI relies more heavily on the vendor's assertions that a system works as described. These assertions are difficult to check without thorough vetting of the system in the context in which it is intended to be used. For that reason, agencies should consider "pre-evaluating" systems. Agencies already have the authority to conduct technical evaluations before making an award. **OMB should encourage agencies to use this authority to incorporate more rigorous evaluation methods such as "show, not tell" demonstrations**.[46]

3. Obligate Chief AI Officers to ensure all contracts for AI systems receive legal review.

Contracting offices have triggers and thresholds at which a contract must receive legal review. **A safety- or rights-impacting use of AI should be considered another trigger for a contract to be subject to legal sign-off.** Agency attorneys should ensure that acquired AI is consistent with civil rights laws, and EO 14091's requirement for agencies to deliver equitable outcomes.[47] Due to the harms arising from the use of personally identifiable information (PII) in AI, agency attorneys should also review how AI contracts implicate PII or otherwise pose privacy concerns.

4. Ensure procurement offices have adequate staffing and training.

In our forthcoming report in which we interview experts working with the federal government, multiple interviewees noted that there are not enough individuals within government with the time or expertise to oversee AI vendors.[48] **The government must grow its capacity to oversee AI vendors in order to innovate on AI uses.**

As the government grows to accommodate these **new skills, training modules, ideally incorporated into existing procurement curriculum, will help**. For example, the Digital IT Acquisition Profession (DITAP) program is one training model that might bring in new training

[46] *See, e.g.* Dept. of Homeland Security Procurement Innovation Lab, *PIL Boot Camp Innovation Technique 2 - Product or Technical Demonstration*, https://www.fai.gov/sites/default/files/periodic_table/PIL_Boot_Camp_workbook-Innovation_Technique_2.pdf**.** As we write in a forthcoming report, "if a vendor is unable to meet the government's requirements, the government would be better off eliminating them *pre-award*. To accomplish this requires the government to conduct pre-award evaluations and technical demonstrations." How to Not Buy Magic: Updating Procurement Policies to Support the Federal Government's Responsible Use of AI, *supra* note 42.

[47] *Executive Order on Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government*, *supra* note 4.

[48] How to Not Buy Magic: Updating Procurement Policies to Support the Federal Government's Responsible Use of AI, *supra* note 42.

specific to AI procurement. In this effort, the United States Digital Service and the Office of Federal Procurement Policy could work with DITAP providers to incorporate AI accountability policy into the curriculum, ensuring a broader reach of training.[49]

ii. Post-award governance

Post-award governance is critical to agency innovation in the use of AI. The realities of managing AI systems—realities such as training AI systems and assigning legal and financial responsibilities to any unintended consequences—must be handled with post-award governance practices. Such practices are often either unfamiliar to agencies or deprioritized.[50] Yet successful adoption of AI requires foresight and planning throughout the agency's use case. The responsibilities and costs for managing AI systems should be developed early in procurement. Agencies should also establish *redress processes*, to assign responsibility for fixing issues that occur in deployment. IEEE's forthcoming AI procurement standards for AI and automated systems may also be instructive in this stage.[51]

1. Advocate for the addition of specific reporting requirements that correspond to the AI RMF and AI Bill of Rights in the FITARA scorecard.

Agencies have improved their IT adoption and inventorying under the Federal Information Technology Acquisition Reform Act (FITARA) in large part due to the success of the FITARA scorecard, which grades agencies performance on implementation.[52] A **similar scorecard for responsible AI practices would likely similarly improve AI management**, because, as detailed in a forthcoming report, "every [expert] interviewee expressed doubt that agencies are meaningfully planning for post-award monitoring of AI."[53]

2. **Develop and publish an "oversight guide" for reviewing agency acquisition activities.**

OMB can **develop an "oversight guide" like that developed by GAO[54] for use by agency officials, congressional representatives, inspectors general, and civil society**. Such a guide would help these government actors and stakeholders monitor the responsible use of AI by offering example questions to ask and corrective actions to take.

RFC Question 8: *What kind of information should be made public about agencies' use of AI in their annual use case inventory?*

Recommendation #1

Clarify guidance to ensure agencies' compliance with disclosure obligations.

The AI Executive Order and draft Memo emphasize transparency as a key element of agencies' responsible AI governance. However, the Memo must be strengthened to achieve effective transparency, and to ensure that agencies interpret the guidance consistently in a manner that makes their disclosures useful to government actors and the public.

Currently, AI inventories are falling short of expectations, with agencies missing the mark on compliance, quality, completeness, and accessibility. Many agencies failed to publish inventories despite a previous Executive Order mandate: a review by Stanford Law scholars of 220 agencies found that 3 out of every 4 agencies potentially required to publish an AI use case inventories did not.[55] Moreover, agencies that did publish inventories often left them incomplete: a review by CDT in summer 2023[56] showed that agencies' entries ranged considerably from one-line descriptions to full paragraphs, with case summaries often using vague and inaccessible language that fails to convey the purpose of a tool, or whom the tool may affect. Entries typically lack dates, making it difficult to know when updates happened. Delays in reporting abound.[57] Agencies varied widely in where they host the inventory online and in which format, despite attempts by The Chief Information Officers Council (CIO Council) to standardize this process.[58]

OMB must take warning from this flawed start and issue clear, specific directives to make the AI inventories into the effective transparency tool the Executive Order and draft Memo envision.

---

[55] Christie Lawrence et al., *The Bureaucratic Challenge to AI Governance: An Empirical Assessment of Implementation at U.S. Federal Agencies*, in Proceedings of the 2023 AAAI/ACM Conference on AI, Ethics, and Society 606 (2023), https://dl.acm.org/doi/pdf/10.1145/3600211.3604701. Among 49 agencies with publicly known AI uses—including AI uses core to the agency's mission—nearly 50% did not publish an AI inventory. Notably, agencies with missions that significantly bear on equity concerns, like the Department of Housing and Urban Development, Small Business Administration, and U.S. Postal Service, have failed to publish known AI uses.

[56] Bowman Cooper, *Like Looking for a Needle in an AI-Stack, Center for Democracy & Technology* (Jul. 21, 2023), https://cdt.org/insights/like-looking-for-a-needle-in-an-ai-stack/.

[57] Lawrence et al., *supra* note 55 (*see,* Appendix D.)

[58] Federal Chief Information Officers Council, *Guidance for Creating Agency Inventories of AI Use Cases Per EO 13980* (2023), https://www.cio.gov/assets/resources/2023-Guidance-for-AI-Use-Case-Inventories.pdf.

Specifically OMB should:

1. **Clarify agencies' obligation to disclose AI uses and give specific guidance on permissible exceptions.**

OMB must emphasize agencies' obligation to disclose AI uses and give clearer guidance on permissible exceptions. Currently, the draft Memo states that "Agencies must only publicly report use cases to *the extent practicable and consistent with applicable law and governmentwide guidance*, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information."[59] (emphasis added)

This language, drawn from the 2023 Advancing American AI Act,[60] provides insufficient guidance for agencies to consistently interpret and effectuate the transparency goals of the Memo and AI Executive Order. OMB must guide agencies on how to interpret the language of the statute, by:

- **Clarifying in what circumstances reporting could be deemed "not practicable"** and ensure this language is narrowly construed.
- Giving **further explanation on how guidance regarding "sensitive law enforcement, national security, and other protected information"** should be interpreted. Such guidance is essential to avoid this exception being misused to avoid reporting, when the draft Memo expressly recognizes that many law enforcement uses are presumptively safety- and/or rights-impacting and warrant heightened scrutiny.
- **Clarifying the reporting obligations of sub-agencies and departments**.
- **Reinforcing to agencies that these inventories support stated objectives of the President** to support agency transparency, accountability, coordination, and innovation – and are not mere compliance exercises.
- **Reviewing, alongside other relevant parties and on a regular basis, agencies' determinations that systems may be exempt from public disclosure** and challenge overbroad interpretations where they are identified.

2. **Develop an annex for sensitive and classified use cases.**

The executive office should never be left in the dark about classified AI uses by federal agencies. The draft Memo currently exempts intelligence agencies from AI inventory requirements, and (as noted above) permits agencies to withhold reporting when consistent with law and guidance concerning sensitive law enforcement, national security and other protected

[59] Office of Management and Budget, Exec. Office of the President, *Proposed Memorandum for the Heads of Executive Departments and Agencies, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* (2023), https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf.
[60] Pub. L. No. 117-263, div. G, title LXXII, subtitle B, §§ 7224(a), 7224(d)(1)(B), and 7225 [Sec. 7225(a)(2)].

information. To ensure agency accountability and meet the information-sharing purposes of the AI Inventory while preserving secrecy obligations, **OMB should work with agencies to create a classified annex to the Inventory.** Such an annex should be made available to relevant oversight bodies like the House and Senate Select Committees on Intelligence, GAO, and the National Security Council. The annex at minimum should include the same kind of information the Department of Defense provides to OMB for its AI Uses not subject to inventory: namely, a summary of the AI Use, along with relevant metrics as laid out in Section 3(a)(v) of the draft Memo. Independent overseers, like the Privacy and Civil Liberties Oversight Board, should have a role in reviewing these disclosures.

3. **Lead by example.**

OMB and other offices within the Executive Office of the President should lead by example by publishing their own AI use cases in the consolidated inventory. The White House can set a precedent in transparent and responsible AI by proactively publishing details of their AI applications.

Recommendation #2

Ensure the inventories' utility by establishing submission standards, quality checks, and a centralized inventory.

1. **Establish basic requirements for AI uses case summaries**

A reader should understand the *what, why, when*, and *how* of each AI use case from its summary. Summaries in use case inventories currently miss that mark: some summaries tell us *what* the agency's goal is[61] but not *how* AI is involved and vice versa.[62]

To meet this criteria, **an AI use case summary should include the following**:

- What inputs the AI system uses
- What the AI system predicts or decides
- What is the agency's stated goal in using an AI system to fulfill the task
- How the agency will measure the success of the AI system

[61] For example, listings for the National Institutes of Health provide descriptions that simply state "Protection of Windows and Mac endpoints from Cyberthreats" or "This project will help to reduce the energy usage for producing chilled water to cool the NIH campus." Available at: Department of Health and Human Services: Artificial Intelligence Use Cases Inventory (last updated Aug. 2023), https://www.hhs.gov/about/agencies/asa/ocio/ai/use-cases/index.html.

[62] For example, a listing in the Department of Agriculture's inventory states: "AI-type statistical techniques are used to model predictive relationships between variables. We routinely use modeling approaches such as random forest, artificial neural networks, k-nearest neighbor clustering, and support vector machines, for statistical prediction." Available at: Dept. of Agriculture, *Inventory of USDA Artificial Intelligence Use Cases* (last updated May 2023), https://www.usda.gov/data/AI_Inventory.

- When the agency uses AI in a certain process
- How long the agency plans to use the AI system
- What departments or agency actors will use the AI system[63]

OMB can include such requirements in its revised memo, as well as change fields in the current inventories like "*where did/does the training data originate*" and "*What specific AI techniques were used"* from "optional" to "required".[64]
Providing guidance in the revised memo to this effect will better serve the Memo's transparency goals, promote consistency, and make OMB's role in administering the policy easier because agencies will adopt more uniform approaches from the start.

2. **Establish quality checks on agencies' Inventory submissions**

OMB must ensure agency submissions are complete and easily understood by the broader public. To maximize efficiency for OMB and agencies alike, this should be achieved through clear guidance and parameters at the data entry phase, as well as auditing**.** OMB should draw on guidance from Inspectors General for managing spending records,[65] including:

- **Provide example language and structured questions**
- **Ensure that entries (and modifications) are dated**
- **Consider minimum length requirements** for fields that warrant longer explanations, such as the AI Use Case Summary (clarifying that a 1-2 sentence submission is insufficient)
- **Instruct agencies to avoid jargon** and abbreviations[66]
- **Develop automated checks and controls** in the submission system, for example via required fields.

3. **Require the maintenance of a consolidated inventory and long-term recordkeeping**

The website *ai.gov* currently hosts an inventory consolidating agencies' disclosures, but the inventory does not appear to be mandated by the draft Memo or other documents (CIO Council

[63] For risks stemming from cross-departmental technical tool use*, see, e.g.* Mary Pat Dwyer and Rachel Levinson-Waldman, Brennan Center for Justice, *A Realignment for Homeland Security Investigations* (2023), https://www.brennancenter.org/our-work/research-reports/realignment-homeland-security-investigations.
[64] *Guidance for Creating Agency Inventories of AI Use Cases Per EO 13980*, *supra* note 58.
[65] U. S. Government Accountability Office, *DATA Act: OIGs Reported That Quality of Agency-Submitted Data Varied, and Most Recommended Improvements | U.S. GAO*, (2020), https://www.gao.gov/products/gao-20-540.
[66] *See, e.g.* Office of Inspector General, Dept. of Homeland Security, *DHS Has Made Progress in Meeting DATA Act Requirements, But Challenges Remain* (2020), https://www.oig.dhs.gov/reports/2020/dhs-has-made-progress-meeting-data-act-requirements-challenges-remain/oig-20-62-aug20 ("DHS did not use plain English language when reporting award descriptions as required. Officials used shorthand descriptions, abbreviations, or terminology that could only be understood by officials at the Department or component that made the award.")

instructions state only that use cases "will be linked at ai.gov.").[67] OMB should support efficient, centralized information-finding for the public and government actors alike, consistent with OMB's long standing open data policies.[68] This should include:

- OMB should **require the creation and maintenance of a central, consolidated inventory, with requirements to ensure consistency of data, ease of access, and the capacity to grow** to accommodate more frequent reporting.
- OMB should **publish a list of agencies that have yet to submit their required inventories** on AI.gov or another centrally findable location.
- **Create a mechanism for users to receive alerts** about updates and modifications to the consolidated inventory.
- **Make use cases accessible through programmatic means, like an API**[69]
- **Post the consolidated inventory data at data.gov**
- **Maintain an archive or other permanent historical record** of the inventory for users to see changes to the inventory over time
- **Support agencies that wish to voluntarily disclose or update** their uses on a regular basis.

Recommendation #3

Establish AI inventories as the central place to report whether a use-case is deemed safety- or rights- impacting; whether a waiver was secured; and to publish any AI Impact Assessment

1. **Require agencies to report in the AI inventory whether or not an AI use case was deemed safety- or rights-impacting, with a justification**

As noted in our response to Question 5, the draft Memo or implementing guidance should require agencies to **report in their AI inventories whether or not a use case has been deemed safety- or rights-impacting in its AI inventory, with a justification.** Such a step will help OMB, other agencies, and the public understand how agencies are interpreting their obligations under the Memo and consolidate this information in a centralized location for ease of use. Agencies' AI inventories should also cite the regulatory authorities that apply to each use case, as this will provide further insights into whether the use case meets the guidance's definitions of rights- or safety-impacting AI.

---

[67] *Guidance for Creating Agency Inventories of AI Use Cases Per EO 13980*, *supra* note 58.
[68] *See, e.g.* Office of Management and Budget, Exec. Office of the President, M-13-13, *Open Data Policy—Managing Information as an Asset* (2013), https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/memoranda/2013/m-13-13.pdf.
[69] *See, e.g.* api.data.gov, https://api.data.gov/ (last visited Nov 29, 2023).

2. **Require agencies to report in the AI inventory waivers from minimum practices, and OMB to conduct annual look-back of waiver use**

Under the draft memo, agency Chief AI Officers may grant waivers to the minimum practices, and must report to OMB detailing the waivers' scope, justifications, and supporting evidence. To ensure waivers are being appropriately and consistently evaluated across agencies, OMB should:

- Require agencies to report in the AI inventory entry for a use case whether a waiver was sought from minimum practices. Reports for rights- or safety-impacting systems that are granted waivers should be accompanied by an explanation of why such a waiver was granted. By publishing their written determinations, agencies will be acting with a commitment to transparency and accountability to the public, and help other federal agencies see what practices meet the standard set by OMB for waiver.
- OMB should evaluate the reports it receives from each agency to confirm whether reported uses are rights- or safety-impacting, and **publish an annual report analyzing the extent to which waivers are being granted appropriately for such uses**.

3. **Require agencies to publish AI Impact Assessments in a manner that is findable via their AI inventory submission**

For safety- and rights-impacting uses, OMB should require agencies to **publish their AI Impact Assessment (AIA) in a manner that is findable via their inventory submission** (for example, with a permanent link to an AIA for each use case included in their inventory submission). Public AIAs should, among other things, report any raw figures related to the agency's independent evaluation, like the number of items in each training dataset used by the system being evaluated, a breakdown of the demographic groups for whom the agency measured the system's impacts, and aggregated statistics about the system's outcomes specific to each demographic group. An abbreviated version may also suffice, should it contain answers to questions of high public interest like any prohibited uses of the AI, who has access and ownership, the number of users, any known causes of failure, and, if applicable, the vendor's terms of service.[70]

Recommendation #4

Prepare agencies for public requests for information

Lastly, agencies should be prepared for public follow up for further information. While OMB already instructs agencies to include an email address for public input in their inventories, it is

[70] *See, e.g.* a proposal for Ecosystem Graphs, which includes detailed fields for transparency in foundation models, Rishi Bommazani et al., *Ecosystem Graphs: The Social Footprint of Foundation Models*, Stanford Institute for Human-Centered Artificial Intelligence (2023), https://arxiv.org/pdf/2303.15772v1.pdf.

important that one or more individuals within each agency is formally designated to monitor that inbox and respond to inquiries and feedback in a timely manner. Agencies need to be responsive to public feedback on agency use cases.

Conclusion

We applaud the Office of Management and Budget (OMB)'s thoughtful work in developing the draft Memo, and its openness to receive public feedback on the proposed memorandum.

In revising the draft Memo, OMB should recognize the value and significance of this guidance, which, with effective execution, will play a significant role in effectuating the Administration's commitment to advancing safe, secure and trustworthy AI. The modifications suggested in this document are each designed to more effectively achieve the Memo and Executive Order's stated goals, by providing clarity and actionable guidance for agency decisionmakers, supporting consistency across agency interpretations, and easing administrative burden for OMB by prioritizing upfront guidance rather than post-hoc compliance efforts once agencies' work has already begun.

OMB's Memorandum and the resulting agency practices have the opportunity to establish the Federal government as a leader in responsible AI development, funding, and use – creating a model that will be looked to by state, localities, and other governments around the world. CDT thanks OMB for focusing on the important issue of advancing robust AI governance and strengthening U.S. leadership on responsible, rights-respecting innovation.

OMB Request for Comments

Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum

Organization: Future of Life Institute

Point of Contact: Hamza Tariq Chaudhry, US Policy Specialist. hamza@futureoflife.org

We would like to thank the Office of Management and Budget (OMB) for the opportunity to provide comments on OMB–2023–0020, or the Memorandum on 'Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence' (hereafter referred to as 'the Memorandum'). The Future of Life Institute (FLI) has a long-standing tradition of work on AI governance to mitigate the risks and maximize the benefits of artificial intelligence. For the remainder of this Request for Comment (RfC) document, we provide a brief summary of our organization's work in this space, followed by substantive comments on the Memorandum. The 'substantive comments' section provides responses to the questions outlined in the RfC. The 'miscellaneous comments' section offers general comments outside the scope of the questions outlined in the Federal Register. We look forward to continuing this correspondence and being a resource for the OMB's efforts in this space in the months and years to come.

About the Organization

The Future of Life Institute (FLI) is an independent nonprofit organization with the goal of reducing large-scale risks and steering transformative technologies to benefit humanity, with a particular focus on artificial intelligence. Since its founding ten years ago, FLI has taken a leading role in advancing key disciplines such as AI governance, AI safety, and trustworthy and responsible AI, and is widely considered to be among the first civil society actors focused on these issues. FLI was responsible for convening the first major conference on AI safety in Puerto Rico in 2015, and for publishing the Asilomar AI principles, one of the earliest and most influential frameworks for the governance of artificial intelligence. FLI is the UN Secretary General's designated civil society organization for recommendations on the governance of AI and has played a central role in deliberations regarding the EU AI Act's treatment of risks from AI. FLI has also worked actively within the United States on legislation and executive directives concerning AI. Members of our team have contributed extensive feedback to the development of the NIST AI Risk Management Framework, testified at the Senate Insight Forums, participated in the UK AI Summit, and helped connect leading experts in the policy and technical domains to policymakers across the US government.

FLI's wide-ranging work on artificial intelligence can be found at www.futureoflife.org.

SUBSTANTIVE COMMENTS

Comments in Response to Questions 5 and 6 from the Federal Register: Definitions of and best practices regarding safety-impacting and rights-impacting AI.[1]

The Memorandum establishes a clear minimum threshold for safety (Section 5,c,iv) that must be attained before agencies are allowed to use AI systems, applicable to both systems being used presently and those intended for use in the future.[2] The requirements for these agencies - which include impact assessments, real-world testing of AI systems before deployment, independent evaluations and periodic post-deployment testing - are a positive step towards minimizing the safety risks from government use of AI models.

We would, however, welcome further details for agencies on the periodic reviews that occur post-deployment to specify that these reviews would also include red-teaming and other auditing processes that make up portions of the pre-deployment review process. In addition, while we appreciate the inclusion of language prohibiting agencies from using AI systems in cases where 'the benefits do not meaningfully outweigh the risks', we invite the OMB to support this language with quantitative examples, as risks may capture both probability and magnitude of harm, especially in the case of safety concerns. For instance, even if the probability of any given risk is found to be considerably lower than that of potential benefit, the magnitude of a risk (e.g., a bio-weapon attack) may be so high that it overrides the benefit despite being of low probability. Agencies should be required to establish, subject to public comment and external review, risk tolerances for activities for which use of AI systems is anticipated, including unacceptable risks to individuals, communities, and society that would disqualify the system from adoption. Establishing these thresholds prior to testing and adoption would help prevent drift in risk tolerance that could gradually rise to insufficient levels.

The Memorandum provides adequate definitions for two categories of potential harm posed by AI systems - safety-impacting AI systems and rights-impacting AI systems. FLI, which predominately focuses on AI safety, supports the broader definition of safety-impacting AI systems offered in the Memorandum, which captures a more expansive set of AI models and does not rely on technical thresholds. We believe this best

[1] 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

[2] We are particularly pleased to see that the scope of this Memorandum applies not just to use and application of AI systems in the future, but also those currently in use by relevant agencies.

positions the executing Agencies to exercise appropriate oversight over use of AI models. In addition, we are pleased to see that under the proposed definition, many models are *presumed* to be safety-impacting (Section 5,b). This is critical as it relieves relevant agencies of administrative burdens and time delays that would otherwise occur in evaluating each system with risk assessments, instead allowing them to devote more time and resources to setting up adequate guardrails. On the same token, we are pleased that additional risk assessments can be conducted to expand the scope of systems receiving due scrutiny. .

Finally, when it comes to 'use of AI', we support efforts to include cases in the Memorandum of procurement in addition to direct use (Section 5, d). However, the language of the Memorandum currently forwards guidance on procurement and contracts not as a set of requirements but as a set of recommendations. It is imperative that the OMB set up robust *requirements* for government purchasing of AI systems that mirror requirements on direct use, ensuring that procurement of AI systems includes consistent, robust evaluation to protect the safety and rights of the American public. This has the potential to minimize harm from government use of AI, and to inform best practices for the private sector, where most of that state-of-the-art models are created.

Comments in Response to Questions 1 and 2 from the Federal Register: Role of Chief AI Officer and the benefits and drawbacks of central AI governance body.[3]

We agree that effective oversight of AI adoption by government agencies should rely on AI governance bodies within each agency to coordinate and supervise AI procurement and use across the broad functions of the agency.This structure facilitates oversight and accountability to ensure that minimum requirements as set out in the Memorandum are met by each agency writ large, while giving different offices within each agency the capability to exercise their mandate when it comes to specific use cases. In addition, we believe such a body can facilitate effective communication across different offices, bureaus and centers within the agency to ensure that poor communication feedback does not lead to under-reporting of use cases or use of AI that could lead to potential harm. Finally, we believe such a body would appropriately empower the Chief AI Officer (CAIO) to exercise their mandate as specified in the Memorandum.

---

[3] 1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?
2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

However, we contend that this "hub and spoke" structure of a centralized AI governance body coordinating and overseeing domain-specific AI governance should be implemented on a whole-of-government level. In other words, we believe that just as there are benefits to having a new central body *within* each agency that helps enforce requirements laid out within the Memorandum, these bodies themselves would benefit from a single governance body that has representation and oversight *across* different agencies. This would facilitate interagency coordination, provide a central hub of expertise to advise agencies where appropriate, avoid costly redundancies in efforts by various agencies, and provide a body to inform and evaluate government AI adoption where domain-specific agency jurisdiction is not clear.

Comments in Response to Question 8 from the Federal Register: Nature of information that should be publicly reported by agencies in use case inventories.[4]

While we welcome provisions within the Memorandum which require annual reporting of use cases of covered AI systems by the relevant agencies (Section 3, a), we are concerned that further elaboration is not provided by the OMB on the details of these use case inventories. We believe that the public should have access to information on the full results of the impact assessments, real-world testing, independent evaluations, and periodic human reviews, wherever possible. Where it is not possible to provide this information in full, we believe it is vital to provide redacted iterations of these documents upon the filing of a Freedom of Information Act (FOIA) request. Secondly, considering that there is some precedent of agencies neglecting to report all use cases in the past, we believe that the Memorandum would benefit from having explicit provisions to guard against under-reporting of use cases. This could, for instance, include guidance for Inspectors General to audit these use cases periodically within their respective agencies. Finally, while we recognize this as a positive first step towards creating transparency in use cases, we emphasize that this does not ensure sufficient accountability in and of itself, and will require further guidance and requirements on empowering the OMB and the CAIOs, and other relevant authorities, to take against violations of use case guidance set up in the Memorandum.

MISCELLANEOUS COMMENTS

Comments on Scope

Section 2 ('Scope') explicitly exempts the intelligence community ('covered agencies', Section 2, a) and cases where AI when it is used as a component of a national security system ('applicability to national security systems', Section, c). As the Memorandum is

[4] 8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

intended to minimize the risks of government use of AI systems, we believe it is critical to establish robust requirements for the intelligence and defense communities, as these are likely to be the highest risk cases of government AI use with the greatest potential harm, and hence the most urgent need for scrutiny. Where it is within the remit of the OMB to set up requirements within these domains, we ask that they urgently do so.

Comments on Definitions

We are pleased to see that Section 6 ('Definitions') outlines an expansive definition of "artificial intelligence" that is broader than the definition offered in the AI Executive Order. In addition, we support that the Memorandum's description of AI systems encompasses all those across different ranges of autonomous behavior, technical parameters and human oversight. However, we believe that it is vital to ensure that the definition of AI employed in this section is treated as an 'or' definition as opposed to an 'and' definition. In other words, we believe that any system which fulfills any of these criteria should fall within the definitional scope of AI. For the same reason, we are concerned that the definition of 'dual-use foundation models' mirrors the definition included in the AI Executive Order, which offers an 'and' definition leading to very few models coming under definitional scope, and potentially excluding those which pose safety risks but do not meet other criteria.[5]

The Memorandum also employs the AI Executive Order definition for 'red-teaming'.[6] While this definition outlines *what* red-teaming would cover, it does not provide any detail on how rigorous this red-teaming must be, and for what period within the lifecycle of the AI system. We support further clarification from the OMB in this regard to ensure that red-teaming as defined in guidance adequately tests models for safety harms for the duration of their procurement and use.

---

[5] Section 3 of the AI Executive Order defines such as model in the following way: “dual-use foundation model” means an AI model that is trained on broad data; generally uses self-supervision; contains at least tens of billions of parameters; is applicable across a wide range of contexts; *and* that exhibits, or could be easily modified to exhibit, high levels of performance at tasks that pose a serious risk to security, national economic security, national public health or safety, or any combination of those matters.” (Emphasis added).

[6] Section 3 of the AI Executive Order defines red-teaming as: The term “AI red-teaming” means a structured testing effort to find flaws and vulnerabilities in an AI system, often in a controlled environment and in collaboration with developers of AI. Artificial Intelligence red-teaming is most often performed by dedicated “red teams” that adopt adversarial methods to identify flaws and vulnerabilities, such as harmful or discriminatory outputs from an AI system, unforeseen or undesirable system behaviors, limitations, or potential risks associated with the misuse of the system.

We endorse the OMB's decision to establish a broad definition for what would count as 'risks from the use of AI' as well as the expansive definition of 'safety-impacting AI'. However, we recommend the addition of loss of control from use of AI systems to the considerable list of risk factors identified in the definition of 'safety-impacting AI'.

Comments on Distinguishing between Generative and Other AI

We believe that all advanced AI systems, whether they are generative or otherwise, should be subject to appropriate requirements to ensure safety. Hence, we are pleased to see that, in a slight divergence from the AI Executive Order, the Memorandum bases requirements on potential harms from AI and does not distinguish between generative AI and other AI systems.

Re: Request for Public Comment on Draft Memorandum - *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI); FR Doc. 2023-24269, 23 Nov. 2023.*

Dear Ms. Martorana,

On behalf of The Leadership Conference on Civil and Human Rights (The Leadership Conference), its Center for Civil Rights and Technology, and the undersigned organizations, we write in response to the Office of Management and Budget's (OMB) *Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum* (Memo). The Leadership Conference is a coalition charged by its diverse membership of more than 240 national organizations to promote and protect the civil and human rights of all persons in the United States. Through its membership, its Center for Civil Rights and Technology, and its Media/Telecommunications Task Force, The Leadership Conference works to ensure that civil and human rights, equal opportunity, and democratic participation are at the center of communications, public education, and technology policy debates. We have been actively engaged in policy development to ensure civil rights are central to the development and use of new technologies, especially where those technologies are rights and safety impacting.

Introduction

As AI systems and tools are being adopted across a broad range of agency tasks, including those that impact individuals who are the most marginalized, the provisions of the OMB Memo are imperative.

With the Memo, OMB is taking a significant step in ensuring AI is effectively governed across the federal government. New agency requirements and guidance for AI governance, innovation, and risk mitigation, including through specific risk management practices for

uses of AI that impact the rights and safety of the public, are critical. While AI has the potential to improve operations and efficiency across the federal government, those outcomes will only be achieved if people impacted by those systems trust the decisions being made and are not harmed by them. The Memo provides actionable guidance to agencies that sets out how to ensure the use of AI upholds our democratic values and earns that trust.

Here we underscore important elements of the Memo that should not be diluted as the draft is finalized, as well as offer some suggestions for improvement:

AI systems and tools must be shown to be safe, trustworthy and enabling of right protecting outcomes before it is put into use. The Memo centers equity and rights. In an August 4, 2023 letter to the White House, leading civil rights and civil society organizations said, "(F)ederal agencies funding, acquiring, or using an AI system have a responsibility to ensure that the system works and is fit for purpose." The groups further urged that the federal government should not use AI systems unless they are shown to be effective and safe. No definition of safe and effective is meaningful unless it is explicit and clear that it includes being non-discriminatory and non-violative of civil and human rights. Simply put, AI should work, and work for everyone.[i] Therefore, it is right that protecting civil liberties and advancing equity should be at the center of the Memo. The American public should be protected against existing and potential harms from AI, including threats to people's rights, opportunities, jobs, economic well-being, and access to critical resources and services.

The marginalized communities served by the different agencies across the federal government are those that bear the most risk from the use of untested and unsafe AI systems. People expect that risks associated with other regulated products will be identified, mitigated, and made known. Likewise, we expect that AI technology is safe and effective –i.e. that it works for everyone.

The Memo builds on administration actions to ensure equitable AI and address AI harms. People who face discrimination on the basis of race, ethnicity, national origin, religion, sex, sexual orientation, gender identity, income, immigration status, or disability are more likely to be harmed by automated systems and often lack the resources to respond to harms when they occur. These harms are well documented and span numerous sectors, including housing,[ii] employment,[iii] financial services and credit,[iv] insurance,[v] public health and health care,[vi] education,[vii] public accommodations,[viii] government benefits and services,[ix] and policing.[x]

The Memo continues the measures this administration has already taken to begin the process of mitigating the risks of AI, including Executive Order 14091 ("Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government"),[xi] the AI Bill of Rights, NIST's AI Risk Management Framework,[xii] the 2023 National AI Research and Development Strategic Plan,[xiii] and the plan for the National AI Research Resource.[xiv] Executive Order 14091, for example, instructs federal agencies to use all of their available authorities to combat algorithmic discrimination.[xv] The National AI R&D Strategic Plan calls for investments in technical research to develop frameworks for accountability, fairness, privacy, and bias, as well as research to understand and mitigate the social and ethical risks of

AI.[xvi] These efforts provide a strong basis for a national AI strategy that is centered on equity and civil rights. These efforts, and their operationalization as detailed in the Memo, are crucial.

The Memo puts in place appropriate and reasonable requirements. We appreciate the administration's continued commitment to equity and civil rights related to the development and use of AI. These values underpin our democracy and are reflected in the Memo. Prior to procuring, using, or funding powerful new AI technology, agencies must also ensure that the technology works. That means that the technology has had sufficient, transparent testing to ensure that it will produce intended, fair, equitable, and unbiased results and will not produce inequitable outcomes for historically disadvantaged groups.

Ideally, these AI systems would be designed, procured, and deployed with equity in mind, wherever possible. The Memo delivers on this outcome by providing appropriate and reasonable guidance to agencies looking to use AI. These requirements in the Memo are critical to achieving the administration's goal to advance equity and protect civil rights and need to be kept in the final version.

The Memo puts the rights-protecting principles of the AI Bill of Rights into practice across agencies. The Memo lists categories of "right-impacting" AI uses that trigger risk assessment and mitigation requirements. It also provides a process for identifying future rights-impacting AI that would put those uses in scope and trigger risk management and other requirements detailed in the Memo. Recognition of use cases that are rights or safety impacting is significant and necessary for agencies to take action to implement appropriate safeguards. Not surprisingly given the ubiquitous adoption of AI, that list is broad. Given the rapid speed of the creation of new technology, and the use of existing system in new ways, it is important that the Memo provides the opportunity to add additional AI use cases. It is also vital that the Memo calls for transparency, as well as human review and recourse, and applies those requirements across the federal government. Taken together, these safeguards will help ensure that the American public will be broadly protected, as well as realize potential benefits.

By focusing on agency governance structures, the Memo appropriately includes provisions that will help ensure AI is properly managed. A sound AI governance structure, including through the appointment of Chief AI Officers (CAIOs), actionable measures to ensure cross-agency coordination, and staff training, is an important starting point. A clear reporting structure, with defined roles and responsibilities and with appropriate authority and resources, will be necessary for the implementation of the Memo's requirements. Cross-agency coordination, and collaboration across the federal government, will help ensure consistency in the implementation of AI policy. Staff guidance is also critical to meet the Memo's objectives. For example, training on how to conduct assessments, real-world testing, and ongoing monitoring, as well as determinations called for by the Memo, such as whether an AI use case is rights-impacting, will help ensure compliance with it. Compliance plans will help keep agencies on track and accountable for achieving consistency with the Memo. Likewise, detailed AI use case inventories, as well as reporting on use cases deemed to be not subject to the inventory, will help provide the means to hold agencies accountable.

The Memo appropriately focuses on ensuring that innovation is equitable and used to benefit the public. As AI becomes more prevalent in society, we must consider both the benefits and challenges of incorporating these tools into daily life, including by government agencies. With the widespread use of AI, individuals are grappling with the impacts of discriminatory rights-impacting systems, leading to the loss of economic opportunities, higher costs or denial of loans and credit, adverse impact on their employment or ability to get a job, lower quality healthcare, and barriers to housing. Just because an AI system is available does not mean it should be put to use. Questions about the systems, including whether they are suitable or fit-for-purpose, as well as whether better alternatives are available, must be asked.

Even with these concerns, we recognize that AI offers the potential to expand opportunities and ensure people are treated fairly, but only if innovation is equitable. There cannot be responsible AI without equitable innovation. To that end, the Memo should be clear that equitable innovation, not just innovation, is a priority and should include metrics for agencies to facilitate ensuring public benefit remains at the core of use of technology. This is an aspect of AI where civil society and civil rights groups, including those organizations that represent diverse communities, can provide constructive views as agencies move forward to implement the Memo.

Risks from right-impacting and safety-impacting AI must be managed. Just as we know of the harms biased and broken AI systems can cause, we know what can be done to identify, prevent, or mitigate those harms. The Memo includes concrete, measurable, and scalable actions that agencies will be required to take to ensure that AI systems work, and risks are managed. In fact, these actions reflect practices already discussed in tech policy, such as the EU AI Regulation, and reflect the "responsible AI principles" adopted by many companies and industry sectors. We agree that agencies should consider disparate impact relative to the use of AI and that requirement should remain in the Memo.

The Memo's success will rest on how well it guides agencies toward more beneficial and equitable outcomes and whether it focuses agencies on making decisions based on democratic values, such as fairness, safety, privacy, inclusiveness, transparency, and accountability. To that end, the Memo includes the following sound requirements: implementation of risk management requirements; pre-deployment impact assessments; real world testing; independent evaluations and ongoing monitoring; requirements for explainability and transparency; training for staff procuring or using AI; a requirement to consult with affected groups; and the need for agencies to provide for remedies and recourse.

Clarifying provisions of the Memo will close potential loopholes and addressing shortcomings and gaps. Clarifications of some aspects of the Memo will assist agencies in complying with the Memo, help to ensure accountability, and enable the government to achieve the Memo's objectives, furthering the administration's goals.

Beyond this, OMB should look to improve the Memo by doing the following:

Build clearer parameters around when CAIOs can seek waivers or exceptions from having to meet risk management requirements. Providing greater clarity, and imposing limits on the circumstances where a waiver or exception is granted, is needed so that the public can be assured that AI systems work

as intended. The Memo provides the CAIO with significant control to grant waivers and exceptions. The Memo should include a check on that authority. For example, there should be a process for recourse or appeal to another senior official where there is disagreement about a decision about a waiver or exception. In addition, more certainty is needed related to the factors used to determine whether to exclude or provide waivers on designating AI uses cases as rights-impacting. Specifically:

- When a waiver or exception is granted, there must be the ability to seek reconsideration of that decision. For example, should new information, such as testing or real-world experience, indicate that harm is occurring because of AI, use of that system should cease until it can be reevaluated.
- The Memo should be clear that waivers and exceptions sunset so the system can be periodically reevaluated.
- The Memo should require that agencies consider less rights-impacting alternatives before granting waivers or exceptions.
- The Memo should require that agencies be transparent about the waivers or exceptions that have been granted through public reporting.

Provide the opportunity to the public to request AI use cases be designated as rights or safety impacting. Impacted communities and the public at large should be provided the opportunity to request that use cases be evaluated as rights or safety impacting. Those who may be subject to the technology are often in the best position to identity harms and potential harms. To the extent a use case may not have been designated as rights or safety impacting, or an existing system is used for a new purpose, communities should have a path outlined in the Memo to engage with agencies.

Fully resource and fund agency governance structures including the establishment of Civil Rights Offices to meet the challenges identified in the Memo.

Provide clarity to ensure that federal grants, especially to state and local governments, are also covered by the Memo.

Provide guidance with public input to assist agency staff with responsible implementation of the Memo. It is unclear whether there will be adequate guidance for agency staff tasked with implementing the Memo. For example, guidance on acceptable testing and tolerances will be critical in assessing areas such as whether a system is "fair."

Provide clarity and more details on how to put easily understandable public reporting into practice, including related to the AI use case inventories. In the August letter, the signatories also urged the administration to expand the required questions for AI use case inventories required under EO 13960 and OMB M-21-06 guidance.[xvii] Use case inventories should include information that would allow the public to assess adherence with the White House's AI Executive Order and the Memo. OMB should also publish the inventories in a format that is understandable and usable by the American people. Finally, agencies should publish an annual report assessing their progress in implementing the Memo for their AI use cases.

Develop best practices for federal agencies overseeing public benefits programs. The Memo is clear that public benefits are a rights-impacting use and therefore those use cases must meet the Memo's risk mitigation requirements. The missing issues in this respect are that the Memo's notice and remedy requirements for rights-impacting AI do not meet the minimum constitutional due process requirements for public benefits decisions. In addition, most public benefits decisions are made at the state and local level. The Memo currently does not, but should, include guidance to federal agencies to construct best practices for the benefits programs they oversee.

Algorithmic systems in benefits can cause a number of harms, including by making determinations based on corrupt or discriminatory data, arriving at determinations with no explanation or without transparency. Applying the risk management protections for benefits determinations will help to address these concerns.

Require agencies to consider the impact of AI on people with disabilities. People with disabilities continue to face accessibility challenges in using AI systems, despite the Executive Order's call for accessibility. Agencies need to intentionally include people with disabilities by building systems that conform to accessibility standards and be mindful that the disability community is a heterogenous group comprising multiple subpopulations. Agencies should also consider the impact that differences in language may have to ensure accessibility for the communities where AI systems are used. Including people with disabilities on AI teams is an effective harm prevention strategy as agencies identify the impact of AI on this diverse population. Careful consideration must be given to disability inclusion as agencies respond to the new requirements from OMB and hire people with disabilities who understand disability rights and other civil rights laws.

Establish a process for ongoing and regular public engagement, including with civil society and civil rights organizations on agencies' use of AI. The public has the most to gain or lose from the use of AI. It is critical that the public interest is respresented. Agencies should be required to establish defined programs to proactively seek community input as they implement the Memo and in their ongoing operations that are covered by the Memo.

Innovate for good. Agencies should ensure that AI is used to make progress in tackling societal challenges, such as accessibility, health disparities, food insecurity, equity, and justice. Likewise, how to innovate to advance equity needs more focus in order to take hold and become a reality. It is critical that agencies seek community engagement as part of this process. The Memo should include a specific mandate to achieve this outcome.

Further tools and practices. It will be important to establish expectations—presumably created by NIST—for the standards-making and/or other processes that agencies will put into place. Specifically, any standards or testing developed pursuant to the Memo, for example for auditing or risk assessments, should be evaluated against the tenets of the AI Bill of Rights and AI Executive Order, to ensure that the Memo furthers the goals of equity and inclusion.

Conclusion

We appreciate this opportunity to comment on the Memo, which sets out a practical and actionable approach for identifying, measuring, and mitigating harms before AI is put into use, as well as evaluating existing systems. If properly implemented, the Memo could be a significant step toward achieving equitable innovation.

For the use of AI to be successful, agencies must ensure that the benefits and risks of AI are considered early on and throughout the AI lifecycle, through design, development, and deployment. Before procuring or using an AI system, an agency should understand its limitations, recognize its intended uses as well as potential misuses, consider how to ensure the AI works for the people, and prevent harm. Thank you for your consideration of our concerns and views. Please direct any questions about these comments to Koustubh "K.J." Bagchi, vice president of the Center for Civil Rights & Technology at The Leadership Conference on Civil and Human Rights, at bagchi@civilrights.org or Frank Torres, civil rights and technology fellow at The Leadership Conference on Civil and Human Rights, at torres@civilrights.org.

TO: Office of Management and Budget

FROM: Center on Race and Digital Justice

SUBJECT: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, OMB-2023-0020-0001

DATE: December 05, 2023

By notice published on November 3, 2023 the Office of Management and Budget ("OMB") requested public comments on their draft policy on the use of AI by federal government agencies.[1] Our comments mostly focus on responding to OMB's questions 3-8 per the notice.

Pursuant to the OMB's notice, the Center on Race and Digital Justice submits these comments to express strong concerns and significant recommendations for the OMB's draft policy. At The **Center on Race and Digital Justice**, our mission is to strengthen a community of academic researchers, leaders, and practitioners operating at the intersection of data, technology, power, and racial justice. Our work cultivates accountability, drives equity, and seeks to contribute to the restoration and expansion of civil, sovereign, and human rights that are threatened by digitally networked systems of power and control. We focus on who holds power, how to redistribute power, and the ways in which data and technology reflect power structures. We stay grounded, not abstract – it is the real experiences of people that motivate us, and real people for whom we work with to make change.

Based on years of research and our current work with partner civil society organizations, organizers, and advocates, we urge OMB to revise the draft policy to meet the current, past, and future potential harm of AI. Higher standards and fewer loopholes are needed to ensure that the most vulnerable people are not harmed by AI. Without stronger regulations and policies, we will never meet AI's innovation potential. Deploying this technology absent mindedly and heedless to its present harms will continue to trap us in a reinforcing loop of our country's past harms and traumas.

Our critiques of the OMB policy stem from OMB's failure to put their draft policies in the right framework. We are disappointed that the OMB draft policies foreground "responsible AI

[1] "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum." Federal Register Vol. 88, No. 212 (November 3, 2023). Available at https://www.regulations.gov/document/OMB-2023-0020-0001

innovation" ahead of managing risks of AI.[2] The correct framework would be one where OMB policies first address harms before diving into further development for "innovation" with AI.

AI has already been in use by federal government agencies under the guise of improving government services and more equitably serving the American people. These uses are sometimes disclosed[3] and sometimes not.[4] Despite this intention, there are many examples about how people implementing what they think are well intentioned AI systems have instead caused deep harm to vulnerable communities.[5] Communities that have been harmed should receive redress and repair for the harm they have already endured and the government must focus first on healing past harm, mitigating current harm, and preventing future harm before moving towards a pollyannaish approach of AI innovation. Moving forward without addressing harms both ignores the real world impact reality of the harm AI is causing today and risks recreating systems of harm into the future. The current OMB framework puts AI innovation ahead of managing AI risks, and this is a fundamental failure.

Our more specific concerns about the OMB draft policy guidance all flow from this fundamental failure. From this, our main categories of criticism include:

1. **The OMB policies cover how federal government agencies use AI and procure AI, but these policies must also cover how federal agencies distribute resources outside of the agencies that further the use of AI.** Most rights and safety-impacting AI is

---

[2] On the website to "Make Your Voice Heard" about the draft OMB policy ("Make Your Voice Heard - AI.gov"), OMB writes: "The document focuses on three main pillars: 1. Strengthening AI governance; 2. Advancing responsible AI innovation; and 3. Managing risks from the use of AI by directing agencies to adopt mandatory safeguards for the development and use of AI that impacts the rights and safety of the public." This front page listing of three pillars mirrors the order of how the pillars appear in the OMB draft policy guidance itself (which can be found here "Proposed Memorandum for the Heads of Executive Departments and Agencies"). As you can see, OMB's policy and presentation of its policy to the public continually and consistently puts the risks and harms to people from AI last. Not only does the policy and its public presentation continually put mention of risk last, it fails to use the word harm in describing what risks it is managing, euphemizing and abstracting the real, tangible, negative harms of AI that are happening now. Additionally, in saying "managing" the risk, OMB policy fails to discuss how the government will redress, repair, or remedy the harms that people have already suffered from AI.

[3] In OMB's announcement about their draft policies on AI (which can be found here "OMB Releases Implementation Guidance Following President Biden's Executive Order on Artificial Intelligence"), OMB wrote that in 2023, federal agencies identified 700 ways that AI is already being used in government. And linked to https://ai.gov/ai-use-cases/.

[4] Research and reporting from Tate Ryan-Mosley at MIT Technology Review in her article "The NYPD used a controversial facial recognition tool. Here's what you need to know" (April 2021); Ryan Mac, Caroline Haskins, Brianna Sacks, and Logan McDonald from Buzzfeed in their article "How A Facial Recognition Tool Found Its Way Into Hundreds Of US Police Departments, Schools, And Taxpayer-Funded Organizations" (April 2021); and Mijente, Immigrant Defense Project, Just Futures Law, and ACLU NorCal in their Press Release "Immigrant Advocates FOIA for Info on Clearview AI Contract with ICE for Facial Recognition Technology" (October 20, 2020) all are examples of how government deployed AI without disclosing its use to the public.

[5] Examples of how the government has deployed AI systems that then harmed communities are documented in research and reporting by Joseph Cox from Vice in his article "Homeland Security Uses AI Tool to Analyze Social Media of U.S. Citizens and Refugees" (May 2023); Sally Ho and Garance Burke from AP News in their article "An algorithm that screens for child neglect raises concerns" (April 2022); and Sam Biddle from The Intercept_ in his article "ACLU Sues to End ICE's Rigged Algorithm for Detaining Immigrants" (March 2020).

procured and deployed on the local level. Federal agencies implicitly and explicitly participate in the development, deployment, and procurement of these AI through funding to local municipalities or local government agencies. The OMB policies must be applied to all the ways that the federal government is providing resources for development, procurement, or deployment of AI technology – that includes through funding to the local level.

2. **In order to meet the scope and depth of past, current, and future harms, the OMB must improve their draft policy by closing the loopholes for items exempt from the minimum standards and strengthening the minimum standards.** The draft OMB policy has loopholes for agencies to self-determine if an AI system deserves a waiver to not meet minimum requirements, but agencies should not be allowed to self-enforce such important decisions. The draft policy also allows the process to receive an extension to be continuous and indefinite, with no enforcement to ensure that the AI system is moving towards compliance. This makes waivers and extensions easy loopholes to allow an agency to never reach minimum standards on AI. OMB must close loopholes for extensions and waivers and improve minimum standards to make the policy meaningful.
3. **The OMB policies must have clear consequences for failures to comply.** Policy must always have a mechanism for accountability or else the policy by default incentivizes noncompliance. The OMB draft policy currently fails to list any consequences for agencies or their contractors who fail to comply with the OMB policy. OMB must include consequences that are serious enough to change behavior, ensuring that the priority is protecting people rather than maintaining contractors' profits or merely increasing government efficiency.

The harms to people from AI already exist and are far too serious to feign ignorance by prioritizing developing AI for its supposed innovation potential. If we continued with the OMB draft policy as is, by focusing on the innovation over harms, OMB would be deliberately disregarding the people who have been harmed by AI and the people who have been researching and speaking out about the harm for decades.

The next sections in our comment go into further depth about our concerns, reference specific language in the draft policy, and enumerate our recommendations for improving the draft policy. From our analysis, the OMB draft policy on use of AI in the federal government has some elements that are noteworthy, but significant work needs to be done to meet the moment.

I. Background: Why AI harms and redress must be the first focus

The continual fascination with AI, its supposed potential for good, and the potential for what some call the existential risk of sentient machines is misguided. We are disappointed to continue to see political leaders and government officials prioritize these viewpoints over the well documented reality of harms caused by AI.

These perspectives are misguided for two important reasons. First, AI's current rise in popularity as a term should be seen for what it is – a successful maneuver from corporate actors to consolidate their power. By popularizing the term AI, corporate actors are able to market predictive algorithms as being able to do more than they can, monopolize the field for further development of this technology, and capture the regulatory space to prevent the "doomsday scenario." Second, prioritizing AI innovation and seeing the biggest threat as the existential risk of robot intelligence overpowering humans ignores the existing and currently exacerbated existential harms caused by algorithms, automated decision making, and unbridled innovation in technology controlled by big tech.

AI's rise as a popular term over the past few years has been an industry led effort. It has successfully helped industry leaders be the majority representation in multiple recent Congressional Committee Hearings and helped executives garner invites to closed door meetings with legislators and government officials.[6] While tech executives claim that regulation is needed in their sector, they provide no specificity on what regulation should look like. Knowing that companies making generative AI products have low scores on transparency for their models,[7] tech executives calling for regulation create an inevitable closed loop where they are the only ones who can make the regulation. If regulation must happen but companies do not share any information to allow for regulation nor do they give any specific recommendations for regulation, then it makes it seem like the tech company executives are the only ones with the knowledge to make sufficient regulations. Even more unsurprising, those involved in making the most recent generative AI technologies want to focus on an existential risk. They frame themselves as the only people who have the knowledge and expertise to understand this risk. In reality, they are worst positioned to regulate their own industries. To maintain their power, tech company executives have to continue this charade of expertise enabled by their lack of transparency.

It is the non-tech executives who see and understand the existential risk of AI to everyday people. Instead of focusing on computer domination over humans as the pathway towards human extinction, scholars, activists, advocates, and organizers have been highlighting how we are already on a pathway towards various forms of existential destruction. The use of ShotSpotter, a technology that uses a form of artificial intelligence through its use of a neural network, was existential to Adam Toledo.[8] The use of commercial algorithms in healthcare can be existential to

[6] For examples, attendees to the Senate Judiciary's subcommittee on Privacy, Technology, and the Law's hearing "Oversight of A.I.: Rules for Artificial Intelligence" (May 2023) and the House Science, Space, and Technology Committee's hearing "Artificial Intelligence: Advancing Innovation Towards the National Interest" (June 2023) had predominantly hearing speakers who still have affiliations with the tech industry. Additionally, tech executives met with Commerce Secretary Gina Raimondo, White House chief of staff Jeff Zients, and other officials according to reporting NPR's Franco Ordoñez in "These tech giants are at the White House today to talk about the risks of AI" (September 2023).

[7] Please review the microsite Foundation Model Transparency Index for the research paper "The Foundation Model Transparency Index" by Rishi Bommasani, Kevin Klyman, Shayne Longpre, Sayash Kapoor, Nestor Maslej, Betty Xiong, Daniel Zhang, Percy Liang (October 2023).

[8] "Chicago Awaits Video of Police Killing of 13-Year-Old Boy" by Jamie Kalven from The Intercept_ (April 2021).

Black patients.[9] The energy consumption from computers to run large language models and its long term environmental impact is existential for our planet.[10] The harms of AI are real across many policy areas and are tangible to communities now. These harms can lead to undue surveillance, increased rates of incarceration, denial of jobs, more expensive rents and mortgages, increased harassment, worsened environmental degradation, and much more.[11]

Until we address the harms that AI is causing now, any new AI will replicate and accelerate these same harms. Additionally, by focusing on the existential risk to communities and our environment, we future proof ourselves to prevent other existential threats. It would be irresponsible to leapfrog over our current conditions of harm to blindly promote AI for good or defend against existential risks that don't yet exist when existential harm already does exist. As such, all of our recommendations for the OMB draft policy guidance center on first tackling the harms caused by AI before any other goals.

II. Recommendations: 3 top recommendations with further details

Given the reality that AI has captured the attention of legislators, government officials, and the public, we are presented with an opportunity to grapple with the real problems of AI – the harms AI has caused to people and its role in exacerbating inequality.

In order to mitigate current harms, redress for past harms, and minimize future harms, government officials and legislators must be intentional with their policy making. We are excited to see that OMB is grappling with policy related to the use of AI by federal agencies. But, we believe the OMB draft policy lacks the intentionality needed to make it meaningful to deal with the harms of AI. Below we enumerate the necessary changes that OMB must make to their draft policy if they want to make the policy intentional and impactful.

1. The OMB policies cover how federal government agencies use AI and procure AI, but these policies must also cover how federal agencies distribute resources outside of the agencies that further the use of AI.

---

[9] "Dissecting racial bias in an algorithm used to manage the health of populations" by Zian Obermeyer, Brian Powers, Christine Vogeli, and Sendhil Mullainathan as published in Science (Ocotber 2019).

[10] The concern of the energy consumption for large language models was first highlighted in Timnit Gebru, Emily M Bender, Angelina McMillan-Major, and Shmargaret Shmitchell's paper "On the Dangers of Stochastic Parrots: Can Language Models Be Too Big?" (2021). Additional research on the energy consumption of generative AI has been reported by Zoe Kleinman and Chris Vallance of the BBC in their article "Warning AI industry could use as much energy as the Netherlands" (October 2023) and by Matt O'Brien and Hannaha Fingerhut of the Associated Press in their article "Artificial intelligence technology behind ChatGPT was built in Iowa — with a lot of water" (September 2023).

[11] While the research and coverage of these issues are too long to list, we recommend reviewing the research by Dr. Safiya Noble's *Algorithms of Oppression*; Ruha Benjamin's *Race After Technology*; Virginia Eubanks's *Automating Inequality*; Cathy O'Neil's *Weapons of Math Destruction;* Xiaowei Wang and Shazeda Ahmed's recent report "Bodily harms: how AI and biometrics curtail human rights;" and Rashida Richardson, Jason M. Schultz, and Kate Crawford's article "Dirty Data, Bad Predictions: How Civil Rights Violations Impact Police Data, Predictive Policing Systems, and Justice."

While we are pleased to see the development of any policy about federal government use of AI, we are disheartened to see that it only covers the AI systems that the federal government uses or procures directly.

We know that the federal government also involves itself in the use, development, and procurement of many AI systems through a variety of resources. The clearest example of how the federal government gives resources that further the use, development, and procurement of AI outside of federal agencies are the use of federal grants for AI systems. For example, based on calculations by the Electronic Privacy Information Center, since 2021, the Department of Justice has given nearly $4 million in grants to local police departments to improve "'data-driven' policing, 'smart' policing, and related practices."[12] One example of technology that these local grants cover that should be subject to any proposed minimum practices from the OMB policy would be ShotSpotter. ShotSpotter has been repeatedly shown to be discriminatory against communities of color, leads to few arrests or solved cases, and does not improve safety in the neighborhoods where it is installed.[13] However, with the current OMB draft policy, a technology like ShotSpotter would be free to continue operating as is with all its flaws. Similarly, reporting from the Washington Post found that the grants from the Department of Housing and Urban Development were being used by local housing authorities to install surveillance cameras with facial recognition. The Post found that these cameras, while supposedly installed to prevent crime, were more often used to find grounds to evict the low-income tenants in the housing complex on minor violations.[14] These facial recognition surveillance systems used by local housing authorities, but bought with federal agency money, would not be covered under OMB's current draft policy.

In order to address this, the OMB policy must apply the minimum practices for technologies secured by monies dispersed by federal agencies, including monies dispersed in the form of local grants. The OMB thinks their draft policies will set a standard for local governments to follow as is (meaning without addressing the money given to local governments for their own AI use), but in reality, the current draft policy would cover so little of the most harmful rights and safety impacting AI that any standard it sets would be barely noticed. Many of the systems that fall under the rights and safety impacting AI are being used and procured at the local level. Instead of setting a standard, by not including technology procured with federal agency grant funding at the local level, the OMB policy is only serving to maintain the many problematic AI systems

[12] Letter from the Electronic Privacy Information Center to the Department of Justice on Title VI and federal grant funding for ShotSpotter (September 2023).
[13] The letter cited above (Letter from the Electronic Privacy Information Center to the Department of Justice on Title VI and federal grant funding for ShotSpotter (September 2023)) provides many citations that are relevant. In particular, we'd like to highlight the research from the Chicago Office of Inspector General "The Chicago Police Department's Use of ShotSpotter" (August 2021) and research and litigation by the MacArthur Justice Center.
[14] "Eyes on the poor: Cameras, facial recognition watch over public housing" by Douglas MacMillan from the Washington Post (May 2023).

without scrutiny. As is, the policy would maintain and exacerbate the incentives for AI companies' to target local governments for their faulty and harmful AI products.

Again, our recommendation is that OMB must include language in their policy to ensure that technology procured with federal agency grants is also subject to the same minimum practices as the technology used by the federal government itself.

2. ***In order to meet the scope and depth of past, current, and future harms, the OMB must improve their draft policy by closing the loopholes for items exempt from the minimum standards and strengthening the minimum standards.***

While we are pleased to see that in the current OMB draft policies Section 5.c states that "Except as prevented by applicable law and governmentwide guidance, agencies must apply the minimum practices in this section to safety-impacting and rights-impacting AI by August 1, 2024, or else stop using the AI until it becomes compliant,"[15] we were disappointed to see how easy it is for agencies to ask for exemptions (waivers and extensions), completely nullifying the minimum practices. It is a positive step for federal governments to expect that agencies must stop using AI if it is not compliant with some set of minimum standards, but that framework of stopping the use of non-compliant AI is made meaningless when an agency can so easily request for their AI systems to be exempt from these standards or ask for indefinite extensions.

The process for getting extensions to meet minimum practices and getting waivers from minimum practices in the OMB draft policy is so general that it allows agencies to essentially avoid any accountability. Two things are particularly problematic for the extensions and waivers.

First, it is highly problematic that the determination of whether an AI system is eligible for an extension or waiver is self-regulated by the agency itself. While we understand that every agency and its use of AI is different, many agencies that have the biggest impact on rights and safety-impacting AI have the worst track record of disclosing their use of AI and have often used exemptions to avoid accountability.[16] We have little reason to have faith that agencies would be scrupulous actors when it comes to self-regulating their use of AI.

Second, the OMB draft policy essentially incentivizes agencies to obtain a waiver or extension for any AI system. According to the draft policy, agencies are given waivers and extensions by default in good faith. For extensions, the agency must provide a "a detailed justification for why the agency cannot achieve compliance for the use case in question and what practices the agency has in place to mitigate the risks from noncompliance, as well as a plan for how the agency will come to implement the full set of required minimum practices from this section," but there is no requirement to stop using the system until the minimum practices are reached, no expectation of

[15] OMB's Proposed Memorandum for the Heads of Executive Departments and Agencies (November 2023).
[16] Please see our joint comments with Just Futures Law, Surveillance Resistance Lab, Mijente, Media Justice, and others for a case study of DHS's failures to comply with various regulations and stated commitments to changes related to their use of surveillance technology.

how long an agency has for an extension, and no mention for consequences if the agency fails to follow through their their "practices…to mitigate risk from noncompliance" or their "plan…to implement…minimum practices."[17] Essentially an extension becomes a self-reported rubber stamp to continue to use a technology. For waivers, the agency must make "written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations."[18] It is easy for any agency to make a case that fulfilling minimum practices on an AI system would "create unacceptable impediment to critical agency operations," especially when a key actor who is approving the waiver is the agency's internal Chief AI Officers (CAIO). Obtaining a waiver also comes with no consequences if the AI system is found to harm people and no timeline for re-evaluation. A waiver allows an agency to continue using their AI as is without any adjustments towards minimum practices and relies on an agency's own self-reporting and self-determinations of waiver worthiness.

In order to solve these two major issues, we recommend that the OMB policy default to all AI systems needing to meet minimum practices. If the policy language must include opportunities for extensions to meet minimum practices, the OMB must amend the policy language for extensions to include that agencies must stop using the AI system for which they are asking for an extension until it can reach minimum practices. This will incentivize agencies to actually get their systems up to minimum practices rather than allowing an indefinite amount of time for compliance, which incentivizes making no changes to meet the minimum practices. Policy language on waivers should not be included – if an AI system cannot meet minimum practices, agencies should be required to find ways to achieve their work without that system. Most agencies have existed for decades and have done their work before these AI systems. We must leave space for the possibility that AI systems are not the solution for improved government service delivery.

We also believe that the OMB draft policy's minimum practices could be strengthened. As mentioned above, we must leave open the possibility that AI technology is not actually necessary for improving government functions. The impact assessment, while it has many good categories, comes from a fundamental assumption that the AI system is necessary. OMB must require that the impact assessment include a review for whether or not an AI system is even necessary to achieve the purpose of the agency's work. If it is not necessary, the model and its data should be destroyed and disgorged so that it cannot be accidentally used or swept up into another system and misused. Similarly, OMB must add policy language that for any system that is found to fail the minimum practices, agencies must stop use of that system or end the contract for that system immediately. The associated system, its model, and its underlying dataset in these scenarios should also be destroyed and disgorged.

[17] OMB's Proposed Memorandum for the Heads of Executive Departments and Agencies (November 2023).
[18] OMB's Proposed Memorandum for the Heads of Executive Departments and Agencies (November 2023).

To reiterate our recommendations and include some additional specific recommendations to address our concerns about extensions, waivers, and minimum practices:

- OMB must limit extensions and waivers further. These limits should especially apply for intelligence and law-enforcement related AI technology and agencies whose work is almost entirely rights and safety impacting.
- OMB should not have a waiver for any AI systems.
- OMB must release their decision-making on exclusions and extensions to the public.
- OMB must strengthen the language around extensions by including language that requires agencies to pause the use of their AI until it meets minimum practices if an extension is given.
- OMB must strengthen the minimum practices by requiring the impact assessment in the minimum practices to include an assessment on whether or not the technology is actually necessary (Section 5.c.iv.A).
- OMB should have the minimum practices also include Consentful Tech framework as a baseline for systems design.
- OMB must include language in their policy that for any AI that is found to not meet minimum practices, the agency must destroy the model and must disgorge the associated data set. If this AI was procured by the federal government, the federal agency must immediately terminate the contract and demand that the contractor disgorge their dataset and destroy the model.

3. ***The OMB policies must have clear consequences for failures to comply.***

With improved OMB policy, consequences for an agency's failure to comply becomes key to enforcement. From the current OMB draft policy and from hearing from OMB staff at various public events with advocates, it remains unclear what the consequences are for agencies if they fail to comply with this policy. OMB seems to be naively expecting agencies to follow through with disclosing all the AI technology they use, writing complete information about these systems and their compliance with minimum practices, and being honest about following up with any necessary practices, plans, or steps to keep the systems in compliance. This blind faith is not effective for achieving compliance.

Many agencies, especially those with work that is rights and safety-impacting, are most notorious for failing to disclose technologies and failing to comply with improvements that are required or that they have publicly committed to.[19] Knowing that many agencies are partnering with for-profit companies for their AI systems, it also becomes essential that the consequences for complying do not become merely "the cost of doing business," but true consequences that force contractors and agencies to put people and their rights first.

[19] Please refer to our joint comments with Just Futures Law, Surveillance Resistance Lab, Mijente, Media Justice, and others for more details on how DHS, as an example, has failed to disclose or improve technologies their agency uses.

Currently the OMB draft policy, to our reading, has no consequences for agencies or the companies with whom they contract. Given our experiences with federal agencies' failure to comply with reporting and accountability measures for technology so far, here are some examples in the OMB draft policy where a lack of consequences is especially problematic.[20]

- Failure to report a use case in the AI Inventory (Section 3.a.iv and Section 3.a.v).
- Failure in stopping use of non-compliant AI (Section 5.a.i).
- Failure of agency to identify an AI as risk or safety impacting (Section 5.c).
- Failure for an agency to provide sufficient justification for why they cannot achieve compliance for a use case of AI (Section 5.c.ii).
- Failure to meet the plan for how an agency will come to implement minimum practices for AI for which the agency received an extension (Section 5.c.ii).
- CAIO's giving waivers without sufficient rationale, CAIO making inappropriate determinations for what is eligible for a waiver (Section 5.c.iii).
- Failure of the CAIO to reassess AI for which a waiver was received (Section 5.c.iii).
- Withholding or incomplete information in an AI impact assessment (Section 5.c.iv.A).
- Insufficient testing of AI (Section 5.c.iv.b).
- Conducting an AI evaluation that is found to not be sufficiently independent (Section 5.c.iv.C).
- Failure to comply with instituted ongoing monitoring and periodic human review guidelines (Section 5.c.iv.D).
- Failure to update or sufficiently update AI based on new or significantly altered risks (Section 5.c.iv.E).
- Failure to complete sufficient training and assessment of AI or failure to comply with instituted plans to ensure sufficient training, assessment and oversight of AI (Section 5.c.iv.F).
- Failure to provide public notice for AI use case inventory (Section 5.c.iv.H).
- Failure to take steps to advance equity, dignity, and fairness (ex: knowingly or unknowingly maintaining factors that contribute to algorithmic discrimination and bias, falsely assessing disparate impacts, failure to mitigate disparate impact, failure to use representative data) (Section 5.c.v.A).
- In situation where it is practicable and consistent with applicable law and governmentwide guidance, failing to consult affected groups in the design, development, and use of AI (Section 5.c.v.B),
- After receiving consultation from affected groups, failing to implement feedback for insufficient reasons (Section 5.c.v.B).
- Failure to conduct ongoing monitoring and mitigation for AI-enabled discrimination (Section 5.c.v.C).
- Failure to notify negatively affected individuals or failure to notify negatively affected individuals in a timely manner (Section 5.c.v.D).

[20] OMB's Proposed Memorandum for the Heads of Executive Departments and Agencies (November 2023).

- Failure to provide negatively affected individuals with a means of contacting the agency or failure to provide available agency staff to respond to individuals' outreach to the agency after being negatively affected (Section 5.c.v.D).
- Failure to maintain a remedy process (Section 5.c.v.E).
- Failure to maintain an opt-out in an AI where it is possible, or failure to provide a prominent and convenient mechanism to opt out (Section 5.c.v.F).
- Failure of a contractor to meet minimum standards for AI (Section 5.c).

Since there appears to be no consequences for failure to comply with much of the policy, OMB is at risk of creating a document that is entirely unenforceable. Even with weak consequences, OMB would be able to assess whether the policy is sufficiently changing behavior and in what ways. We recommend that the consequences the OMB policy should include range from fines and fees that go towards a reparations fund for those harmed by AI systems; disgorgement of data sets for non-compliant AI; deletion of models and algorithms related to non-compliant AI; and immediate contract termination for contractors who are unable to comply with minimum standards or subsequent evaluations, plans, or practices.

III. Conclusion

As the Center on Race and Digital Justice, the expanse of our work allows us to see the interconnections between power, race, technology, data, and AI across a variety of policy areas. We are impressed with legislators, government officials, and the public in their current desire to make a difference in these fields. However, we are disheartened to see the continued misguided focus on AI's innovation potential over the reality of AI's harm to communities and society.

The OMB draft policy is a first step towards improving our relationship with AI and protecting people from worsening inequality. But, as is, the draft policy is wholly insufficient. We hope that these comments offer clear opportunities for improvement to the OMB draft policy and we look forward to the improvements you will make on the policy. If you need to follow up on any of these items, please reach out to Akina Younge at aki@raceanddigitaljustice.org.

Gigamon Comments to OMB Draft Memo re AI Final

Gigamon®

Comments from Gigamon on the Draft Memorandum entitled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"

Gigamon appreciates the opportunity to comment on the proposed memorandum *Advancing Governance, Innovation, and Risk Management for Agency Us of Artificial Intelligence* (OMB AI Guidance). Among other things, President Biden's Executive Order on Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence and the proposed memorandum seek to manage risk associated with the use of AI. To that end, Gigamon recommends that OMB more clearly articulate risk associated with the (1) security of the underlying IT infrastructure that support AI Systems, and (2) integrity of the data used to build/train and test AI/ML classifiers.

1. Risk associated with the underlying infrastructure.

Gigamon recommends that OMB specifically highlight risk associated not just with the training and application of the AI systems themselves, but also risk associated with the security of the underlying IT infrastructure that support AI systems. This includes (1) the compute infrastructure which hosts that AI system (which may be distributed across multiple infrastructures), and (2) the environment(s) that hosts the compute infrastructure(s).[1]

As recent high profile attacks demonstrate, infrastructure is not immune to supply chain attacks or exploitation of vulnerable source code. These risks are magnified in the context of AI systems. By way of example, many AI systems are built on top of a very large and rapidly innovating series of open- and closed-source libraries and modules. In this rapidly changing environment, a motivated adversary may attempt to trojanize or backdoor an open source library and/or associated package manager, which is then accessed by the AI System.[2] This is just one threat vector, but traditional OS vulnerabilities in the operating system, supply-chain delivered implants in hardware, attacks on the cloud service provider are all possible as well.

[1] As these environments are highly complex, Gigamon recommends against conflating the AI application (and associated models), the compute-infrastructure which hosts that application, and the environment in which that compute infrastructure is hosted. This will increase the likelihood that departments and agencies will be able to identify and manage risk more comprehensively for the supporting infrastructure and the IA system.

[2] While comparisons could be made with critical software like Linux, which also pulls in a large number of packages to make a distribution, the community has developed well-understood processes and distributions, and manage security via well-structured processes. At this time, there is no equivalent in the AI field.

As such, departments and agencies should consider and mitigate risk associated with AI systems that trust down implicitly without proof of trustworthiness. While there have been some technical advances in making trust-down assumptions more reliable, they are nonetheless exploited regularly via things like supply chain attacks. Consistent with zero trust principles being adopted across the federal enterprise, AI systems should not implicitly trust libraries and operations systems; and operating systems should not implicitly trust firmware, drivers, and hardware.

To mitigate such risk, monitoring of the running infrastructure to detect aberrant behavior correlated with threat actor behavior is essential. For example, the appearance of an unexpected network connection could be a command and control channel from a backdoored PyPI package[3]. This monitoring should be pervasive and, using CISA's Extensible Visibility Reference Framework terminology, should be across multiple "Visibility Surfaces". So, traditional logging, network behavior, configurational data, static source code analysis data would all be viable visibility surfaces that should be correlated and analyzed. Of note, the ingestion of these "visibility surfaces" into a cybersecurity focused AI application would allow correlation and prediction, which would readily identify deviations which correspond to risk which warrants an investigatory and potentially corrective response.

2. Data used to build/train and test AI/ML classifiers

While the NIST *Artificial Intelligence Risk Management Framework* (AI RMF 1.0)[4] articulates risk associated with the integrity of data used to build/train and test AI/ML classifiers, the potential high impact of adversary efforts to impact the functionality and trustworthiness of the AI System through data poisoning/tampering attacks at any stage of the data lifecycle, and up and down the data supply chain, justifies articulating it explicitly in the OMB AI Guidance so that agencies consider and mitigate risk as part of their data and cybersecurity strategies.

[3] Typical AI infrastructures are built on large numbers of libraries, both open source and commercial/closed source. As of the time of writing, many of these libraries are under active development by highly distributed teams of international developers. They are rapidly innovating, and subject to constant development and regular updates. The supply chain "attack surface" is broad and highly challenging to see. See https://blog.inedo.com/python/package-dependencies/ for additional discussion.

Data and Society comment on OMB memo 12-5-23

DATA&
SOCIETY

December 5, 2023

Response to the Request for Comments on OMB's
Advancing Governance, Innovation, and Risk Management
for Agency Use of Artificial Intelligence Draft Memorandum

Data & Society is an independent, nonprofit research institute studying the social implications of data-centric technologies, automation, and artificial intelligence. Through empirical research and policy and media engagement, our work illuminates the values and decisions that drive these systems and helps shape futures grounded in equity and human dignity.

OMB's draft guidance takes important steps toward AI accountability. As detailed in response to the questions below, the OMB guidance rightly identifies many AI systems that have caused harm to the public and appropriately requires federal agencies to institute key practices to protect the public against further such harms.

Critically, the OMB guidance starts with the presumption that certain uses of AI impact people's rights. The procedure to determine whether an AI use case is rights-impacting, described in the draft memo, includes a predetermined list of systems where harms have previously been demonstrated and which are presumed to require the described risk mitigation practices. Employing this presumption based on the predetermined lists is a useful mechanism that has the potential to allow agencies to guard against harms without being required to conduct extensive and potentially time-consuming risk assessments in cases where AI system harms are already publicly known. Essentially, OMB has already conducted the risk assessment on their behalf.

The memo mandates a floor of minimum practices that an agency must meet in order to use an AI system. The required minimum practices for rights-impacting AI systems include sociotechnical approaches to AI accountability, including impact assessments and public consultation. Such approaches, appropriately used in combination, represent the best known standards for AI accountability across a wide variety of AI systems. The OMB memo requires that if minimum practices are not met, or if testing required by these practices reveals concerns, agencies cannot use the system in question. This prohibition on unrestricted use is key to future effectiveness of this guidance.

We applaud these steps and encourage OMB to keep these important measures in their final guidance. The procedures described by the draft memorandum are both achievable and necessary to protect the public from the demonstrated harms of rights-impacting AI systems. We encourage OMB to preserve these needed protections in its final guidance, and particularly to maintain the requirement that federal agencies may not use systems that fail to meet the identified minimum practices.

In response to OMB's specific questions, we provide the following additional thoughts.

Table of Contents

3. How can OMB best advance responsible AI innovation? 2

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why? 3

AI systems that should be presumed to be rights-impacting 3

Clarification to the definition of AI 12

Waiver process 12

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed? 13

Consult and incorporate feedback from affected groups (Section 5.c.v.B.) 13

Missing practices 14

Data privacy 14

Explanation 15

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts? 15

Concern that the values language in the draft memorandum does not center equity 16

Contract requirements that include the minimum practices 17

Detailed reporting and the AI use case inventory 17

Federal grants must also require the minimum practices 17

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory? 18

Including all AI systems in the inventory 18

Summary reporting of excluded AI systems 19

Detailed reporting of testing and risk as part of the AI use case inventory 19

Complete an AI impact assessment (Section 5.c.iv.A) 19

Take steps to ensure that the AI will advance equity, dignity, and fairness (Section 5.c.v.A) 20

Consult and incorporate feedback from affected groups (Section 5.c.v.B) 21

3. How can OMB best advance responsible AI innovation?

Key to the private sector's successful use of responsible AI innovation is the federal government's oversight of that use in ways that support safety and rights. As part of the National AI Talent Surge, enforcement agencies such as the Department of Justice Civil Rights Division, the Federal Trade Commission, the Equal Employment Opportunity Commission, and the Consumer Financial Protection

Bureau must receive significantly more staffing. Such agencies are often overlooked when considering technical talent, but should be provided staffing to build AI auditing systems and conduct assessments.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

AI systems that should be presumed to be rights-impacting

Research and reporting have demonstrated harms from the AI systems that are already included in OMB's list of systems presumed to be rights-impacting. In support of keeping *all* such systems on this list and requiring they meet a minimum bar of protective practices, we include references to the documented harms of these systems below. Additionally, we suggest below specific systems that should be added to the list based on similarly documented harms. We note that the preface to the list of systems is appropriate and should not be substantially modified — it is important that the list not only includes AI systems that directly control outcomes but those that influence them, since a human is often in the loop for rights-impacting decisions. The preface states that the below AI systems should be presumed to be rights-impacting AI "if it is used to control or meaningfully influence the outcomes of any of the following activities or decisions":

Purposes That Are Presumed to Be Rights-Impacting.

A. Decisions to block, remove, hide, or limit the reach of protected speech;[1]
B. Law enforcement or surveillance-related risk assessments about individuals,[2] criminal recidivism prediction,[3] offender prediction,[4] predicting perpetrators' identities,[5] victim prediction,[6] crime

a. Suggested change: ensure that the closing clause includes "decisions *or risk assessments* related to …" to ensure that, for example, pretrial risk assessments[20] are included in this list.

C. Deciding immigration, asylum, or detention status;[21] providing risk assessments about individuals who intend to travel to, or have already entered, the U.S. or its territories;[22] determining border access or access to Federal immigration related services through biometrics (e.g., facial matching) or other means (e.g., monitoring of social media or protected online speech);[23] translating official communication to an individual in an immigration, asylum, detention, or border context;[24] or immigration, asylum, or detention-related physical location monitoring devices.[25]

a. Suggested change: in the first clause "deciding" should be changed to "deciding or providing risk assessments related to" to ensure that detention risk assessments[26] are included.

[83] Ibid.

In addition to the presumption that some use cases are rights-impacting, there are two key components of the determination of whether a system is required to follow the minimum practices that we believe deserve further clarification: the definition of AI and the waiver process.

Clarification to the definition of AI

As evidenced by agencies' drastic underreporting to OMB and the public in previous AI use case inventories,[84] which excluded many AI use cases that were publicly known, agencies need further clarification and encouragement to report all their AI use cases. As appropriately clarified in the draft memo, this includes all machine learning systems. We suggest that OMB strengthen that section of the guidance to make it clear that the inclusion of all such systems as within scope of the guidance is not simply a suggestion, but a requirement. Specifically, we suggest changing "For the purposes of this memorandum, the following technical context may assist in interpreting this definition" to read "For the purposes of this memorandum, the following technical content guides the interpretation of and extends this definition."

Waiver process

The requirements and process that agencies must satisfy to be given a waiver from instituting the minimum practices for identified safety- or rights-impacting AI systems are unclear, which may undermine the federal government's efforts to protect Americans from algorithmic harms. Currently, the draft memo states that some components of the minimum practices can be waived "after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations."

First, waiving *all* minimum practices in such situations is inappropriate — OMB can and should always expect agencies to test their systems for effectiveness and discrimination, among other minimum practices. We encourage OMB to add the following as minimum practices that may *not* be excluded from the requirements through the waiver process:

- Complete an AI impact assessment (Section 5.c.iv.A)
- Test the AI for performance in a real-world context (Section 5.c.iv.B)
- Conduct ongoing monitoring and establish thresholds for periodic human review (Section 5.c.iv.D)
- Mitigate emerging risks to rights and safety (Section 5.c.iv.E)
- Take steps to ensure that the AI will advance equity, dignity, and fairness (Section 5.c.v.A)
- Conduct ongoing monitoring and mitigation for AI-enabled discrimination (Section 5.c.v.C)

The above steps—appropriately identified by OMB as *minimum* practices—are necessary to ensure basic functioning, safety, and non-discrimination of any AI system. The federal government should not use AI systems that do not meet this bare minimum bar.

[84] Heilweil, R. and Adler, M. (2023, August 16) OMB acknowledges issues with process for inventorying AI use cases. *FedScoop*. https://fedscoop.com/omb-acknowledges-issues-with-process-for-inventorying-ai-use-cases/

Second, OMB should clarify in its final guidance that waivers require a justification and a risk assessment for *each* minimum practice for which the waiver is desired. Given that these practices are a *minimum* bar, and given that the practices already include caveats throughout such as "where appropriate," "where possible," and "to the extent practicable," the requirements for risk assessment and reporting to OMB and the public about waivers to these reasonable and necessary minimum practices should be strict. Waivers should be a tool of last resort, and should only be granted per system and per minimum practice waived, with justification for each such practice waived.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Overall, the minimum practices identified are appropriate and necessary to ensure the safe and rights-respecting functioning of AI, although we offer some suggested edits and additions below. The requirements for impact assessments and public consultation are especially important parts of public accountability for AI, and must be coupled with robust public transparency into the methods and results of these assessments. Our specific suggestions for reporting requirements for the AI use case inventory are below in response to question 8, but we note here that impact assessments require such reporting in order to be a successful form of AI accountability.[85]

Guidance throughout the draft memo identifies that if a minimum practice can not be met (for example, if a demographic disparity can not be mitigated), then agencies should not use or integrate the AI tool. These requirements that agencies not use AI tools that do not work or otherwise do not meet federal government expectations are of key importance and must not be weakened in the final guidance.

Consult and incorporate feedback from affected groups (Section 5.c.v.B.)

The draft memo's directive for federal agencies to "consult and incorporate feedback from affected groups" is a critical component of the federal government's AI governance. AI researchers increasingly have identified public participation in technology design, deployment, and oversight as a critical safeguard.[86] Research indicates that public participation, when done well, improves decision-making by incorporating the viewpoints of those most likely to be impacted by technologies.[87] Further, the memo's incorporation of public input "*before* initiating use of new or existing rights-impacting AI" is important—

for participation to be meaningful, affected groups should be involved at the beginning of the process, particularly in establishing the desirability or need of the system in the first place.

However, as currently drafted, the guidance only requires federal agencies to consult affected groups "to the extent practicable and consistent with applicable law and governmentwide guidance," leaving a substantial loophole for federal agencies to bypass public input. Specifically, many federal agencies—already facing capacity and staffing constraints—may find that additional procedures such as holding public meetings, gathering public input, soliciting comments through an RFI, and consulting with federal employees' unions on the use of AI to fall beyond "the extent practicable."

The key issue with public participation is that *it works only when done well*.[88] Under the memo as drafted, many federal agencies may either ignore the directive, or go through rote motions of cursory listening sessions and RFIs without meaningfully elevating the voice of marginalized communities. The guidance could be strengthened by omitting "To the extent practicable," which would encourage robust adoption of participatory methods while still preserving the condition that agencies' public consultation be "consistent with applicable law and government guidance."

Missing practices

Two key principles of the Biden-Harris administration's Blueprint for an AI Bill of Rights[89] are missing or only partly satisfied by the minimum practices of the draft memorandum: explanation and data privacy.

Data privacy

Excluding data privacy from the minimum practices entirely misses a major opportunity to safeguard people's rights because, as the draft memo identifies, data is a key part of any AI system. Given OMB's role in overseeing compliance with the Paperwork Reduction Act, this also misses an opportunity for further oversight and/or consolidation. The key minimum practice to add related to data privacy is data minimization, which is also a key pillar of the bipartisan American Data Privacy and Protection Act.[90] Specifically, we suggest adding the following minimum practice from the Biden-Harris administration's Blueprint for an AI Bill of Rights to the final guidance:

> ***Data collection and use-case scope limits****. Data collection should be limited in scope, with specific, narrow identified goals, to avoid "mission creep." Anticipated data collection should be determined to be strictly necessary to the identified goals and should be minimized as much as possible. Data collected based on these identified goals and for a specific context should not be used in a different context without assessing for new privacy risks and implementing appropriate mitigation measures, which may include express consent. Clear timelines for data retention should be established, with data deleted as soon as possible in accordance with legal or policy-based limitations. Determined data retention timelines should be documented and justified.*

Explanation

Explanations, especially of adverse decisions about individuals, are necessary in order for those individuals to seek meaningful recourse. Explanations are broadly understood as important and form a core pillar of Leader Schumer's SAFE Innovation Framework for future AI legislation.[91] Additionally, such explanations are already required under federal law in the case of adverse action notices by financial institutions—even in cases where AI informs decisions—as made clear by the CFPB.[92] Explanations as required by the CFPB must be specific and "accurately indicate the principal reason(s) for the adverse action."[93] Such explanations are useful to people and, importantly, *are technically feasible to generate* no matter the type of AI system. Footnote 37 of the draft OMB memorandum states that "exact explanations of AI decisions are often not technically feasible." While it's true that an "exact" explanation would require a re-explanation of the entire AI system and is thus not *useful* to a person, it's certainly possible to generate. More importantly, meeting the standard set by the CFPB for AI system explanations is both useful and technically feasible. Common methods[94] have readily available software packages[95] that can be used to generate feature importance values that are model-agnostic. We suggest adding the following minimum practice to the continuing practices part of Section 5.c.v, adapted from OMB's draft memorandum footnote 37:

> ***Explanations***. *Agencies must provide explanations to individuals when AI meaningfully influences adverse actions by rights-impacting AI systems which specifically impact them. Explanations provided to the individual shall: explain why the AI system produced the result it produced for this specific individual; be scientifically valid, meaningful, useful, and as simply stated as possible; accurately indicate the principal reason(s) for the adverse action; and include more comprehensive explanations for higher-risk decisions.*

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Concern that the values language in the draft memorandum does not center equity

We are concerned that the procurement section (Section 5.d) of the draft memorandum introduces new principles focused on values in the particular context of procurement that do not align with the requirements in Executive Order 14110. The values language included in this section does not address the Administration's existing equity commitments. Specifically, the procurement section copies language from Executive Order 13960, which says that AI should be:

> Lawful and respectful of our Nation's values. Agencies shall design, develop, acquire, and use AI in a manner that exhibits due respect for our Nation's values and is consistent with the Constitution and all other applicable laws and policies, including those addressing privacy, civil rights, and civil liberties.

The procurement section of the draft memorandum similarly says:

> Aligning to National Values and Law. Agencies should ensure that procured AI exhibits due respect for our Nation's values, is consistent with the Constitution, and complies with all other applicable laws, regulations, and policies, including those addressing privacy, confidentiality, copyright, human and civil rights, and civil liberties.

Yet Executive Order 14110 clearly states that:

> Artificial Intelligence policies must be consistent with my Administration's dedication to advancing equity and civil rights. My Administration cannot—and will not—tolerate the use of AI to disadvantage those who are already too often denied equal opportunity and justice. From hiring to housing to healthcare, we have seen what happens when AI use deepens discrimination and bias, rather than improving quality of life. Artificial Intelligence systems deployed irresponsibly have reproduced and intensified existing inequities, caused new types of harmful discrimination, and exacerbated online and physical harms. My Administration will build on the important steps that have already been taken—such as issuing the Blueprint for an AI Bill of Rights, the AI Risk Management Framework, and Executive Order 14091 of February 16, 2023 (Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government)—in seeking to ensure that AI complies with all Federal laws and to promote robust technical evaluations, careful oversight, engagement with affected communities, and rigorous regulation. It is necessary to hold those developing and deploying AI accountable to standards that protect against unlawful discrimination and abuse, including in the justice system and the Federal Government. Only then can Americans trust AI to advance civil rights, civil liberties, equity, and justice for all.

and Executive Order 14091 states that:

> When designing, developing, acquiring, and using artificial intelligence and automated systems in the Federal Government, agencies shall do so, consistent with applicable law, in a manner that advances equity.

The Biden-Harris administration's commitment to equity, as evidenced through many executive orders (including 13985, 14091, 14110, and others) and administration practices, go beyond a minimal commitment to upholding existing civil rights law as stated in the draft memorandum. The minimum

practices identified by OMB in the draft also ensure more than this minimum standard. **We strongly encourage OMB to revise these principles in the context of procurement and follow the clear directives in favor of equity from this administration; as written, the procurement principles do not meet the expectations of EOs 14091 or 14110.**

Contract requirements that include the minimum practices

There should be no difference between the requirements for agency use of AI based on whether the agency procured the system or developed it in-house; contract requirements should be based on the minimum practices detailed in the OMB draft memorandum. The process of determining whether a system is safety- or rights-impacting is already detailed in the draft memorandum and should also be followed for procured systems. Similarly, the AI use case inventory should include procured systems. **Contracts can incorporate these requirements by**:

1. **Instituting the minimum practices** of the draft memorandum as required clauses in any safety-impacting or rights-impacting AI system contract;
2. Simultaneously **procuring an external evaluator** to conduct independent testing and monitoring of the AI system, for example using the existing JAIC contract vehicle[96]; and
3. **Requiring detailed reporting** via the AI use case inventory as part of both contracts.

We encourage the Office of Federal Procurement Policy (OFPP) to build on the strong foundation laid by the minimum practices described in the draft memorandum—these practices can and should be applied to procurement as well. There is no need to reinvent the wheel. The procurement section of the draft memorandum introduces new practices focused on generative AI, but the draft memorandum already covers generative AI within its definition of AI. Procurement guidelines should follow this approach.

Detailed reporting and the AI use case inventory

Including the detailed reporting via the AI use case inventory is an important part of public accountability for these systems and will also serve to provide contracting agents with information they need to appropriately assess a system to determine whether it is safe, effective, and rights-protecting. **We thus encourage OFPP to examine the responses to question 8 of this RFI**; there may be cases where OMB decides not to incorporate detailed questions and responses into the public-facing portion of the AI use case inventory, yet these questions can provide a useful starting point for contracting officers aiming to privately assess a system. A similar approach that relies on an assessment of detailed questions answered by a vendor is used by an industry consortium to assess HR vendor systems that can include AI.[97]

Federal grants must also require the minimum practices

Finally, we encourage OMB's Office of Federal Financial Management to work with OFPP to learn from this procurement process and incorporate similar protections into their grant guidance. Federal grants

[96] JAIC Public Affairs. (2022, February 11). AIC Offers New Enterprise-Wide Contract Vehicle for Rapid Procurement of AI Test & Evaluation. https://www.ai.mil/blog_02_11_22_jaic_new_contract_vehicle.html
[97] Data & Trust Alliance. Algorithmic Safety: Mitigating Bias in Workforce Decisions. https://dataandtrustalliance.org/our-initiatives/algorithmic-safety-mitigating-bias-in-workforce-decisions

have a substantial impact on state and local governments and communities. The federal government should not be providing monetary support to instituting AI systems that would violate the government's own guidelines and present risks to the public's safety or rights.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Public reporting on agencies' AI uses—including impact assessments, risk mitigation procedures, and demographic disparity measurements and results, among other items—are key to effective AI accountability.[98] OMB's plans to integrate the collection of this data into its annual Integrated Data Collection process represent an important step, and ensuring that information about *all* safety-impacting and rights-impacting AI systems is reported publicly will be critical for building public trust in these systems.

Including all AI systems in the inventory

As also described above in response to question 5, previous AI use case inventories have not included all AI systems;[99] as part of this renewed AI use case inventory, OMB must close existing loopholes and make clear to agencies that *all* AI use cases must be reported. For example, in the existing AI use case inventory, the Department of Justice reported only 4 AI use cases,[100] but did not include the facial recognition services that GAO has reported[101] are used by DOJ, nor did they include the DOJ-developed PATTERN risk assessment tool.[102] Two possible loopholes that should be closed by OMB include:

1. Lack of reporting of commercially developed software used by the federal government through acquisition, and
2. Lack of reporting of tools perceived to be less sophisticated than cutting-edge AI systems.

Given that the OMB guidance applies to agency "use of AI" and is clearly meant to apply to acquired systems as well, OMB should make clear to agencies that they are required to report on their use of commercially developed AI, such as the facial recognition tools identified by GAO as in use by DOJ. Additionally, some agencies may be under-reporting AI systems because they interpret trained regression

tools (like those that make up PATTERN[103]) as not being within scope of the definition of artificial intelligence under the 2019 NDAA, as also used in the OMB draft memorandum. But linear regression, logistic regression, and other such models *are* machine learning models,[104] which should be considered within the scope of the definition of artificial intelligence used by OMB since (as OMB rightly notes in its definitional clarification in the draft memorandum) the definition encompasses machine learning. We suggest that OMB make this needed clarification by changing "For the purposes of this memorandum, the following technical context may assist in interpreting this definition" to read "For the purposes of this memorandum, the following technical content guides the interpretation of and extends this definition"—and make it clear that agencies are expected to fully report their AI use cases.

Summary reporting of excluded AI systems

Given the waiver process and that some systems are additionally excluded from public reporting as part of the AI use case inventory, it is important that there be public reporting summarizing these exclusions. Such reporting should include at least the following information:

- Number of AI systems excluded from public reporting per agency and per rationale (whether excluded via Section 5.c.i or via a different mechanism);
- Number of AI systems subject to an extension for compliance with minimum practices per agency (Section 5.c.ii);
- Detailed justifications and plans to meet the minimum requirements per AI system that has been granted an extension for compliance with minimum practices (Section 5.c.ii);
- Number of waivers granted per agency and per minimum practice (Section 5.c.iii); and
- The risk assessment done to justify each granted waiver or detailed justification of agency need for critical operations (Section 5.c.iii).

Detailed reporting of testing and risk as part of the AI use case inventory

For each minimum practice described in the draft memo, the public should receive information and assurances through the AI use case inventory that the agency took the required protective steps. This should include providing specifics about risk mitigation practices and resulting findings. Example questions for a few key minimum practices are included below, but a more comprehensive exercise should be undertaken to ensure detailed and specific reporting for each practice. The below suggested questions for the AI use case inventory draw directly from the documentation suggested by and needed to meet OMB's draft memo list of minimum practices.

Complete an AI impact assessment (Section 5.c.iv.A)

The intended purpose for the AI and its expected benefit (Section 5.c.iv.A.1)

- What is the intended purpose of the AI system?
- What is the expected benefit of the AI system?

[103] U.S. Department of Justice. (2021, December). 2021 Review and Revalidation of the First Step Act Risk Assessment Tool. *NIJ report NCJ 303859*. https://www.ojp.gov/pdffiles1/nij/303859.pdf; Ryan Labrecque. (2023, March). 2022 Review and Revalidation of the First Step Act Risk Assessment Tool. *NIJ report NCJ Number 305720.* https://nij.ojp.gov/library/publications/2022-review-and-revalidation-first-step-act-risk-assessment-tool.
[104] Russell, S. and Norvig, P. (2022) Artificial Intelligence: a modern approach. 4th U.S. edition. https://aima.cs.berkeley.edu/, see Chapter 19.6 on linear regression https://aima.cs.berkeley.edu/contents.html

- What performance metrics and/or qualitative analysis was used to assess the fitness to purpose and expected benefit of the AI system?
- What were the quantitative and/or qualitative results found by the above described analysis?

The potential risks of using AI (Section 5.c.iv.A.2)

- What stakeholders will be most impacted by the use of the AI system?
- What possible failure modes may result from use of the AI and of the broader system, both in isolation and as a result of human users and other likely variables outside the scope of the system itself?
- What are the potential risks to underserved communities?
- Describe how the expected benefits of the AI functionality were weighed against its potential risks and how it was determined that the benefits meaningfully outweigh the risks. Note that if the benefits do not meaningfully outweigh the risks, agencies should not use the AI.

The quality and appropriateness of the relevant data (Section 5.c.iv.A.3)

- What is the provenance and quality of the data for its intended purpose?
- How is the data relevant to the task being automated and why does it have a reasonable expectation of being useful for the AI's development, testing, and operation?
- Does the data contain sufficient breadth to address the range of real-world inputs the AI might encounter? How was that assessed?
- Does the data come from an adequately reliable source? How was that assessed?
- How are errors from data entry, machine processing, or other sources measured and limited? What are the associated data error rates? This should include errors from relying on AI-generated data as training data or model inputs.

Take steps to ensure that the AI will advance equity, dignity, and fairness (Section 5.c.v.A)

Proactively identifying and removing factors contributing to algorithmic discrimination or bias (Section 5.c.v.A.1)

- What is the process by which factors were assessed for bias?
- List any factors which were proactively removed based on this assessment.

Assessing and mitigating disparate impacts (Section 5.c.v.A.2)

- What metrics and/or qualitative analysis was used to assess disparities in the AI's performance across demographic groups?
- What demographic groups were included in the assessment?
- How was demographic data acquired or inferred to perform the assessment?
- What were the quantitative and/or qualitative results found by the above described analysis per demographic group?
- How was the AI system's real-world deployment impact assessed, and what did that assessment find?
- How were identified disparities that have the potential to lead to discrimination, cause meaningful harm, or decrease equity, dignity, or fairness mitigated? Note that if adequate mitigation of the disparity is not possible, then agencies should not use or integrate the AI tool.

Using representative data (Section 5.c.v.A.3)

- What communities will be affected by the AI system?
- What demographic groups are included in the data used to develop, operate, and assess the AI system?
- How was demographic data acquired or inferred to perform the assessment?
- What is the total number of people represented in the training data? What is the total number of people represented in the test data?
- What is the number of people from each of the demographic groups in the training data and in the test data?
- How was the data used to develop, operate, and assess the AI collected?
- What is the historical and societal context of the data and data collection process?
- Describe how any improper bias in the data has been assessed and mitigated.

Consult and incorporate feedback from affected groups (Section 5.c.v.B)

- On what date(s) was consultation with affected groups, including underserved communities, conducted about the design, development, and use of the AI?
- What affected groups were consulted? Affected groups may include customers, federal employee groups, and employees' union representatives among other members of the public.
- What type of consultation was conducted? Choose from the following (you may choose more than one):
    1. Direct user testing, such as observing users interacting with the system;
    2. General solicitations of comments from the public, such as a request for information in the Federal Register or a “Tell Us About Your Experience” sheet with open-ended space for responses;
    3. Post-transaction customer feedback collections;
    4. Public hearings or meetings, such as a listening session; or
    5. Any other transparent process that seeks public input, comments, or feedback from the affected groups in a meaningful, equitable, accessible, and effective manner.
- If the consultation listed above was some other transparent process (option 5), describe that process.
- If consultation with affected groups was not conducted because doing so was inconsistent with applicable law or governmentwide guidance, describe the applicable law or governmentwide guidance that is inconsistent with such consultation.
- Provide a URL to any public documentation of the consultation, such as resulting RFI submissions.
- Give a summary of the key findings of the consultation.
- Describe any changes made to the AI system and/or planned rollout in response to the consultation.

Respectfully submitted,

Sorelle Friedler, Senior Policy Fellow
Brian J. Chen, Policy Director

Washington, DC 20503

Dear Chief Information Officer Martorana:

Thank you for the opportunity to respond to this Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence.

For nearly 20 years, Benefits Data Trust (BDT) has harnessed the power of data, policy, and technology to provide efficient and dignified access to assistance. A cornerstone of BDT's work is identifying individuals who are enrolled in one means-tested program but are eligible for more and helping them access additional assistance. As the digital landscape evolves, we recognize the transformative potential of artificial intelligence (AI) in optimizing service delivery and improving outcomes for those we serve. BDT is exploring how AI might be beneficial in human services, including advancing a more intelligent, dignified, and effective delivery of public benefits services to people in need. We are tackling questions such as: "How can AI assist front-line workers who lead and run government programs that are essential to fighting poverty and meeting people's basic needs? "How should we make the most of new AI tools that can modernize and streamline work, while guarding against risks that can harm people's health and well-being and contribute to inefficiency and inequity in the public benefits system?"

A nonprofit since 2005, BDT has secured more than $10 billion in benefits for households across the country, building pathways to economic mobility and a more equitable future. BDT has nearly 20 years of experience in using data and technology to target outreach and awareness campaigns to connect people to essential benefits and services such as SNAP, WIC and Medicaid, informing public policy strategies, and incorporating human-centered design to ensure services are informed by — and responsive to — clients' needs. This is the perspective and history BDT is bringing to the AI conversation generally and to the comments and recommendations contained in this submission.

BDT applauds and supports the Office of Management and Budget's recognition of the transformative effects AI can have on the way the federal government operates and serves its constituents while also recognizing the imperative need to establish safeguards to mitigate the inherent risks in inserting AI into this domain. When applied to the government's administration of and people's access to public benefits such as Supplemental Nutrition Assistance Program (SNAP) and Medicaid, AI is entering a sensitive rights-affecting and life-impacting terrain. Done well, AI can boost productivity by relieving government workers of rote tasks, cutting through unproductive processes and practices, and bringing greater analytical horsepower to operations. But done poorly, without due concern for inherent ethical and socio-technical vulnerabilities AI can have unintended consequences. In this regard, AI can cause a range of harms such as replacing human judgment in areas unsuited to automation, introducing automated bias into programs already laced with off-putting complexity and historic exclusion, and exacerbating illness, insecurity, and other challenges facing people and communities human service agencies are charged with serving. It is important to navigate this AI landscape in the context of the existing Executive Order on Transforming Federal Customer Experience and Service Delivery to Rebuild Trust in Government. The Order stated, "we must use technology to modernize Government and implement services that are simple to use, accessible, equitable, protective, transparent, and responsive for all people of the United States." This paradigm should be used as the federal government explores ways to add AI to its processes and services. This is particularly true in the context of AI in the public benefits sector.

Maximizing the use of AI in the public benefits sector will require further improvement and execution of data sharing or computer matching agreements across multiple government agencies. BDT's extensive experience in assisting states in executing data sharing agreements across benefit programs has demonstrated time and again that challenges with these agreements can stymie data analysis, client outreach, and streamlining benefits access. At the federal level, there are strong examples like the use of National Verifier, where federal data sources including Medicaid enrollment, federal housing assistance programs, Federal Pell Grant and Veteran Pension and Survivors Benefits are shared to verify enrollment in the Affordable Connectivity Program and Lifeline. Further encouragement is needed to have greater coordination amongst Federal agencies to appropriately share information for AI purposes to fully reap the benefits of government efficiencies and improved experiences for consumers.

The breadth and depth of what is possible with AI in the federal government context is expansive. Millions of individuals engage with the federal government through federal and federally assisted benefits programs each year. Imagining ways AI can be used to assist these individuals' experiencing poverty and relying on social safety net programs to make accessing benefits more streamlined and easier to use and maintain is a worthy priority. BDT is contributing to and learning from cross-sector conversations to build ethical guiderails on these kinds of human engagements in AI development and distribution. It is from these learnings and BDTs own exploration in bringing AI into the public benefits sector that BDT offers the following recommendations.

(5) MANAGING RISKS FROM THE USE OF ARTIFICIAL INTELLIGENCE.

(b) Determining Which Artificial Intelligence Is Presumed to Be Safety-Impacting or Rights Impacting.

(ii) Purposes That Are Presumed to Be Rights-Impacting.

BDT supports that presumed rights impacting activities includes "decisions regarding access to, eligibility for, or revocation of government benefits or services; allowing or denying access—through biometrics or other means (e.g., signature matching)—to IT systems for accessing services for benefits; detecting fraud; assigning penalties in the context of government benefits."

Integrating AI into decisions regarding eligibility and enrollment in these programs imparts profound influence on individual's everyday lives. As such we support recognizing eligibility and enrollment in government benefit programs as "presumed rights impacting" activities and decisions.

(c) Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence.

(iv) Minimum Practices for Either Safety-Impacting or Rights-Impacting AI.

(A) Complete an AI Impact Assessment.

(1) The intended purpose for the AI and its expected benefit. Sometimes the addition of technology into human services can unwittingly create barriers to access due to the way that technology translates into the experience of the consumer in engaging with the technology. **BDT recommends that agencies should be required to consult with and document work with internal or external groups focusing on customer service delivery, including clients themselves, to ensure the AI does not result in more burdensome experiences for the consumer.** Groups with this expertise can assist with pinpointing the ways AI can actually improve the customer experience in addition to the efficiencies it will create for the federal agencies.

BDT recommends that AI impact assessments should be required to ensure the AI initiative efforts are in line with government capacities. There are a myriad of ways AI could be integrated into federal agencies' benefits delivery systems. However, it is important to consider government capacities as AI initiatives and opportunities are vetted. Though this guidance is directed towards federal agencies, BDTs experience in supporting state benefit delivery systems informs that when there is a new federal initiative there is a trickledown effect of burden on state and local governments as well as the consumer. In addition, there is sometimes confusion on the part of the state with understanding and implementing new federal guidance. This tension often intersects with state efforts to improve the ways in which they serve individuals. This is an opportunity where the use of AI could reduce the burden to governments and the consumer if done well. Impact assessments should strategically prioritize AI efforts where the expected benefit and impact outweigh the expected burden to federal and state government as well as the individual. In weighing these factors an AI impact assessment should provide insight into how and why this initiative is being prioritized. The goal of this introspection being avoidance of overwhelming benefits delivery systems.

(3) The quality and appropriateness of the relevant data. OMB has noted the importance of "proactively identifying and removing factors contributing to algorithmic discrimination or bias" in the Proposed Memorandum. **BDT recommends that agencies must document in the AI impact assessment how the agencies have assessed the data for inherent biases affecting marginalized and underserved populations and the mitigation measures the agency will take to help reduce the risk of discriminatory outcomes.**

(v) Additional Minimum Practices for Rights- Impacting AI.

(A) Take Steps to Ensure that the AI Will Advance Equity, Dignity, and Fairness.

(1) Proactively *identifying and removing factors contributing to algorithmic discrimination or bias.* BDT supports the requirement that agencies assess whether rights-impacting AI materially relies on information about a class protected by Federal nondiscrimination laws in a way that could result in algorithmic discrimination or bias against that protected class. Accounting for these characteristics and communities will help ensure that the insertion of AI into the public benefits sector will not further worsen already existing gaps in access to public benefits.

(B) Consult and Incorporate Feedback from Affected Groups.

BDT supports the requirement that agencies must consult affected groups, including underserved communities, in the design, development, and use of the AI, and use such feedback to inform agency decision-making regarding the AI. Marginalized and underserved communities have unique needs and perspectives that should be considered in the AI design, implementation and review processes. These communities often face the consequences of systemic biases. In the context of public benefits this means that individuals can be forced to go without necessities like food and healthcare or endure an unduly burdensome process to attain these supports. Actively involving these communities in the AI development process can help identify and mitigate biases that might otherwise go unnoticed and further worsen systemic inequities. Sometimes access to public benefits is intertwined with cultural contexts and nuances. Incorporating user experience from marginalized communities helps to achieve culturally competent AI systems and outcomes as well.

Sometimes the use of technology in human services systems can unwittingly create barriers for the consumer, such as issues with digital literacy. **BDT also recommends that agencies should be encouraged to consult and document work with internal or external groups focusing on customer service delivery including ensuring the AI does not result in more burdensome experiences for the consumer.**

(C) Conduct ongoing monitoring and mitigation for AI-enabled discrimination.

BDT supports the requirement that agencies must also monitor rights-impacting AI to assess and mitigate AI-enabled discrimination against protected classes that might arise from unforeseen

circumstances, changes to the system after deployment, or changes to the context of use or associated data.

(D) Notify Negatively Affected Individuals and (E) Maintain Human Consideration and Remedy Processes.

BDT supports the requirements that agencies must notify negatively affected individuals and maintain human consideration and remedy processes. **BDT recommends that agencies should be required to plan for how AI, which meaningfully influences eligibility decisions and/or the appeals processes, both ensures accessibility and accommodates diverse levels of technological literacy.** Due to the complex nature of AI algorithms, there is concern that individuals may be unable to understand the basis for eligibility or appeals process decisions negatively affecting them. Agencies should be able to provide clear, plain explanations that detail the factors that influenced the decision using an AI algorithm.

The use of AI in public benefits administration should not erode the eligibility or appeal process by being too complicated to pinpoint reasons for adverse outcomes. It should not create additional or unduly burdensome hurdles for eligibility or appeals processes. Benefits systems do individuals a disservice if efficiencies at the agency are prioritized at the expense of the consumer experience for the individual.

(F) Maintain Options to Opt-Out Where Practicable.

BDT supports the requirement that agencies maintain options to opt-out from AI functionality in favor of a human alternative where practicable. This is a way in which agencies can maintain individual choice in this new AI landscape. Government agencies are often seeking ways to improve the level of trust their constituents have in the agency. Providing the option for a human alternative to AI builds trust and recognizes differing levels of comfort with the new technology. It is important to honor individual choice and recognize that providing AI without a human alternative may make individuals wary of eligibility processes and have a chilling effect on benefits access overall.

OMB Draft Policy RFC_ CCC Final Response

The Computing Community Consortium's Response to the Office of Management and Budget's Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

December 5, 2023

Written by: David Danks (University of California, San Diego), Haley Griffin (Computing Community Consortium), David Jensen (University of Massachusetts Amherst), Chandra Krintz (University of California Santa Barbara), Daniel Lopresti (Lehigh University), Rajmohan Rajaraman (Northeastern University), Matthew Turk (Toyota Technological Institute at Chicago), and Holly Yanco (University of Massachusetts Lowell)

This response is from Computing Research Association (CRA)'s Computing Community Consortium (CCC). CRA is an association of nearly 250 North American computing research organizations, both academic and industrial, and partners from six professional computing societies. The mission of the CCC, a subcommittee of CRA, is to enable the pursuit of innovative, high-impact computing research that aligns with pressing national and global challenges.

Please note any opinions, findings, and conclusions or recommendations expressed in this material are those of the authors and do not necessarily reflect the views of the authors' affiliations.

This response pertains to questions 1-6, and 8 (each numbered and copied below in italics) from the Request for Comments:

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

We strongly endorse the notion that the Chief AI Officers should be at the senior level in order to maximize their impact. They will be responsible for helping to shepherd our government through one of the most significant technological transitions in our nation's history. Our

impression is that it will be a dual-hatted position, so we also emphasize that they should be provided with all necessary resources, including sufficient staffing and a highly qualified deputy with expertise in a wide range of emerging AI topics.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

A new body to perform AI governance is the right approach because there is danger in following the status quo given the speed and scale of AI developments today. It is essential to look for new ways of thinking, and this can be actualized through AI Governance Bodies that consist of individuals who are studying pressing AI issues both broadly and deeply. We also propose that the AI Governance Bodies at each agency have several members who are Special Government Employees (SGEs), bringing insights from outside of each agency while still understanding key aspects of each agency's mission. In particular, we encourage the Bodies to include SGEs such as researchers participating in NSF AI Institutes, professional organizations with long-standing expertise in AI including the Computing Research Association (CRA), Association for the Advancement of Artificial Intelligence (AAAI), Institute of Electrical and Electronics Engineers (IEEE), Association for Computing Machinery (ACM), etc., and members of potentially impacted communities. Given the breadth of AI's impact, interdisciplinary contributions from a wide range of fields will be critical in order to provide appropriate perspectives about research and impact on communities. AI Governance Bodies should not only include experts in computing, but also those with expertise in other disciplinary approaches, such as health and human services, transportation, and the social sciences.

Additionally, we believe that there needs to be a transparent mechanism for interactions across AI Governance Bodies of different agencies. While AI Councils are mentioned as a potential vehicle for coordination, the draft policy lacks a description of how the collaboration between these bodies will take effect. We believe such collaborations will be vital for reducing duplication of effort and, ultimately, for success of this effort, but these benefits will not be realized without careful design.

3. How can OMB best advance responsible AI innovation?

It is essential for responsible AI innovation advancement to…

- Bring in non-agency and non-vendor expertise, perhaps through outside individuals on advisory boards for agencies, both technical experts and average citizens. The work of such boards should be observable and transparent where possible (so that the public can give feedback as needed).
- Prioritize that the outcomes from using AI are trustworthy, fair, and reliable. While using good, clean data is important in developing AI systems, the results and impacts on individuals and communities need to be top of mind especially since even good data can be misused.
- Implement monitoring mechanisms that recognize that even if a large number of individuals have used an AI system over a period of time and have not yet reported any issues, that does not mean that the AI system is safe or reliable. Rare but impactful edge cases are common across all fields of computing.
- Reevaluate an AI/ML system each time a software update is implemented, or a dataset is changed. We recognize that there are difficult questions about exactly when a software or dataset update is significant enough to require re-evaluation. We do not propose a hard-and-fast rule, but we contend that any such criterion should err on the side of too much re-evaluation, rather than too little.
- Encourage independent evaluation and testing of all AI/ML systems so as not to become dependent on vendors who may employ differing criteria.
- Actively plan and prepare for unforeseen deleterious impacts because the behavior of many AI systems remain unpredictably complex.
- Release metrics and reasons for determinations that an AI is neither “safety impacting” nor “rights impacting.” The public should have access to these measures given the significant incentives for companies to claim their systems are neither safety- nor rights-impacting in order to minimize scrutiny.
- Use a more fluid characterization of an AI system, as the impact of such technology can change rapidly and needs to be reconsidered often.
- Encourage and support public scrutiny of the AI use case inventories that Agencies are releasing. There is always a possibility they are choosing to display the work they know will please the public instead of a random/average sample.
- Require that AI use cases be published with a sufficient level of detail and, where appropriate, representative data, so that outside independent experts can evaluate potential risks and provide constructive feedback for ongoing improvement of AI deployments.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

At this early stage in the development of generative AI, we urge a cautious, carefully considered approach to employing generative AI in agency missions and business operations. We applaud current research on generative AI, and we are optimistic about the tremendous possibilities that it offers, but caution should be taken. Systems and processes built around generative AI should be prepared to deal with errors and unanticipated outputs. The private sector is going through processes of trial and error in the generative AI space, and will continue to do so for the immediate future; there is wisdom in letting them work through the growing pains of this new technology before taking any large scale measures as a government. Additionally, at this time business operations can oftentimes be more improved by non-generative AI solutions; agencies should not presume that generative AI systems are the only, or even the best, way to advance their missions and operations.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

The following challenges should be considered when categorizing use cases:

- *The challenge of AI software components* — One fundamental challenge is that a vast number of computer systems could be deemed to be "AI" because one (perhaps largely incidental) component of that system uses some form of AI technology. For example, consider
    - a video-conferencing system that uses a computer vision model to identify the background of an image (to add blur to that background).
    - an email system that uses a simple Bayesian classifier for spam detection.
    - a word processor that uses a simple language model for autocomplete.
- *The challenge of update frequency* — Software components based on machine learning have the potential to dramatically increase the frequency, scope, and potential impact of updates to software that is routinely used by agencies.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

There should be an open mechanism for affected groups/users of an AI system to have a redress path that leads back to the appropriate AI experts in the agency. When a decision is being made

by a human, there is a human to complain to, and a process for the complaint to be taken up the chain of command as needed. It is crucial that especially for rights or safety-impacting AI, that there is a clear process for perceived harms to be documented and addressed.

On a similar note, if possible there should be a notice to an individual if they were negatively impacted by an AI system. If an error was made and is being fixed, they should be updated on this change. This is similar to what happens today when there is a data breach and private information is stolen from a website.

Additionally, in regards to data usage in these AI systems, legacy data should automatically be considered suspect until proven otherwise since so much data from the past contains inherent biases, as has been demonstrated through numerous published studies. All data used to develop AI needs to newly pass the criteria outlined in the minimum practices, just like the AI systems themselves will have to do.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Given the huge impact AI can have on our society and competing interests, many of which are powerful and well-funded, special efforts will be needed to make sure the public receives a true and accurate picture of what AI can and cannot do, and how it is being applied in government. So use cases should include an interpretation, explanations, and examples that the average citizen can follow, understand, and question when necessary. There should also be a process to make sure that the case the agency is providing is either random or average so they can not choose to just display their best examples.

Oakland Privacy Comments - OMB Federal Agency use of AI

The Office of Management and Budget (OMB)
Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

FR Doc. 2023–24269
Publication Date: November 2, 2023

December 5, 2023

We appreciate the opportunity to give comments on the Office of Management and Budget's (OMB) proposed guidance on Advancing Governance, Innovation, and Risk Management for Agency Use in relation to President Biden's Executive Order for Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence.

Oakland Privacy is a citizens' coalition that works to defend the right to privacy, enhance public transparency, and promote oversight regarding the use of surveillance techniques and equipment. We develop frameworks for the implementation of equipment with respect for civil rights, privacy protections and community control and engage in other public information awareness efforts that support civil, human and privacy rights.

Despite the recent proliferation of the use of AI, the public's trust has not evolved with it. A survey released in 2023 on AI trends indicated that most Americans express reservations about AI for high-value applications such as accessing government benefits or healthcare. 78% of those polled indicated that they are very or somewhat concerned that AI can be used for malicious intent.[1]

Consumers and the general public are not alone in their concerns about the use of AI. A recent report found that organization leaders have concerns about the bias and ethics of AI systems.[2] Of the organizations polled, most organizations reported having encountered ethical issues relating to the use of AI within the last 3 years. Furthermore, 77% of executives claimed to be uncertain about the ethics and transparency of the AI systems used by their organizations. Finally, in 9 out of 10 organizations, executives admitted to having awareness of at least one case in which the use of their AI tools resulted in ethical issues.

[1]https://www.mitre.org/news-insights/news-release/mitre-harris-poll-finds-lack-trust-among-americans-ai-technology
[2] https://www.capgemini.com/wp-content/uploads/2019/08/AI-in-Ethics_Web.pdf

It is vital that both the public and entities have trust in the development and deployment of AI systems, and that those systems and tools are ethical, protect civil rights and privacy.

Limitations on use of AI
A balanced guidance should outline instances where restrictions or a complete ban on the use of AI are appropriate.

The use of biometric related AI should be severely restricted, in part because the full potential dangers of applications of this type of AI are still unknown and - just as important - because of significant related privacy issues. Unlike other personal information like banking details or a medical records, biometrics are not easily reset, providing intimate, unique and unchanging details about individuals and their relatives..

A decade ago, it was generally thought that if biometrics became more prevalent and their use became more widespread, more agencies and states would regulate their use; however, that has not happened in a meaningful way. In fact, agencies are already using biometrics to administer programs without guardrails which is extremely problematic. Several states have utilized facial recognition on applicants in order to access unemployment insurance programs.

Facial recognition has been established to be biased and otherwise problematic, and has prevented people with legitimate claims from applying and receiving funds in a time of dire need during the pandemic.[3] The Department of Veterans Affairs lists over 40 uses of AI that include predictive modeling and several relying on biometrics.[4] Biometrics are also used by state and federal agencies to manage border ports of entry, issue electronic passports, administer voter registration and identification verification, and issue disbursements. The use of facial recognition by law enforcement has already resulted in several black men being wrongfully arrested for crimes they did not commit.[5]

An “error” can mean the denial of a benefits claim, an arrest record, and/or the loss of work and income. Restrictions on the use of AI that can result in substantial harms is appropriate and warranted. Just because you can, doesn’t mean you should.

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

The qualifications and training necessary for a Chief AI Officer (CAIO) should be further elaborated. In addition to a general background in AI, a CAIO should have knowledge in areas such as tech ethics and digital safety and security, among others. The CAIO should have experience implementing programs with the aforementioned areas of expertise. Additional resources and references on AI - and tech - ethics generally should be curated and be made available to agencies, such as this collection[6] from the National Institute of Standards and Technology (NIST).

[6] https://www.nist.gov/system/files/documents/2021/08/23/ai-rmf-rfi-0040.pdf

3. How can OMB best advance responsible AI innovation?

The statement that "promoting innovation and growth of AI is a high priority of the U.S. government" should also make it clear that the priority is in safe and trustworthy AI. While this question refers specifically to responsible AI innovation, the OMG guidance specifically emphasizes the objective of "identifying and removing barriers to the responsible use of AI," but does not sufficiently address related AI harms.

Oftentimes rules and regulations are placed at odds with innovation, when in reality, innovation will happen despite regulation. Appropriate regulation will help protect people and resources from exploitation, reduce negative externalities, and disincentivize the development of irresponsible AI products and services. Moreover, thoughtful rules regulation can avoid favoring or further helping entrenched incumbents which in turn reduces competition and a large and diverse AI ecosystem. The development and deployment of AI should not come at the expense of people's civil liberties and should have robust guardrails, so the question of advancing AI innovation is really a question of mitigating related harms.

Guidance proposed for the use of safety-impacting or rights-impacting AI in particular should also include a clear and concise reporting mechanism for individuals who feel they have been harmed in a way that is accessible and user friendly.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Generative AI holds the potential of automating many repetitive and time-consuming tasks and enabling parts of the federal workforce to conduct more creative assignments. However, the increased efficiency of automating these tasks must not result in enhanced bias, discriminatory outcomes or erroneous outputs. Where judgment comes into play, humans must remain in the loop. Further, agencies should be prepared to proactively discover and address harms before such AI deployment becomes entrenched and the harms become too unmanageable.

In particular, AI data leak risks should be adequately addressed and mitigated. Specifically with generative AI, data leaks are happening despite strong guardrails, as reported by Google's DeepMind researchers with OpenAI's ChatGPT. This erodes trust and raises significant privacy issues.[7]

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

Item K under "Purposes That Are Presumed to Be Rights-Impacting" should be expanded to include foster youth. There is not really much information about the impact of data collection or the use of AI systems to deliver services to foster youth and other wards of the court. For one, because foster youth as wards of the court are under significant government supervision, there is a lot more data - and sensitive data in particular - collected and documented about them. This includes things like school special education plans, mental health treatments and reproductive care. These and other factors have put this population at high risk of exploitation such as identity theft as a result. While there are some current laws to protect foster youth, just the fact that more data points are collected about this population makes them especially vulnerable. Furthermore, having more data collected on this

[7] https://www.zdnet.com/article/chatgpt-can-leak-source-data-violate-privacy-says-googles-deepmind/

population can have negative impacts on various other areas of their lives long-term, such as obtaining loans, securing housing or pursuing education.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Agencies should strive to go beyond the minimum practices outlined in the OMB guidance, particularly in safety and right-impacting uses of AI.

Under the “Mitigate Emerging Risks to Rights and Safety” section, the guidance directs agencies to cease the use of safety and right-impacting AI when “...risks to rights or safety exceed an acceptable level”. “Acceptable level” should be further defined to give agencies direction on either a baseline or how to establish a baseline for their particular agency.

Strengthening these minimum practices will provide more robust protections in instances where potential for AI harms are greatest and potentially highly detrimental.

Law Enforcement

The OMB guidance should absolutely and unequivocally address the use of AI by law enforcement and the harmful impacts of its use on already underserved and marginalized communities in particular.

Although the OMB guidance is directed at government agencies, the symbiotic relationship of government and the commercial tech sector cannot be glossed over. With ever growing use of AI, marginalized and underserved communities are over-surveilled by the government and the commercial surveillance complex is complicit in this endeavor.

People who are not under suspicion of committing crimes become victims of surveillance, having vast troves of personal information collected by both the private sector and law enforcement, who in turn share this data with other government agencies and data brokers.

This practice of rampant data-sharing has multiple negative impacts including unwanted law enforcement contacts. One example is that the Sacramento Department of Welfare in California had installed license plate readers in their parking lot and fed geolocation data from that parking lot to a cloud database accessed by a number of local law enforcement agencies, including the municipal police and sheriff's departments as well as numerous federal agencies. People collecting assistance benefits - which is not a crime - forced them to be victims of law enforcement surveillance. Public uproar forced the agency to remove the license plate readers from the premises.[8]

Managing Data

AI and its data is a double-edged sword. While data is addressed in the second section under “removing barriers to the responsible use of AI”, it is not sufficiently addressed in the third section under “Managing Risks”. As mentioned in the earlier section on generative AI, due to potential risks and privacy issues, further consideration about data management should be given including accounting and addressing data leaks. There is a lot of emphasis on the trustworthiness of data

[8] https://www.sacbee.com/news/local/article216093470.html

processed by algorithms, but that should also extend to all data an algorithm has seen in the various stages of pre-training and training.

Exclusions and Waivers
Research and development should not be excluded from minimum practice guidelines. As there are both established ethical concerns and potential risks stemming from AI use in research and development, OMB should establish some guidelines.

Clearview AI, a surveillance tech company which uses facial recognition and is used by law enforcement agencies used the troubling practice of scraping data from the likes of Google and Facebook.[9] One issue is the unethical means by which Clearview AI obtained the data used to train its algorithms. It is so problematic that there are numerous publications around the ethical use of ill-gotten data.[10] For example, there should be more scrutiny about the use of data that became available through web scraping, data leaks or other unethical means as the people this data references have likely not consented to its use by third parties or for said research. If the government is to lead by example, it should not accept such practices from either within various agencies or vendors relating to the use of AI. Agencies should demand that vendors abide by sound ethical standards with the development and deployment of AI tools.

The ability for agencies to apply for and obtain waivers is also overly broad and is ripe for exploitation. Law enforcement agencies in particular have been circumventing fundamental civil rights protections to conduct surveillance and are highly likely to continue to circumvent accountability and oversight with regard to their use of AI tools. We insist that the OMB work on closing these various loopholes and provide further guidance to agencies.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

OMB guidance should include information for agencies to conduct due diligence on vendors and establish service level agreements into contracts related to AI tech.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Agencies should be encouraged to supply and make public as much information as possible about their use of AI, including:

- Vendor information
- Related extensions and waivers granted to the agency
- Research and development using AI
- Related complaints and subsequent investigations
- Start and stop dates of deployments

[9]https://www.cnet.com/news/privacy/clearview-ai-hit-with-cease-and-desist-from-google-over-facial-recognition-collection/
[10]https://www.cambridge.org/core/services/aop-cambridge-core/content/view/8B21B19600D708551026B42025830B7C/S1049096520000323a.pdf/analyzing_the_ethical_implications_of_research_using_leaked_data.pdf

AI Maturity
The guidance defines “Artificial Intelligence Maturity” as “A Federal Government organization’s capacity to successfully and responsibly adopt AI into their operations and decision-making across the organization, manage its risks, and comply with relevant Federal law, regulation, and policy on AI.” AI maturity should be further defined, possibly outlining various maturity models or reference an existing maturity model.

Federal Procurement of AI
Further guidance should be outlined regarding the procurement of AI, including the responsibilities and requirements placed on contractors, vendors and other third parties who handle data, including data brokers and white-label services. While agencies may be procuring AI products or services from one vendor, the actual underlying AI data set or model may come from one or more third-party suppliers which is essentially white-label data or AI. This is especially problematic for trustworthy and accountable AI, as the agency may lack adequate information about the AI they are using within their agency, and hampers their ability to implement meaningful oversight. Agencies should require that vendors supplying AI tools and services furnish information about the scope and context of the deployment of their AI. Without impacting IP, this information will provide both agencies and the public with greater transparency as to how AI is being deployed and their contexts, and greater accountability on the part of vendors.

Privacy
Due to the risks associated with the use of AI, the OMB guidance should strengthen privacy protection requirements. For agencies to implement the requirements outlined in the guidance, they will need to evaluate how commercial data is collected and used. Therefore privacy protections should be in place governing the ownership of data, collection of data, data management, storage, and restrictions on the use of data. Furthermore, agencies should establish and implement privacy-preserving measures with the procurement, training and deployment of AI.

For government agencies to lead in the responsible deployment of AI, they must have robust guardrails in place that foster trust, mitigate harms and protect fundamental civil rights and privacy. Agencies should not only adopt the minimum standards outlined in the OMB guidance but strive to go beyond to create and implement processes and procedures for high risk use of AI that is safety-impacting and rights-impacting. Agencies should strive for transparency and meaningful public engagement for oversight and accountability.

Respectfully,

Yadi Younse

OMB Docket Submission (1)

December 5, 2023

Clare Martorana
U.S. Federal Chief Information Officer
Office of the Federal Chief Information Officer
Office of Management Budget
725 17th St., NW
Washington, DC 20503

Dear Ms. Martorana:

We appreciate the opportunity to submit these notes on the OMB's proposed memorandum for the heads of executive departments and agencies. We write on behalf of the AI Now Institute, a leading policy research center founded in 2016 to address the burgeoning impact of artificial intelligence technologies on the public.

AI Now has long viewed government AI procurement processes as a key lever of intervention to ensure that AI systems are accountable to the contexts and communities they are meant to serve, especially when these systems mediate or replace public functions. In this note we draw from this broader body of work including *Confronting Black Boxes: A Shadow Report of the New York City Automated Decision System Task Force* (a formal review prepared by a broad based NGO coalition of a government report);[1] an international collaboration with multiple city governments in Europe that included model contractual provisions for AI contracts with government bodies,[2] and recommendations to other government agencies.[3]

It is critical that in its guidance the OMB uphold the Biden Administration's stated commitment to ensuring that the rights and safety of the public are foregrounded in its use of artificial intelligence technology, and that it center the need for fair competition in its execution of the mandates outlined in the EO.[4] These are precisely the right goals for the

[3] AI Now Institute, "Submission to the Australian Human Rights Commission Human Rights & Technology Discussion Paper," March 13, 2020, https://humanrights.gov.au/sites/default/files/2020-07/51_-_ai_now_institute_nyu_2.pdf
[4] White House, "Executive Order on the Safe, Secure and Trustworthy Development and Use of Artificial Intelligence", Oct. 30, 2023,

White House to be foregrounding at a moment where many companies are racing to commercialize artificial intelligence systems before they're ready.[5] This means that many products on the market lack adequate testing and validation, and their compliance with existing law remains uncertain.[6]

While ensuring that the US government is at the cutting edge is a laudable goal, blanket adoption of AI does not offer a shortcut to innovation. A responsible approach would foreground the need for agencies to critically evaluate whether AI is necessary, appropriate, and fit for a particular task, and whether its use opens up the possibility of other detrimental effects, alongside considering what measures should be implemented to ensure when AI is used, it is deployed in ways that mitigate potential harms.[7]

We have two broad observations that apply across the Guidance, alongside more specific comments below.

First, elements of the Guidance Memo, as currently structured, could incentivize reckless, wasteful and misguided adoption of AI, as well as an overreliance on waivers to escape obligations. To mitigate this, there needs to be more stringent evaluation of the value proposition of using AI in a particular context, its impact on fair competition, and procedural safeguards to prevent routine waivers from risk assessment. For example, there are many examples where litigation following the reckless adoption of AI ended up costing the agencies and taxpayers more than the 'efficiencies' of these technologies saved them.[8]

[7] Rashida Richardson, "Best Practices for Government Procurement of Dataa-Driven Technologies," *SSRN,* June 1, 2021, https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3855637

[8] See, for example, "State of Michigan Announces Settlement of Civil Rights Class Action Alleging False Accusations of Unemployment Fraud, *Michigan Department of Attorney General,* October 20, 2022, https://www.michigan.gov/ag/news/press-releases/2022/10/20/som-settlement-of-civil-rights-class-action-alleging-false-accusations-of-unemployment-fraud. The AI Now Institute has held several convenings making observations about litigation practices that challenge government use of artificial intelligence systems, see Litigating Algorithms: Challenging Government Use of Algorithmic Decision Systems, Sept. 2018 https://ainowinstitute.org/publication/litigating-algorithms-3 and Litigating Algorithms 2019 US Report: New Challenges to Government Use of Algorithmic Decision Systems, Sept. 2019, https://ainowinstitute.org/publication/litigating-algorithms-2019-u-s-report-2.

We would underscore first and foremost that the benefits of some types of AI use remain untested,[9] and in some cases blanket AI adoption mandates can contribute to both harm and waste. **In its implementation of the Executive Order, OMB should foreground that the presumption that AI adoption will in all cases enhance operations or efficiency, or will inherently improve innovation, has historically proven to be flawed.** In many instances, wholesale adoption mandates for implementation of AI technologies can do the opposite by increasing waste, exacerbating social harms, and simply failing to work as intended.

Second, it is **critical that the OMB's guidance be crafted to ensure that federal procurement of artificial intelligence technology, a significant buyer in this technology market, is structured to avoid deepening the significant concentration that already exists within the sector**.[10] Promoting fair competition is an issue that the Biden administration has prioritized in both its Executive Orders on AI and on Competition. **To align with this priority, the OMB guidance can be more specific in its competition** provisions: we are particularly concerned that absent sufficient measures to ensure otherwise, there is a risk that the mandate for AI adoption across government will ultimately deepen lock-in to dominant firms' technological ecosystems.

As we describe with more specificity below, this includes:

1. **Avoiding infrastructural dependencies** to ensure competition and avoid the creation of single points of failure through which risk can disseminate across government.[11] Particular measures to prioritize include ensuring that egress fees for data transfers be zero or at cost, and that interoperability mandates ensure that third party services both connect seamlessly and under the same conditions as dominant firms' products.

---

[9] See, for example, the use of a flawed emotion recognition system by Customs and Border Patrol, a multimillion dollar contract for an AI system that relied on methods disregarded by the scientific community as pseudoscientific: Joseph Cox, "The A.I. Surveillance Tool DHS Uses to Detect 'Sentiment and Emotion'", *404 Media,* Aug. 24, 2023, https://www.404media.co/ai-surveillance-tool-dhs-cbp-sentiment-emotion-fivecast/.

[10] Nihal Krishan, "Federal gov spending on AI hit $3.3b in fiscal 2022: study," *FedScoop,* https://fedscoop.com/us-spending-on-ai-hit-3-3b-in-fiscal-2022/.

[11] See, for example, Gary Gensler's recent remarks on the systemic risk introduced by the reliance on a limited number of large-scale AI models: Stefania Palma and Patrick Jenkins, "Gary Gensler urges regulators to tame AI risks to financial stability," *Financial Times,* Oct. 15, 2023, https://www.ft.com/content/8227636f-e819-443a-aeba-c8237f0ec1ac; the Treasury Department has outlined similar concerns in its cloud report, https://home.treasury.gov/news/press-releases/jy1252, and the Department of Health and Human Services compiles threats to the security of healthcare systems due to its use of cloud computing, including tracking of the effects of cloud outages on health systems: https://www.hhs.gov/sites/default/files/threats-in-healthcare-cloud-computing.pdf.

2. **Minimizing firms' access to data** through the implementation of strong data security mandates and evaluating any anti-competitive advantages firms may already have in certain sectors (such as healthcare and finance) as well as advantages they may gain through access to agency data.
3. **Apply competition protections to public investment measures,** particularly the pilot of the National AI Research Resource, to ensure that public investments are deliberately structured so the benefits do not directly accrue to already dominant firms rather than serve the interests of the broader public.[12]
4. **Evaluate levels of corporate dependency on particular firms across government agencies**, enabling clear insight in to the level of concentration in adoption of technology services.

Our specific recommendations are as follows:

1. **Amend Section 3(b)(ii) on "promoting AI innovation" to ensure that the directive to identify and prioritize appropriate uses of AI does not overtly incentivize use and undercut the risk evaluation directives that follow.**

Current OMB Guidance:

CAIOS, in coordination with other responsible officials and appropriate stakeholders, are responsible for: [...]

Promoting AI Innovation

G. working with their agency to identify and prioritize appropriate uses of AI that will improve their agency's mission and advance equity;
H. identifying and removing barriers to the responsible use of AI in the agency, including through the advancement of AI-enabling enterprise infrastructure, workforce development measures, policy, and other resources for AI innovation;
I. advocating within their agency and to the public on the opportunities and benefits of AI to the agency's mission

Recommended amendment:

[12] AI Now Institute and Data & Society Institute, "Democratize AI? How the National AI Research Resource Falls Short", Oct. 5, 2021, https://ainowinstitute.org/publication/democratize-ai-how-the-proposed-national-ai-research-resource-falls-short.

ADD [[None of the above should be construed as a bias or presumption in favor of AI as necessarily beneficial. AI must only be used in cases where there is a demonstrated value proposition (see Section 5(c)(iv)(A)). In addition, any promotion of AI within agencies should be accompanied by awareness of known risks and failures and costs associated with risk mitigation, as described below.]]

2. **Amend Section (5)(c)(iv)(A)(1)(p15) to explicitly state that if there is no clear value proposition in terms of the intended benefit of the AI use case, then such AI use should be abandoned. The costs associated with necessary risk mitigation (including human review) must be factored into this assessment, as well as indirect costs introduced by the use of the AI system and an evaluation of alternative uses of the funding.**

Current OMB Guidance:

The intended purpose for the AI and its expected benefit, supported by specific metrics or qualitative analysis. Metrics should be quantifiable measures of positive outcomes for an agency's mission, for example to reduce costs, wait time for customers, or risk to human life, that can be measured after the AI is deployed to confirm or disprove the value of using AI. Where quantification is not feasible, qualitative analysis should demonstrate an expected positive outcome, such as for improvements to customer experience or human interactions—and demonstrate that AI is a good fit to accomplish the relevant task.

Recommended amendment:

The intended purpose for the AI and its expected benefit, supported by specific metrics or qualitative analysis. Metrics should be quantifiable measures of positive outcomes for an agency's mission, for example to reduce costs, wait time for customers, or risk to human life, that can be measured after the AI is deployed to confirm or disprove the value of using AI. Where quantification is not feasible, qualitative analysis should demonstrate an expected positive outcome, such as for improvements to customer experience or human interactions—and demonstrate that AI is a good fit to accomplish the relevant task.

ADD [[Note that any personnel and financial costs associated with risk mitigation that will be required for the AI use (including human review) must be factored into the assessment, as well as ancillary elements introduced by the system such as an increase in energy usage or other costs. Finally, based on such assessment, where it is found that AI is not an appropriate fit to accomplish the relevant task, or if the costs or detrimental factors outweigh the benefits, such use should be abandoned.]]

3. **Retain text in Section (5)(c)(iv)(A)(2)(p15) mandating that Agencies engage in a risk/benefit analysis prior to utilization of an artificial intelligence system.**

Current OMB Guidance:

The potential risks of using AI, as well as what, if any, additional mitigation measures, beyond these minimum practices, the agency will take to help reduce these risks. Agencies should document the stakeholders that will be most impacted by the use of the system and assess the possible failure modes of the AI and of the broader system, both in isolation and as a result of human users and other likely variables outside the scope of the system itself. Agencies should be especially attentive to the potential risks to underserved communities. The expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, agencies should not use the AI.

Recommendation:

RETAIN this text as is.

4. **Eliminate language in (5)(c)(iii)(p14) on when CAIO's may waive minimum protective practices for safety and rights-threatening technologies, which introduces a dangerous loophole for avoiding accountability measures.**

Current OMB Guidance:

Waivers from Minimum Practices. In coordination with other relevant officials, an agency CAIO may waive one or more of the requirements in this section for a specific covered AI application or component after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations. Such waivers are applicable for the duration of the AI's use, but must be reassessed by the CAIO if there are significant changes to the conditions or context in which the AI is used. An agency CAIO may also revoke a previously issued waiver at any time. Agencies must report to OMB within 30 days of granting such a waiver, detailing the scope, justifications, and supporting evidence.

Recommended amendment:

REMOVE this provision entirely.

5. **Amend 5 (d) (iii) to ensure competition provisions introduce necessary requirements for fair competition in artificial intelligence.**

Current OMB Guidance:

Promoting Competition in Procurement of AI. Agencies should take appropriate steps to ensure that Federal AI procurement practices promote opportunities for competition among contractors and do not improperly entrench incumbents. Such steps may include promoting interoperability and ensuring that vendors do not inappropriately favor their own products at the expense of competitors' offerings.

Recommended amendment:

ADD [[Require that all procured systems work across multiple cloud environments, that third party services can be used seamlessly and under the same conditions as the services of infrastructure providers, and ensuring that Agencies can seamlessly port data into and out of a system at cost and without additional fees. Given the need for Agencies to conduct ongoing auditing and assessment of procured systems, these provisions should further extend to the provision of sandboxes or other testing environments, as well as to the procurement of systems for the National AI Research Resource Pilot.

The OMB should also produce an annual review quantifying and evaluating the degree of concentration in government contracts with technology providers.]]

—————————————————————————

Thank you for considering these recommendations. If you have any questions about our submission or if we can provide any additional information that would be helpful as you continue your important work, please do not hesitate to contact us:

Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

No. 2023-24269

December 5, 2023

TABLE OF CONTENTS

Introduction **2**

I. Key Aspects of OMB's Draft Memorandum Can and Should be Fortified **4**
- a. Safety-impacting and rights-impacting AI designations 4
- b. Funding for AI risk management, training, and compliance 11
- c. AI use case inventories 13
- d. AI impact assessments 16
- e. Decommissioning noncompliant AI 18
- f. AI procurement procedures 19

II. Agencies Should Not Adopt AI Solely for AI's Sake **23**
- a. AI systems are frequently discriminatory 24
- b. AI systems are frequently inaccurate 25
- c. AI systems perpetuate harmful data practices 26
- d. OMB should remove or revise provisions promoting AI adoption 27

III. OMB Must Prioritize Transparency and Accountability **29**

IV. OMB Should Narrowly Construe National Security Exemptions **31**

Conclusion **35**

INTRODUCTION

The Electronic Privacy Information (EPIC) submits these comments in response to the Office of Management and Budget (OMB)'s Request for Comments on its "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" Draft Memorandum, published on November 3, 2023.[1]

EPIC is a public interest research center in Washington, D.C., established in 1994 to secure the fundamental right to privacy in the digital age for all people through advocacy, research, and litigation.[2] We advocate for a human-rights based approach to AI policy that ensures new technologies are subject to democratic governance.[3] Over the last decade, EPIC has consistently advocated for the adoption of clear, commonsense, and actionable AI regulations across the country.[4] EPIC has litigated cases against the U.S. Department of Justice to compel production of documents regarding "evidence-based risk assessment tools"[5], against the U.S. Department of Homeland Security to produce documents about a program purported to assess the probability that an individual will commit a crime,[6] and against the National Security Commission on Artificial Intelligence (NSCAI) to enforce its transparency obligations under the Freedom of Information Act and the Federal Advisory Committee Act.[7] EPIC has also published extensive research on

emerging AI technologies like generative AI,[8] as well as the ways that government agencies develop, procure, and use AI systems around the country.[9]

At all levels of government, administrative agencies are granted authority to exercise a wide array of enforcement, adjudicative, and rulemaking powers due to their unique expertise—and agencies' reliance on AI systems when exercising these powers can erode the accuracy, reliability, and legitimacy of government decisions.[10] Government AI systems can undermine individuals' control over their data and fortify the position of data-extractive technologies and data brokers.[11] They can perpetuate and obscure inaccuracies and bias within data in ways that undermine individuals' civil rights and access to government services.[12] And without sufficient transparency and oversight, government AI systems can undermine decades-old processes for ensuring that government agencies meet their legal and regulatory obligations.[13]

RECOMMENDATION

EPIC submits these comments to **(1)** express support for OMB's inclusion of several key responsible AI provisions that will rebuff many risks imposed by government AI uses, including but not limited to AI impact assessments, a publicly available AI use case inventory, and AI-specific procurement processes; **(2)** recommend additional refinements to these responsible AI provisions, including additional refinements for AI impact assessments and AI use case inventories; **(3)** urge OMB to encourage AI adoption only where AI can serve as a curated tool to meet predefined agency needs; **(4)** caution OMB against implementing the Draft Memorandum without mechanisms to ensure agency compliance; and **(5)** urge OMB to narrowly construe national security system exclusions throughout the Draft Memorandum.

I. KEY ASPECTS OF OMB'S DRAFT MEMORANDUM CAN AND SHOULD BE FORTIFIED

Safety-Impacting and Rights-Impacting AI Designations

Responsive to Questions 5-7

EPIC applauds OMB's adoption of comprehensive risk designations and minimum risk managements practices required for agencies using any AI system deemed safety-impacting or rights-impacting. Ensuring that agencies maintain both pre-deployment and ongoing testing, evaluation, and risk management processes is foundational for any responsible AI paradigm. In particular, EPIC applauds the inclusion of (1) pre-deployment impact assessments to identify intended uses, risks, limitations, and data misuse or overuse and ongoing; (2) ongoing and independent AI testing to ensure federal AI systems are accurate, reliable, and unbiased; (3) human training and assessment provisions to ensure agency employees have the skills and resources they need to adequately oversee AI development, procurement, and use; (4) public, plain-language notice of AI use to ensure the public is aware of how their government is using AI; (5) requirements to involve—and inform—affected groups when a federal AI systems may impact them; and (6) a provision requiring convenient opt-outs in favor of human alternatives. Many government AI systems are still prone to serious errors and biases,[14] and these minimum safety requirements are a strong mechanism for mitigating AI harms and maintaining accountability for agency use of AI technologies.

In part because OMB's suggested minimum practices are robust, EPIC fears that agencies and AI contractors may seek to circumvent OMB's minimum practices altogether either by determining that edge-case AI applications fall outside the scope of OMB's safety-impacting and rights-impacting AI designations or by liberally granting waivers to the minimum practices. The challenge of determining whether edge-case AI applications should receive greater evaluation and oversight is not new. In Europe, for example, regulators drafting the European Union's AI Act have struggled to draw clean lines between risk designations for newer and emerging AI technologies like foundational models.[15] And while the European Commission has more recently

[14] *See, e.g.*, Outsourced & Automated Report at 5–25.
[15] *See, e.g.*, Will Henshall, *E.U.'s AI Regulation Could be Softened After Pushback from Biggest Members*, Time (Nov. 22, 2023), https://time.com/6338602/eu-ai-regulation-foundation-models/ ("Big tech companies, largely headquartered in the U.S., have been lobbying to weaken the proposed E.U. legislation throughout its development."); Supantha Mukherjee & Foo Yun Chee, *EU Lawmakers Face Struggle to Reach Agreement on AI Rules—Sources*, Reuters (Oct. 23, 2023), https://www.reuters.com/technology/eu-lawmakers-face-struggle-reach-agreement-ai-rules-sources-2023-10-23/; Billy Perrigo, *Big Tech is Already Lobbying to Water Down Europe's AI Rules*, Time (Apr. 21, 2023), https://time.com/6273694/ai-regulation-europe/.

suggested moving toward light touch "codes of practice,"[16] such a compromise position will *not* ensure that AI systems are accurate, reliable, trustworthy, or responsibly deployed.

Similarly, consider edge-case AI applications like automated notice generation systems.[17] While OMB's Draft Memorandum presumes that AI decisions about, e.g., someone's eligibility for public benefits or loans are rights-impacting, it is currently silent on automated systems used to notify applicants of outstanding documents, process expectations, eligibility determinations, or options for appeal. These automated notice generation systems may not directly influence the outcome of a decision-making process, but any errors they produce *can* hinder an applicant during the decision-making process: delays in notice delivery, errors in the substance of the notice, and the failure to generate notices can all undermine an applicant's ability to provide proper documentation, respond to questions, and pursue timely appeals. Faced with robust minimum practices for safety-impacting and rights-impacting AI systems and no required AI practices for AI systems deemed outside the scope of either designation, agencies and contractors will be incentivized to circumvent the Draft Memorandum's risk practices through narrow interpretations of risk designations and waivers.

RECOMMENDATION

To mitigate the risk that harmful AI use cases and agency practices evade proper scrutiny under the Draft Memorandum, **EPIC proposes four recommendations**:

1. OMB should require agencies to incorporate certain **minimum risk practices for *all* federal AI use cases**, such as ensuring adequate human training and completing a rudimentary AI impact assessment when determining whether an AI system is safety-impacting or rights-impacting.

2. OMB should **explicitly prohibit or deem presumptively noncompliant AI use cases that are provably harmful or biased**, including emotion recognition, biometric categorization, social scoring, and one-to-many facial recognition.

3. OMB should incorporate **explicit principles of data minimization** into federal AI development, procurement, and use standards.

4. OMB should include **additional protections for sensitive personal data**—protections that may include a **strict necessity data minimization** standard.

[16] *See* Luca Bertuzzi, *AI Act: EU Commission Attempts to Revive Tiered Approach Shifting to General Purpose AI*, Euractiv (Nov. 20, 2023), https://www.euractiv.com/section/artificial-intelligence/news/ai-act-eu-commission-attempts-to-revive-tiered-approach-shifting-to-general-purpose-ai/.
[17] *Cf.* Outsourced & Automated Report at 11, 35.

a. Recommendation One: Expand Minimum Practices and Oversight

OMB should require agencies to incorporate certain minimum risk practices for *all* federal AI use cases—and implement an independent oversight process for determinations concerning safety-impacting and rights-impacting designations. Universally applicable AI risk management practices and independent AI designations would ensure that the agencies tasked with evaluating AI applications and mitigating AI risks do not cut corners by trying to circumvent the risk management process altogether. In addition, universally applicable AI risk management practices would ensure that AI vendors could not creatively market their products to avoid proper scrutiny.[18]

Several minimum practices already outlined within OMB's Draft Memorandum would be feasible as universally applicable AI risk management practices. For example, Section 5(b) of the Draft Memorandum already requires agencies to "review each use of AI that they are developing or using to determine whether it matches the definition of safety-impacting or rights-impacting." To make these impact determinations, an agency official will need to conduct some form of rudimentary AI impact assessment for all agency AI use cases. Rather than permit agencies to determine what procedures to follow when making these initial determinations, OMB could incorporate elements of its minimum practices at the determination stage to expand basic AI risk management to all AI use cases. For example, OMB could require an agency, when determining an AI system's designation as safety-impacting or rights-impacting, to report (1) its intended purpose and limitations, (2) the data used in the AI's design, development, training, testing, and operation, and (3) any human training or oversight measures undertaken.

OMB could seamlessly incorporate basic AI risk management practices into other reporting programs as well. Under Section 208 of the E-Government Act of 2002, for example, federal agencies are required to conduct, review, and publish PIAs before "developing or procuring information technology that collects, maintains, or disseminates information that is in an identifiable form" or before initiating a new collection of information.[19] And while Section 208 dictates minimum requirements for PIAs, it grants OMB broad authority to determine the exact contents of PIAs.[20] Many government AI systems rely on the collection, transfer, and use of identifiable information to produce outputs like risk scores, predictions, recommendations, and inferences,[21] so when an agency uses AI to collect, process, store, or analyze identifiable

[18] Similar industry lobbying around AI designations has hindered European AI regulations. *See* Henshall, *supra* note 15; Perrigo, *supra* note 15.
[19] 44 U.S.C. 3501 note at 208(b)(1)(A); *see also* Memorandum from EPIC to the Exec. Off. of the President, the Vice President, and OMB on Integrating AI requirements into Section 208 Privacy Impact Assessments (Aug. 8, 2023), https://epic.org/wp-content/uploads/2023/10/EPIC-208-Memo.pdf [hereinafter "EPIC Section 208 AI Memo"].

information, such use would cleanly fall within the definition of "information technology" covered by Section 208, requiring a PIA.[22] Integrating minimum AI impact requirements within OMB's existing PIA reporting program would not only align with OMB's statutory authority under the E-Government Act, but also align with the Biden-Harris Administration's priorities on responsible AI use.[23]

b. Recommendation Two: Prohibit Provably Harmful AI

OMB should include a list of AI use cases that are presumed noncompliant with the AI risk management practices set forth in the Draft Memorandum. For comprehensive AI oversight mechanisms to be effective, they must not only highlight the practices, policies, and procedures that agencies should follow, but also those that they should *avoid*. While the exact form of these prohibitions may vary, EPIC urges OMB to explicitly prohibit or deem presumptively noncompliant AI use cases that have proven to be particularly harmful and prone to algorithmic bias, including emotion recognition, biometric categorization, and one-to-many facial recognition.

Emotion recognition systems rely on the false premise that both universal emotions and a clear correlation between emotion and facial expression exist—a premise that has been repeatedly disproven.[24] Similarly, biometric categorization systems are based on the belief that certain physical characteristics can be linked to specific traits. This is essentially a form of digital phrenology.[25] Companies providing these AI systems have claimed to be able to predict anything from the likelihood of terrorist leanings to sexuality based solely on the analysis of facial features.[26]

Lastly, one-to-many facial recognition systems—also known as biometric identification systems—involve indiscriminate and ongoing privacy violations of millions of people in the hopes of identifying a single suspect. As Senators Wyden, Markey, Padilla, and Booker put it, "[n]ot only does this violate individuals' privacy, but the inevitable false matches associated with one-to-many recognition can result in applicants being wrongly denied desperately-needed services for weeks or even months as they try to get their case reviewed."[27] Further, one-to-many recognition systems have been shown to falsely identify people of color as criminals at rates as much *as 100 times higher* than those for people of Eastern European descent.[28] All of these AI applications exhibit persistent and inherent inaccuracy, bias, and harm that are central and inseparable from the AI systems themselves; they cannot be corrected in a way that mitigates harm while permitting the AI application to continue.[29] These systems are harmful by their very nature and EPIC urges OMB to prohibit them expressly within its Draft Memorandum.

c. Recommendation Three: Incorporate Data Minimization Principles

OMB should incorporate explicit principles of data minimization into federal AI development, procurement, and use standards.[30] Given the data-dependent nature of AI development and use, as well as the number of potential risks and stakeholders impacted by AI systems, the risk of data misuse, cyber incidents, and other potential harm is high even when agencies evaluate the quality and appropriateness of data used. In other words, the *quantity* and *redundancy* of personal data used by many AI applications is also a source of serious AI risk.

Reps. & EPIC, How the FTC Can Mandate Data Minimization Through a Section 5 Unfairness Rulemaking 3 (Jan. 26, 2022), https://epic.org/wp-content/uploads/2022/01/CR_Epic_FTCDataMinimization_012522_VF_.pdf.

Most government AI use cases can be achieved without individuals' personal data being transferred to private vendors or used for an unrelated secondary purpose.[31] And in fact, an agency's collection, use, and transfer of personal data to private parties may already violate existing data privacy laws.[32] Incorporating data minimization into the Draft Memorandum is a viable, well-tested, and robust measure for preventing many forms of government AI risk.

Data collection, processing, and use are *prerequisites* for any government AI system, whether procured from the private-sector or developed by an agency. Much of the collection of personal data—both commercial and for government collection—happens so routinely and automatically that Americans have little to no knowledge of its scope[33]: everything from browsing the internet and using smart devices to filing your taxes and interacting with everyday government services can collect personal information that is then used to train and operate a wide variety of AI systems.[34] In fact, many of the most commonly procured government AI systems—systems used to, e.g., detect fraud, generate risk scores, and verify identities—are developed and sold by major data brokers that regularly and surreptitiously collect, process, repackage, and sell granular personal data.[35] Therefore, OMB cannot ensure responsible AI development, procurement, and use without also ensuring responsible government data collection, storage, transfer, and use

To capture and adequately mitigate the AI risks stemming from improper government data collection, processing, storage, transfer, and use, EPIC recommends amending the language to the data quality and appropriateness provision in Section 5(c)(iv)(A) of the Draft Memorandum as appears on the following page (**changes bolded in blue**):

[31] For example, an agency-developed AI system used only for its intended purpose would avoid unnecessary risk caused by relying on private AI vendors, transferring government data to private vendors, or passing sensitive personal data through an AI system trained on commercial data collected haphazardly. *See* EPIC, Comment on the FTC's Proposed Trade Regulation Rule on Commercial Surveillance & Data Security 30–66 (Nov. 21, 2023), https://epic.org/wp-content/uploads/2022/12/EPIC-FTC-commercial-surveillance-ANPRM-comments-Nov2022.pdf (discussing data minimization principles broadly) [hereinafter "EPIC FTC Commercial Surveillance Comment"].

"3. *The quality, **appropriateness, and necessity** of relevant data*. Agencies must assess the quality of the data used in the AI's design, development, training, testing, and operation**; its fitness to the AI's intended purpose; and its necessity and proportionality to effect the AI's intended purpose.** If the agency cannot access such data after a reasonable effort to do so, it must obtain sufficient descriptive information from the AI or data provider to satisfy the reporting requirements in this paragraph. At a minimum, agencies must document:

a. the provenance and quality of the data for its intended purpose;
b. how the data is **necessary and proportional to the task being automated, the AI's intended purpose, and the AI's development, testing, and operation;**
c. whether the data contains sufficient breadth to address the range of real-world inputs the AI might encounter;
d. whether the data comes from an adequately reliable source; and
e. how errors from data entry, machine processing, or other sources are adequately measured and limited, to include errors from relying on AI-generated data as training data or model inputs.

Unless otherwise required by law, agencies must not collect, process, purchase, or transfer data for the purposes of developing, training, or using AI unless the collection, processing, purchasing, or transfer is limited to what is reasonably necessary and proportionate to effect a purpose permitted by law that benefits those to whom the data pertains."[36]

RECOMMENDATION

d. Recommendation Four: Adopt Additional Protections for Sensitive Personal Data

EPIC encourages OMB to include additional protections for sensitive personal data, including children's data; data pertaining to race, sex, ethnicity, religion, and national origin; and other similarly sensitive types of personal information. AI systems that use these categories of data are particularly vulnerable to inequitable or otherwise harmful outcomes—including data breaches and discrimination—and should always be considered rights-impacting.[37] For example, hiring

[36] *See* ADPPA; Cons. Reps. & EPIC, *supra* note 30.
[37] *See, e.g.*, Compl. for Permanent Inj. & Other Equitable Relief at 34–35*, FTC v. CompuCredit Corp.*, No. 1:08–CV–1976–BBM–RGV (N.D. Ga. Oct. 8, 2008), https://www.ftc.gov/sites/default/files/documents/cases/2008/06/080610compucreditcmptsigned.pdf (FTC suit against credit card company that allegedly used undisclosed behavioral scoring algorithm to determine credit limitations based on consumer conduct); James Vincent, *The Invention of AI 'Gaydar' Could be the Start of Something Much Worse*, Verge (Sept. 21, 2017), https://www.theverge.com/2017/9/21/16332760/ai-sexualitygaydar-photo-physiognomy; Claudia Garcia-Rojas, *The Surveillance of Blackness: From the Trans-*

algorithms and automated workplace management systems can produce racially discriminatory employment determinations.[38] Criminal and pretrial risk scores can exacerbate racial disparities in sentencing and bail decisions.[39] And a wide variety of AI use cases—from fraud detection to facial recognition—can incorporate protected characteristics into automated decision-making in potentially harmful ways through "proxy variables" like ZIP codes and last names.[40]

Because of the heightened risk of harm that the collection, processing, and use of sensitive personal data implicates, EPIC advocates for a heightened *strict data minimization* standard for AI use cases involving sensitive personal data: agencies must only collect, process, transfer, or use personal data pertaining to a legally protected characteristic like race, sex, national origin, or age—as well as any personal data of individuals under 18—when *strictly necessary* to achieve a purpose permitted by law and intended to benefit those to whom the data pertains.[41]

Funding for AI Risk Management, Training, & Compliance

Responsive to Question 7

Responsible AI development, procurement, and use takes time and resources. Before agencies can ensure that AI use is safe, reliable, responsible, and trustworthy, they must, at minimum, (1) learn what data inputs an AI system requires, (2) learn how an AI system produces outputs, (3) train their employees on AI system uses and limitations, (4) test the AI system for accuracy, reliability, security, and lack of bias, (5) evaluate AI system performance across relevant, real-world environments, and (6) develop ongoing testing and oversight procedures to ensure that an AI system remains safe, responsible, and trustworthy over time.[42] For AI systems procured

from private developers, agencies must also ensure they have access to enough information to accomplish these tasks on an ongoing basis.[43] And these substantive oversight procedures must also pair with ongoing transparency and reporting mechanisms to ensure that OMB and the general public can hold agencies accountable for their AI use. All these tasks require resources, so funding for AI risk management must be at the core of any responsible AI use paradigm.

OMB has taken a strong stance on AI risk management funding by including explicit language within its Draft Memorandum requiring the "head of each covered agency… [to] consider the necessary financial, human, information, and infrastructural resources to carry out these responsibilities effectively, including providing or requesting resources via the budget process."[44] Despite this strong language, however, ensuring that agencies devote sufficient resources to AI risk management in practice may still pose a challenge. Following the passage of the E-Government Act of 2002, for example, federal agencies were required to conduct and report Privacy Impact Assessments (PIAs) when "developing or procuring information technology that collects, maintains, or disseminates information that is in an identifiable form" or "initiating a new collection of information" using information technology.[45] However, EPIC has uncovered several agencies that have failed to conduct and publish PIAs when required, including the Federal Bureau of Investigation, the Census Bureau, and the U.S. Postal Service.[46]

RECOMMENDATION

To ensure that agencies comply with the substantive requirements of the Draft Memorandum, OMB should consider **conditioning agency budget approvals and funding recommendations under the Draft Memorandum on ongoing compliance** with the Draft Memorandum's substantive provisions—and ongoing documentation proving that agencies are directing this dedicated funding directly and solely toward AI risk management.

AI Use Case Inventories

Responsive to Questions 6–8

EPIC applauds OMB's inclusion of long overdue, government-wide AI use case inventories within its Draft Memorandum. While several agencies have already begun to publish AI use case inventories[47] pursuant to Executive Order 13960,[48] the information included in existing AI use case inventories are thus far insufficient to ensure responsible AI development, procurement, and use. Some existing use case inventories, like that of the Department of Health and Human Services, only include a use case name, designated federal office, and 200-word summary of the AI system.[49] Others, like the Department of Energy's use case inventory, are riddled with blank entries.[50] Given the variety of AI use case inventories in both format and quality, OMB's AI use case inventory requirement has the potential to set a robust benchmark for responsible AI documentation across government.

AI use case inventories are valuable only insofar as they provide sufficient information to ensure agencies' compliance with their substantive AI risk management obligations. Inventory information should be granular enough for OMB, auditors, and concerned citizens to understand both how an agency is using its AI systems and how an agency is testing, evaluating, and mitigating AI risks. Anything less undermines government accountability, government transparency, and AI risk management.

[47] *See* Ben Winters, *Agencies Begin to Comply with 2020 Executive Order on AI Transparency*, EPIC Blog (Aug. 3, 2022), https://epic.org/agencies-begin-to-comply-with-2020-executive-order-on-ai-transparency/.

[49] *See* Dep't Health & Hum. Servs., Artificial Intelligence Use Cases – FY 2022 (2022), https://www.hhs.gov/sites/default/files/hhs-ai-use-cases-inventory.pdf.
[50] *See* Dep't Energy, Agency Inventory of AI Use Cases (2022), https://www.energy.gov/sites/default/files/2022-07/DOE_Agency_Inventory_of_AI_Use_Cases.pdf.

RECOMMENDATION

To ensure AI use case inventories complement other substantive AI risk management practices and incentivizes agency compliance with the Draft Memorandum, **OMB should require, at minimum, the following six (6) pieces of information within an AI use case inventory**:

1. **Agency determinations** that an AI system is safety-impacting or rights-impacting;

2. Agency **requests for extensions to or waivers** of OMB's minimum practices, alongside explanations or justifications;

3. **AI impact assessments**, alongside any documentation of the methods used and results produced.

4. Any agency **documentation of how an AI system was developed or procured**, including any contractors or vendors involved, any finalized contracts, any training methods used, and any pre-deployment testing, evaluation, validation, or verification completed;

5. The procedures for and results of any **ongoing AI testing** undertaken by the agency;

6. **Incident reports** following the identification of any errors, biases, or other documented harms of an agency AI system, alongside any remedial changes that the agency plans to adopt to mitigate the identified issue.[51]

[51] OMB may wish to consult existing incident reporting procedures from agencies like the National Transportation Safety Board (NTSB) for examples of what these reports could look like. *See* Nat'l Transp. Safety Bd., *Investigation Report*, NTSB.org, https://www.ntsb.gov/investigations/AccidentReports/Pages/Reports.aspx (last visited Dec. 5, 2023). At minimum, these reports should include (1) details about the documented risk or incident, (2) an analysis of any factual data, (3) evaluations of likely root causes, and (4) a remedial compliance plan to mitigate the identified issue.

In addition, EPIC recommends the following amendment to Section 3(a) of the Draft Memorandum, which draws on both existing federal AI guidelines[52] and EPIC's own research into effective AI oversight and accountability mechanisms[53] (**changes bolded in blue**):

RECOMMENDATION

"AI Use Case Inventories. Pursuant to Section 7225 of the Advancing American AI Act, and subject to the exclusions in that Act and Section 10.1(e) of the AI Executive Order, each agency (except for the Department of Defense and the Intelligence Community) must annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency's website. OMB will issue detailed instructions for the inventory through its Integrated Data Collection process or an OMB-designated successor process. Beginning with the use case inventory for 2024, agencies will be required, as applicable, to identify and report additional detail on how they are using safety-impacting and rights-impacting AI, the risks—including risks to equity—that such use poses, how they are managing those risks, and any related extensions and waivers granted under. **These additional details must include, at minimum:**

a. **The name of the AI system;**
b. **The intended uses and limitations of the AI system;**
c. **All required data inputs for the AI system;**
d. **A determination on whether the AI system is generative AI;**
e. **Documentation and results of all testing and evaluation procedures completed since the previous submission;**
f. **Any completed incident reports relevant to the AI system;**
g. **Documentation on AI system development or procurement, including information on related vendors, sources of data, and relevant contracts."**

Under Section 5(c) of its Draft Memorandum, OMB also requires agencies to "provide public notice and plain-language documentation through the AI use case inventory," including documentation or links to the information "where people will interact with or be impacted by the AI."[54] **Whenever possible, EPIC urges OMB to ensure that as much information about**

[52] NIST, *NIST AI Risk Management Framework Playbook – Govern* 7 (Jan. 28, 2023), https://github.com/usnistgov/AIRMF/blob/nist-pages/govern/govern.pdf; Blueprint for an AI Bill of Rights at 21; *cf. also The Government is Using AI to Better Serve the Public*, AI.gov, https://ai.gov/ai-use-cases/ (last visited Dec. 5, 2023) (existing AI use case inventories).
[53] *See, e.g.*, Accountable Tech, AI Now Institute, EPIC, Zero Trust AI Governance (2023), https://ainowinstitute.org/wp-content/uploads/2023/08/Zero-Trust-AI-Governance.pdf; EPIC Generative AI Report.
[54] Draft OMB AI Guidance at 17–18.

agency AI risk management practices as possible is also made publicly available in a plain-language and approachable format—including all information suggested in the list above. Civil society organizations and concerned members of the public can and should play a role in holding agencies accountable for their compliance with the Draft Memorandum, but they cannot do anything unless they have access to information about what AI systems the federal government uses, how those systems impact them, and how federal agencies are managing the risks of AI use.

AI Impact Assessments

Responsive to Questions 6–8

Truly responsible AI requires rigorous, supported oversight infrastructure and careful moderation. Without oversight, measurable demonstrations of compliance efforts, and the possibility of enforcement or other legal liability, AI actors have few incentives to spend the time and resources necessary to conform their practices to the standards that OMB and individual agencies set out. Without actionable transparency and accountability mechanisms, there can be no public trust in the government's use of AI.

Building on existing federal AI guidelines[55] and EPIC's own research into effective AI oversight and accountability mechanisms,[56] EPIC recommends further amending Section 5(c)(iv) of the Draft Memorandum—as appears on the following page—to bolster OMB's oversight capabilities through more robust AI impact assessment requirements (**changes bolded in blue**, **previous data minimization amendment bolded in green**):

[55] NIST, *NIST AI Risk Management Framework Playbook – Govern* 7 (Jan. 28, 2023), https://github.com/usnistgov/AIRMF/blob/nist-pages/govern/govern.pdf; Blueprint for an AI Bill of Rights at 21; *cf. also The Government is Using AI to Better Serve the Public*, AI.gov, https://ai.gov/ai-use-cases/ (last visited Dec. 5, 2023) (existing AI use case inventories).
[56] *See, e.g.*, Accountable Tech, AI Now Institute, EPIC, Zero Trust AI Governance (2023), https://ainowinstitute.org/wp-content/uploads/2023/08/Zero-Trust-AI-Governance.pdf; EPIC Generative AI Report.

RECOMMENDATION

"3. *The quality, **appropriateness, and necessity** of relevant data*. Agencies must assess the quality of the data used in the AI's design, development, training, testing, and operation**; its fitness to the AI's intended purpose; and its necessity and proportionality to effect the AI's intended purpose.** If the agency cannot access such data after a reasonable effort to do so, it must obtain sufficient descriptive information from the AI or data provider to satisfy the reporting requirements in this paragraph. At a minimum, agencies must document:

a. the provenance and quality of the data for its intended purpose;
b. **the inputs and logics of the AI system;**
c. **the type or types of data generated by the AI system;**
d. how the data is **necessary and proportional to the task being automated, the AI's intended purpose, and the AI's development, testing, and operation;**
e. whether the data contains sufficient breadth to address the range of real-world inputs the AI might encounter;
f. whether the data comes from an adequately reliable source; and
g. how errors from data entry, machine processing, or other sources are adequately measured and limited, to include errors from relying on AI-generated data as training data or model inputs.
h. **The process and results of regular AI system validation studies;**
i. **Any downstream uses for AI system outputs beyond the system's intended purpose;**
j. **Any agency data management policies and procedures relevant to the AI system;**
k. **The process and results of any environmental impact statements or similar analyses regarding the AI system;**
l. **Any agency procedures for human review or interaction with the AI system;**
m. **The results of any risk-benefit analysis conducted for the AI system.**

Unless otherwise required by law, agencies must not collect, process, purchase, or transfer data for the purposes of developing, training, or using AI unless the collection, processing, purchasing, or transfer is limited to what is reasonably necessary and proportionate to effect a purpose permitted by law that benefits those to whom the data pertains."[57]

[57] *See* ADPPA; Cons. Reps. & EPIC, *supra* note 30.

EPIC has organized and published comparisons of impact assessments in current regulations, law, and proposed law.[58] While these impact assessment requirements vary, there are two notable consistencies throughout. **First**, in nearly all of the AI assessments introduced in state legislatures, assessments required (1) a description of the AI system's intended purpose and proposed use; (2) information on necessity of the automated decision-system; (3) a cost-benefit analysis weighing AI risks with benefits; (4) information regarding the effects of an AI system on civil, constitutional, and legal rights; (5) disparate impact evaluations; (6) risk mitigation plans; (7) data quality assessments; (8) performance or benchmark auditing requirements; and (9) bias audits or similar testing.[59] **Second**, to determine when AI assessments are required, laws or bills in Canada and the United Kingdom—as well as California, Vermont, and Washington—require AI assessments for *all* AI systems that contribute to or replace a decision-making process, rather than restricting AI assessments to categories like safety-impacting or rights-impacting AI.[60]

EPIC remains eager to assist OMB in finalizing protective and workable AI impact assessment and audit requirements to align government use of AI with the priorities of OMB and the Biden-Harris Administration.

Decommissioning Noncompliant AI

Responsive to Question 6

EPIC strongly supports OMB's inclusion of AI decommissioning requirements "[w]here the AI's risks to rights or safety exceed an acceptable level and where mitigation is not practicable."[61] Decommissioning or disgorging AI systems when mitigation fails has been a core element of several recent federal efforts to manage AI risks, including the White House Office of Science and Technology Policy (OSTP)'s Blueprint for an AI Bill of Rights,[62] the National Institute for Standards and Technology (NIST)'s AI Risk Management Framework,[63] and several recent Federal Trade Commission (FTC) enforcement actions.[64] Several AI and machine learning practitioners—including Amazon Web Services AI researchers Alessandro Achille, Michael Kearns, Carson Klingenberg, and Stefano Soatto—have also proposed model disgorgement and

[58] For a full table containing side-by-side comparisons of impact assessment requirements around the world, see Kara Williams, *Assessing the Assessments: Comparing Risk Assessment Requirements Around the World*, EPIC Blog (Dec. 4, 2023), https://epic.org/impact-comparison/.
[59] *Id.*
[60] *Id.*
[61] Draft OMB AI Guidance at 17.
[62] Blueprint for an AI Bill of Rights at 5, 15.
[63] NIST AI RMF at 23, 33.
[64] *See, e.g.*, Jevan Hutson & Ben Winters, *America's Next "Stop Model!": Model Disgorgement* 9–11, 14–16 (Priv. L. Scholars Conf. Draft Paper, 2023), https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4225003.

deletion as a best practice for responsible AI development and use.[65] Achille and colleagues argue that model disgorgement and deletion could "address a wide range of issues, such as reducing bias or toxicity, increasing fidelity, and ensuring responsible usage of intellectual property."[66]

RECOMMENDATION

Given the wide-ranging benefits of model decommissioning as a risk management practice, EPIC strongly encourages OMB to **expand the procedures, expectations, and oversight for AI decommissioning under its Draft Memorandum**, including, *inter alia*, provisions establishing a minimum acceptable level for all federal AI applications, independent review of agency AI use to identify systems in need of decommissioning, and an **interagency blacklist of decommissioned AI systems** to inform future agency decisions around AI development, procurement, and use.

AI Procurement Procedures and Contract Language

Responsive to Questions 1, 6, and 7

EPIC applauds OMB's inclusion of additional procurement requirements for federal AI procurement, particularly the requirements to keep procured AI transparent, maintain AI testing and risk management practices for procured AI, and promote competitive bidding. In fact, many of OMB's suggested procurement requirements mirror recommendations from EPIC's own research into government AI procurement.[67] EPIC's research highlighted to core barriers to responsible AI procurement: (1) procurement officials' lack of knowledge, access, and resources they need to properly oversee the AI procurement process and (2) noncompetitive procurement processes like cooperative purchasing that powerful AI vendors have used to capture government contracts without serious scrutiny.[68] OMB's draft AI procurement provisions are an important step toward overcoming both barriers. For example, OMB's provision encouraging agencies to "take appropriate steps to ensure that Federal AI procurement practices promote opportunities for competition among contractors and do not improperly entrench incumbents"[69] is in line with

[65] *See, e.g.*, Alessandro Achille et al., *AI Model Disgorgement: Methods and Choices*, arXiv (Apr. 7, 2023), https://arxiv.org/pdf/2304.03545.pdf.
[66] *Id.* at 1. For more on model disgorgement, decommissioning, and deletion, see Hutson & Winters, *supra* note 64.
[67] *See* Outsourced & Automated Report at 50–62.
[68] *See id.* at 32–36, 54.
[69] Draft OMB AI Guidance at 21.

EPIC's findings that cooperative purchasing agreements have been abused by powerful AI vendors like Deloitte and Thomson Reuters to entrench their position across agencies.[70]

Although OMB's Draft Memorandum goes further than other AI guidance to implement AI risk management into the procurement process, it currently ignores the power imbalance between several agency procurement offices and major AI vendors. For example, vendors may attempt to pressure procurement officials to ignore transparency or testing requirements within AI contracts or seek to market their products outside the scope of OMB's safety-impacting or rights-impacting designations. In practice, there is only so much an agency can do to monitor the AI systems they procure under existing contracts. From provisions that grant AI vendors exclusive rights to maintain and operate an AI system[71] to data privacy provisions that fail to restrict how vendors use AI outputs created using government data,[72] many AI contracts benefit vendors far more than agencies. These contracts reflect the relative power and knowledge of the contracting parties: because many agencies lack the expertise and resources to check or overwrite provisions that favor AI vendors, they often agree to contractual language that restricts or undermines their authority.

RECOMMENDATION

To support agency procurement offices in similar circumstances, EPIC encourages OMB to provide agencies with **sample contract language or similar templates** for responsibly navigating the AI procurement process and managing procured AI.[73] EPIC has identified three contractual provisions that OMB should focus on to maximize the ability of agency procurement officials to effectively manage the risks of procured AI:

1. Improving data oversight and control;
2. Imposing transparency and reporting requirements on vendors; and
3. Incorporating sunsetting clauses and procedures to transition ownership to agencies.

[70] *See* Outsourced & Automated Report at 33–35; *cf.* Grant Fergusson, *Public Benefits, Private Vendors: How Private Companies Help Run Our Welfare Programs*, EPIC Blog (Jan. 26, 2023), https://epic.org/public-benefits-private-vendors-how-private-companies-help-run-our-welfare-programs/.

[72] *See* Carahsoft Master Agreement with Aisera Pricing Schedule (2016), https://epic.org/wp-content/uploads/2023/09/Carahsoft-NASPO-Master-Agreement-Aisera-Pricing-Schedule.pdf.
[73] EPIC attorneys are involved with the IEEE's draft AI procurement standard, P3119. *See Standard for the Procurement of Artificial Intelligence and Automated Decision Systems*, IEEE SA, https://standards.ieee.org/ieee/3119/10729/ (last visited Dec. 5, 2023). EPIC would be happy to discuss responsible AI procurement further.

a. Provision One: Improving Data Oversight and Control

EPIC's research into AI procurement suggests that government AI contracts often fail to consider what secondary uses a vendor may have for agency data, meaning that vendors could use the data agencies provide (or inferences derived from that data) for other purposes after the contract requirements are met.[74] Stronger data oversight provisions in government AI contracts can ensure that AI vendors do not misuse or profit off government data in secondary commercial markets. However, the opposite is also true: agencies should not attempt to use AI contracts to access vendor data beyond what government agencies are entitled to collect directly.

Of the 621 AI contracts EPIC reviewed, few included strong data protection and control provisions.[75] However, EPIC has identified at least one example of strong contract language concerning government data oversight and control—language taken from a contract between the Illinois Department of Employment Security and Pondera Solutions, a Thomson Reuters subsidiary:

> *All work performed or supplies created by Vendor under this contract, whether written documents or data, goods or deliverables of any kind, shall be deemed work for hire under copyright law and all intellectual property and other laws, and the [Contracting Agency] is granted sole and exclusive ownership to all such work, unless otherwise agreed in writing.*[76]

While EPIC does not believe this language should be adopted as-is, the Illinois AI contract goes further than many to ensure that data inferences, AI models, and other resources generated by a vendor under the contract remain solely within the government's control.

b. Provision Two: Imposing Transparency and Reporting Requirements

While researching AI procurement, EPIC identified several instances in which agencies outsourced the entire operation of AI systems to vendors. These contracts—often described as "software as a service" contracts—make it difficult for agency officials to understand how procured AI systems work or why they produce certain outputs.[77] Without direct access to and

---

[76] *Id.* at 43–44; *see also* Contract between Ill. Dep't Emp. Sec. and Pondera Solutions (2020), https://epic.org/wp-content/uploads/2022/06/EPIC-21-10-22-IL-IDES-FOIA-20211110-Illinois-Pondera-Contract.pdf.
[77] *See* Contract between D.C. Dep't Hum. Servs. and Pondera Solutions (2020), https://epic.org/wp-content/uploads/2022/06/EPIC-21-06-25-DC-DHS-FOIA-20210719-Production-Pondera-Contract.pdf.

independent oversight of the processes used to produce AI outputs, agencies cannot ensure that the AI systems they procure and use are fair, accurate, or reliable.

Robust and independent audits of AI systems and their outputs are the gold standard for responsible, transparent AI use[78]—and ongoing audit requirements like those found in Section 5(c)(iv)(C) of the Draft Memorandum can and should be incorporated into government AI contracts. These audit requirements could come into play at two stages of the AI procurement process. **First**, AI vendors and contractors could be required to disclose a detailed description of their AI system's capabilities, data requirements, intended uses, and limitations when they bid on a federal contract.[79] Agency procurement officials could then compare AI systems' capabilities with their agencies' needs to determine whether the AI system is appropriate—or even whether an AI system is necessary. **Second**, state agencies could include contractual provisions requiring AI audits as part of the bidding process or during the contract term.[80]

Only a few of the 621 AI contracts EPIC reviewed contained an AI audit requirement. However, EPIC has identified at least one example of strong contract language concerning independent AI audits—language taken from a contract between the Michigan Department of Technology, Management, and Budget and Deloitte Consulting:

> *Contractor will deposit with [an] escrow agent… the Source Code for the [AI System Software], as well as the Documentation and names and contact information for each author or other creator of the [AI System Software] … At [Agency's] request and expense, the escrow agent may at any time verify the [Source Code,] compar[e] it to the [AI System Software], and review[] the completeness and accuracy of any and all material.*[81]

While EPIC does not believe this language should be adopted as-is, the Michigan AI contract goes further than many to ensure that vendor-provided AI systems are independently audited throughout the contract term.

[78] For example, the White House recommends audits as part of the Blueprint for an AI Bill of Rights, and NIST includes audits, testing, and evaluation as core features of its AI Risk Management Framework. Blueprint for an AI Bill of Rights at 20–21, 24, 38; NIST AI RMF at 16, 19, 26–30.
[79] *See* Outsourced & Automated Report at 52–53.
[80] *Id.*
[81] *Id.* at 48; *see also* Contract between Mich. Dep't Tech., Mgmt., & Budget and Deloitte Consulting (2023), https://epic.org/wp-content/uploads/2023/09/Michigan-Deloitte-uFACTS-Contract.pdf.

c. Provision Three: Incorporating Sunsetting Clause and Procedures to Transition Ownership to Agencies

EPIC identified several government AI contracts that gave vendors complete and exclusive control over the operation of the AI system. These contracts, which can last for several years, restrict agencies' ability to change how they use AI systems and which vendors they use—unless they spend a large amount of money to terminate contracts and initiate another procurement process.[82] Although EPIC was unable to find contract language supporting AI system sunsetting and ownership transition, these provisions can ensure that agency officials maintain sufficient control over government AI systems to comply with the requirements of OMB's Draft Memorandum.

II. AGENCIES SHOULD NOT ADOPT AI SOLELY FOR AI'S SAKE

We recognize the desire of the White House to promote the research and development of AI used for beneficial purposes. However, EPIC urges OMB to remove provisions that explicitly call for the adoption of AI in general, rather than considering the best approach for each issue. As several federal government agencies—as well as President Biden and Vice President Harris—have recognized in no uncertain terms, there are serious and ever-present issues of discrimination and inaccuracy with AI use today.[83] The administration should not make an unforced error by justifying the rapid research and development of AI "solutions" in search of problems. If innovation must be the primary goal, rather than civil rights and privacy protection, there must be a more balanced perspective of what true innovation is—one that focuses on responsibility and integrates innovative methods for AI risk management throughout the AI lifecycle.

[82] For example, the Michigan Unemployment Insurance Agency was forced to abandon its $47 million MiDAS system after litigation revealed thousands of false fraud allegations. *See Michigan Unemployment Insurance False Fraud Determinations*, Benefits Tech Advoc. Hub, https://www.btah.org/case-study/michigan-unemployment-insurance-false-fraud-determinations.html. To replace the faulty system, Michigan paid Deloitte $59 million. *See* Contract between Mich. Dep't Tech., Mgmt., & Budget and Deloitte Consulting (2023), https://epic.org/wp-content/uploads/2023/09/Michigan-Deloitte-uFACTS-Contract.pdf.

[83] Vice President Harris, Remarks by Vice President Harris on the Future of Artificial Intelligence at the U.S. Embassy in London (Nov. 1, 2023), https://www.whitehouse.gov/briefing-room/speeches-remarks/2023/11/01/remarks-by-vice-president-harris-on-the-future-of-artificial-intelligence-london-united-kingdom/; Khari Johnson, *Joe Biden Wants US Government Algorithms Tested for Potential Harm Against Citizens*, Wired (Nov. 1, 2023), https://www.wired.com/story/joe-biden-wants-us-government-algorithms-tested-for-potential-harm-against-citizens/; Rohit Chopra et al., Joint Statement on Enforcement Against Discrimination and Bias in Automated Systems (Apr. 25, 2023), https://files.consumerfinance.gov/f/documents/cfpb_joint-statement-enforcement-against-discrimination-bias-automated-systems_2023-04.pdf.

The need to protect innovation is often raised as a reason to oppose or weaken proposed privacy protections.[84] However, OMB must recognize that innovation in AI guardrails, oversight mechanisms, evaluation methods, and risk management practices must come before innovation in AI models. Expediting AI research and development is not responsible AI innovation, but *irresponsible* AI innovation. For federal AI development, procurement, and use to be truly responsible, the United States must instead focus on being first-in-class for AI oversight, risk management, and harm prevention.

AI Systems are Frequently Discriminatory

Responsive to Questions 3–4

Numerous governmental bodies, including NIST, the Government Accountability Office (GAO), OSTP, and many others, have published reports outlining key issues with AI, such as bias, discrimination, and inaccuracy.[85] As publicly funded institutions, these bodies and other agencies are well positioned to be a trusted source for expertise on matters of AI accuracy, bias, and disparate impact. EPIC urges OMB to leverage the expertise and public trust of federal agencies to publish key information about how AI is used in different sectors, and how that use affects the public.

For example, in 2022, NIST published Special Publication 1270, "Towards a Standard for Identifying and Managing Bias in Artificial Intelligence," which identifies three types of bias that infiltrate AI—systemic bias, human bias, and statistical or computational bias—and provides recommendations to mitigate these biases for AI developers and users.[86]

Another NIST study, published in 2020, reviewed 189 algorithms from 99 developers and found that facial recognition technology had widespread issues identifying non-White faces.[87] Patrick Grother, a NIST computer scientist who worked on the report, said, "While it is usually

incorrect to make statements across algorithms, we found empirical evidence for the existence of demographic differentials in the majority of the face recognition algorithms we studied."[88]

AI Systems are Frequently Inaccurate

Responsive to Questions 3–4

Automated systems, encompassing both generative and non-generative modalities, confront substantial accuracy challenges that necessitate vigilant human intervention.[89] Despite advancements in AI language generation, image recognition, and decision making, AI systems are intrinsically susceptible to fallibility, particularly when confronted with intricate or nuanced scenarios.[90] Generative AI models like GPT-4 and DALL-E 2 exhibit a capacity for contextually coherent yet fundamentally inaccurate information generation. The absence of genuine comprehension within these models renders them susceptible to producing misleading or erroneous content, particularly in response to ambiguous inquiries or situations characterized by incomplete data. Due to the importance of many interactions with government, these results are particularly dangerous.

Automated decision-making within governmental services is susceptible to AI bias and often proves incapable of accurately navigating diverse and dynamic nature of real-world application contexts.[91] These systems heavily rely on training data, and if the data incorporated during their development is biased or incomplete, consequential inaccuracies may emerge in AI predictions and decisions.[92] The innate inflexibility of AI systems to adapt to unforeseen circumstances renders them unreliable in contexts where adaptability is paramount. The

unwillingness of AI developers to devise their systems in a way that explains the reasoning for the output of a system leads to an impossibility of accountability.[93]

AI Systems Perpetuate Harmful Data Practices

Responsive to Questions 2–4

AI systems are tools with specific uses and limitations, not general-purpose tools that agencies can apply to every problem. Defining problems that need AI is crucial for any AI innovation or adoption to be responsible.

Agency adoption of Generative AI poses privacy risks.[94] These risks are inherently harmful, but also lead to compounding harms. Many generative AI tools use models built on data scraped from publicly available websites.[95] This information often includes personal information posted on social media and other websites.[96] When companies scrape personal information and use it to create generative AI tools, they undermine consumers' control of their personal information by using the information for a purpose for which the consumer did not consent. The individual may not have even imagined their data could be used in the way the company intends when the person posted it online.[97] Individual storing or hosting of scraped personal data may not always be harmful in a vacuum, but there are many risks. Multiple datasets can be combined in ways that cause harm: information that is not sensitive when spread across different databases can be extremely revealing when collected in a single place, and it can be used to make inferences about a person or population.[98] Even "anonymized data" has been shown to be easily tied to a

specific individual.[99] And because scraping makes a copy of someone's data as it existed at a specific time, the company also takes away the individual's ability to alter or remove the information from the public sphere.

The privacy harms that follow from indiscriminate scraping of personal information for AI training data also create potential chilling effects for confused or concerned consumer.[100] Basic data minimization principles dictate that peoples' personal information should only be collected or used for the specific purpose for which each person provided the information.[101] But there are currently no statutes that prohibit companies from scraping people's personal information and using it to train generative AI tools.

Privacy laws in the U.S. exempt most publicly available information from regulation based on a concern that the collection and use of this information is protected by the First Amendment.[102] However, data brokers and AI companies scrape more than just publicly available information when building AI tools, regularly violating individual users' privacy.[103] In drafting regulations about potential agency use of these tools, OMB must be careful not to encourage extractive, invasive, or otherwise harmful data practices by agencies or AI developers seeking to enrich their underlying AI models with individuals' or government data.

OMB Should Revise Provisions Promoting AI Adoption for AI's Sake

Responsive to Questions 2–4

Much of Section 4 of the Draft Memorandum encourages AI adoption for AI adoption's sake, but OMB should revise its Draft Memorandum to instead reflect the concerns around responsible AI use and risk management described above. It is inappropriate for OMB to encourage the use of a specific modality, especially one as risky as AI, without sufficient regard

or safeguards for meaningful oversight. EPIC has four suggested changes to the Draft Memorandum.

First, from Section 3(b) of the Draft Memorandum, the below tasks are assigned to Chief AI Advisors. On the following page, EPIC recommends maintaining the relationship between AI adoption and specific circumstances of use and need (**changes bolded in blue, deletions crossed out**):

RECOMMENDATION

H. identifying and **instituting the requisite oversight necessary to achieve truly** responsible use of AI in the agency, including through ~~**the advancement of AI-enabling enterprise infrastructure,**~~ workforce development measures, policy, and other resources for AI innovation;

I. advocating within their agency and to the public **in plain language** on **proposed AI use cases that align with the agency's mission and assist operations;**

Second, EPIC is concerned that the introductory paragraph of Section 4 of the Draft Memorandum encourages agencies to 'move fast and break things,' when in fact this is in tension with responsible AI use by a government that works for the people and has immense obligation. Here, EPIC's recommendations hinge on ensuring the oversight and evaluation structure is supported—and that those developing and deploying AI are integrated into the relevant teams and processes where those AI systems will be instituted (**changes bolded in blue**):

RECOMMENDATION

"Agencies should create internal environments where those developing and deploying AI have flexibility **and opportunities to build subject matter expertise relevant to managing AI risk. These internal environments should be integrated into the appropriate agency teams to achieve** AI innovation **that is appropriate to the needs of the agency** and **prioritizes** risk management **throughout the AI lifecycle**."

Third, in Section 4(a) of the Draft Memorandum, OMB currently requires CFO Act agencies to "remove barriers to the use of AI." In Section 4(b), this phrase is used again, but with the word responsible included. **EPIC recommends that OMB delete both instances of the phrase or reorient the phrase's language around *support* for proper safeguards and oversight mechanisms as foundations for responsible AI innovation.**

Fourth, EPIC is deeply concerned at the promotion of generative AI as a technology worth adopting in and of itself. In Section 4(b)(v) of the Draft Memorandum, OMB encourages agencies to "assess potential beneficial use cases of generative AI in their missions and establish adequate safeguards and oversight mechanisms that allow generative AI to be used in the agency without posing undue risk."[104] **EPIC urges OMB to delete this provision entirely or reword it substantially to account for the severe privacy, accuracy, and bias concerns that generative AI technologies have demonstrated.**[105] This provision, as well as most of the Section 4 does work for AI companies by legitimizing the use and development of AI.

III. OMB Must Prioritize Transparency & Accountability

Responsive to Questions 2 and 8

RECOMMENDATION

OMB guidance without compliance is ineffective, and agency compliance without transparency risks being unaccountable. To ensure that OMB's Draft Memorandum effectively advances responsible government AI development and use, EPIC urges OMB to:

1. carefully consider how it could **use its existing budgetary and oversight authorities to incentivize or mandate strict compliance** amid differing agency priorities and interpretations of OMB's guidance;
2. revisit compliance protocols for and coordination with related, existing reporting requirements like **privacy impact assessments (PIAs) under the E-Government Act of 2002**;[106] and
3. **expand the scope and accessibility of information** that agencies are expected to make publicly available.

As discussed in Section II, *supra*, the mere existence of minimum AI risk management practices and OMB reporting requirements[107] will not ensure agency compliance. Despite decades-

[104] *Cf.* Executive Order 14110.
[105] *See generally* EPIC Generative AI Report.
[106] 44 U.S.C. § 3501 note.
[107] The Draft Memorandum currently requires covered agencies to provide OMB with, e.g., (1) the identities of their appointed Chief AI Officers (CAIOs), (2) their compliance plan under the Draft Memorandum or a "written determination that the agency does not use and does not anticipate using covered AI," (3) an inventory of their AI use cases, (4) any agency-specific lists concerning safety-impacting or rights-impacting AI use

old PIA requirements under the E-Government Act of 2002,[108] for example, many federal agencies still fail to generate and publish PIAs when required.[109] To incentivize compliance with the Draft Memorandum and Executive Order 14110, EPIC urges OMB to condition agency budget approvals and funding recommendations on compliance with all minimum practices and reporting requirements under the Draft Memorandum, including conditions on including agency budget requests within consolidated budget proposals prepared for the President pursuant to the Budget and Accounting Act of 1921.[110] Additionally, EPIC encourages OMB to prioritize review of agency determinations that AI systems are *not* safety-impacting or rights-impacting, as well as waivers of minimum practices and other related decisions concerning the applicability of the Draft Memorandum to an agency's practices. Historically, agencies have faced less OMB scrutiny for deregulatory measures than pro-regulatory measures,[111] but given the time and resources required to adequately comply with the Draft Memorandum, many agencies will be heavily incentivized to underreport AI use cases and deprioritize ongoing AI testing and evaluation measures even in circumstances where serious AI risks remain. Strong OMB oversight—built atop stringent reporting requirements and independent review—will be crucial for ensuring responsible AI development, procurement, and use throughout government.

The Draft Memorandum's minimum practices and reporting requirements do not exist in a vacuum either. Agencies are already obligated to document and report to OMB a large array of information related to their data and technology needs under statutes like the E-Government Act of 2002.[112] To ensure these other oversight and reporting requirements complement, rather than compete with, agency compliance with the Draft Memorandum, EPIC encourages OMB to revisit existing compliance and reporting programs to determine how agency CAIOs and similar officials should coordinate overlapping compliance requirements and effectively manage limited resources. For example, EPIC recently published a memorandum detailing how AI impact assessment requirements could be incorporated into PIAs under the E-Government Act.[113] OMB could

---

cases, (5) any agency determinations—or reversals of determinations—that an AI use case is not safety-impacting or rights-impacting and thus need not be subject to the minimum practices listed within the Draft Memorandum, (6) any documentation of agency implementation of the minimum practices listed within the Draft Memorandum, and (7) any waivers from minimum practices granted by the agency's CAIOs, which must detail the scope, justifications, and supporting evidence. Draft OMB AI Guidance at 4, 10–11, 13–15, 26.

[113] EPIC Section 208 AI Memo.

similarly publish guidance clarifying whether and how PIA requirements and related OMB guidance relates to the minimum practices and reporting requirements under the Draft Memorandum. If more expansive implementations of OMB's oversight and budgetary authorities can pressure agencies to comply with the minimum practices and reporting requirements of the Draft Memorandum, coordinating compliance with other agency programs and reporting regimes will help lower barriers to adequate and ongoing compliance.

Lastly, EPIC urges OMB to incorporate the public as a co-evaluator and source of pressure for agencies through increased transparency efforts around agency compliance with the Draft Memorandum. Civil society organizations like EPIC, as well as concerned citizens and independent researchers, can serve a valuable role as auditors, evaluators, co-regulators, researchers, and sources of pressure for agencies conducting the minimum practices and reporting requirements outlined in OMB's Draft Memorandum—but only if we have access to key information about federal AI development, procurement, and use. To the extent possible under existing laws, EPIC urges OMB to make public all procedures, documentation, compliance plans, testing results, and AI impact assessments produced by agencies under the Draft Memorandum so organizations like EPIC and academic researchers can evaluate agency practices, flag issues, and suggest innovative paths forward for federal AI risk management.

IV. OMB Should Narrowly Construe National Security Exemptions

Responsive to Questions 3 and 5

EPIC urges OMB to make every effort to narrowly define national security and other exempted uses to increase transparency and accountability around the most dangerous AI systems. Many of the most dangerous systems—those that violate the principles espoused in Executive Order 14410—are the very ones that need a meaningful public assessment. These systems are also likely to be used in part for ostensible national security purposes.[114] Without

[114] GAO, GAO-21-386, DHS Needs to Fully Implement Key Practices in Acquiring Biometric Identity Management System 7 (2021), https://www.gao.gov/assets/gao-21-386.pdf (reporting that DHS's HART/IDENT biometric database is used for verifying identity of persons in national security matters); Sam Biddle, *How Peter Thiel's Palantir Helped the NSA Spy on the Whole World*, Intercept (Feb. 22, 2017), https://theintercept.com/2017/02/22/how-peter-thiels-palantir-helped-the-nsa-spy-on-the-whole-world/; EPIC et al., Comments on Use of HHS Information Collection for Immigration Enforcement (Nov. 6, 2018), https://www.scribd.com/document/392614190/November-6-2018-Comments-to-HHS-and-DHS (explaining how information collected by HHS could be used to harm immigrant communities and in particular vulnerable children).

strong guardrails on national security exemptions, agencies may use these exemptions to avoid oversight altogether.

RECOMMENDATION

OMB should interpret the exceptions outlined in the Advancing American AI Act[115] narrowly by:

1. adopting a **use-case approach** to defining national security systems;
2. explicitly **requiring review of dual-use systems**; and
3. requiring agencies to **justify the rationale behind exempting systems** for national security reasons.

The Draft Guidance outlines several carveouts from the requirements of the guidance for national security purposes. The "Intelligence Community" is fully exempted from the Guidance under the Advancing American AI Act, while the Department of Defense (DoD) is partially exempted. Agencies outside the intelligence community can still claim an exemption which extends to AI "when it is used as a component of a national security system".[116] The Intelligence Community, as statutorily defined, covers both freestanding agencies like the National Security Agency (NSA), and agency subcomponents like the Office of Information and Analysis (I&A) withing the Department of Homeland Security (DHS), the Bureau of Intelligence and Research in the State Department, and "intelligence elements" of the armed forces, the DEA, and the FBI.[117] For agencies that are fully exempted like the NSA, OMB must still be careful not to exempt systems shared between agencies from all scrutiny. The task is more difficult when considering exempted sub-components in otherwise covered agencies, like DHS' I&A. Here OMB should be especially careful to ensure that agencies do not use these exemptions to avoid scrutiny by misclassifying their AI systems because of de minimis national security or intelligence community involvement.

Without careful guardrails and oversight from OMB, there is a substantial risk that agencies will designate all systems with some minimal national security purpose as exempted from the Draft Guidance, a loophole that could swallow the rule. By statute, "national security systems" are defined broadly to include "any information system" used by an agency where the "the function, operation or use of" the system "involves intelligence activities."[118] The State Department's Visa

[115] 40 U.S.C. § 11301 note; Pub. L. No. 117-263, 136 Stat. 3668.
[116] Draft OMB AI Guidance at 3 (Section 2(c)).

[118] 44 U.S.C. § 3552(b)(6)(A).

Records System (SORN State-39)[119] and Consular Consolidated Database[120] illustrate the risk that overbroad exemptions will fail to protect a substantial number of individuals from rights-impacting and harmful AI systems.

Visa Records is the overarching system used by the State Department to hold information on everyone who applies for a visa to visit the U.S., individuals who sponsor visa-holders, and a broad array of relevant information collected from various sources. The system holds sensitive personal information, biometrics like fingerprints and facial images, and extensive records. Visa Records lists routines users including several agencies within the Intelligence Community, and is marked as both a Classified and Unclassified system.[121] The Consular Consolidated Database is the State Department's overarching records system for both U.S. persons and non-U.S. persons, housing sensitive personal information including biometric data.[122] The CCD system also "serves as a gateway" to the State Department's facial recognition system.[123] CCD is integrated with other databases across the federal government, including DHS's massive biometrics data HART/IDENT and is accessible via information sharing memoranda of understanding with intelligence community agencies.[124]

Together these systems hold records on hundreds of millions of people and are used for substantial rights-impacting purposes like determining visa eligibility and screening for access to consular services for American citizens.[125] AI used for facial recognition and data analytics run off these systems collectively impacts millions of Americans and people around the world every year.[126] These systems are used mainly for straightforward determinations on access to services

[119] System of Records Notice Visa Records, State-039, 83 Fed. Reg. 280362 (Nov. 8, 2021), https://www.state.gov/wp-content/uploads/2021/11/State-39-Visa-Records-SORN-Web-Post-2021.pdf [hereinafter "Visa Records SORN"].

[124] *See EPIC v. State Department (Facial Recognition Database)*, No. 19-1468 (D.D.C. Mar. 12, 2019), https://epic.org/documents/epic-v-state-department-facial-recognition-database/. EPIC successfully obtained many of the memoranda of understanding allowing other agencies access to CCD through a FOIA case, revealing for the first time the full extent to which CCD is used by the federal government.
[125] *Id.*
[126] U.S. Dep't of State, *Table I: Immigrant and Nonimmigrant Visas Issued at Foreign Service Posts Fiscal Years 2018–2022*, *in* Report of the Visa Office 2022 (2023), https://travel.state.gov/content/travel/en/legal/visa-law0/visa-statistics/annual-reports/report-of-the-visa-office-2022.html (reporting that the U.S. issued 6.8 million visas in 2022); *Exclusive: Security Gaps Found in Massive Visa Database*, ABC News (Mar. 31, 2016), https://abcnews.go.com/US/exclusive-security-gaps-found-massive-visa-database/story?id=38041051 ("the database contains more than 290 million passport-related records, 184 million visa records and 25 million records on U.S. citizens overseas.")

and travel authorization.[127] Such systems require meaningful investigation and oversight to ensure that individuals are not wrongfully denied services by biased, misused, or inaccurate AI. Yet an overly broad reading of the national security exemptions could remove these entire systems from OMB's purview because intelligence community agencies make some use of the systems.

OMB has significant latitude in how to interpret the broad "national security system" definition and can limit the reach of the exemption in full accordance with its statutory authority by adopting a use-case approach for AI systems. Under a use-case approach, AI systems would only be exempted from the Draft Guidance when they are used for a national security purpose or by a fully exempted intelligence community agency. For example, CCD's facial recognition system would be subject to the requirements of the Draft Guidance, but any use that the NSA makes of that facial recognition system would not be. A use case approach would also ensure that AI used for data analysis like Palantir would not be exempted from scrutiny when it is used by Health and Human Services or law enforcement,[128] even if it is also used by intelligence community agencies.[129]

The use-case definition should be paired with a requirement in the Draft Guidance that agencies must include dual-use systems in review and oversight. Dual-use systems are systems like CCD with a substantial non-national security purpose that are also used for some national security purposes. OMB should be explicit that such systems are covered by the Draft Guidance, subject to limited carveouts for elements of the system that are used for national security purposes. OMB should also be careful to note that just because a system collects information or intelligence that is ultimately used for national security does not mean that such a system falls under the national security system definition. Finally, OMB can limit abuse of the national security system exemption by requiring agencies to justify their exemptions. The onus should be on agencies to identify which systems are legitimately exempted and justify those exemptions to OMB with enough detail for OMB to provide meaningful oversight.

[127] CCD PIA at 10. ("Yes, the information in the CCD centralized database supports the implementation of the Department of State's visa, America citizens and passport programs. The information is required to make determinations for granting the various consular services being requested to validate applicant information and to provide centralized storage of information internally for use by posts, in addition to sharing and validating information with other government agencies.")

[129] Biddle, *supra* note 114.

CONCLUSION

EPIC welcomes OMB's efforts to ensure responsible AI development, procurement, and use throughout the federal government and applauds the OMB's inclusion of several key responsible AI provisions within the Draft Memorandum, including greater funding for AI risk management, a cross-agency AI use case inventory, procedures to decommission AI systems that fail to meet minimum safety standards, required training data cleaning and labeling, and additional procurement requirements when seeking AI systems. OMB can and should use its budgetary and oversight authorities to:

1. enforce agency compliance with the Draft Memorandum,
2. refine responsible AI provisions like AI impact assessments and AI use case inventory reporting to increase transparency and accountability for more types of AI systems,
3. increase agency data management practices through additional data minimization provisions and reinvigorated privacy impact assessment reporting requirements,
4. encourage AI adoption only where AI can serve as a curated tool to meet predefined agency needs, and
5. monitor national security systems and mandate AI risk management practices when they are used for other purposes covered by the Draft Memorandum.

We appreciate this opportunity to comment on OMB's Draft Memorandum and are willing to engage with OMB further on any of the issues raised within our comment, including universal AI evaluation requirements; coordination between AI impact assessments and privacy impact assessments; AI procurement reform; the risks of national security AI systems; and the need for greater transparency over government AI use. These recommendations relate closely to the goals of Executive Order 14410 and bolster the responsible AI provisions within OMB's Draft Memorandum to ensure that government development, procurement, and use of AI is safe, equitable, and trustworthy both now and long into the future.

Gideon Comment on OMB-2023-0020

Gideon Alg Gov draft Sept 2023

Comment on Docket: OMB-2023-0020

I appreciate the opportunity to comment on the OMB's proposed Memorandum associated with the President's Executive Order on AI. The following contains my comments on the OMB draft Proposed Memorandum for the Heads of Executive Departments and Agencies regarding Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (the Memorandum). I am on the Executive Faculty of the Fletcher School at Tufts University and hold a PhD in Public Policy from Harvard University. My area of expertise is information and communication policy, and one of my current research projects analyzes several possible approaches to regulating automated decision-making, which includes AI systems. I also teach professional graduate students International Communications, and Public Policy Analysis and have been doing so for almost 20 years. It is in these capacities that I comment on the Memorandum.

Comment 1:
There are many things in the Memorandum that are promising for improving the use of AI by the Federal Government. Most notably, this includes the (1) specific assignment of responsibility for AI to a senior official in each agency, (2) mandatory periodic risk assessments, (3) presumptions of safety and rights impact, and (4) procurement requirements.

(1) The assignment of a senior official as CAIO in each agency is essential for prioritizing the level of attention and resources necessary for reviewing the potential risks of AI. Since AI operates as an evolving black box, significant resources are required to evaluate and monitor the AI, particularly when it is used for government decision-making or providing information, to be sure that it is achieving its purpose, complying with existing laws, and consistent with the values and policies of the Federal Government and specific Agencies. Too often decisions are made to use AI based on an incomplete assessment of the relevant costs and benefits. One of these shortcomings is the assumption that labor hours will be saved by automating tasks and learning, without consideration of the labor hours required to test and monitor for risks and effectiveness. Another is the assumption that the AI-based process will be more accurate and more efficient. This has often proven not to be the case. The third shortcoming is a short-term evaluation, missing an analysis of the dynamic effects of how the AI might evolve and other adaptations that will result. Also, the assignment of senior officials of an agency to meet regularly with the CAIO as an AI Governance Body ensures that a multidisciplinary perspective is in place for governing the use of AI. While it is necessary to have technological expertise, understanding of the subject matter and implications of design and practices is equally critical for identifying potential benefits, costs and risks in actual use, and often outside the scope of the technologist's expertise.

(2) The mandatory periodic risk assessment is critical to responsible use of AI. AI, by its very definition, is never static. These systems learn and evolve, often in unforeseeable ways, and must be reassessed for continued compliance with laws and continued non-violation

of safety and rights to all segments of society, as noted in the Executive Order and the Memorandum.

(3) The presumption of safety and rights impact of the systems noted in Section 5(b) serve a very important purpose. This removes the burden of proof of finding that an AI or AI component is impacting safety or rights on an ex-post basis. Such an ex-post burden of proof is highly problematic as it requires efforts and knowledge that are insurmountable, especially in light of the extreme information asymmetry that exists. The burden of proof must clearly and explicitly be on those who would claim the systems described in Section 5(b) are not safety- or rights-impacting. This must be clear and explicit and require strong evidence that conforms to a very high level of statistical confidence. The presumption of safety- and rights-impact also prevents harms which can quickly escalate, as well documented by many, including O'Neil (2016).

(4) The procurement requirements are critical for contracting AI that complies with the Executive Order. Agency use of contracted AI cannot be responsible without compliance with these standards.

For these reasons, I strongly encourage the OMB to maintain these aspects of the Memorandum.

Comment 2:
Benefits exceeding the risks of AI is not an appropriate criterion for Safety- and Rights-impacting AI. Section 5(c)(iv)(A)(2) (p. 15), in describing what must be documented in an AI impact assessment as part of the Minimum Practices for Either Safety-Impacting or Rights-Impacting AI, states: "The expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, the agencies should not use the AI." This criterion is ill suited to this context. The weighing of benefits relative to costs, or risks, is a measure of efficiency. While efficiency is an important criterion for policy, it is not the only criteria. Other criteria, such as equity, fairness, justice, legitimacy, for example, are at least as important in the context of these decisions. Particularly when considering violation of rights, safety, or compliance with law. In such an instance, a determination could be made that the benefits of an AI, which might include expedited service for many citizens and reduced cost to the agency, which benefits all citizens, exceeds the risk to safety and rights of a minority population, especially one that is underserved. Such decisions negate the purpose of reducing the risk to safety and rights of Americans stated to be the purpose of this Executive Order and Memorandum. Rather, the criteria should state that certain levels of risk to any minority population are unacceptable regardless of the broader benefits. While it might be difficult to determine that level of risk that is unacceptable, it is necessary to avoid continued excessive burdens on the already otherwise disadvantaged sectors of our society. (Noet that the criteria of equity, dignity, and fairness are listed for rights-impacting AI in Section 5(v)(A) on p.180.)

Comment 3:

Explanation of independent review of rights-impacting AI needed. Section 5(c)(iv)(C) (p.16) states that AI must be evaluated independently. The only stipulation of who might conduct this independent review is that 'The independent reviewing authority must not have been directly involved in the system's development." This is insufficient. There should be description of qualifications of the independent reviewers, and if they may be from government or from industry. This is somewhat related to the research I am currently [producing. Please see the attached draft for an example of methodology to determine the relative efficacy of different types of reviews by different types of reviewing parties (Gideon 2023). Reviewers must include technical expertise and also agency-relevant knowledge to understand impacts in use.

Comment 4:
Soliciting feedback from affected groups regarding Rights-Impacting AI should be a requirement, not merely encouraged. Section 5(c)(v)(B) (p.19) states that for Additional Minimum Practices for Rights-Impacting AI "[a]gencies are strongly encouraged to solicit feedback on an ongoing basis from affected groups…" This should be a requirement, not an encouragement. Historically the groups most often and severely adversely impacted by our systems are not represented in the decision-making bodies, or the leadership in the development of the technology. This leads to a blindness of potential effects. Thus, soliciting this input is a requirement if the intent is to minimize the risk to rights of such underrepresented individuals and groups.

Comment 5:
Disclosure requirements for procured AI must be explicit and detailed and far-reaching, and periodic. Section 5(d)(ii) (p. 21) lists Transparency and Performance Improvement requirements for procured AI. The requirements in this section are too vague and will likely lead to insufficient documentation and information provided by the contractors. There must be an explicit requirement in procurement contracts that agencies can deeply inspect the AI provided. Too often contractors provide statistical information that sounds very good but is misleading, providing the wrong conditional probabilities or probabilities of error or success that are not quite the same thing as the agency would need to know. Those without advanced familiarity with statistical methods such as Bayes Theorem will not be prepared to adequately assess such statements. There must be requirements for rigorous independent review of procured AI, similar to that required for agency AI that is safety- or rights-impacting (see Gideon, 2023).

Comment 6:
Related to Comment 5 above, OMB should address the question of existing contracts for AI in agencies that do not meet the requirements of the Executive Order and Memorandum, and how these contracts might legally be made consistent with the risk management requirements contained in the Memorandum.

Comment 7:
The standard for designating an AI use or component listed in the Memorandum in Section 5 not to be safety- or rights-impacting. Must be very high and explicit. This must be stated clearly with necessary conditions for such designation to avoid under-inclusion, which would undermine thie Memorandum and the Executive Order.

Comment 8:
Consider expanding scope to any recipients of Federal funding and or grants. This would include state and local governments and many universities and research institutions, and some businesses. Expanding the impact of this rules in what is likely to be a very long period before any legislation for regulation of AI will have very large benefits for society.

Thank you for your consideration of my comments. Please contact me with any comments or questions or for further discussion.

Sincerely,

Dr. Carolyn Gideon

Evaluating Algorithmic Regulation Policies: A Game Theoretic Analysis

Introduction

The term 'algorithmic governance' has two meanings in the policy debate and existing literature: (1) the role of algorithms in governing our lives, and (2) the governance of the algorithms. Algorithms govern our lives both explicitly and implicitly. Explicitly, the public sector and governance institutions use algorithms, often outsourced to contractors, to fulfill their missions, such as allocating policing resources and determining prison sentencing. Implicitly, they govern many aspects of our lives, such as the shape of discourse in our digital public sphere, qualifications for loans, insurance premiums, employment eligibility, movie recommendations, the routes we drive to work, airline fares, college admissions, and more. With our lives increasingly shaped by digital platforms of social media and search engines, these opaque private-sector algorithms may be governing our lives more than the laws of our governments (MacKinnon 2013). The harms of these governing algorithms in the context of public sector and private sector use have been well documented (see for example O'Neil 2016, Noble 2018). These algorithms lack transparency and legitimacy, and sometimes violate existing laws. This presents a situation where we must think through how to extend governance to be sure laws are maintained when algorithms are used, i.e. the second meaning of algorithmic governance. This paper attempts to increase our understanding of how to govern these algorithms by exploring incentives and effects of different policies on how algorithms and AI are developed and deployed.

Several algorithms have been found to violate laws, human rights, and cause disparate harm by replicating and amplifying racial and other biases. An algorithm used by the Dutch government to detect fraud in social services was found by Dutch courts in 2020 to violate Article 8 of the European Convention on Human Rights, which protects the right to respect for private and family life (Vervloesem, 2020). Several US school systems contracted private big-data companies to evaluate teachers, resulting in the firing of award-winning teachers with the municipalities having no right to see the criteria and weighting behind the decisions (O'Neil 2016). In Scotland, the introduction of algorithmic grading during the pandemic was protested by students. The algorithm considered past school performance as a predictive metric to grade students in the absence of exams, ignoring the effect of the school's neighborhood on performance, which tends to determine socioeconomic status, thereby exacerbating existing socioeconomic discriminations (Tiffany 2020).

One criticism of algorithm use for important decisions, such as evaluating recidivism probabilities after incarceration, is that algorithms present biases of their own. These biases manifest against marginalized communities, notably Black and Brown individuals, women, low-income neighborhoods, LGBTQ and other minorities. For example, Chicago Police Department's crime prediction algorithm predicts if someone will be involved in a crime, though not whether they will be the perpetrator or the victim. It considers the preponderance of crime around the person, determined by neighborhood and zip code. Institutional segregation policies pushed Black and Hispanic people into certain neighborhoods, which are flagged by the algorithm, exacerbating disadvantages. In this bizarre example, a young man whom the

algorithm predicted would be involved in gun violence was shot twice because the algorithm led to 24/7 police surveillance of him, raising suspicions that he was an informant. Essentially, the algorithm used to prevent crimes caused the crime (Stroud 2021).

As these algorithms reach into increasing areas of our lives performing governance functions, there are problems of opacity and lack of accountability. Several countries have begun to introduce regulations of algorithms and AI to address this. However, these laws are still in their fledgling state or they may not work as intended and have unintended consequences. Such policies face critical challenges, including information and expertise asymmetry, the dynamic nature of the algorithms and their use, and sheer volume. While there has been a great deal of helpful legal scholarship exploring this issue, there has been little economic analysis clarifying the incentives created for different parties by the algorithmic governance policy options. This paper will address this deficit by providing game theoretic modeling of alternative approaches to regulating algorithms.

In this paper we will evaluate recent and proposed policies addressing algorithmic decision-making on several criteria, including (1) incentives for firms and other entities to comply, (2) effectiveness in governance (including monitoring and enforcement), (3) minimization of obstacles to innovation (by potential entrants as well as incumbents), (4) balance of Type I vs Type II errors, and (5) accountability. These evaluations will consist of game theory modeling of multiple players' incentives and outcomes under different proposed governance structures and in different contexts. We will test the results of these models with empirical evidence from trials of such policies where they exist, and similar regulation of other industries where they do not. We will evaluate several major proposed policies, including aspects of the EU Artificial Intelligence Act, the US Algorithmic Accountability Act, the FDA model of pre-market testing and evaluation, and an alternative model similar to independent accounting audits of corporate financial statements for legal compliance. Note that we are considering algorithmic decision making to include all such automated decision making. Some of this will be forms of AI and some will not. In this paper we will at times use the terms interchangeably as the basic problem of regulatory regime design and evaluation is similar, though obviously far more complicated for more complex versions of AI.

The results of this analysis will provide comparisons of the different policies along each of the above criteria. We hope this will improve our understanding of how competing governance models can be expected to perform and help guide the necessary tradeoffs for policymakers addressing the complex problem of governing algorithms.

Background – The Need to Govern Algorithms

The existing and potential harms of algorithmic decision making, both with and without advanced AI, has been well documented (Holder et. al. 2016, Noble 2018, O'Neil 2016, Reike et. al, 2018, and many others). Too often algorithms are deployed without considering if they may be violating well established laws. One glaring recent example of this is the delivery of ads by Meta, violating fair housing and employment discrimination laws in the US [CITE]. Since these algorithms operate as proprietary black boxes, their lack of compliance with laws is often not readily apparent, requiring the compilation and analysis of data of the algorithms' outcomes, often unavailable to those outside the

creators' firms. Even the 3rd party users of algorithmic decision-making systems, including public sector institutions, are not provided any explanation of the algorithms' outcomes (see O'Neil 2016 examples of algorithms used by public school systems for teacher evaluations, courts for sentencing, and law enforcement departments for deployment). In some instances, algorithmic decision making can lead to physical harm, even if not explicitly breaking existing rules, such as with self-driving cars [CITE], incorrect COVID diagnosis algorithms for Black patients [CITE], and advertising and revenue driven algorithms of web searches leading to decontextualized sensationalist racist extremist content (Noble 2018). There are also many documented instances of bias in all sorts of algorithms.

While there are existing laws to protect against many of these and other harms, algorithmic decision making often operates outside of those laws due to the many obstacles for detecting when they violate laws. The algorithms are not transparent or explainable, even when being used by the public sector. And the data necessary to find if there is statistical evidence of violation is often unobtainable. Even when it is obtainable, much harm will have been done before the analysis can be presented as evidence. Without direct regulation of the algorithms to ensure compliance with law, the burden of proof is on those least able to determine if their rights are violated by non-compliance with laws. In such an environment, the algorithms are simply not being held to the law, and the laws themselves lose any meaning as so much decision-making is shifting from huma to algorithmic processes.

We have several objectives of any algorithmic regulations. The primary focus of this paper is compliance with the law. We consider this to be the lowest-hanging fruit, as the laws already exist. Several other objectives, such as reducing further biases, ethics, transparency or explainability, are equally important. However, unlike the laws that are already existing, the definitions and extents of these objectives are still subject to much debate. These debates are critically important, but if we cannot even establish regulation to bring algorithmic decision-making in compliance with existing laws, there is little chance of achieving success in these other areas. So we focus on solving this case first as it is less complicated for that reason.

Background – Existing and Proposed Regulations

Many countries have recognized the need for regulating algorithmic decisionmaking and have begun to institute laws and regulations. Here we note a few of these, recognizing this is in no way meant to be exhaustive. For a recent comprehensive compilation of algorithmic regulation worldwide, please see Almeida 2021 and [*CITE*].

European Union

The European Union introduced the EU AI Act in April 2021, proposing regulation of all processes, institutions, products, and systems using Artificial Intelligence at any stage. The High-Level Expert Group established by the European Commission has defined AI systems as "software (and possibly also hardware) systems designed by humans that, given a complex goal, act in the physical or digital dimension by perceiving their environment through data acquisition, interpreting the collected structured or unstructured data, reasoning on the

knowledge, or processing the information, derived from this data and deciding the best action(s) to take to achieve the given goal. AI systems can either use symbolic rules or learn a numeric model, and they can also adapt their behavior by analyzing how the environment is affected by their previous actions." (AI HLEG, 2019a).

The result of an online public consultation with a variety of actors, this act classifies all products and services in terms of the risk posed to people, the fundamental rights, and the European values. A system that poses an *unacceptable risk* is prohibited. Systems that score people, biometrics, and AI that uses subliminal techniques to manipulate behavior falls into this category. Systems that are *high risk* must follow a set of horizontal mandatory requirements, which place obligations on both the developers of these systems as well as the deployers or users. These systems must go through oversight, approval, and ex-ante conformity assessment procedures that will classify it as high risk. AI used in education training, migration, administration of justice and democracy, generative language models, CV scanning tools, will fall within the high-risk purview. This assessment will be conducted by third parties under sectoral legislation, which involves ensuring that design and development are in compliance with regulation requirements. *Minimal or no risk* systems are permitted with no restrictions and limited oversight but can have voluntary code of conducts about transparency requirements. Chatbots, synthetic deep fake content were the examples given for this categorization.

The responsibility and obligations for AI fall mostly on the developer, where they are expected to create a risk management system. Their datasets should meet quality criteria of representativeness and accuracy, and this dataset should be available publicly and traceable. It is also their duty to undergo conformity assessment, register the system in the proposed EU database, conduct post marketing monitoring to ensure compliance for reliability and safety, and mitigate future risks, and collaborate with surveillance authorities. It is important to note that third party conformity assessments prior to market placement would be limited to mostly providers themselves. The deployer or the user is supposed to operate the systems in consonance with the instructions of use, ensure human oversight while doing so, and keep monitoring the systems for possible risks. In case incidents arise, they are required to report it to the producer. There are compliance penalties that can be levied, which go up to 30 million Euros.

With regards to enforcement of these regulations, the bill builds on member states' governance systems by proposing the establishment of a European AI board to provide consistency across European nations. While it does seek harmonization with existing sectoral legislation, ex ante requirements still must be met even when products have been covered by old approaches. The commission will be responsible for monitoring the consequences of this proposal and for establishing a database of high-risk AI system information available across the Union.

While the bill awaits its transformation into a law, which will happen when a common version is agreed upon by the Council and the Parliament, there are many questions and concerns that have been raised. The classification of risk seems arbitrary, with phenomena such as deepfake content which has shown to have serious political implications classified as minimal or low risk (Nehamas 2023; Veale and Zuiderveen Borgesius 2021). The idea of harm or risk has mostly been viewed from an individual and instant lens, not taking into account collective harm or cumulative risk that builds up over time (Veale and Zuiderveen Borgesius 2021). There seems to

still be ambiguity with regards to competent authorities present in this regulatory process apart from the Union itself, for verifying compliance (EU AI Act). Apart from penalties, there is no elaboration on how it will be decided who is responsible for any violations, which might regurgitate the classic fight of system vs user responsibility [CITE]. Lastly, companies in Europe have raised concerns about the effect of this legislation on technological sovereignty, innovation, and competitiveness (Toh 2023).

The GDPR also addresses some aspects of algorithmic decision-making. Most notably, Article 22 of the regulations specifically restricts automated decision-making and profiling, which produces legal effects or similarly significantly affects the data subject. Additionally, the GDPR empowers individuals to demand and receive explanations or meaningful information about the logic involved relating to such automated decision-making. For instance, if a loan application is refused, Article 22 may require the data controller in question to provide information about the information around the algorithmic method used, that is, input data related to the loan applicant and general parameters set in the algorithm that enabled the decision-making. Despite these requirements, Article 22 would not require any explanation around the source code, or how and why such decision was made against the applicant.

Brazil

Brazil also has proposed a law in progress replacing three old bills, emphasizing the creation of a regulatory body to enforce this law and taking a risk based approach for categorization of systems. It also focuses on penalizing providers or operators and obligation on them to report incidents. Individuals are also given rights and can demand explanations of decisions and contest the decisions in front of administrative bodies or courts. Similar to the EU model, a preliminary assessment by suppliers themselves classifies these models and the risks. However, a striking difference is that algorithmic impact assessment is to be performed by independent professionals under the Brazil law. This assessment is mandated for high-risk systems.

US

The United States does not yet have federal regulation in place, guiding the use of Artificial Intelligence in the nation. This leaves all regulation to the different agencies to address where algorithms and AI may be violating the laws they enforce. Federal agencies such as the Federal Trade Commission (FTC), Department of Defense, and the Food and Drug Administration (FDA) have proposed guidelines applying to private companies and governments emphasizing transparency, fairness, and traceability. The FDA, for instance, in 2022 released four criteria that clinical decisions software must follow to regulate AI used in healthcare decision-making. Any software that does not follow these will be subjected to intense FDA oversight. The National Institute of Standards and Technology (NIST) also released a voluntary, non-sector specific AI risk management framework for designing and developing AI based systems. This framework defines 7 characteristics that AI must have including fairness, validity, reliability. It also outlines functions such as mapping, monitoring, and documenting, that can be implemented to measure risks.

Apart from Federal Agencies, States have also been pushing for legislation within their own borders. 43 bills in total have been introduced in 21 states, out of which only 4 have been passed

and become a law. These 4 bills introduced in Montana, Indiana, Tennessee, and Texas, include obligations on companies to disclose use of personal data and empower individuals to opt out of their data being used for automated decisions. Texas also created an AI advisory council to study intelligence systems employed by the state. While the passed bills have been largely about private industry AI usage, states like Connecticut are looking to make the department of administrative services conduct an inventory of AI systems they use beginning February 2024.

Several bills have been proposed in Congress as well, most recently the SAFE innovation framework introduced by US Senator Chuck Schumer in June 2023. He proposed four regulatory principles - identification of the person/company responsible for the training algorithm and who the intended audience is, disclosure of data sources, explanation of its results and how it arrived there, and transparency. The most innovative part of the proposal is the series of AI insight forums where AI experts will be invited to brief Congress on topics, starting September. Other legislative proposals include the Algorithmic Accountability Act and the Platform Accountability and Transparency Act of 2022, which advocate for impact assessments and data access for external researchers. Additionally, voluntary mechanisms such as the National Institute of Standards and Technology (NIST)'s 2023 Risk Management Framework, which promotes third-party audits, are also gaining traction (Goodman, 2022).

The Biden Administration has also been taking consistent steps to gently pave a path toward creating a framework for the use of AI. On Oct 4, 2022, the White House released a Blueprint for AI Bill of Rights as a guiding document for AI developers and the principles they should follow in the process of creating systems. These guidelines included taking multiple stakeholders into account, pre deployment testing, proactive equity assessments to prevent algorithmic discrimination, data that is representative, consumer permission to use data, accessibility and knowledge for people to understand how these systems work and the ability to contest and report if their data is misused. He also signed the executive order 13985 directing federal agencies to root out bias in design and use of AI technologies. Most recently, in July, he convened a meeting with leading AI companies including Meta and Open AI to secure voluntary commitments from these companies for development of AI technology. While the commitments include processes like safety procedures and public disclosure of those, and watermarking AI being used by the public to generate products, these commitments are *voluntary* and there is presently no way to enforce these or ensure the companies are following them.

FTC

In its role regulating “unfair and deceptive practices.” FTC has established a sort of “soft law” by issuing guidelines, press releases, workshops and white papers. (Spiro, 2020). Soft laws are informal procedures to address and mitigate grievances. Issued as guides on how to properly use technologies such as facial recognition, and disclosures on mobile applications, these seem to be recommendations and not a compulsory framework. These are statements from the FTC, highlighting its own interpretation of its authority and Section 5, and how it might choose to enforce it (Solove and Hartzog 2013).[*UPDATE and description to be added*]

In 2017, NYC Council became the first legislative body in the US to pass an algorithmic transparency law requiring a comprehensive review of its automated decision systems (Bunnel

2021). The legislation also created a task force to review the state agencies' use of algorithms and the impacted policies. After the review, a recommendation would be developed on whether these algorithms should be made public and how their biasedness will be assessed.

Bunnell (2021) proposes states and local governments establish their own independent Algorithmic Transparency Commissions (ATCs) to balance transparency and accountability with corporate secrecy and security, along with minimizing costs. Such commissions would develop jurisdiction specific rules involving disclosures, audits, investigations, amongst other things through legislative and regulatory actions. A single, centralized commission, the ATC would promote ex-ante rules on minimum disclosure, design, and fairness requirements, while leaving discretion for agencies and vendors to design their systems. He advises bestowing the ATC with enforcement and legal powers, along with bestowing individuals to challenge these systems if they don't meet the ATC requirements. While he discusses multiple nuances of the model, the question of how the ATC itself would be regulated is in contention.

FDA Model

A popular idea supported by many scholars and advocates working in the field is regulation by a federal regulatory agency conducting pre-market review of some algorithms for safety and efficacy, modelled on how the US regulates drugs (Tutt, 2017) (henceforth called the FDA Model). Andrew Tutt, a senior associate at a leading regulatory and litigation law firm, proposed the creation of a new agency, which would have three main responsibilities: (1) to "organize and classify algorithms into regulatory categories by their design, complexity, and potential for harm (in both ordinary use and through misuse)," (2) to "prevent the introduction of algorithms into the market until their safety and efficacy has been proven through evidence-based pre-market trials, and (3) to impose disclosure requirements and usage restrictions to prevent algorithms' harmful misuse."(Tutt 2017).

The FDA model is designed to achieve regulatory efficiency through a centralized authority for vetting algorithms. Lechterman (2022) acknowledges that this form of regulation could hold companies more accountable for the algorithms that they are creating. Other find this model to be unrealistic for a variety of reasons. Almeida et al (2021) believe that though this initiative would increase algorithmic code transparency, that may not ensure explainability of the harms that the algorithm could cause. Furthermore, grouping all forms of artificial intelligence together under one agency would be unfeasible since algorithmic applications vary enormously (Lechterman 2022). Ultimately, establishing public regulatory bodies seems complex due to a "wait and see" approach taken with AI and a lack of technical expertise within public policy bodies (Lewis et al 2020). Therefore, certain scholars have advocated for improving existing institutions as opposed to creating new ones (Himmelreich 2022, Spiro 2020).

CPA-style auditing model (CPA model)

We propose a regulatory model based somewhat on how the independent auditors review corporate financial statements on a regular basis to certify their compliance with national laws and standards. Note that in the case of algorithmic decision-making, auditing is a simplifying term for a more complicated multidimensional process. We do not simply mean auditing the code of an algorithm, or the training data. As Almeida et. al. (2021) points out, "… on certain

occasions, even in case the AI algorithm is open, full transparency cannot be ensured, as there is a difference between seeing the whole code and understanding all of its potential effects," (p. 507). Reike et. al. (2018) explains this very well, providing a 6-dimensional framework for evaluating automated decision-making systems. Mokander et al (2023) notes that the effectiveness of auditing as an algorithmic governance mechanism is arguably based on three broad ideas: (1) ensuring procedural regularity and transparency which can promote good governance, (2) being proactive in the design of algorithms helps in identifying potential risks and preventing harm before it occurs, and (3) maintaining operational independence between the auditor and the entity being audited enhances the objectivity and professionalism of the evaluation.

One of the advantages of this regulatory model, as compared to the FDA model described above, is that the level of bureaucracy and expertise required at the federal level is greatly reduced. As in the SEC's structure, significant expertise is required by the regulator to set standards and engage in oversight. Yet much of the expertise required for evaluating the algorithms themselves can be contained in the private sector, as a commercial industry of automated decision making auditors will develop. These auditing teams likely will be more cross functional than financial auditing teams, as they will require knowledge of coding, data science, and machine learning as well as subject matter expertise in the many laws that could be violated explicitly or implicitly.

Several versions of this have been proposed in the literature, such as periodic audits (Bunnel 2021, Engstrom 2023, Grimmelikhuijsen 2022, and Mokander 2021) and impact assessments focusing on aspects like data privacy and human rights (Almeida 2021, Bunnel 2021, Clough 2018, Engstrom 2023, Grimmelikhuijsen 2022). Some perspectives include combining algorithmic impact assessments with software verification techniques depending on specific use cases (Lechterman 2022), or embedding ethical rules and norms directly in algorithmic code (Bunnel 2021, Gervais 2021).

However, there is a lack of well-defined measures in this field (Buolamwini, 2019). The absence of widely accepted standards or regulatory guidance makes it challenging to verify claims that an AI product or system has undergone an *audit*, regardless of whether the audit was conducted by first-party, second-party, or third-party auditors. This ambiguity can lead to a range of potential issues, as it may not effectively address bias and harm, and in some cases, could even exacerbate the situation (Costanza-Chock et al, 2022). Several scholars have questioned the effectiveness of audits given the lack of industry standards on the scope of audits, and potential conflicts of interest that stem from situations where audits are funded by the company being audited (Schneiderman, 2016; Schellmann, 2021; Buolamwini, 2019)

Other/General
Several other regulatory structures have been proposed. Almeida et al (2021) proposes dynamic regulation based on learning by doing and continuity of regulatory relationships, as well as transparency, to address the challenges that arise from rapid changes to the technology capabilities and definitions.
[*To be completed*]

Summary: Key components of possible governance regimes

Based on the above inexhaustive synopsis of existing and proposed regulatory structures, we highlight a few key charact eristics that must be chosen.

- Centralized v decentralized
  Some proposed regulatory models require a national centralized regulator for all algorithmic decision making and/or AI, while others reply on the regulatory agencies with knowledge and experiences in their specific fields to regulate AI decision making within their scope. This will impact the incentives and effectiveness of the regulator and the resultant incentives of the firms. While a centralized deregulator may reduce some of the information asymmetries, some will remain to the firms' advantage. A centralized regulator will also be more susceptible to capture by the algorithm-deploying firms.
- Ex-post v ex-ante
  Regulation may occur before the deployment of the decision-making system, or after it is in use. This will impact the costs of both the regulator and the firms, as well as the incentives.
- Burden of proof
  The burden of proof that automated decision systems comply with the law may be on the firms to certify their products' compliance or may be on the regulator (and public) to discover lack of compliance. This will significantly impact incentives.
- What gets reviewed

…

A Framework for Evaluating Algorithmic Regulation

We will evaluate alternative forms of regulation according to five criteria:
(1) incentives for firms and other entities to comply
(2) effectiveness in governance (including monitoring and enforcement)
(3) minimization of obstacles to innovation (by potential entrants as well as incumbents)
(4) balance of Type I vs Type II errors
(5) accountability
[*Descriptions to be added]*

Analysis of Regulations

We will create simplified stylized models of the different basic forms of regulation considered.

1. Ex-post evaluation of algorithmic decision making (did it violate the law?)
2. Ex-ante evaluation of algorithm for decision making by a regulatory agency (i.e. the FDA model)

3. Ex-ante revaluation of algorithmic decision making by an independent auditor, as required by regulation (i.e. the CPA model).

Basic Model

There is a fairly large existing literature on game theory modeling of industry regulation[1]. Applied to numerous types of industries and regulations, the general form is considering a firm (or firms) that chooses to comply with the regulation or violate it, and a regulator who chooses to inspect the firm(s) or not. We can simplify that form as follows:

		Regulator: Inspect	Regulator: Don't Inspect
Firm	Comply	f_1 , r_1	f_2 , r_2
	Violate	f_3 , r_3	f_4 , r_4

We can then modify this model to fit our context of regulating algorithmic decision-making to comply with the law. In our case, it is more fitting to think of the level of effort the firm chooses to be sure their algorithms do not violate existing laws (or to minimize the probability that the algorithms violate the law). The regulator, in this case, chooses how rigorously to review the algorithms for violations of laws. Our simplified regulatory model is then as follows[2]:

		Regulator: Tough Review	Regulator: Loose Review
Firm	High Effort	f_1 , r_1	f_2 , r_2
	Low Effort	f_3 , r_3	f_4 , r_4

Each quadrant represents the payoffs of the firm, and then the regulator, for each possible combination of choices. For purposes of this analysis we shall refer to the quadrant 1 (Q1) for High Effort and Tough Review, quadrant 2 (Q2) for High Effort and Loose Review, quadrant 3 (Q3) for Low Effort and Tough Review, and quadrant 4 (Q4) for Low Effort and Loose Review.

There are two standard assumptions we can take as given:

1. If the regulator knows that the firm will use high effort, it will prefer to conduct a less costly les rigorous review, meaning $r_1<r_2$.
2. If the firm knows that the regulator will use a loose review, it prefers to use low effort, meaning $f_2<f_4$.

[1] See, for example Tsebelis 1991, Kilgour, Fung and Hipel 1992, and Gu, Hung and Sun 2022.

[2] As in the noted literature, we simplify by creating a discreet-choice model of a situation that has continuous choices for level of effort and toughness of review. This does not change the conclusions.

Based on these conditions, we see that for this game, neither Q1 nor Q2 can be a Nash Equilibrium regardless of the other characteristics. This means there is no Nash equilibrium where the Firm chooses to exert high level of effort in making their algorithms comply with the law. (*Below we will consider the possibility of ways to develop a regulatory system where the firm does not have a dominant strategy to use low effort.*)

Q3 is a possible Nash Equilibrium and will be the outcome when $f_3>f_1$ and $r_3>r_4$. While the latter condition is conceivably likely, that the regulator will prefer a tough review when the firm uses low effort, the former condition is less likely. If a tough review is lengthy and slows the innovation and profits of the firm by delaying its use of the algorithm, and if the penalty and further delay of a finding of high probability of law violation in the review is sufficiently large, we would expect the firm to prefer high effort when the regulator uses tough review. Thus this equilibrium seems unlikely, though it will depend on the composition of the payouts to the firm and regulator in any particular instance.

Q4 is also a possible Nash Equilibrium and will occur when $f_4>f_2$ and $r_4>r_3$. We have already noted above that the first condition holds. The second condition will hold when the regulator has a dominant strategy to use loose review. We would hope to develop a regulatory system where this is not the case, as it would be highly ineffective, with a Nash Equilibrium of low effort and loose review. The occurrence of this as a Nash Equilibrium will again depend on the components of the payoffs, to be discussed below.

It is also possible that none of the quadrants is a Nash Equilibrium, leaving us with a situation of both players randomizing between their moves in a Mixed Strategy Nash Equilibrium (MSNE). This will happen when $f_1>f_3$ and $r_3>r_4$. When this is our situation, each player's randomizing probabilities will be determined not by their own payoffs, but by the other player's payoffs, as follows:

$$\text{P(Firm chooses High)} = p^* = \frac{r_4 - r_3}{r_1 - r_2 - r_3 + r_4}$$

$$\text{P(Regulator chooses Loose)} = q^* = \frac{f_4 - f_2}{f_1 - f_2 - f_3 + f_4}$$

Thus we see that, as found by Tsebelis (1991), if we are in the MSNE, any changes to the firm's payoffs meant to increase their incentive, and thus frequency, of high effort, will not change the firm's probability of high effort, but will change the probability of the regulator doing a tough review, and likely will decrease it.

As noted above, the equilibrium outcome of the regulatory game will be determined by the components of the players' payoffs, which may change under different regulatory design regimes. Before we consider these changes, let we will first describe the different [possible components of each player's payoffs.

Firm's payoff components:
π = profit from use of algorithm
c_1 = costs of algorithm development and deployment

c_2 = costs associated with effort to comply with laws (higher for higher effort)
c_3 = costs associated with regulatory review (higher for tough review)
c_4 = costs of delay in using algorithm while waiting for completion of review (higher with tough review)
v_1 = value of the violation (e.g. fewer constraints in use of targeting marketing, etc) (Kluger, Fong & Hipel 1992)
R = reputation effect of violation found (<0) or not found (>0)
P = penalty imposed when law violation found

Regulator's payoff components:
a_1 = costs of review (higher when tough)
a_2 = societal cost of law violation
a_3 = societal costs of slowed innovations when review causes delay (higher when tough for ex-ante)
H = reputation and legitimacy gain from finding violation

We will now consider this basic model in the context of different possible regulatory regimes.

Ex-post regulator review (FDA model)
In a regime of ex-post regulatory review, the regulator would review the algorithm after its deployment when there is probable cause that a law was violated. This has some similarities to regulation by litigation. If there is probable cause, we can assume the regulator will conduct a thorough, rigorous review. The choice of the regulator for light or tough review comes in the level of investigation to determine if there is probable cause based on evidence from the system being in use.

First, we note that the two standard assumptions of the basic model will still hold as given in this instance. If the regulator knows that the firm is using high effort, then the probability of law violation is lower so the regulator will prefer the less costly light review for probable cause. Also, if the firm knows that the regulator is using light review and therefore unlikely to find probable cause, even if it exists, the firm prefers to the less costly low effort.

To determine if Q3 will be an equilibrium, we must consider how likely it is that $f_3>f_1$ (giving the firm a dominant strategy to use low effort) and $r_3>r_4$. In an ex-post regulatory regime, the firm's profits earned from the algorithm (π) are higher because the algorithm can be deployed and used sooner. While the benefit of this is the same for high effort and low effort, the cost of high effort to comply with laws will be more than low effort (c_2). Usually the cost of a tough review (c_3) will be higher for the firm if it used low effort versus high effort, but with the ex-post regulatory system these are probably the same because the information asymmetries between the firm and regulator are higher, making it more difficult for the regulator to find probable cause even when the firm used low effort. This also means the probability of finding probable cause is lower in this regulatory system, even with a tough review, so the probability of the firm incurring a penalty (P) is likely very similar for low effort and high effort. This also means the value of R is likely the same for both low effort and high effort, because law violations are less likely to be found. Since law violations are less likely to be found, any such violations that still exist because

the firm chose low effort will bring additional value to the firm (v_1) Therefore, the differences between f_3 and f_1 are largely based on the additional cost of high effort and the loss of the value of the violation for high effort so low effort will have the higher payoff, making the condition $f_3>f_1$ true.

For the regulator's payoff condition, the cost of the tough review (a_1) is higher, but because of the higher information asymmetries of ex-post regulation, the tough review is not much more likely to result in probable cause than the loose review, so the probability of receiving the benefit of H is not higher. The societal cost of the violation (a_2) is likely the same for tough or loose review for the same reason, and the societal cost of delayed innovation (a_3) is not relevant because the algorithm is deployed prior to review, causing no delay in innovation. With the only significant difference in payoffs being the cost of the review, the condition $r_3>r_4$ does not hold. Therefore, Q3 is not an equilibrium.

Based on this analysis, we do see that Q4 is likely to be an equilibrium, as we just concluded that the condition for this, $r_4>r_3$, does hold for this regulatory regime. Therefore, we conclude that ex-post regulation is likely to have an outcome of low effort by the firm and loose review by the regulator, resulting in high probabilities of law violations in algorithmic decision-making.

A MSNE will occur if $f_1>f_3$ and $r_3>r_4$. The analysis above shows that both of these conditions are unlikely to hold, so this is an unlikely outcome.

While this analysis shows which outcomes are likely under an ex-poste regulatory regime, it also provides guidance in designing such regulation. We can use this understanding of the incentives to create mechanisms that will change the relative payoffs as described here to try to get different outcomes.

Note that the outcome of harm from violations if not caught by the regulator is far more likely in the case of algorithmic decision-making than in other regulatory situations. This is because something not caught by the regulator is unlikely to be caught at all. It would take quite a lot of effort and cost to compile results across a large number of individuals to show that there is a violation of law. In other regulatory situations modeled in the literature, like environmental regulation compliance or infrastructure maintenance laws or worker safety regulation, undetected violations will have a more significant probability of resulting in a public event (e.g. a major oil spill, worker harm, bridge failure, etc). Thus, ex-post regulation is not very effective.

Ex-ante by regulator

In a regime with ex-ante review by a regulator, the regulator must review and approve algorithms before they are deployed. This is the FDA model discussed above. While all algorithms of certain specifications will be reviewed, the regulator is choosing the thoroughness and rigor of its review (tough or loose). We can generalize this to include the quality of the review, based on the choice and ability of the regulator to acquire the necessary expertise and skill.

Again, we note that the two standard assumptions of the basic model will still hold as given in this instance. If the regulator knows that the firm is using high effort, then the probability of law violation is lower so the regulator will prefer the less costly light review. Also, if the firm knows

that the regulator is using light review and therefore unlikely to find a violation, even if it exists, the firm prefers to the less costly low effort.

To determine if Q3 will be an equilibrium, we must consider how likely it is that $f_3>f_1$ (giving the firm a dominant strategy to use low effort) and $r_3>r_4$. In an ex-ante regulatory review, the firm's profits earned from the algorithm (π) are reduced because the algorithm cannot be deployed and used until it has been reviewed and approved. While the cost of this delay (c_4) will likely depend more on the regulator's choice of tough or loose than on the firm's choice of high effort or low effort. However, when comparing these two payoffs under tough review, the delay might be less for high effort than low effort because there is a lower probability that a violation is found, so the algorithm will be approved without revision. Also, with high effort it is possible that the firm can provide the regulator with more information to aid its review that will expedite even a tough review, further reducing the delay time. The cost of high effort to comply with laws will be more than low effort (c_2). Usually, the cost of a tough review (c_3) will be higher for the firm if it used low effort versus high effort, because there will be more questions raised that require the firm's response and the cost of modifications for any violation found. Low effort does provide some additional value from the violation (v_1) if it is not found by the regulatory review, but in a tough review it is more likely to be found so the expected value of this is lower. Since a violation from low effort is more likely to be found in a tough review, the value of R is higher for high effort than low effort.

In sum, if there is a tough review, a high effort will provide the firm a payoff with higher compliance costs and no expected value of benefit from a violation, but lower review costs, lower delay costs, higher reputation benefits, and no expected penalty cots compared to its payoff from low effort. The condition $f_3>f_1$ will be true when:

$$c_{2H} - c_{2L} + \alpha v_1 > c_{3L} - c_{3H} + c_{4L} - c_{4H} + \alpha R + \alpha P,$$

where α is the probability that a violation is found with tough review.

For the regulator's payoff condition, the cost of the tough review (a_1) is higher. In an ex-ante regulatory review system the information asymmetries are lower than the ex-post regulation, and a tough review is significantly more likely to find any existing law violation than the loose review, so the probability of receiving the benefit of H is higher for the tough review than the low review since the firm's effort is low. The societal cost of the violation (a_2) is higher for a loose review since the violation is less likely to be found and corrected. The societal cost of delayed innovation (a_3) is higher for a tough review than a loose review, as the tougher review will take longer and increase the delay in innovation. Thus, the condition $r_3>r_4$ will hold when:

$$a_{2L} - a_{2T} + \alpha H > a_{1T} - a_{1L} + a_{3T} - a_{3L}.$$

Therefore, Q3 (low effort and tough review) may bet an equilibrium, depending on the relative value of the above components of the players' payoffs.

Based on this analysis, we see that Q4 (low effort and loose review) will be an equilibrium when the condition $r_3>r_4$ does not hold, or when:

$$a_{2L} - a_{2T} + \alpha H < a_{1T} - a_{1L} + a_{3T} - a_{3L}.$$

This is possible depending on the relative magnitude of the components of the regulator's payoffs only.

An ex-ante regulatory review regime will result in MSNE when $f_1 > f_3$ and $r_3 > r_4$. Based on the above analysis, we see this occurs when the two following conditions are met:

$$c_{2H} - c_{2L} + \alpha v_1 < c_{3L} - c_{3H} + c_{4L} - c_{4H} + \alpha R + \alpha P, \text{ and}$$

$$a_{2L} - a_{2T} + \alpha H > a_{1T} - a_{1L} + a_{3T} - a_{3L}.$$

Ex-ante by independent auditor as required by regulation (CPA model)
Regulation that requires ex-ante review by an auditor is similar to the ex-ante regulatory review discussed above. The payoffs for the firm remain the same. However, the auditor has different payoffs than the regulator does. In this case we will assume the auditor is part of a private sector firm that provides audit services for automated decision-making systems. In most other senses the game is similar because the auditor, like the regulator, chooses the level of rigor of the audit they conduct. This has been modeled for auditing of public company financial statement by certified public accountants (CPAs) in many ways using game theory. Some of these models consider the auditor's choice of how rigorously to audit the financial statements, sometimes based on the length of relationship with the client to determine if this leads to increases in knowledge and ability to detect errors or to decreases in independence and willingness to report errors.[3]

We begin by considering the same basic model as above, replacing the payoff components of the regulator with those of the decision system auditing firm as follows:

Auditor's payoff components:
a_1 = costs of review (higher when tough)
H_1 = reputation gain from finding violation, which can maintain or increase standing with regulator.
H_2 = impact of reputation from finding violation on obtaining and retaining clients (Intuitively it seems this could be positive or negative. However, Anastasopoulos and Asteriou (2021) include both a penalty for not finding errors when they are present and a bonus for finding errors in their models, so tentatively considering this to be positive when violations found and negative when violations not found, if that is subsequently discovered.)
F = revenues received from client firms for auditing services, assumed increasing in reputation of quality audits because can charge higher rates. (This is based on H_1 and H_2 because neither client firm nor regulator can observe if auditor has chosen tough audit or loose audit.)

For this game we must modify our two standard assumptions taken as given in the basic model above:

[3] For example, Fellingham and Newman 1985, Anastasopoulos and Asteriou 2021,.

1. If the auditor knows that the firm will use low effort, it will prefer to conduct a tougher more rigorous audit to find violations and maintain its certification status, meaning $r_4<r_3$.
2. If the firm knows that the auditor will use a loose, less rigorous audit, it prefers to use low effort, meaning $f_2<f_4$.

Based on these conditions, we see that for this game, neither Q2 nor Q4 can be a Nash Equilibrium, regardless of the other characteristics. This means there is no Nash equilibrium where the auditor chooses the less rigorous audit.

Q1 is a possible Nash Equilibrium and will be the outcome when $f_1>f_3$ and $r_1>r_2$. The analysis of the condition for the firm's payoffs is the same as in the discussion for Q3 when there is ex-ante regulatory review above, except the cost of the audit will be the same for high or low effort as the fees form the auditor will be the same. In sum, if there is a tough audit, a high effort will provide the firm a payoff with higher compliance costs and no expected value of benefit from a violation, but lower delay costs, higher reputation benefits, and no expected penalty cots compared to its payoff from low effort. The condition $f_1>f_3$ will be true when:

$$c_{4L} - c_{4H} + \alpha R + \beta P > c_{2H} - c_{2L}\ \alpha v_1,$$

where β is the probability that the regulator later finds a violation not found by the auditor.

For the auditor's payoff condition, given that the firm uses high effort, the cost of a loose audit will be lower, the reputation benefits with the regulator and for obtaining and retaining clients will be higher for a tough audit if a violation is found, and a tough audit offers potential to increase fees charged for audits in the future (indicated by *F'*) if a violation is found. Therefore, the condition will be met when

$$\alpha H_1 + \alpha H_2 + \alpha F' > a_{1H} - a_{1L}.$$

Q3 will be a Nash Equilibrium when $f_3>f_1$ and $r_3>r_4$. The second condition is given as an assumption so that is true. The first condition is simply the opposite of the condition previously considered in evaluating the possibility that Q1 is a Nash Equilibrium. The first condition will be met when

$$c_{4L} - c_{4H} + \alpha R + \beta P < c_{2H} - c_{2L}\ \alpha v_1.$$

The only equilibrium will be an MSNE when $f_1>f_3$ and $r_2>r_1$. Based on the review of the quadrants, these conditions will be met when:

$$c_{4L} - c_{4H} + \alpha R + \beta P > c_{2H} - c_{2L}\ \alpha v_1, \text{ and}$$

$$\alpha H_1 + \alpha H_2 + \alpha F' < a_{1H} - a_{1L}.$$

Regardless of the value of the parameters in any situation that determine the equilibria of this game, one clear advantage of this regulatory regime is that Low Effort and Loose Audit is never an equilibrium. This is a better outcome for society it increases the possibility of high effort by

the firm, and increases the probability that violations from a firm choosing low effort will be found.

Additional advantages of the auditor review include less burden on the government to acquire the necessary (and expensive) expertise in large numbers, and the benefit to the economy of the new auditing firms and jobs created.

Evidence based on independent auditing requirement for corporate financial statements
U.S. history offers valuable insights from the audit industry and its regulation. The Securities Act of 1933 and the Securities Exchange Act of 1934 laid the foundation for the regulation of securities and financial reporting, requiring public companies to submit audited financial statements to the Securities and Exchange Commission (SEC) (Barkai and Benzell, 2018). This move bolstered investor trust and encouraged capital (Fridson 2003) flow into the market. The audit industry's expertise and experience in assessing financial records and internal controls have been instrumental in preventing fraud, enhancing corporate governance, and safeguarding the interests of shareholders and stakeholders. Moreover, the establishment of accounting standards, such as the Generally Accepted Accounting Principles (GAAP), further solidified the industry's role in providing consistent and reliable financial information (Fridson 2003).

The U.S. accounting regulation historical evolution demonstrates the significant impact of regulatory measures on investments and business sentiments. After the Enron scandal in 2001, the Sarbanes-Oxley Act (SOX) was introduced to address corporate fraud and rebuild investor trust in financial institutions. SOX mandated stricter financial reporting requirements, internal controls, and enhanced corporate governance practices. The regulatory response led to increased transparency and accountability in the financial sector, positively influencing investments and restoring business sentiments over time. The impact on the regulated firms is also worth noting. SOX implementation initially led to a decline in the initial returns of Initial Public Offerings (IPOs) in the United States, but was found to improve the aftermarket performance of IPOs potentially due to the provisions of the act aimed at enhancing transparency and reducing market volatility (Johnston and Madura 2009). The success of SOX in enhancing investor confidence therefore may provide some evidence for how the CPA model may foster compliance, audit, and trust in algorithmic decision-making systems from a market perspective.

Carney (2005) provides an analysis of the impact of SOX on small firms. He found had a significant impact on small firms, resulting in increased compliance costs, financial strain, limited access to capital, and a potential hindrance to business operations. Compliance with SOX requirements placed a burden on smaller companies, diverting resources from core operations and hindering their competitiveness. Some investors and lenders perceived the higher compliance costs as a risk factor, limiting small firms' access to capital. The Securities and Exchange Commission (SEC) made efforts to address these concerns by streamlining auditing requirements for small companies in 2007, aiming to reduce the compliance burden while upholding the Act's goals (Carney 2005).

It is also interesting to note how the CPA industry evolved based on these regulations, and helpful to contemplate how an industry of certified algorithm auditors might similarly develop. The evolution of the independent auditor industry in the United States can be traced back to ancient times when societies began to keep records of economic goods and activities. As societies became more complex, the need for accountability in tribute and taxes collected by ruling authorities arose. Furthermore, the advent of double-entry bookkeeping and the publication of Luca Pacioli's book on double-entry bookkeeping in 1494 marked significant milestones in accounting development. The Industrial Revolution in the late 18th century brought about changes in business operations, leading to the growth of large-scale manufacturing and joint-stock companies, which necessitated more sophisticated accounting practices. During the late 1800s and early 1900s, professional associations like the AICPA2 emerged, setting standards and codes of conduct for accountants and auditors. The Great Depression in the 1930s facilitated the formation of the SEC, leading to standardized accounting principles for publicly-traded companies (Zaff 2021). As the American economy grew and became dynamic and complex over the years, the need arose for reliable and standardized assessments of companies' financial health. The establishment of auditing practices helped to address this gap by providing independent evaluations of financial statements, ensuring accuracy, and detecting fraudulent activities (Auditing Symposium 1994).

Criticism and downsides of the auditing system, particularly in relation to the independence of auditors, have been a topic of discussion in the accounting and auditing profession for decades. One key concern is the potential lack of sufficient independence of auditors, which could compromise the objectivity and credibility of their work[4].

RE: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI) - OMB–2023–0020

Credo AI is a Responsible AI Governance Platform that has been a driving force for change within the global AI ecosystem, pushing for greater transparency, governance, and oversight of AI and its responsible development and use since its inception in 2020. Credo AI's Founder and CEO, Navrina Singh, serves as a Member of the National AI Advisory Committee (NAIAC) and is a Member of the OECD's Expert Group on AI Risk and Accountability. She has dedicated her career to building AI products responsibly (safe, secure, fair, compliant and human centered) advocating for Responsible AI Governance and its safe development and deployment on a global scale.

About Credo AI

Credo AI is a software tool provider; we have built a Responsible AI Governance platform that supports contextual AI governance in companies of all sizes from Global 2000s to early stage startups, across different industries including financial services, insurance, healthcare, human resources, public sector use of AI (including federal procurement), and more.

Credo AI's mission is to maximize the benefit of AI to humanity, using our leading AI governance platform for AI risk management, compliance, safety, ethics, explainability, fairness, and economic opportunity. With Credo AI, organizations are able to adopt and scale AI safely, responsibly and effectively, oversee and mitigate AI risk (including operational, regulatory, and reputational risks), maintain AI ethics standards and compliance (with both internal policies and external regulation and guidance), and future-proof their organization to enable frontier AI adoption.

Credo AI is very encouraged by the U.S. Office of Management and Budget (OMB) Draft Memorandum on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence." We agree that it is incumbent upon the United States Government to chart a path forward to harness the benefits and mitigate the risks of AI. As the OMB has rightly noted, promoting continued U.S. leadership in AI innovation requires managing AI risks and effective AI governance.

With the issuance of this guidance, the United States can lead by example - setting the global standard for AI enterprise risk management. Credo AI strongly supports the establishment of mandatory requirements for federal agencies to adopt minimum risk management practices for safety-impacting and rights-impacting AI.

Executive Summary

Credo AI stands ready and willing to help OMB operationalize risk management for agency use. In our response, we have focused on:

- **Advancing Responsible AI Innovation.** To build internal enterprise capacity to support responsible AI innovation and improve AI procurement, OMB should continue to reinforce the need for agencies to document and register all their AI use cases, identify risks contextually, track changes in system compliance, and mitigate risk.
- **Using Governance Artifacts to enable Transparency in AI Procurement Processes.** A crucial, initial step toward advancing responsible AI innovation and risk management within federal agencies is to document and register all AI use cases and applications.
- **Evaluation and Public Transparency.** Third-party auditing enables responsible use of AI and increases transparency and explainability of AI systems. Outcomes from third-party audits should be included within annual use case inventories along with information about why a vendor was selected, the procured AI model's intended use case(s), and the steps taken to govern procured AI pre- and post-deployment.

Advancing Responsible AI Innovation (Q3)

We fully support agencies' work to improve their ability to use AI in ways that benefit the public, while recognizing when and why AI may not be suited for a given task.

To build internal enterprise capacity to support responsible AI innovation and improve AI procurement, OMB should continue to reinforce the need for agencies to:

- **Document and register** all their AI use cases. Agencies need to maintain a repository for AI they are building, procuring, and using.
- **Identify risks contextually**. Develop a plan to manage context specific risks.
- **Track Changes in System Compliance**. Establish adequate safeguards and oversight mechanisms for all uses of AI, not just generative AI.
- **Mitigate Risk**. If the AI System isn't meeting all requirements, identify mitigation strategies and accountable stakeholders.

Registering AI Use Cases (Q5)

We are aligned with the OMB's guidance to agencies to incorporate additional best practices for AI risk management, such as from the National Institute of Standards and Technology (NIST) AI Risk Management Framework. This will be critical for interoperability and common definitions across government and industry.

Registering and documenting all AI use cases is a critical first step in understanding potential risks, impacts, and the value of AI systems. This is also a method for agencies to prioritize high-value systems for development earlier on, and potentially "hold off" on procuring or acquiring AI systems that do *not* deliver enough value to justify the potential risk. Having a comprehensive list of risks ahead of testing and evaluating AI systems may prove difficult, given unknown or unforeseen risks. We are aligned with the current guidance that agencies should identify additional context-specific risks that are associated with their determined use cases (i.e. including the use of generative AI for internal purposes by agency staff). It is critical to have an auditable repository that allows agencies to review and approve AI use cases.

Using Governance Artifacts to enable Transparency in AI Procurement Processes (Q4, Q7)

Credo AI recommends the adoption of trustworthy practices for government use and procurement of AI systems in order to ensure that both generative AI and traditional AI/ML procured by the USG is contributing to the provision of essential services, and

the public good. At minimum, these trustworthy practices should include mechanisms for third-party transparency pre- *and* post- procurement.

The USG has an opportunity to lead by example by establishing a baseline of what Responsible AI adoption requires in practice. To safely procure and adopt generative AI, large language and foundation models providers should be required to:

- **Provide model-level transparency disclosures.** Such disclosures should be made available to the appropriate regulatory or enforcement body within the USG, the agencies that wish to procure the use of such a model, as well as any downstream application developers (*not* the general public) to ensure they are fit for purpose. Disclosures can take the form of several different types of "governance artifacts," including comprehensive AI use case risk reporting, model cards, data set cards, and algorithmic impact assessments (AIAs) described in detail below. Information about red-teaming methodologies and outcomes can increase the robustness of these disclosures.
- **Provide organizational-level process (and use) disclosures.** Organizations should be required to disclose (to the general public and corresponding agency) if and how they are using LLMs/FMs. Beyond transparency disclosures at the model level, LLM/FM providers must institute organization-level policies for responsible use and development, including investment in AI safety and governance, and processes to ensure full lifecycle governance.

Beyond large language and foundation model providers, any enterprise providing traditional AI or general AI services should be required to provide governance artifacts. Within the procurement process, federal agencies should be requesting enterprise vendors to provide governance artifacts.

Governance Artifacts

For adequate testing and safeguards against risks such as discriminatory, misleading, inflammatory, unsafe, or deceptive outputs, agencies should incorporate requirements into relevant contracts such as:

- Algorithmic Impact Assessments (AIAs) of the systems when applied to a use case;
- requirements for Model and Dataset Cards from the commercial AI providers;

- a public catalog of AI systems used or procured by government bodies aligned with EO 13960[1]; and,
- regular transparency reporting requirements that provide information about the system (including its performance, assessment for unintended bias, potential risks, incidents of harm, and impacts) through Conformity Assessments.

Algorithmic Impact Assessments

The components identified in the OMB Guidance would be further complemented by referencing a taxonomy of risks correlated to AIAs - this taxonomy of AI risk would provide needed and consistent guidance for developers and deployers of AI systems, and ideally inform the areas that are most important to consider when assessing its AI system's potential impact. The following risks could be considered in such a taxonomy: abuse & misuse, compliance, environmental and societal impact, explainability and transparency, fairness and bias, performance and robustness, privacy, and security.

AIAs are indispensable transparency tools for entities throughout the entire AI value chain, from foundational model providers to the developers who build upon them, to the end users using AI in their daily lives. We support the OMB's inclusion of AI Impact Assessments in the minimum practices for safety-impacting and rights-impacting AI procured by federal agencies.

Key Considerations for Inclusion in AIAs

Some elements of the AIA should be standardized, some should not (e.g. some AIAs should be more focused on privacy than safety depending on the Agency). Baseline requirements for AIAs across all agencies should include:

- Use Case Description
  - Application Context
  - Task & Output
  - Data & Input
  - ML Models (with model cards)
- Responsible AI Evaluation
  - Abuse & Misuse: How well is the system protected from the potential to be used maliciously or irresponsibly (intentionally or unintentionally)?
  - Performance Evaluation: How well does the system perform, what are the accuracy and performance limitations?

[1] Promoting the Use of Trustworthy Artificial Intelligence in the Federal Government

    - Fairness Evaluation: Is the system causing disparate impact or harm to different groups that interact with it?
    - Security Evaluation: Is the system secure against adversarial attacks or other bad actors' manipulations?
    - Privacy Evaluation: Does the system preserve individual privacy?
    - Explainability and Transparency Evaluation: Is the system understandable and transparent to all relevant stakeholders?
    - Environmental & Societal Evaluation: What broader changes might the AI system induce in society and the environment, such as labor displacement, mental health impacts, or the strain on natural resources and carbon emissions caused by training complex AI models?
- Risk & Harms
    - Assessment: What are the potential risks and harms caused by the system. What is the likelihood and impact of each risk and harm?
    - Mitigation: What steps have been taken to mitigate the identified risks and harms?

AIAs should also consider and include:

- Context and use case specific information tailored to meet the needs of each agency.
- Information that helps determine if a model is fit for purpose.
- Information about what non-AI solutions were explored, the relevant risks and benefits for that solution and why was an AI system ultimately chosen.
- Descriptions of why certain performance and evaluation metrics were selected.
- Reports should be readable by employees and data scientists at each agency.
- AIAs should include documentation on plans to proactively identify and address new risk scenarios.

Model Cards, Dataset Cards, & Conformity Assessments

Liability is distributed throughout the AI value chain; as such, creating and providing transparency documentation is the responsibility of both providers and downstream developers of AI. Credo AI agrees that Federal Agencies should take steps to ensure the transparency and adequate performance of their procured AI by obtaining documentation from vendors, such as through the use of AIAs, model cards, dataset cards, and system cards. Examples (or explicit references to templates) from OMB on the elements that should be included in these AI model cards, dataset cards, and system cards would further enhance the usefulness, viability, and interoperability of these transparency mechanisms.

Model Cards should document basic technical information about a ML model that is relevant regardless of where and how the model is going to be deployed. Model Cards can be created by model builders before a final end application for the model has been identified. Model Cards are designed to give stakeholders visibility into how a model works and what it does, along with potential technical limitations and risks.

Dataset Cards are designed to provide some basic information about what a dataset is and contains, its source, and its potential limitations for use in training (or testing) a ML system. Dataset Cards provide critical supplementary transparency about the factors that influenced a model's development and facilitate third-party auditing and reproducibility.

Conformity assessments enable buyers, sellers, consumers, and regulators to have confidence that products sourced meet specified standards. Conformity assessments ensure that products, services, systems, persons, or entities meet certain required characteristics, and that these characteristics are consistent from product to product, service to service, system to system, etc.

We believe that the practices outlined above will result in positive downstream effects that encourage the adoption of Responsible AI practices in industry and commercial sectors, similar to how government procurement standards have led to the widespread adoption of data encryption and energy efficient building standards.

Evaluation and Public Transparency (Q8)

We support the Executive Order's inclusion and emphasis on the need to develop standards for testing and evaluation of AI models, building on NIST's previous AI Risk Management Framework (RMF). Such standards will create interoperable benchmarks for third-parties to better evaluate and audit AI capabilities.

Independent audits that allow a third-party to replicate the foundation model provider's findings, providing a layer of external scrutiny and accountability, should be mandated. It is possible for foundation model providers to provide the requisite content for a third-party assessor or auditor to test the foundation model's bias, self-awareness, and other dimensions without releasing actual model code or training data (IP and proprietary information).

To ensure effective transparency, agencies should include in their annual use case inventories information about why a vendor was selected, the procured AI model's intended use case(s), and the steps taken to govern procured AI pre- and post-deployment such as use case risks, governance controls, and compliance protocols. Governance and compliance protocols include risk assessment and mitigation steps taken by the corresponding agency and, where appropriate, the outcomes from third-party audits.

Conclusion

We must foster an environment where transparency is not an afterthought, but a foundational aspect of AI development. The USG demanding transparency from procured AI and leading by example will not only engender trust, but also catalyze innovation in a manner that is responsible, equitable, and aligned with our collective values.

Credo AI appreciates this opportunity to comment on these issues and OMB's efforts to advance governance and risk management for agency use of AI. We welcome any further opportunity to provide resources or information to assist in this important effort. If you have any follow-up questions regarding these comments and recommendations, please contact Credo AI's Director of Global Policy, Evi Fuelle (evi@credo.ai).

Sincerely,

Navrina Singh

AFL-CIO Tech Institute Comment OMB AI Guidance

Clare Martorana
U.S. Federal Chief Information Officer
Office of Management and Budget
725 17th St. NW
Washington, DC 20503

Re: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (Docket ID: OMB-2023-0020)

December 5, 2023

Dear Chief Information Officer Martorana,

The AFL-CIO Technology Institute welcomes the opportunity to provide comments on the Office of Management and Budget's (OMB) draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* available at 88 Fed. Reg 75625.[1] The AFL-CIO Technology Institute (TI) is an independent, non-partisan organization affiliated with the AFL-CIO–a voluntary, democratic federation of 60 unions representing 12.5 million workers in all regions and sectors of the economy and public service, including the federal government. The AFL-CIO Technology Institute seeks to provide workers a voice in the technological changes sweeping the workplace and society, including artificial intelligence, and ensure that technology augments, empowers, and benefits workers.

TI commends the OMB for proposing a robust regulatory framework for the federal government's use of artificial intelligence (AI). The presumptions of safety-impacting and rights-impacting purposes and required minimum risk-management practices provide a strong foundation for addressing the significant threats AI poses to workers on the job and as citizens. In the comments below, TI offers recommendations for ways the OMB can build upon this foundation to better center workers in its guidance. Our comments focus on four areas: 1) Ensuring AI improves the quality of federal jobs and empowers federal workers to deliver high quality public services, 2) Incorporating worker voice into agency AI governance, 3)

[1] Office of Management and Budget, "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum," *Executive Office of the President*, U.S. Federal Government (November 3, 2023).

Strengthening AI risk management practices to include worker-centered R&D, and 4) Including worker protections within AI procurement policy

The OMB must ensure that AI improves the quality of federal jobs and empowers federal workers to deliver high quality public services (Q3 & Q4)

President Biden's Executive Order 14110 on the Safe, Secure and Trustworthy Development and Use of Artificial Intelligence directs the Executive Branch to adhere to the principle that "the responsible development and use of AI requires a commitment to supporting American workers."[2] This principle, as elaborated in the EO, includes ensuring workers have a seat at the table through collective bargaining and taking steps to prevent AI from worsening job quality, encouraging undue worker surveillance, introducing new health and safety risks or causing harmful labor-force disruptions.[3] The OMB may further adhere to this principle by: 1) aligning its guidance with the Executive Order on Worker Organizing and Empowerment and the Executive Order on Protecting the Federal Workforce; 2) encouraging good faith collective bargaining with federal unions; and 3) investing in training incumbent workers.

Align OMB guidance with the Executive Order 14025 on Worker Organizing and Empowerment and the Executive Order 14003 on Protecting the Federal Workforce

The OMB's guidance will shape the most significant change to federal jobs and federal work in a generation. This momentous change must not be permitted to intensify workloads, justify understaffing, ratchet up worker surveillance and algorithmic management, overrule professional judgment, deskill or displace federal workers altogether. The deterioration of federal job quality threatens to harm not just federal workers alone. The public receives higher quality public services from federal workers empowered with the skills, tools, time, and autonomy to be flexible and creative in how they serve the public.

To protect federal job quality and empower federal workers to deliver quality public services, OMB guidance must fully incorporate the Biden Administration's extant job quality directives, namely, Executive Order 14025 on *Worker Organizing and Empowerment*[4] and Executive Order 14003 on *Protecting the Federal Workforce*.[5] The Executive Order on *Worker Organizing and Empowerment* seeks to establish the federal government as a model employer and encourage worker organizing and collective bargaining–including by federal workers–as official policy of the Biden-Harris Administration. According to the report of the White House Task Force on Worker Organizing and Empowerment chaired by Vice President Harris:

---

[2] *Memo*, pg 75191.
[3] *Ibid.*
[4] Executive Order 14025 on Worker Organizing and Empowerment, Executive Office of the President, U.S. Federal Government (April 26, 2021).
[5] Executive Order 14003 on Protecting the Federal Workforce, Executive Office of the President, U.S. Federal Government (January 22, 2021).

> "The federal government should be a model employer that facilitates its own employees joining or organizing a union, if that is what employees choose to do. Also, when federal employees organize a union, they should have an effective voice in workplace issues through their union and federal management should work closely with these unions to solve workplace issues in a manner that advances agencies' missions and produces high-performance workplaces."[6]

The Executive Order on *Protecting the Federal Workforce* reiterates that the policy of the Biden Administration explicitly encourages empowering federal workers, federal worker organizing and collective bargaining with federal unions:

> "It is the policy of the United States to protect, empower, and rebuild the career Federal workforce. It is also the policy of the United States to encourage union organizing and collective bargaining. The Federal Government should serve as a model employer."[7]

The OMB guidance must emphasize the Biden Administration's commitments to federal job quality and worker empowerment and require agencies to implement AI in ways that reflect that commitment. First and foremost, AI strategic plans and implementation actions must comport with existing collective bargaining agreements. When creating new federal AI or AI-related jobs, agencies should utilize the Departments of Labor and Commerce's *Good Jobs Principles*.[8] AI and AI-related jobs should be full-time jobs within existing bargaining units or easily accretable into existing bargaining units, as opposed to overreliance on non-union hiring pathways such as excepted service, national service, and fellowships. As AI reshapes existing federal jobs, agencies must create processes in collaboration with federal unions that allow incumbent workers to move into higher pay grades as AI and upskilling shifts the task mix of jobs towards higher complexity tasks. Lastly, unions can play a formal role in investigating and reporting non-compliance with OMB and agency AI policies.

Encourage good faith collective bargaining with federal unions over the adoption of workplace AI systems and their impact on federal jobs and workers.

Given the potential of AI to transform jobs and working conditions, the OMB should encourage agencies to regard AI technologies as a mandatory subject of bargaining and submit to federal mediation at impasse. The duty to bargain must be broadly drawn, encompassing not just the impact of AI technology on workers but the selection of specific technologies, allowable uses of the technology and its data, training, implementation timelines and accommodations, ongoing

---

[6] White House Task Force on Worker Organizing and Empowerment, *Report to the President*, U.S. Federal Government (February 2022), pg 17.
[7] *Executive Order 14003*
[8] U.S. Departments of Labor and Commerce, *Good Jobs Principles*, U.S. Federal Government (June 21, 2022).

consultation during and after deployment, and other issues as they arise. Federal agencies must notify the union prior to making the decision to implement a specific AI technology and disclose relevant information about the AI technology to the union for bargaining purposes, including the results of predeployment impact assessment, testing, and independent evaluation, as well as the data it collects on workers, who owns worker data, and how agencies and vendors use worker data.

Collective bargaining helps to address the socio-technical challenges arising from AI technologies. Integrating AI into the workplace can be a fraught process that creates costly disruptions and worker and customer dissatisfaction. Researchers have documented how the introduction of new technologies reconfigures work roles and expectations, shifting employee norms, interpersonal relationships and teamwork, procedural routines and skill sets.[9] Integrating new AI technologies into the workplace requires a concerted effort that often goes unrecognized and uncompensated, requiring additional workload that may be unfairly and unevenly distributed among employees.[10] Women and people of color often bear the brunt of integrating technology as more vulnerable workers enjoy less of a say over their jobs and how the burdens of change are distributed across a workplace. Negotiations help to surface legitimate concerns, foster agreement on timelines, and provide needed worker supports (e.g. communication, training, technical assistance, learning time, and workload adjustments), which helps smooth the process of integration and leads to more equitable outcomes.

Invest in training incumbent federal workers

Federal policy for safe, secure, and trustworthy AI use must include complementary policies to support high road workforce development and career paths that empower federal workers, raise standards, and promote equity. OMB should encourage federal agencies to invest in training and upskilling incumbent workers to avoid displacement and to create opportunities for workers to grow in their public service careers. Labor-management partnerships are the preferred training provider. Labor-management partnerships deliver worker-centered training at the times, places, languages, and formats workers need and with a focus on developing the skills workers need to advance in their career. By centering the needs and concerns of workers, labor-management partnerships advance equity by making training accessible to historically marginalized workers. Where labor-management partnerships are infeasible, federal unions should be consulted on training programs. Training should also foster compliance with law, regulation, and administration policy by covering employee rights, risk management practices, and the role of unions in addressing worker concerns with respect to AI technologies.

[9] Mateescu, A., and Elish, M. C. "AI in Context: The Labor of Integrating New Technologies." *Data & Society* (2019).
[10] *Ibid.*

Worker voice must be fully incorporated into agency AI governance (Q1 & Q2)

Agency AI governance boards must include seats for federal unions. Sitting alongside senior agency officials responsible for AI adoption and risk management, union representatives can speak to the experience and concerns of frontline workers with respect to AI technologies and the effects those technologies are having on workflow and workers. In addition, union representatives can speak to inequities experienced by women workers and workers of color. As a result, agency leadership will make better decisions about AI performance and implementation. To be effective, however, union representatives must be fully empowered members of the AI governance boards, and not mere observers or non-voting members.

The qualifications of the Chief AI Officers (CAIO) must include an understanding of socio-technical considerations and a demonstrated commitment to collaboration with unions around technological change. The OMB proposal requires the CAIO to possess the requisite skills, knowledge, training and expertise to coordinate their agency's use of AI, promote AI innovation, and manage risks from the use of AI. Technical qualifications and expertise are not enough, however, to ensure AI innovation and adoption meets the goals of the Executive Order without harming workers or perpetuating racial, gender, and other forms of bias and discrimination. Unions representing agency workers should be consulted about CAIO candidates and qualifications.

When developing Compliance Plans and AI Strategies, and on an ongoing basis, CAIOs should meaningfully consult with unions representing agency workers. These plans and strategies may have implications for collective bargaining agreements and workers rights that must be properly addressed. In addition, consultation and collaboration with unions will help CAIOs execute on their duty to advance workforce development measures, policy, and other resources for AI innovation.

Strengthen the OMB memo's risk management provisions and require worker-centered R&D as a minimum practice (Q5 & Q6)

TI supports the OMB's comprehensive but non-exclusive list of presumptively safety- and rights-impacting purposes and required risk-management practices. Agency definitions of the purposes served by a specific AI technology, however, must be broadly drawn and subject to oversight to prevent the evasion of risk management requirements through misclassification. Workers also expect to experience new infringements upon their safety, dignity, and rights as AI technologies develop new capacities and use cases; unions should be consulted when agencies update their specific lists of presumptively risky AI.

TI strongly encourages the OMB to include an additional minimum practice that requires agencies to bring unions and vendors together to undertake worker-centered R&D before and during implementation of presumptively risky technologies. Worker-centered R&D brings union

members and developers together to co-create worker-augmenting and empowering AI systems based on real workplace use cases. Through daily experience, frontline workers possess intimate knowledge and informed opinions about the complexities of the work itself, which work tasks and processes need to be rethought, which problems should be prioritized, and what tradeoffs workplace technologies make between quality, safety, equity, efficiency, and other goals. Worker-centered R&D can reduce the likelihood of unintuitive design choices that limit the perceived and actual usability and usefulness of AI technologies, while reducing the risk of harms to worker physical and mental health, safety, civil rights, privacy, performance, and productivity. Moreover, it helps management avoid poorly conceived technologies that fail to deliver the promised productivity gains.[11]

Federal AI procurement policy must incorporate strong standards into contracts with AI vendors that include protections for workers and the public (Q6 & Q7)

Federal procurement policy directly influences hundreds of billions of dollars worth of economic activity and shapes state and local government procurement as well. As a uniquely important tool for protecting workers and the public, TI encourages the OMB to lay out procurement provisions, including specific language around required terms and conditions in vendor contracts. Unions should have a chance to weigh in on those procurement provisions to ensure that what federal workers say they need to do their jobs right is being heard by procurement personnel, vendors, labor relations personnel, and agency leadership.

Procurement should require genuine worker-centered R&D in which vendors collaborate with unions to help design and develop AI technologies for use by the federal government. This collaboration must be meaningful in that vendors substantively respond to worker feedback. This requirement not only helps address potential safety and rights impacts, but also leads to better technologies. Although vendors conduct user testing on their products, union members will provide independent feedback from the perspective of frontline workers who are experts in the tasks that make up their jobs.

The OMB must also take steps to ensure the responsible use of intellectual property to train AI systems, including adequate transparency and auditability of training data, and adequate knowledge of and a commitment to abide by any collectively bargained terms impacting the use of intellectual property in their systems input and output, including voice and likeness data.

Additional provisions in AI vendor contracts are required to safeguard the public interest. The OMB should require joint data access and control to allow federal IT professionals to review and edit data. This helps avoid vendor overcharging for small modifications and also helps to facilitate internal auditing and monitoring of system efficacy. Vendors should be required to make adjustments at minimal expense when problems are found as part of standard

[11] Acemoglu, D. and Restrepo, P. Automation and New Tasks: How Technology Displaces and Reinstates Labor. *Journal of Economic Perspectives* (2019) 33:3-30

procurement contracts. AI contracts should also be relatively short term due to the fact thatAI technology is developing rapidly and the federal government should not lock itself into AI technologies now. AI vendor contracts should be subject to FOIA to ensure public accountability. And the Federal government should prohibit vendors from moving data collected by AI systems out of the country for storage or processing. There are data security concerns, especially when the data is from the federal government and concerns the American citizens. Lastly, procurement contracts should place the burden on AI vendors to demonstrate that their AI system is safe, nondiscriminatory, and effective prior to the sale and use of such systems to the federal government.

And as part of the Biden Administration's commitment to worker empowerment, the OMB should also address labor standards in the AI supply chain. It has been widely documented that AI models require an enormous amount of human labor to clean, label, and annotate the training data. Many of these jobs are poorly paid, precarious, and expose workers to harmful content.[12] The OMB memo should require AI vendors to comply with labor standards and allow their workers a free and fair choice of a union in which the vendor stays neutral.

We look forward to working with the OMB to ensure that AI in the federal government serves the best interests of the American people and its public servants.

Sincerely,

Amanda Ballantyne

(NOTE: Comments are submitted in his capacity as a private citizen, and not as a representative of past or current employers or clients.)

Submitter Bio

Bill Curtis-Davidson is an accessible product design and technology leader with over twenty years of experience championing inclusive emerging technologies, including artificial intelligence (AI) and extended reality (XR). Mr. Curtis-Davidson is a member of the Partnership on AI (PAI) Global Task Force for Inclusive AI, a ForHumanity Fellow, and a ForHumanity Certified Auditor (FHCA) in Disability Inclusion & Accessibility. He has significant experience developing accessibility standards as well as consulting with public and private sector organizations to help them implement sustainable inclusive design and accessible technology programs. Through this work, Mr. Curtis-Davidson has been recognized with a Service to the Citizen Champions of Change Award, earned a U.S. patent for Automated Wayfinding of an Accessible Route, and contributed to the development of accessible airport kiosks, among other notable highlights. He also serves on the External Advisory Board of the Georgia Tech Human-Computer Interaction (HCI) Degree Program and is a mentor for LGBT Tech.

Question 2: Convening Agency AI Governance Bodies

What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body?

- **Concerning section 3(a)(ii) and 3(c)(ii), Convening Agency Governance Bodies:** Consider how Agency AI Governance Bodies and Coordination should involve agencies' existing DEIA (diversity, equity, inclusion, and accessibility) and Section 508 (information and community technologies accessibility) programs. This is important because such programs serve as knowledge networks and play a role in helping ensure that agencies meaningfully integrate DEIA into programs/services and that technologies are accessible and usable for all employees as well as external users.
- **Concerning section 3(a)(ii) and 3(c)(ii), Convening Agency Governance Bodies:** Consider *internal agency* coordination as well as *interagency* coordination. Coordination on topics related to DEIA could benefit from interagency coordination, to help agencies share implementation practices and lessons learned, and help to fill in gaps when human and program resources vary between agencies. Such interagency coordination may require new interagency bodies or could leverage programs or working groups in the existing CIO Council Accessibility Community of Practice (CIO.gov) and the Chief Diversity Officers Executive Council (OPM). As well, coordination with the U.S. Access Board and General Services Administration (GSA) Office of Technology Policy might help with interagency accessibility program management, resources, and infrastructure.

Question 3: Advancing Responsible AI Innovation

- **Concerning section 4(b)(iv) Workforce (consistent with EO 14110 Sections 5.1 & 10.2):** Agencies should take full advantage of available special hiring and retention authorities to fill gaps in AI talent, encouraging applications from individuals with diverse perspectives and experiences. This should explicitly include employment, assignment, and professional development of qualified jobseekers and employees with disabilities in both technical and non-technical roles.

(NOTE: Comments are submitted in his capacity as a private citizen, and not as a representative of past or current employers or clients.)

Question 6: Minimum Practices for Rights-Impacting AI

Concerning section 5(c) Minimum Practices for Safety-Impacting/Rights-Impacting AI: The minimum practices baseline should consider the following aspects related to DEIA:

- OMB guidance should require that risk assessments be performed by human teams that are diverse (including people with disabilities) and who represent multiple internal and external parties.
- Risk Assessment should consider AI Fairness – including for people with disabilities – across the life cycle of AI design, development, and deployment in federal agencies. Resources such as the AI Fairness Checklist Research Project[i] might offer practical, peer-reviewed practices that are co-developed with AI practitioners.
- The OMB guidance should incorporate learnings from the NIST CCOE Project "Mitigation of AI/ML Bias in Context", and establish socio-technical approaches to testing, evaluation, verification, and validation (TEVV) of AI systems in context. This includes testing for bias against protected classes (including people with disabilities) in pre-process dataset analyses, in-process model training analyses, post-process model inference analyses, and human-in-the-loop decision flows. This project will help operationalize how to address challenges documented in NIST SP-1270, Towards a Standard for Identifying & Managing Bias in Artificial Intelligence (March 2022).
- The OMB guidance should ensure that risk assessments, risk mitigations, and risk management consider impacts for people in different protected classes (including people with disabilities) – including developing protected class impact assessments, documenting/disclosing residual risks (i.e., unmitigated risks), implementing feedback loops and adverse incident reporting systems, and deploying post-market and continuous monitoring.

Question 7: Materials or Resources to Help Agencies Incorporate OMB Requirements into Relevant Contracts

- **Concerning section 5(d):** Agencies might benefit from having procurement guidance that helps ensure responsible federal procurement of AI considers the safety and rights of people in different protected classes including people with disabilities. This could involve connecting with existing federal procurement-type requirements such as those put in place through Section 508 (ICT Accessibility), or connecting with agencies' DEIA programs to consider benefits or risks to their DEIA efforts internally or externally.
- **Concerning section 5(d):** OMB should consider requiring third-party, independent evaluation of compliance with all OMB and agency requirements before acquisition.
- **Concerning section 5(d):** OMB should consider requiring agencies to document (with input from suppliers) any existing impact, fairness, or bias assessments before acquisition.

Date: December 5, 2023

To: Director Shalanda D. Young, U.S. Office of Management and Budget

Subject: Comment on OMB Draft Memorandum "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"

The Beeck Center for Social Impact + Innovation at Georgetown University invites the Office of Management and Budget (OMB) to consider the following recommendations to improve the guidance for federal agencies' governance of artificial intelligence (AI) with a focus on improving the digital delivery of government programs. These recommendations are in response to the **Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum**, hereinafter the "Draft Memorandum."

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

With regard to the designation of a chief AI officer (CAIO) role in every agency, we recommend that agencies consider the role of a CAIO in the context of existing agency executive roles that are responsible for related issue areas such as IT/chief technology officers (CTOs), chief information officers (CIOs), cybersecurity/chief information security officers (CISOs), or data/chief data officers (CDOs). Agencies should identify potential overlap with the new CAIO role alongside existing roles and responsibilities of agency executives, with a goal of streamlining and aligning the oversight of coordination, innovation, and risk management efforts regarding their agency's use of AI. Agencies should also ensure that all executive roles involved in determining agency AI governance have sufficient resources and capacity. Specific recommendations are as follows:

Recommendation. OMB should clarify the overlapping responsibilities and points of coordination between appointed CAIOs and existing executives overseeing IT, data, or cybersecurity. This should include providing clear guidance regarding how each of these roles might merge AI-related responsibilities with those designated by other relevant federal guidance.[1] The Draft Memorandum provides appropriate guidance regarding the position and reporting structure of this role, especially that the CAIO must be positioned "highly enough to engage regularly with other agency leadership." Certain measures can be more clearly articulated with regard to suggested points of collaboration between CAIOs and other officers, including but not limited to the following:

a. With regard to coordinating agency use of AI:
    i. CAIOs should coordinate with CDOs to support and coordinate agency involvement in AI standards-setting bodies and oversee the adoption of voluntary consensus industry standards for AI.
    ii. The Draft Memorandum appropriately names the CAIO's imperative to coordinate with the chief financial officer and chief human capital officer as officers within agencies to improve resourcing requirements and workforce skill sets for the acquisition of AI-capable talent.
b. With regard to promoting AI innovation:
    i. Agency CIOs oversee enterprise infrastructure governance and use and should be proactively involved in any changes to IT infrastructure that enable AI's use within agencies. OMB should provide clearer guidance regarding the delineation of roles between CAIOs and CIOs to "identify and remove barriers to the responsible use of AI including through the advancement of AI-enabling enterprise infrastructure."
c. With regard to managing risks from the use of AI:
    i. The CAIO should coordinate with chief procurement officers or equivalent roles to carry out mandated goals to "identify and manage risks from the use of AI" and "to establish and update processes to measure, monitor, and evaluate ongoing performance of AI applications and whether they are achieving intended objectives" in the purchase and management of AI technologies or tools. These functions are integral to procurement processes, and any new efforts to improve agency-wide risk management with regard to AI—or to measure performance—should be integrated with procurement protocols

[1] For example, the Foundations for Evidence-Based Policymaking Act of 2018. https://www.congress.gov/115/plaws/publ435/PLAW-115publ435.pdf.

to ensure that vendors are beholden to agency-wide practices to support responsible AI innovation.

ii. The CAIO should coordinate with the CDO to conduct risk assessments of agency AI applications, including by incorporating risk-assessment processes into any existing data-governance processes that require assessing privacy risk, bias, or any other relevant data-governance functions.

iii. The Draft Memorandum appropriately identifies that the CAIO should be responsible for overseeing agency-specific lists of purposes for uses of AI that impact safety or rights.

iv. OMB should review the CAIO role in 18 months to assess role functions, effectiveness, and staffing.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

We support OMB's mandate for AI Governance Bodies to meet no less than quarterly, and to be chaired by deputy secretaries and vice-chaired by CAIOs. Existing governance bodies like Data Governance Boards are not equipped to meet the standards laid out by the Draft Memorandum. According to OMB memo M-19-23 on the Evidence-Based Policymaking Act of 2018, Data Governance Bodies are required to be chaired by CDOs, which may not provide a sufficient level of agency executive oversight. Given these discrepancies, we recommend:

Recommendation. Build AI governance intentionally and strategically from the existing data-governance infrastructure and align with data privacy, risk assessment, open data, and other data-management practices that form the foundation of responsible AI innovation in government. There are a number of steps that OMB could take to ensure that the respective agency governance structures are working in coordination to embed shared AI governance responsibilities across the relevant bodies. OMB should align or clarify guidance to ensure that agencies are able to easily retrofit Data Governance Bodies or other similar governance structures to take on AI-governance responsibilities without significantly overhauling existing data-governance functions.

For example, OMB could provide guidance for agencies to align Data Governance Board meeting cadences and chairperson requirements to comply with required governance of AI, agencies could take clearer steps to integrate AI and data governance processes, including potentially combining CAIO and CDO governance boards completely or in areas of direct overlap, and/or include CAIOs as central stakeholders in data governance decision-making. This approach empowers both CDOs and CAIOs—including individuals potentially occupying both roles—to integrate AI governance into existing data-governance infrastructure and align it with current or updated data privacy, risk assessment, open data, and other data-management practices.

3. How can OMB best advance responsible AI innovation?

Responsible AI innovation involves the incorporation of new AI technologies into frameworks for data and technology governance that already serve to prioritize important facets of responsible AI—such as consent to use personal data, ability to opt out of data use, notification of misuse of data or cybersecurity risks, or transparency and accountability around data and technology use. Given the breadth of data and technology governance areas influenced by the use of AI, OMB should take a broader approach to collecting inventories of AI use cases. OMB should also provide clearer guidance for CAIOs and AI Governance Bodies on how to maintain pertinent data-governance and privacy work or policies as they work to remove barriers to the beneficial use of AI.

Recommendation. OMB needs stronger measures to ensure agencies actually disclose AI uses in their inventories. The public needs a clear understanding of which public-data agencies are using AI and in what manner it is being used. However, agencies are failing to disclose use cases in their current data inventories.[2] OMB should:

a. Formalize the requirement of a single List of Record for the use case inventory that consolidates all agencies' submissions. That format should meet formatting requirements—such as publishing in a machine-readable format—and be regularly updated. The inventory must require disclosure of whether something is deemed

[2]A recent Stanford paper evaluating AI use case inventories found that nearly half of agencies failed to publicly issue AI use case inventories; those that did comply showed inconsistencies and gaps in coverage. Christie Lawrence, Isaac Cui & Daniel Ho, *The Bureaucratic Challenge to AI Governance: An Empirical Assessment of Implementation at U.S. Federal Agencies*, *in* Proceedings of the 2023 AAAI/ACM Conference on AI, Ethics, and Society (2023), https://dl.acm.org/doi/10.1145/3600211.3604701 (last visited Nov 1, 2023); CDT has found similar trends. Bowman Cooper, *Like Looking for a Needle in an AI-Stack*, Center for Democracy and Technology (Jul. 21, 2023), https://cdt.org/insights/like-looking-for-a-needle-in-an-ai-stack/ (last visited Nov 1, 2023)

safety-or-rights impacting, and provide a brief explanation of why the agency determined an AI use case is not safety-or-right impacting.

b. Include all AI uses covered by the memo in this List of Record. The Draft Memorandum now requires that the Department of Defense (DOD) report on particular AI uses that were previously exempt under the Advancing American AI Act. The information DOD reports should be included in the List of Record so that the public can have one clear, central repository.
c. Clarify to agencies that AI-use disclosure is mandatory. OMB gives too much leeway to agencies by allowing them to report uses "to the extent practicable and consistent with applicable law and government-wide guidance." To guide agencies, OMB should interpret this language, which comes from the Advancing American AI Act, as a presumptive obligation to disclose.
d. Develop guidance to ensure agency personnel know how to classify use cases. Agency officials are often unable to recognize when their systems are AI uses.
e. Establish data-quality procedures and guidance for inventorying. As the Center for Democracy and Technology has found, "some use case summaries are so vague as to render them meaningless." The problem is, like agencies complying with the Digital Accountability and Transparency Act (DATA) of 2014, agency Offices of Inspector General have found error rates and low quality submissions of spending records. GAO's recommendations for compliance with the DATA Act are useful here too. OMB should:
    i. Provide example language and more structured questions to agencies,
    ii. Develop automated checks and controls in the submissions process, and
    iii. Work with stakeholders to correct erroneous submissions.
f. Within the inventory, include documentation of an AI impact assessment, or otherwise document the department that conducted the assessment or agency official that signed off on it.
g. Support compliance by reinforcing that AI Use Inventories support agency goals—like management of data as a strategic asset and agency-wide risk management—and are not a burdensome task.

Recommendation. Provide guidance for appropriate oversight of removal of barriers to the responsible use of AI. The Draft Memorandum encourages CAIOs to remove barriers to agencies' use of AI by providing agencies with access to "high-performance computing infrastructure specialized for AI training and inference" with regard to IT infrastructure, and to "maximize appropriate access to

internal data and share data within the agency." However, OMB should provide more specific guidance to include all enterprise IT infrastructure and large-scale data sources for AI technologies that may reasonably contribute to an agency's expansion of responsible use of AI, but that may not be considered "covered AI technologies" in the current guidance. By including foundational technology systems or tools that contribute data or technology for agency AI use, CAIOs will be empowered to provide oversight and input to help ensure that significant agency expenditures or contracts in IT procurements and data acquisitions will be in compliance with OMB guidance. We provide further recommendations on procurement in response to question seven below.

This may include:

a. Conducting risk assessments to vet potential new AI technologies before receiving approval from the AI Governance Body to put out requests for proposals for enterprise IT infrastructure that would enable advanced computing using AI technology.
b. Working with Data Governance Bodies to ensure that data sources are well-documented, high quality, and include information collected with the consent of represented individuals to be used in emerging AI experiments or new unvetted AI use cases.
a. Prioritizing updates to cybersecurity infrastructure, including giving cybersecurity officials authority to allocate funds dedicated to improving use of AI toward long-term improvements to cybersecurity protections before seeking continuous authorizations for AI technologies.
b. Ensuring that cybersecurity standards within agencies meet best practices set by the NIST AI Risk Management Framework pertaining to AI system security and resilience; for example, establishing red-teaming protocols and verifying that third party AI resources and personnel undergo security audits and screenings.
c. Including guidance for reporting requirements to be delivered to the CAIO during the procurement process for new AI technologies to track performance measures that might affect agencies' compliance with OMB guidance on responsible AI innovation, including for generative AI technologies.
d. Empowering the CAIO to stop procurement processes for AI technologies that are in non-compliance or unable to indicate future compliance with OMB guidance regarding AI.

Recommendation. Clarify how waivers to minimum practice requirements are established and potentially strengthen OMB's oversight of the waiver process.
As described in section 5 of the Draft Memorandum, all agencies that are not elements of the Intelligence Community must follow minimum practices to manage risks from AI uses determined to be safety- or rights-impacting. Section 5.c.iii introduces a waiver process by which an agency CAIO may waive one or more of the minimum requirements for a specific covered AI application or component. OMB should provide more clarity around and potentially strengthen this process. This may include:

a. Clarifying which relevant officials should be engaged in the process of establishing a waiver, and clarifying which officials and bodies have decision-making power to grant a waiver. The text of the draft guidance appears to give agency CAIOs wide latitude in making waiver determinations, without clarifying how other entities and individuals should be engaged in that process.
b. Establish clearer mechanisms for OMB to review, appeal, and potentially revoke waivers that agencies have granted for specific use cases.
c. Consider establishing time periods within which waivers to minimum practice requirements must be reviewed and reassessed.
d. When OMB issues detailed instructions to agencies to establish practices for inventorying use cases going forward, ensure that information about any granted waivers included in use case inventories provide detailed documentation about how and why a waiver was established.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Generative AI offers opportunities to increase efficiency, effectiveness, and equity of government services. But current AI offerings seldom are designed for government tasks, making the translation of private tools into public contexts sometimes difficult and complex. For example, generative AI is not always well-suited for engaging broadly with customers, especially in government contexts where trust and reliability are of the utmost importance. Generative AI is known for bringing in hallucinations, mistakes, or other communication errors that might create challenges for people who urgently need access to public benefits and services. However, generative AI, deployed for specific purposes or clearly denoted as an AI tool meant to serve a limited function, may help customers navigate government systems and support workers in the delivery of those programs.

Recommendation. Generative AI offers opportunities to improve the business operations and delivery of government programs. We believe the following examples offer use cases where generative AI, with appropriate safeguards and review, could be used to benefit agency staff and the public. We have included specific examples as they relate to the delivery of public benefits, where there is great need to improve equity and efficiency in delivery so that people receive the supports they are eligible for. These include:

1. Summarizing content
    a. Summarizing content for agency staff, including guidance and other documents
    Generative AI's capacity to quickly summarize information has previously been identified by the federal government and state government, as a potential use case. This summarizing approach could be applied to summarize statutory code, government guidance, and other documents that would otherwise require significant human hours to review and synthesize. Trust and accuracy concerns around the content generative AI can produce (for example, generative AI tools can produce "hallucinations" or inaccurate content), mean that generative AI should be used as a time and resource saving tool, with any content produced by generative AI subsequently undergoing review by humans. Use of generative AI to summarize text and guidance could facilitate training of staff, or could support agencies preparing information for public-facing materials or customer service touchpoints.
    b. Summarizing feedback from residents/end users
    Generative AI might also be usefully deployed to summarize feedback and insights from interactions with residents or end users of government services. For example, in a November 2023 report on Generative AI use cases in government, the State of California pointed to the potential for generative AI to be used to summarize meetings, work, and public outreach documentation. Again, because accuracy can be an issue, such syntheses should be reviewed by humans, but could be used to save time and resources.

2. Transforming text content
    a. Generating drafts of plain language content
    An important requirement for federal agencies is communicating with the public in language that is clear and understandable. Generative AI tools could be used to help transform existing information into plain language. While human review would still be necessary prior to publicly disseminating any text produced by a generative AI tool, transforming existing text into a plain language version could help save time for

agencies and enable government entities to provide more of an agency's content in plain language versions more quickly.

b. As translation improves, producing content in languages other than English

Generative AI tools may offer more accurate and adequate translations between languages than previously available machine translation tools, as well as offer opportunities to train models on specific dialects or population language needs. Currently, generative AI tools may perform less well for translations of underrepresented languages, and may introduce bias through their training data. In the future, if performance continues to improve, generative AI might be used to support government agencies in translating content into other languages, improving access to government information and services.

3. Policy review, format translation, and modeling
    a. Identifying and summarizing agency rules that are "outmoded or redundant" or contain inaccuracies

    As with the above examples of reviewing and summarizing content, generative AI tools could be used in retrospective reviews of rules to catch errors, redundancies, and conflicts. Generative AI is well suited to detecting patterns and differences in content for analysis, saving human hours in the original comparison between sources.

    b. Translating agency rules, guidance, and policy into computer code

    Currently, an immense amount of interpretation and duplicated effort occurs as software developers translate program policy and rules into computer code for digital systems, such as the public-facing website for a benefits application. Methods such as rules as code offer a way to standardize how rules are written in software. Generative AI could be trained on a data framework to translate the rules from their current English format to provide versions in plain language logic and computer code. It would be important for humans to review for accuracy in the translation. Using generative AI could speed this needed digital transformation, allow for easier implementation of updates and changes, create more public and government transparency on how rules operate within digital systems, increase efficiency by eliminating duplicative efforts among disparate levels of government and delivery organizations, and reduce the burden for public employees who are changed with administering and delivering benefits. Additionally, with rules now in code, there could be new pathways for policymakers, legislators, administrators, and the public to model and measure impacts of policy changes. For example, a generative AI tool could help model different scenarios for a rule change, and utilize de-identified

and/or create synthetic data to measure impact on a specific population or geography.

4. Accelerating the use of human-centered design systems and software development
    a. Generative AI can be a powerful design and software development assistant, allowing for rapid prototyping of websites, forms, and other materials using design standards, such as the U.S. Web Design System, to follow human-centered design patterns and utilize accessibility standards. Generative AI can allow designers and software developers to generate a multitude of options, and also quickly iterate on those options. It is important that the prototypes are evaluated with their end users to ensure they meet their needs. Additionally, generative AI may be well suited for helping governments migrate legacy system code and translate it into modern code languages.

5. Cybersecurity
    a. Generative AI can be used to identify patterns that may be suspected cybersecurity attacks or vulnerabilities. Rather than burdening end users, government agencies should use generative AI in cybersecurity approaches to detect and analyze patterns that may be suspicious activity and propose remedies.

Recommendation. Require cross-agency collaboration in developing guidance for the use of generative AI in public benefits. We recommend that OMB require the U.S. Department of Health and Human Services, the U.S. Department of Agriculture, and the U.S. Department of Labor to coordinate their guidance for programs such as Supplemental Nutrition Assistance Program (SNAP), Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), Temporary Assistance for Needy Families (TANF), Medicaid, Children's Health Insurance Program (CHIP), and Unemployment Insurance (UI). Benefits administering agencies should not have different guidance for the use of generative AI in public benefits delivery—both for the benefit of the public and for the state, local, tribal, and territorial governments that deliver these programs. A beneficiary of one program may likely be the beneficiary of another program, and should have a seamless, transparent experience across all programs. Increasingly, people seeking and receiving benefits are using digital systems that integrate programs that have separate federal funding streams, policies, and agencies (such as SNAP and Medicaid) into single applications, accounts, and service points. As such, when federal agencies do not coordinate guidance, state, local, tribal, and territorial governments are required to interpret what is allowed and negotiate between and across agencies.

Recommendation. Provide guidance for how other automated, but non-generative technologies, such as robotic process automation, can work separately and in conjunction with generative AI to improve business operations.
The Draft Memorandum explicitly excludes "robotic process automation or other systems whose behavior is defined only by human-defined rules or that learn solely by repeating an observed practice exactly as it was conducted." Federal agencies and state agencies are using approaches like robotic process automation, optical character recognition (OCR), and other types of automation in their operations and delivery of services. While we do not think these uses should be grouped with artificial intelligence use cases, we do recommend that the OMB direct agencies to provide coordinated guidance on uses of robotic process automation and other technologies to safely and equitably improve business operations.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Contracting for emerging technologies requires clearly communicated standards—both internal and external—to ensure that both vendors and procuring agencies are able to make informed decisions about the potential risks and opportunities of new tools on the market. Without specific attention to incorporating OMB guidance on AI into federal agencies' existing procurement practices, agencies are at risk of taking fragmented approaches to procuring not only AI but also data services, enterprise IT, and privacy-preserving technologies that could serve to destabilize responsible procurement of data and technology writ large.

Recommendation. Develop and publish an "oversight guide" for reviewing agency acquisition activities. Building on the GAO's "Accountability Framework for Federal Agencies and Other Entities," OMB should develop an "oversight guide" with specific references to parts of the acquisition planning process where agencies should already be considering responsible AI principles. An oversight guide could be used by Congress, federal agency executives, inspectors general, civil society, and the public to better understand what types of questions to ask of federal government employees and federal contractors. Because structured oversight processes can help drive agencies toward better outcomes, having a shared understanding of what "good" looks like from an oversight perspective would be useful.[3]

[3] How to Not Buy Magic: Updating Procurement Policies to Support the Federal Government's Responsible Use of AI, Center for Democracy & Technology (Forthcoming).

Recommendation. Define "adequate performance" including by providing suggested documentation that vendors must submit to support performance measurement and evaluation for AI contracts. Suggested documentation for vendor reporting to meet requirements for adequate performance may include reporting on third-party data sources used in AI tool testing, development, or deployment, and documents that govern responsible data management practices to ensure that data sources are ethical and well-managed. "Adequate performance" should also include considerations for the following:

a. With regard to promoting competition:
    i. Incentivizing practices that protect data rights in third party source data, like collecting individual consent to access, use, or sell personal data; ability of individuals represented in third party data sources to opt out; cybersecurity protocols to ensure that data is safe and secure; collective or cooperative governance structures that allow for individuals to be represented in decision-making over access to personal data.
    ii. Incorporating contract evaluation measures specific to AI that ensure responsible data governance, which could include innovating around public trustmarks or other certifications for AI vendors that use responsible data practices that increase the pool of competitive vendors who ensure that data rights are protected.
b. With regard to maximizing the value of data for AI:
    i. Ensuring that procuring agencies not only have "sufficient rights to data and any improvements to that data so as to avoid vendor lock-in and facilitate governments continued design, development, testing, and operation of AI," but also have specific guidance from OMB to require mandatory reporting of source data or control over access to source data to ensure responsible data governance practices during the contract's implementation.

Thank you for your time and consideration of these recommendations.

ACT Comment re Draft OMB Memo on Advancing Governance Innovation and Risk Management for Agency Use of AI (120523) (w appendix)

December 5, 2023

Cindy Martinez
Office of Management and Budget
Office of Information and Regulatory Affairs
725 17th St NW
Washington, District of Columbia 20503

RE: Comments of ACT | The App Association to the Office of Management and Budget on its Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Ms. Martinez:

ACT | The App Association (App Association) appreciates the opportunity to submit views to the Office of Management and Budget (OMB) on its draft Memorandum that would establish new agency requirements in areas of artificial intelligence (AI) governance, innovation, and risk management, and would direct agencies to adopt specific minimum risk management practices for uses of AI that impact the rights and safety of the public.[1]

I. General Views of the App Association on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

The App Association represents thousands of small business software application development companies and technology firms that create the technologies that drive internet of things (IoT) use cases across consumer and enterprise contexts. Today, the value of the ecosystem the App Association represents—which we call the app economy—is $1.8 trillion and is responsible for 6.1 million American jobs, while serving as a key driver of the $8 trillion IoT revolution.[2] Alongside the world's rapid embrace of mobile technology, our members create the innovative solutions that power IoT across modalities and segments of the economy. OMB's strategy, in response to President Biden's Executive Order on Safe, Secure, and Trustworthy Development and Use of AI, and the efforts of numerous agencies with respect to AI policy and regulation directly impact the app economy. We support OMB's goal of ensuring federal agencies instill proper safeguards that prioritize economic and national security, privacy, civil liberties and more when utilizing AI and other advancements in technology and innovation.

[1] 88 FR 75625; OMB Draft Memorandum, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence*, https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf

[2] ACT | The App Association, State of the App Economy (2022), https://actonline.org/wpcontent/uploads/APP-Economy-Report-FINAL.pdf

AI is an evolving constellation of technologies that enable computers to simulate elements of human thinking – learning and reasoning among them. An encompassing term, AI entails a range of approaches and technologies, such as Machine Learning (ML) and deep learning, where an algorithm based on the way neurons and synapses in the brain change due to exposure to new inputs, allowing independent or assisted decision making.

AI-driven algorithmic decision tools and predictive analytics are having, and will continue to have, substantial direct and indirect effects on Americans. Some forms of AI are already in use to improve American consumers' lives today; for example, AI is used to detect financial and identity theft and to protect the communications networks upon which Americans rely against cybersecurity threats.

Moving forward, across use cases and sectors, AI has incredible potential to improve American consumers' lives through faster and better-informed decision making enabled by cutting-edge distributed cloud computing. As an example, healthcare treatments and patient outcomes stand poised to improve disease prevention and conditions, as well as efficiently and effectively treat diseases through automated analysis of X-rays and other medical imaging. AI will also play an essential role in self-driving vehicles and could drastically reduce roadway deaths and injuries. From a governance perspective, AI solutions will derive greater insights from infrastructure and support efficient budgeting decisions.

Today, Americans encounter AI in their lives incrementally through the improvements they have seen in computer-based services they use, typically in the form of streamlined processes, image analysis, and voice recognition (we urge consideration of these forms of AI as "narrow" AI). The App Association notes that this "narrow" AI already provides great societal benefit. For example, AI-driven software products and services revolutionized the ability of countless Americans with disabilities to achieve experiences in their lives far closer to the experiences of those without disabilities.

Nonetheless, AI also has the potential to raise a variety of unique considerations for policymakers. The App Association appreciates the efforts to develop a policy approach to AI that will bring its benefits to all, balanced with necessary safeguards to protect consumers. We strongly encourage that OMB's memorandum align with the App Association's comprehensive AI policy principles:

1. Harmonizing and Coordinating Approaches to AI

A wide range of federal, local, and state laws prohibit harmful conduct regardless of whether the use of AI is involved. For example, the Federal Trade Commission (FTC) Act prohibits a wide range of unfair or deceptive acts or practices, and states also have versions of these prohibitions in their statute books. The use of AI does not shield companies from these prohibitions. However, federal and state agencies alike must approach the applicability of these laws in AI contexts thoughtfully and with great sensitivity to the novel or evolving risks AI systems

present. Congress and other policymakers must first understand how existing frameworks apply to activities involving AI to avoid creating sweeping new authorities or agencies that awkwardly or inconsistently overlap with current policy frameworks.

2. Quality Assurance and Oversight

Policy frameworks should utilize risk-based approaches to ensure that the use of AI aligns with any relevant recognized standards of safety, efficacy, and equity. Small software and device companies benefit from understanding the distribution of risk and liability in building, testing, and using AI tools. Policy frameworks addressing liability should ensure the appropriate distribution and mitigation of risk and liability. Specifically, those in the value chain with the ability to minimize risks based on their knowledge and ability to mitigate should have appropriate incentives to do so. Some recommended areas of focus include:

- Ensuring AI is safe, efficacious, and equitable.
- Encouraging AI developers to consistently utilize rigorous procedures and enabling them to document their methods and results.
- Encouraging those developing, offering, or testing AI systems intended for consumer use to provide truthful and easy-to-understand representations regarding intended use and risks that would be reasonably understood by those intended, as well as expected, to use the AI solution.

3. Thoughtful Design

Policy frameworks should encourage design of AI systems that are informed by real-world workflows, human-centered design and usability principles, and end-user needs. AI systems should facilitate a transition to changes in the delivery of goods and services that benefit consumers and businesses. The design, development, and success of AI should leverage collaboration and dialogue among users, AI technology developers, and other stakeholders to have all perspectives reflected in AI solutions.

4. Access and Affordability

Policy frameworks should enable products and services that involve AI systems to be accessible and affordable. Significant resources may be required to scale systems. Policymakers should also ensure that developers can build accessibility features into their AI-driven offerings and avoid policies that limit their accessibility options.

5. Bias

The bias inherent in all data, as well as errors, will remain one of the more pressing issues with AI systems that utilize machine learning techniques in particular. Regulatory agencies should examine data provenance and bias issues

present in the development and uses of AI solutions to ensure that bias in datasets does not result in harm to users or consumers of products or services involving AI, including through unlawful discrimination.

6. Research and Transparency

Policy frameworks should support and facilitate research and development of AI by prioritizing and providing sufficient funding while also maximizing innovators' and researchers' ability to collect and process data from a wide range of sources. Research on the costs and benefits of transparency in AI should also be a priority and involve collaboration among all affected stakeholders to develop a better understanding of how and under which circumstances transparency mandates would help address risks arising from the use of AI systems.

7. Modernized Privacy and Security Frameworks

The many new AI-driven uses for data, including sensitive personal information, raise privacy questions. They also offer the potential for more powerful and granular privacy controls for consumers. Accordingly, any policy framework should address the topics of privacy, consent, and modern technological capabilities as a part of the policy development process. Policy frameworks must be scalable and assure that an individual's data is properly protected, while also allowing the flow of information and responsible evolution of AI. A balanced framework should avoid undue barriers to data processing and collection while imposing reasonable data minimization, consent, and consumer rights frameworks.

8. Ethics

The success of AI depends on ethical use. A policy framework must promote many of the existing and emerging ethical norms for broader adherence by AI technologists, innovators, computer scientists, and those who use such systems. Relevant ethical considerations include:

- Applying ethics to each phase of an AI system's life, from design to development to use.
- Maintaining consistency with international conventions on human rights.
- Prioritizing inclusivity such that AI solutions benefit consumers and are developed using data from across socioeconomic, age, gender, geographic origin, and other groupings.
- Reflect that AI tools may reveal extremely sensitive and private information about a user and ensure that laws require the protection of such information.

9. Education

Policy frameworks should support education for the advancement of AI, promote examples that demonstrate the success of AI, and encourage stakeholder engagements to keep frameworks responsive to emerging opportunities and challenges.

- Consumers should be educated as to the use of AI in the service(s) they are using.
- Academic education should include curriculum that will advance the understanding of and ability to use AI solutions.

10. Intellectual Property

The protection of intellectual property (IP) rights is critical to the evolution of AI. In developing approaches and frameworks for AI governance, policymakers should ensure that compliance measures and requirements do not undercut IP or trade secrets.

II. App Association Responses to Specific Questions Posed in the Request for Public Comment

Noting our general support for federal agencies' efforts to appropriately address AI governance, innovation, and risk management, we offer the following responses to specific questions posed in OMB's request for comments.

Question #1: The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers (CAIO) sufficiently flexible and achievable for the breadth of covered agencies?

The App Association generally supports the roles, responsibilities, seniority, position, and reporting structure proposed for CAIOs, however:

- While we appreciate the noted role of "Promoting AI Innovation," we urge that OMB include within this responsibility the imperative to consult with and consider the role and needs of the private sector, including small businesses, which will have a critical role in creating and deploying AI innovations within agencies.
- The responsibility of "Managing Risks from the Use of AI" should be updated to reflect the need to scale risk management practices according to the harm presented by the use, consistent with well-established risk management practices[3] as well as the National Institute of Standards and Technology's (NIST) foundations in its AI Risk Management Framework (AI RMF).[4]

[3] E.g., https://www.iso.org/standard/77304.html.
[4] https://www.nist.gov/itl/ai-risk-management-framework.

Question #2: What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Initially, the App Association notes that AI-related risks can and should initially be addressed under agencies' existing authorities and functions, as the functions the AI at issue is providing are the same that humans would produce, only much faster. Agencies will need flexibility to addressing whether or not they need to create a new body to address AI, aside from existing constructs used to address privacy, IT, data, or other topics. OMB's vision of AI Governance Bodies within agencies can and should facilitate coordination in risk management practices across relevant groups and take appropriate steps to address gaps or inefficiencies identified (e.g., overlapping scopes across multiple groups).

Question 3: How can OMB best advance responsible AI innovation?

The App Association strongly encourages agencies' alignment with its comprehensive AI policy principles.[5] Notably, OMB should ensure that agency approaches to risk management, whether in intra-agency policy or in regulation/guidance to those the agency regulates, are based on established risks and harms (not edge/rare use cases or hypotheticals), that measures taken to manage risks are scaled to the harms presented, and that those who know or should know about a risk and have the ability to take action to mitigate that risk have the appropriate incentives to do so. Further, agencies can do much to advance responsible AI innovation through efforts to build their internal enterprise capacity and through their procurement policies (e.g., specify thoughtful AI design requirements).

Question 4: With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

The potential benefits of generative AI are extensive and could revolutionize day-to-day business operations and effectiveness across the federal government. With appropriate safeguards in place, generative AI offers numerous benefits, including but not limited to content generation (e.g., text, speech, images, video, etc.), streamlined software engineering/coding capabilities, drastically improved and more accessible interfaces for citizen services (e.g., text-to-speech solutions), and augmented research capabilities. Generative AI offers the possibility of introducing new efficiencies at numerous levels,

[5] https://actonline.org/wp-content/uploads/Policy-Recommendations-for-AI.pdf.

from backend/administrative to supporting key assessments/decisions made by humans. Agencies are already exploring generative AI uses, with the State Department's bureaus having sought industry feedback on potentially adopting generative AI and machine learning capabilities to assist with basic contract writing.[6]

Question 5: Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

The draft Memo's definition states that the term "safety-impacting" encompasses "AI that has the potential to meaningfully impact the safety of human life or well-being, including loss of life, serious injury, bodily harm, biological or chemical harms, occupational hazards, harassment or abuse, or mental health, including both individual and community aspects of these harms."[7] The App Association believes that this definition should provide the agencies with the direction they need to address what is and is not "safety-impacting" or "civil rights-impacting" consistent with the need for agency flexibilities acknowledged elsewhere in the memorandum. A static list will be seen as inappropriately including some use cases or not including others; the nature of the development of AI means that such a list will quickly become outdated. We therefore recommend that OMB remove its list of "safety-impacting" or "civil rights-impacting" use cases from the memorandum.

Question 6: Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Yes, the minimum practices identified for safety- and rights-impacting AI are generally consistent with the App Association's recommended approach to risk management. We urge OMB, and all federal agencies, to be mindful of the negative impacts of imposing such requirements on AI use cases that may not always be high risk. Again, we urge OMB to update its memo to emphasize that federal agencies leverage a scaled and outcome-focused approach to AI risk management, which we discuss above and in our foundational AI policy principles. OMB's memo should align with the App Association's policy principles for AI, as well as approaches being taken in the NIST AI RMF and leading standards such as ISO/IEC 23894:2023.

[6] Billy Mitchell, *State Department considers generative AI for contract writing* (June 15, 2023), accessible at https://fedscoop.com/state-department-considers-generative-ai-for-contract-writing/
[7] Draft Memo p. 26

Question 7: What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

We recommend that OMB align its memorandum with the following:

- ACT | The App Association's *Policy Recommendations for AI*: https://actonline.org/wp-content/uploads/Policy-Recommendations-for-AI.pdf
- NIST's AI Risk Management Framework: https://www.nist.gov/itl/ai-risk-management-framework
- ISO/IEC 23894:2023 (Information technology, Artificial intelligence, Guidance on risk management): https://www.iso.org/standard/77304.html

Question 8: What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The App Association welcomes the memorandum's requirement that agencies provide adequately detailed and generally accessible documentation for the AI they use to provide its users and the general public of its practices, while taking measures to protect intellectual property, national security, and other important interests. The App Association welcomes the release of information that will provide easy-to-understand insights into how agencies are (1) ensuring AI is safe, efficacious, and ethical/equitable; and (2) utilizing procedures to test for efficacy, safety, and equity. For example, the public will benefit from learning about how agencies examine data provenance and bias issues present in the development and use of AI solutions to ensure that bias in datasets does not result in harm to users or consumers of products or services involving AI. The exact metrics of how these agency uses are captured will likely need to vary from agency to agency, so adequate flexibility should be provided to agencies, with outcome-based measures being employed.

III. Conclusion

The App Association appreciates OMB's consideration of the above views. We urge OMB to contact the undersigned with any questions or ways that we can assist moving forward.

Sincerely,

Brian Scarpelli
Senior Global Policy Counsel

Leanna Wade
Regulatory Policy Associate

APPENDIX A

Policy Recommendations for AI

ACT
The App Association

Artificial Intelligence (AI) is clearly a priority for policymakers, with 37 AI-related laws enacted globally, more than 80 pending legislative proposals at the state level and several more at the federal level. To understand and shape rules for this complex and evolving technology, a vital voice—that of small businesses, members of ACT| The App Association—must be prioritized in order to create a competitive, safe, and secure AI future.

We initially released these principles in 2021. However, we are updating them continually to reflect new developments in privacy and data security laws around the world and new learnings about the benefits, risks, and challenges presented by evolving AI tools in use cases from healthcare and education to software development and cybersecurity.

A successful policy approach to AI will align with the following guidelines:

1. Harmonizing and Coordinating Approaches to AI

A wide range of federal, local, and state laws prohibit harmful conduct regardless of whether the use of AI is involved. For example, the Federal Trade Commission (FTC) Act prohibits a wide range of unfair or deceptive acts or practices, and states also have versions of these prohibitions in their statute books. The use of AI does not shield companies from these prohibitions. However, federal and state agencies alike must approach the applicability of these laws in AI contexts thoughtfully and with great sensitivity to the novel or evolving risks AI systems present. Congress and other policymakers must first understand how existing frameworks apply to activities involving AI to avoid creating sweeping new authorities or agencies that awkwardly or inconsistently overlap with current policy frameworks.

2. Quality Assurance and Oversight

Policy frameworks should utilize risk-based approaches to ensure that the use of AI aligns with any relevant recognized standards of safety, efficacy, and equity. Small software and device companies benefit from understanding the distribution of risk and liability in building, testing, and using AI tools. Policy frameworks addressing liability should ensure the appropriate distribution and mitigation of risk and liability. Specifically, those in the value chain with the ability to minimize risks based on their knowledge and ability to mitigate should have appropriate incentives to do so. Some recommended areas of focus include:

- Ensuring AI is safe, efficacious, and equitable.
- Encouraging AI developers to consistently utilize rigorous procedures and enabling them to document their methods and results.
- Encouraging those developing, offering, or testing AI systems intended for consumer use to provide truthful and easy-to-understand representations regarding intended use and risks that would be reasonably understood by those intended, as well as expected, to use the AI solution.

3. Thoughtful Design

Policy frameworks should encourage design of AI systems that are informed by real-world workflows, human-centered design and usability principles, and end-user needs. AI systems should facilitate a transition to changes in the delivery of goods and services that benefit consumers and businesses. The design, development, and success of AI should leverage collaboration and dialogue among users, AI technology developers, and other stakeholders to have all perspectives reflected in AI solutions.

4. Access and Affordability

Policy frameworks should enable products and services that involve AI systems to be accessible and affordable. Significant resources may be required to scale systems. Policymakers should also ensure that developers can build accessibility features into their AI-driven offerings and avoid policies that limit their accessibility options.

5. Research and Transparency

Policy frameworks should support and facilitate research and development of AI by prioritizing and providing sufficient funding while also maximizing innovators' and researchers' ability to collect and process data from a wide range of sources. Research on the costs and benefits of transparency in AI should also be a priority and involve collaboration among all affected stakeholders to develop a better understanding of how and under which circumstances transparency mandates would help address risks arising from the use of AI systems.

6. Modernized Privacy and Security Frameworks

The many new AI-driven uses for data, including sensitive personal information, raise privacy questions. They also offer the potential for more powerful and granular privacy controls for consumers. Accordingly, any policy framework should address the topics of privacy, consent, and modern technological capabilities as a part of the policy development process. Policy frameworks must be scalable and assure that an individual's data is properly protected, while also allowing the flow of information and responsible evolution of AI. A balanced framework should avoid undue barriers to data processing and collection while imposing reasonable data minimization, consent, and consumer rights frameworks.

7. Bias

The bias inherent in all data, as well as errors, will remain one of the more pressing issues with AI systems that utilize machine learning techniques in particular. Regulatory agencies should examine data provenance and bias issues present in the development and uses of AI solutions to ensure that bias in datasets does not result in harm to users or consumers of products or services involving AI, including through unlawful discrimination.

8. Ethics

The success of AI depends on ethical use. A policy framework must promote many of the existing and emerging ethical norms for broader adherence by AI technologists, innovators, computer scientists, and those who use such systems. Relevant ethical considerations include:

- Applying ethics to each phase of an AI system's life, from design to development to use.
- Maintaining consistency with international conventions on human rights.
- Prioritizing inclusivity such that AI solutions benefit consumers and are developed using data from across socioeconomic, age, gender, geographic origin, and other groupings.
- Reflect that AI tools may reveal extremely sensitive and private information about a user and ensure that laws require the protection of such information.

9. Education

Policy frameworks should support education for the advancement of AI, promote examples that demonstrate the success of AI, and encourage stakeholder engagements to keep frameworks responsive to emerging opportunities and challenges.

- Consumers should be educated as to the use of AI in the service(s) they are using.
- Academic education should include curriculum that will advance the understanding of and ability to use AI solutions.

10. Intellectual Property

The protection of intellectual property (IP) rights is critical to the evolution of AI. In developing approaches and frameworks for AI governance, policymakers should ensure that compliance measures and requirements do not undercut IP or trade secrets.

Hugging Face Response to the Office of Management and Budget Request for Comments on Agency Use of Artificial Intelligence

Hugging Face commends the Office of Management and Business on its extensive work framing the responsible use of AI by federal agencies. The following comments are informed by our experiences as an open platform for state-of-the-art (SotA) AI systems, working to make AI accessible and broadly available to researchers for responsible development.

About Hugging Face

Hugging Face is a community-oriented company based in the U.S. and France working to democratize good Machine Learning (ML), and has become the most widely used platform for sharing and collaborating on ML systems. We are an open-source and open-science platform hosting machine learning models and datasets within an infrastructure that supports easily processing and analyzing them; conducting novel AI research; and providing educational resources, courses, and tooling to lower the barrier for all backgrounds to contribute to AI.

Summary

The draft memorandum outlines a strong framework for fostering responsible AI adoption by federal agencies. In a context of commonly inflated claims about the performance of AI systems and pervasive risks of exacerbating discrimination, we particularly appreciate the proposed requirements to not only conduct thorough impact assessments, but also to demonstrate that the adoption of AI does provide added value to the agencies.

In order to best support this mission, we recommend that the OMB and the proposed AI Governance bodies prioritize mechanisms that support the open sharing of skills, resources, and information; build internal capacity along as much of the AI development chain as possible, from pre-training data curation to model fine-tuning and deployment (including, as currently outlined in Section 4.b.iv, non-technical expertise); and develop further guidance on what constitutes a sufficient improvement to warrant AI adoption and how to choose an AI system to meet those goals.

For the purpose of sharing best practices, we note that the proposed AI Use Case inventory constitutes a particularly promising tool. We recommend that entries in the inventory include as much information as possible about the AI application and system, including data and model documentation according to established standards such as dataset sheets and model cards, the metrics used to assess whether AI adoption would have a positive impact for the agency's use case, the reasoning for determining whether the system was safety- or rights-impacting, and links to the specific versioned systems used, including any open-source or open-access components.

We also recommend that the OMB extend the scope of memorandum OMB M-16-21 on open source software to include AI systems. In particular, we believe that the testing datasets developed by agencies to meet the requirements laid out in the present draft memorandum have a significant role to play in advancing the state of the art in performance and risk evaluation of AI systems if they are shared broadly with researchers and stakeholders. By supporting agencies in sharing this data to all relevant stakeholders, including by providing guidelines for the use of synthetic data, data pseudonymization, and governance of public datasets, the OMB can accelerate the development of robust responsible AI practices that will benefit all of society.

Beyond evaluation datasets, we encourage the OMB to direct agencies to build capacity to develop and share their own full AI stacks, including by leveraging and adapting existing public, open-source, and open Machine Learning models and datasets. This approach can lead to more energy-efficient AI applications, more transparency into the regulatory compliance of the AI development chain, and better visibility into the handling of *e.g.* privacy and intellectual property rights along the development process (see for example the StarCoder open code generation LLM). To that end, and in addition to the evaluation and test, we recommend that the AI strategy of federal agencies include to the extent possible the development and sharing of:

- pre-training datasets for base models (or foundation models) focused on their domain of activity
- the corresponding pre-trained (or foundation) models
- fine-tuning datasets and fine-tuned models tailored to the agencies' needs
- any software needed to process the inputs and outputs of AI systems

We provide further feedback on the draft memorandum below by answering the questions accompanying the Request for Comments. If a question is not highlighted, we do not have specific, actionable feedback.

Questions

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

While AI Governance will require involvement from many existing groups in agencies, including but not limited to privacy, IT, data, and legal departments, approaching the new challenges posed by AI adoption holistically and efficiently will require coordination and skill sharing between different stakeholders, which is best managed by a new AI Governance Body. Such a body can also facilitate broader civil society involvement and standardization of documentation practices. As examples of the possible functions of such a body, we point to the role of the cross-areas working groups within the BigScience workshop on Large Language Models, and its proposed structure for a multi-stakeholder AI data governance organization for large scale ML. In particular, we stress the importance of the role of centralizing documentation and transparency guidelines and the adoption of interoperable data formats to allow for better skill sharing within and across agencies.

3. How can OMB best advance responsible AI innovation?

The OMB has a unique role to play in championing responsible AI innovation beyond the federal government by helping create a body of positive examples and in-context operationalizations of responsible AI principles. Other agencies and companies may then learn from those examples

and leverage the resources created in the process – especially if they are shared as open and open-source AI systems – to follow suit. These should include:

- Requiring documentation of key sections of the development pipeline demonstrating decisions that respect peoples' rights and abide by applicable laws. This included:
    - Data Development
    - Model Training
    - Model Evaluation
    - System Evaluation (when models are implemented as part of a larger system)
    - Actions for continued Monitoring
- Building resources and knowledge about how to assess, evaluate, document, and audit AI systems
    - In particular, focus on building capacity to audit specific parts of AI development, including training data and procedure
    - Build a robust reporting system including labor complaints and whistleblower protections
- Leveraging shared experience between agencies to build best practices informed by the practicalities of deployment
- Highlight that AI should in many cases *NOT* be used, and/or may not be an improvement over current/alternative systems, in particular by providing transparency through the AI Use Case inventory about the process for weighing the risks and benefits of AI adoption.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Generative AI, when used for the purposes it is best suited for, can be a useful tool to explore AI in a new application setting, increase productivity in settings such as software engineering, and support applications that are less reliant on accuracy or grounding in factual information – especially when it is developed with sufficient transparency, consideration for the rights of data subject, and attribution of the model outputs. In particular, generative AI systems that are designed to handle a variety of tasks or work in so-called zero-shot settings can significantly accelerate the development of a "proof-of-concept" AI system to explore whether AI can bring value to an agency in a particular setting; possibly to then be replaced by a more efficient discriminative system.

Generative AI also introduces unique concerns, including increased financial and environmental costs when it is used in settings where a discriminative AI alternative could suffice, an increased cybersecurity attack surface and range of vulnerabilities, and a dependence on web-scale and larger training datasets that exacerbates social issues, including biases and discrimination.

The trade-offs mentioned also depend on the modality considered. Code generation models such as the openly developed StarCoder (see the project's Governance Card for more detail), have already shown their value in accelerating the process of software development, and are less subject to (but not exempt from) exacerbating social biases along the development chain. Image generation models, on the other hand, are still very likely to reproduce and exaggerate stereotypes, which makes them a poor fit for generating illustrations of people in government communications.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

We note that neither privacy nor handling of medical processes are currently included in the safety section. Mishandling of medically relevant decisions by AI systems can lead to immediate personal risks – especially given the prevalence of social biases in medical datasets, and leaks of private information can expose citizens to scamming, phishing, and identity theft. We would recommend explicitly adding both those considerations in (Section 5 (b.i)). The latter should also extend to systems that are used to infer or predict private information or personal characteristics.

For (Section 5 (b.ii)), we also recommend considering at least some of the rights listed in the recently published Taxonomy of Human Rights Risks Connected to Generative AI published by the UN OHCHR, including but not limited to rights to employment, freedom from Physical and Psychological Harm, and rights to Culture, Art and Science. This recent editorial also delves deeper into the rights at play and outlines how different steps in the development process have bearing on specific rights.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum practices identified constitute a strong baseline on which to develop responsible AI practices across a variety of potentially safety-impacting and rights-impacting AI applications. We strongly believe that these minimum practices should be encouraged for **all AI systems** even when not strictly required, to help develop robust best practices and mitigate risks that some systems may be mistakenly omitted.

We also recommend taking the following additions:

- For the sections on **Completing an AI impact assessment** and **ensuring that the AI will advance equity, dignity, and fairness**, we recommend explicitly mentioning due diligence background research that considers historical discrimination in the domain. AI applications tend to exacerbate existing problems.
- In addition for the existing requirements to **conduct monitoring**, **mitigate emerging risks**, and prioritize incremental adoption, agencies should, whenever possible, have a plan in place for rolling back AI systems as needed without disrupting ongoing processes,
- Finally, we stress the value of documentation in pursuit of the goals outlined in this memorandum. We recommend that **data documentation** and **model cards** be required for AI systems with safety-impacting and rights-impacting potential, along with **system cards** and **governance cards** as needed.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

The following categories of guidance will be particularly helpful to agencies:

- Specific questions to answer to inform the processes outlined in this document, especially with respect to pro-actively assessing the benefits of AI adoption and risks to rights, fairness and non-discrimination, and safety – and how to weigh those to make an adoption decision
- Standards on documentation content and quality, especially as regards information to be included in the AI Use Case inventory
- Providing a repository of positive examples of implementation of the requirements to help showcase successful operationalization

We note in particular that given the fast evolution of the technology and breadth of possible adoption, this guidance should be designed to evolve with time and feedback from federal agencies. We recommend in particular dedicating appropriate resources to maintaining and updating this information.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

We recommend the following information for entries in the AI Use Case inventory:

- Brief description of the AI system, including its deployment context, expected inputs and outputs, and expected behaviors, and appropriate context of use
- Description of the metrics used to assess what value the AI system is bringing to the agency's use case
- Whether the system is deemed to be rights-impacting or safety-impacting, with justification
- Description of the metrics tracked to assess performance and potential rights and safety risks, especially with regard to non-discrimination
- The expected volume of interactions with the system, *e.g.* number of inputs processed per time period or number of users within the agency
- A list of the AI components used in the AI system, including:
    - ML models, including base pre-trained model and fine-tuned models, with version when applicable
    - ML training datasets, including pre-training and fine-tuning datasets, with version when applicable
- Model and data documentation for all components according to established standards
    - For models, this should include appropriate contexts of use and evaluation in light of both those uses and different types of users and affected groups
        - Example model cards to consider: BLOOM, OBELICS, StarCoder
    - For data, this should include handling of consent, licensing, analysis of possible source of biases, etc.
        - see also: https://hf.co/blog/yjernite/data-transparency
- Description of the governance processes relevant to the AI system, for example:
    - Data governance in BigScience (BLOOM model)
    - Governance card for BigCode (StarCoder model)

All items outlined above have a significant role to play in ensuring the proper governance of AI systems. By centralizing this information across uses of AI in federal agencies, the AI Use Case inventory will both be a useful tool for supporting this governance and an invaluable resource to support new research into best practices for AI adoption across society.

OMB AI EO Comments

REQUEST FOR COMMENT RESPONSE

Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Docket ID: OMB-2023-0020

December 5, 2023

I. INTRODUCTION

In response to the Office of Management and Budget's ("OMB") request for comment ("RFC") to develop a governance, innovation, and risk management memorandum for Agency use ("memorandum"), CrowdStrike offers the following views.

We approach these questions from the standpoint of a leading international, US-headquartered, cloud-native cybersecurity provider that defends globally distributed enterprises from globally distributed threats. CrowdStrike offers insights informed by multiple practice areas: cyber threat intelligence; proactive hunting, incident response and managed security services; and an AI-powered software-as-a-service cybersecurity platform and marketplace. Accordingly, this perspective is informed by CrowdStrike's role in protecting organizations from data breaches and a variety of other cyber threats.

II. COMMENTS

CrowdStrike welcomed the release of the Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence ("E.O."). The E.O. will not only affect the U.S. government's Executive Branch, but more broadly inform industry best practices, and can even potentially inform subsequent laws and regulations in the U.S. and abroad.

We appreciate the OMB's quick response to the E.O. and their efforts to create a comprehensive agency-wide strategy on Artificial Intelligence ("AI"). The RFC correctly notes that AI is evolving at a rapid pace and creating benefits, and considerations of risks, across many sectors and aspects of life. The cybersecurity sector is no different with AI enhancing security capabilities while also creating new threats that require mitigation.

While we do not have feedback on every question in the RFC, we do want to offer several points that may be of value to the OMB as it refines the draft memorandum.

A. *Question 1*) The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

And

Question 2) What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

The RFC correctly notes that the differences across agencies in size, budget, mission, etc., require flexible requirements to comply with the tasks outlined in the memorandum. The requirements to establish a Chief AI Officer and AI Governance Body seem logical from CrowdStrike's perspective and there seems to be an appropriate amount of room for agencies to adopt the new positions to fit the specific agency. However, like with any new initiative, room for improvement will be discovered as the new roles and groups progress. We recommend that OMB empower agencies to make slight readjustments to the roles of their Chief AI Officer and AI Governance Body as new best practices are discovered.

Perhaps more important than the new roles and groups, is the guidance and requirements that will come from them. CrowdStrike urges alignment where possible with existing rules and regulations created by other agencies. Any new guidance or requirement on AI from agencies has the opportunity to improve AI, which plays critical roles in the everyday lives of many Americans as well as the economy writ large. Nonetheless, new regulation will not be issued in a vacuum but instead amongst a venn diagram of regulations across agencies, sectors, states, other technology areas, and other countries.

The draft memorandum states:

> "*This memorandum does not supersede other, more general Federal policies that apply to AI but are not focused specifically on AI, such as policies that relate to enterprise risk management, information resources management, privacy, Federal statistical activities, IT, or cybersecurity.*"

This language provides clarification and we recommend that it remain in the final version. As implied, there is often overlap between cybersecurity technologies and AI because, from a cybersecurity standpoint, the use of AI to detect threats is an enormous advantage. AI is the best tool defenders have to identify and prevent zero-day attacks and malware-free attacks, because AI can defeat novel threats based on behavior cues rather than known signatures. Leveraging these technologies is essential to meeting constantly-evolving threats. In cybersecurity, there are already a myriad of competing and overlapping regulations; continued clarification on how new AI regulations will interact with cybersecurity regulations will be needed.

Finally, as agencies complete their AI strategies and other tasks from the memorandum, CrowdStrike encourages agencies to leverage a risk management approach as seen in AI Risk Management Framework (NIST AI 100-1).

B. *Question* 3) How can OMB best advance responsible AI innovation?

The memorandum and RFC's focus on ensuring innovation, even with new requirements for AI going into effect, aligns with CrowdStrike's views. New requirements or regulations should not stifle innovation and new technologies. Regulating AI, and its use, for the sake of the technology rather than its application is not the best approach to foster-innovative solutions to difficult problems. As adversaries continue to evolve and find new ways to target victims, organizations must increase their emphasis on cybersecurity practices that leverage the most effective technologies - and that includes AI.

The proposed memorandum defines safety-impacting AI and right-impacting AI and determines only AI applications that meet one of those definitions are subject to the minimum practice. This risk-based approach is welcome; however, OMB should be cautious to not expand these definitions to encompass any AI application.

Innovation often comes from competition. The memorandum requires the following:

> "*Promoting Competition in Procurement of AI. Agencies should take appropriate Steps to ensure that Federal AI procurement practices promote opportunities for competition among contractors and do not improperly entrench incumbents. Such steps may include promoting interoperability and ensuring that vendors do not inappropriately favor their own products at the expense of competitors' offerings.*"

CrowdStrike supports promoting competition in the procurement of AI and encourages this language to remain in the final memorandum.

C. *Question 4*) With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

CrowdStrike leverages generative AI to assist analyst workflows and to make other security analyst tasks more efficient. This capability (coined "*Charlotte*") utilizes CrowdStrike's highest-fidelity security data, which includes the trillions of security events captured in the CrowdStrike Threat Graph, asset telemetry from across users, devices, identities, cloud workloads, and threat intelligence. The use of this knowledge base drives efficacy, actionability, and relevance, as well as addresses the risk of "hallucination."

Further, the natural language interface seeks to make cybersecurity responsibilities more broadly accessible. Our goal with *Charlotte* is to help close the cybersecurity skills gap and improve the response time so users can stay ahead of adversaries – boosting security across organizations. Today, we see this use of generative AI as one of the most relevant to improving security outcomes in the near- to mid-term.

Agencies should leverage generative AI that uses models that are trained using validated sources and sound data, like *Charlotte*.

D. *Question 8*) What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The draft memorandum requires a publicly released compliance plan, an inventory of its AI use cases, and an agency strategy. While CrowdStrike recognizes the intent around these efforts, we caution against publicly disclosing this information. While it could be a helpful exercise for an organization to review their AI use cases, publicly

disclosing what technologies are in agency networks could enable threat actors to conduct malicious activities. Adversaries are innovative and smart – threat actors could intentionally target listed AI applications or monitor for a vulnerability they could leverage. For those reasons, public disclosure in these instances may have an adverse effect on security.

III. CONCLUSION

The OMB's memorandum, and the broader E.O., provides a thoughtful analysis of a complex, constantly evolving, policy area. As the memorandum, and other tasks from the E.O., move forward, we recommend continued engagement with stakeholders. Finally, because the underlying technologies evolve faster than law and policy, we recommend that the strategy focus on principles rather than prescriptive requirements and include a mechanism for periodic revisions.

IV. ABOUT CROWDSTRIKE

CrowdStrike®, a global cybersecurity leader, is redefining security for the cloud era with an endpoint protection platform built from the ground up to stop breaches. The CrowdStrike Falcon® platform's single lightweight-agent architecture leverages cloud-scale AI and offers real-time protection and visibility across the enterprise, preventing attacks on endpoints on or off the network. Powered by the proprietary CrowdStrike Threat Graph®, CrowdStrike Falcon correlates over 3 trillion endpoint-related events per week in real time from across the globe, fueling one of the world's most advanced data platforms for security.

With CrowdStrike, customers benefit from better protection, better performance and immediate time-to-value delivered by the cloud-native Falcon platform.

There's only one thing to remember about CrowdStrike: We stop breaches. Learn more: https://www.crowdstrike.com/.

CONTACT

We would welcome the opportunity to discuss these matters in more detail. Public policy inquiries should be made to:

RE: Response to The Office of Management and Budget Request for Comments on Advancing Governance, Innovation and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (88 Fed. Reg. 75625, November 3, 2023)

COVER SHEET

COMMENTER	:	National Legal Aid & Defender Association
QUESTIONS ADDRESSED	:	Questions 3, 4, and 6
ORGANIZATION MISSION	:	Because the quality of justice in America should not depend on how much money a person has, NLADA leads a broad network of advocates on the frontlines to advance justice and expand opportunity for all by promoting excellence in the delivery of legal services for people who cannot afford counsel.
CONTACT INFORMATION	:	For questions or follow-up, please contact Christopher Buerger, NLADA's Chief Counsel for Civil Legal Services, at c.buerger@nlada.org
LICENSURE	:	NLADA warrants that our organization is the sole author and owner of the below comments and that there are no obstacles to providing nonexclusive licenses of participant rights to the Federal Government to apply, share, and use the materials included in this submission.

a. NLADA: WHO WE ARE

The National Legal Aid & Defender Association (NLADA) greatly appreciates the Office of Management and Budget's (OMB) efforts to address the use of artificial intelligence (AI) by government agencies, and we especially appreciate the important step of seeking public input. The increased use and capability of new AI tools have already shown that these have incredible potential to increase efficiency and automate tasks in a way that would have been thought impossible just a year or two ago. Nevertheless, they also have the potential to do great harm to vulnerable communities, communities NLADA members serve and comprise.

NLADA is America's oldest and largest nonprofit organization dedicated to excellence in the delivery of legal services for people who cannot afford to pay for counsel. We count among our membership more than 700 organizations that provide civil legal aid and public defender services to low-income and underserved individuals and communities across the country. We represent the voices of thousands of attorneys, staff, and clients in the 50 states, the District of Columbia, American Samoa, Micronesia, Puerto Rico, and the U.S. Virgin Islands.

Civil legal aid and public defenders serve people living in or near poverty, and those who experience many of the disparate impacts of government policies and practices. NLADA also has as part of our membership a Client Section, which allows us to hear and elevate the voices and experiences of the people who are directly impacted by inequitable policies and practices. We are submitting these comments based on the experiences of our communities of civil legal aid, client, and public defender members.

b. HOW LEGAL AID, PUBLIC DEFENDERS, AND CLIENTS INTERACT WITH FEDERAL AGENCIES

Our client communities interact with federal agencies in a number of entry points, often in ways that intersect with multiple agencies as well as state and local institutions. Americans with low incomes rely on agency programs related to housing, health care, income support, education, and others. Meanwhile, individuals coming through state or federal criminal systems are impacted by policies and procedures set by federal entities and law enforcement agencies, including the U.S. Department of Justice and its various components.

Civil legal aid helps advance the mission of federal agencies by ensuring people have access to basic needs like housing, health and nutrition, education, employment, and income support, and removing barriers that prevent access to these programs. Legal aid serves to educate, facilitate, and advocate in these spaces to ensure that agencies reach and serve the intended beneficiaries of these systems. In the criminal legal system, public defenders are present in court every day, fighting to realize the promise of the U.S. Constitution for each and every defendant, and many provide holistic services to ensure success and stability after involvement in the legal system.

When these promises aren't met, when programs do not serve the American people, and we increase inequity instead of justice, the toll this takes on our families and communities manifests at the doorsteps of public defender and legal aid offices. When a problem does show up, it frequently shows up across multiple agencies. All of these systems are interconnected, and for the most vulnerable Americans, it can feel like a house of cards. A failure at even one entry point can cause a cascading of problems that can permanently and negatively alter lives. In short, changes to these supports systems cannot afford to get it wrong.

Additionally, it is important to note that these challenges are not borne equally across society. We know that the people who show up with civil legal problems and the people who find themselves in need of a public defender are disproportionately people of color. When low-income individuals struggle to access critical programs, the problems will disproportionately fall upon those communities of color. It is a good start to require agencies to "test their AI to determine whether there are significant disparities in the AI's performance across demographic groups," but the policy should go further and require a report on how, regardless of "the AI's performance," the end result will improve or potentially exacerbate already existing disparities.

c. GENERAL CONCERNS AND EXAMPLES OF PAST PROBLEMS WITH AUTOMATION IN OUR LEGAL SYSTEMS

The crisis in our public defender systems is well documented.[1] In the world of civil legal aid, the Legal Services Corporation studied the "Justice Gap" in 2017. Their findings revealed that roughly 86 percent of the civil legal problems of low-income Americans receive either inadequate or no legal help.[2] When they repeated the study in 2022, the number had increased to a staggering 92 percent![3] Advocates in these spaces are among the most innovative and flexible. They are problem-solvers. Indeed, the increased use of technology, AI-based or otherwise, often is utilized as a valuable tool.

And yet, we have experienced and are keenly aware of the limits, and even dangers, of an increased use of technology when it comes to legal issues involving individual rights.[4] Some of these problems have traditionally included issues of access to technology, security of private information, and concerns about how these changes can negatively impact outcomes for self-represented litigants as well as individuals served by legal aid and defenders. In recent years, however, we have seen more pernicious problems arise with the use of more advanced technology.

[4] Legal Aid of Arkansas' comments to OMB's request go into much greater detail on some of these experiences. We agree with their comments and hope our brief comment serves to emphasize and incorporate some of their primary points.

For example, around the country, states have replaced human decision-makers (such as nurses or social workers) with algorithms to determine the amount of health care and assistance certain individuals need. These methods have been deemed "arbitrary" and "cruel" by advocates, and they have resulted in "immense human suffering" and even unnecessary deaths.[5] In some instances, legal aid programs have already successfully sued states using these algorithms, but not before this new automation caused serious harm.

In Michigan, the state spent $47 million to create the Michigan Integrated Data Automated System (MiDAS) to detect fraud in unemployment benefits claims. The system was efficient in identifying fraud; in fact, it worked too efficiently. From 2013 to 2015, the automated system identified over 42,000 incidents of fraud. *It was wrong in 93 percent of those incidents.*[6] These individuals, 93 percent of whom were entitled to these unemployment benefits, were forced to pay back all previously received funds plus a 400 % fine. Unfortunately, this algorithm went unchecked by human review, causing financial ruin from which many victims never recovered.

The criminal legal system is also no stranger to problematic uses of technology. In just one example, a tool called COMPAS promised to use advanced algorithms to accurately identify recidivism risks among defendants in Florida. However, a Pro Publica investigation found that "black defendants were far more likely than white defendants to be incorrectly judged to be at a higher risk of recidivism while white defendants were more likely than black defendants to be incorrectly flagged as low risk."[7]

Additionally, the increased use of pretrial risk assessment instruments has been rife with problems and has failed to address existing racial and ethnic bias in the criminal legal system. NLADA and others have already raised concerns on this topic, insisting that jurisdictions needed to develop further protocols and collect more data. We have identified a need for such assessments to have ongoing monitoring by advocates and community groups.[8]

Our members serve on the front lines of our legal systems. They have seen the way past attempts of automation have wreaked havoc on the most vulnerable. When people turned to their government for help, or were involuntarily pulled into these systems, including the criminal legal system, their government told them: I'm sorry; this algorithm says you lose. At its best, the result is dehumanization and distrust, and at its worst, loss of liberty, security, and even life. That is unacceptable. As AI develops and

promises better and more automation, we must proceed with great caution and learn from past failures.

d. BROADER APPROACHES TO IMPROVE AGENCY USES OF AI

We are genuinely encouraged by the OMB's efforts to create guidance, especially guidance that gives special consideration to the use of AI uses that impact individual rights. The request for comments included two questions that went to the broader idea of using AI in government processes:

> QUESTION 3: *How can OMB best advance responsible AI innovation?*
>
> *QUESTION 4:* *With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?*

On these questions, we urge OMB to issue guidance and for agencies to take special care to be conscious of the questions they are asking when they make use of AI tools and what a successful use will look like. For example, crafting a tool to limit supports to low-income individuals, either by detecting fraud or more efficiently identifying ineligible applicants is unlikely to provide any direct benefit to vulnerable communities. Meanwhile, as demonstrated by past attempts of automation, there is significant risk.

Agencies can put safeguards in place, but they will not help if the ideal use will simply "cause no harm" with our fingers crossed that we get as close to zero as possible. When we ask AI to find fraud or limit benefits, it will do exactly that. Further, no matter how good of a model an agency might have, how advanced of an algorithm they might use, there will certainly be false positives. As agencies think about how AI can help serve their mission, they must envision AI uses that will provide tangible and substantive, not simply procedural, benefits to vulnerable people. At the heart of all potential uses of AI, the question must not simply be how, if all goes well, will it improve efficiency, but how it will increase equity and *do no harm*.

e. MINIMUM STANDARDS FOR RIGHTS-IMPACTING PURPOSES NEED TO BE STRENGTHENED

In the request for comments, OMB asks:

> *QUESTION 6:* *Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?*

We wish to begin our discussion by expressing our appreciation that OMB has put together this draft memorandum and put in the effort to identify "Minimum Practice"

safeguards for "Rights-Impacting AI." We firmly believe this is a critical first step and the correct approach. We do have some feedback on where some of those minimum practices should be strengthened.

First, in section 5(c)(iv)(A), OMB identifies an AI impact assessment as a minimum practice. We concur and are especially encouraged by section 5(c)(v)(A), which requires agencies to identify, address, and mitigate potential discrimination, bias, and disparate impacts. In particular, we endorse OMB's conclusions that "If adequate mitigation of the disparity is not possible, then agencies should not use or integrate the AI tool."

Still, if an impact assessment, including assessment for bias and discrimination, is to be meaningful, it should require agencies not just to identify known bias and discriminatory results, but also to identify the risks of possible bias and discriminatory results. In fact, any and all impact assessments should be required to identify possible risks with scientifically sound quantitative or qualitative analyses. They should further be required to explain how ongoing assessments will monitor the specific use of AI. How and when will the agency determine whether or not the possible risks identified in the impact assessment have come to bear? And if so, how they will determine when and if that specific use of AI should be discontinued.

In a similar vein, the requirement in section 5(c)(v)(B) to "consult and incorporate feedback from affected groups" is critical, but the requirement as written is too weak. Requiring agencies to consult with affected groups "to the extent practicable" and making ongoing feedback "strongly encouraged," is simply too soft and too vague for what might be the most important requirement. At minimum, meaningful and significant feedback should be the default required. Agencies should be required to report not just all the feedback received, but the efforts that were made. Which voices were heard and which were not? And for those whom could not be contacted, why not? And if the agency plans to go forward with the proposed use of AI, why do they believe the level of input received is sufficient? Finally, this section should also include a requirement that agencies reach out to known service providers and community based organizations who serve affected communities. Not only will these groups have insights on how AI uses could impact communities, they may also serve as valuable liaisons between the agencies and the community.

The requirement for human consideration and remedy processes in section 5(c)(v)(E) is yet another important component of any successful use of AI. This section needs more detail about making the human consideration a truly meaningful review. In past problems with automation, advocates in legal aid and public defense have been met with review processes that are rigid and unquestioning. Our members have reported that in many instances the "human review" is simply a check to ensure that the proper data was entered. Severe automation bias results in meaningless human reviews with an approach along the lines of "don't blame me; that's just what the algorithm says." A human review that assumes an AI tool will necessarily reach the right result is no review at all. This section must include requirements for agencies to address the risk of automation bias and ensure that the remedy processes do not simply defer to the technology.

Finally, this policy does not address language justice concerns. There is a mention that, when giving notice to affected individuals, the agency "should provide notice in multiple languages," but language justice efforts must be much broader than this. Agencies should assess how language barriers may impact the use of any AI tool. Will its creation and any shift of processes to this tool create or worsen language barriers? Language barriers may manifest in non-native English speakers, but also across cultures and different uses of colloquialisms, particularly in communities of color. It is much easier for human decision-makers to consider these differences on a case-by-case basis. It is much more difficult for AI, both generative and non, to identify and account for this. There also are additional barriers and disparities to consider. For those with limited English proficiency, will results differ compared to native English speakers? Relatedly, agencies that seek to increase language access not through increased human translation, but through AI, how will effectiveness be tested? What safeguards will be put in place to ensure that machine-based translation is actually adequate? Language justice is too important of an issue; it must receive greater consideration.

f. CONCLUSION

This draft memorandum represents a strong opening effort on the part of the federal government to ensure the responsible use of AI tools across agencies. NLADA is encouraged to see this focus and effort from the OMB.

Nonetheless, even more safeguards and requirements are necessary. Particularly when it comes to rights-impacting AI uses, the risk of harm to vulnerable communities is immense. Incredible harm has already been done with more rudimentary automation tools, and it would be a grave error to assume that more advanced AI tools would necessarily prevent future harms and not possibly enact even greater harm on an even larger scale.

In particular, people and communities of color, low-income, and underserved individuals, families, and communities are especially vulnerable because they so often are dealing with multiple government systems across multiple agencies. An AI-fueled mistake at one agency or in one system could have a cascading effect on, just as an example, an individual's health insurance, housing, and income. These systems intersect and work in conjunction with each other. As OMB continues to work with agencies to minimize risks, it should encourage agencies to acknowledge and account for this intersectionality, including how federal supports may be administered by states and localities and their utilization of technology and, specifically, AI. It is less of a specific minimum standard, but a broader view of the risks and what is at stake for vulnerable Americans.

NLADA does not take the position that AI tools can never be used in a legal context. Instead, it is our position that extreme caution is nevertheless warranted at this time. We appreciate this opportunity to provide comments and look forward to future opportunities to work closely with federal agencies on these issues.

Respectfully.

ResponseDec5

Thank you for the opportunity to provide feedback on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum". Below is a reply organized in reference to the 8 questions the OMB asked about according to the Federal Register. My replies begin with "Reply:". For background, I am the Director of Research and Senior AI Scientist at Leela AI. I hold a PhD in Computer Science recently earned with a focus on machine learning and transformer models. Prior to my PhD, I was an executive-level engineering fellow at Advanced Micro Devices designing X86 processors. I run a MIRIx monthly symposium on AI safety and this reply incorporates feedback from that symposium group.

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?
Reply: The chief AI officer role feels inward-focused but can help implement broader goals within an agency, and, just as importantly, bring concerns from an agency into broader discussions. As implied by the question, different agencies may need different staff sizes to support the CAIO, but having a CAIO for every agency provides a consistent interface into this issue and common contact for all agencies.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?
Reply: Within the private sector, negligence and strict liability laws should be established and government agencies should be subject to legal risk for AI safety failures. This helps ensure that those developing and using AI are incentivized to verify safety concerns. Effort should be made to mirror something like the Gene Synthesis Consortium in the AI community. A strong but flexible and responsive organization should be encouraged as oversight of AI developments. Certainly AI should be a new role in the agencies. As AI advances it will acquire new and varied abilities; if stated AGI goals by various companies are even partly achieved, AI governance must include assessing risk in ways similar to hiring an intelligent but somewhat erratic new employee to work on a team - issues of trust and internal goals become important. In this response and later, I use the term 'intelligent but erratic new employee' to bring to mind a person with perhaps a lot of knowledge but little real-world experience. As AI advances, it's learned behavior will vary widely even as we try to control its training data and learning environment. Considering how differently humans may approach a task gives some insight to how much these AI systems may vary too.

3. How can OMB best advance responsible AI innovation?
Reply: Work to establish common standards of communicating about AI capabilities and validation concepts. For example, the 6 levels of

vehicle autonomy have been adopted throughout the automotive industry and the consumer base interested in this technology. This allows for clear validation strategies to develop, customer expectations to be met, and even liability rules to engage at the various levels. Creating such levels for other AI areas may be valuable (loan officer, radiologist, etc). Level 2 implies competent AI behavior but human oversight is always required; level 5 implies AI quality that generally matches or exceeds skilled humans. A similar 0-5 scoring for AI content is proposed by Daniel Miessler: https://danielmiessler.com/p/ai-influence-level-ail .

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?
Reply: As stated in the question, one must understand the limitations of the AI when using it. Certainly using AI to summarize complex data can be done today with varying success. AI can be used to quickly generate graphics and make a variety of tasks more efficient. An office fully embracing the AI capabilities of December, 2023 could be more efficient at communicating complex data. Many government agencies have data from millions of citizens which can be used to find patterns and predict improved outcomes (i.e., school lunch menus relative to student performance in the afternoon, for example). At this point in time, you can ask GPT-4 for detailed descriptions of ways it can help out and it can provide examples; employees should be encouraged to explore this with guidance from the CAIO team on how best to prompt these LLMs and what weaknesses they exhibit relative to the goals of a given agency. As AI advances, part of the CAIO team should be involved with sharing best practices for AI use within an agency.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?
Reply: The concerns in the 'pause giant AI experiments' open letter from the Future of Humanity Institute, and signed by over 33,000 people, should be directly discussed. In particular, allowing an advanced AI access to control systems of any kind, including the internet, may be a risky act in the same way hiring an intelligent but erratic person for a task may be a risky act - can you fully trust the goals of the actor (AI or human) to reliably implement the agency's goal? With access to the internet, AI systems have already demonstrated the ability to manipulate people in order to accomplish incorrectly constrained goals (https://nypost.com/2023/03/17/the-manipulative-way-chatgpt-gamed-the-captcha-test/). So I would highlight the need to evaluate an AI in the same way one might evaluate a new employee, including such HR and behavioral interview questions like "How should deal with difficult clients" or "How did you learn from a mistake you made?"

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How
can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?
Reply: OpenAI has organized to work on the stated goal of creating an artificially intelligent AI safety researcher. Such a system could scale

to be more capable as AI evolves in the future, and establishing a history of issues and concerns with that approach today could be critical for testing the AI of tomorrow. Designing a test paradigm that not only addresses today's systems but can scale into future capabilities should be a major goal. The new AI safety non-profit METR identifies as a safety concern 'Cannot autonomously replicate', which I think should be added to the safety-impacting list.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?
Reply: Similar to the reply to question 3, clearly defined terms that can be used in a variety of AI use settings will help with contract terms. A small number of well-defined terms would allow a small number of court cases to set precedent and establish expectations for both sides of a contract. There may also need to be certain AI failure cases (such as any resulting in direct avoidable harm to a human) which are spelled out as cases where strict liability applies, not just negligence. Requiring 3rd party review (from a group like METR) should be a sign of due diligence when designing and evaluating an AI system.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?
Reply: In relation to paragraph 5.c.iv.F in the memorandum; at a minimum all AI uses should include a summary of how the training data was collected and curated, a description of the type of AI model used (including paper citation when available), a description of the model output, and some relevant measure of accuracy of the model. Such data could allow informed citizens to understand AI use cases in the agency.

Re: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Ms. Martorana:

We write to you as a coalition of more than 50 organizations working together to break the dangerous stranglehold of Amazon over our democracy, economy, and planet. We welcome the efforts of the administration to seek public comment as we chart a path of technological innovation that advances shared prosperity.

In the president's executive order on artificial intelligence, the Biden-Harris administration correctly focuses on worker rights, civil rights, transparency, a strong public sector, and reducing concentrated corporate power as cornerstone principles. Importantly, the executive order acknowledges that current market forces will drive artificial intelligence in suboptimal and even dangerous directions. We have the opportunity to reshape that.

For the purposes of this comment, we focus on Amazon as a harbinger of a dystopian technological future where corporations can run roughshod over communities, workers, small businesses, and the public. Dominating multiple markets, Amazon has initiated a race to the bottom by worsening working conditions, attacking democratic institutions, increasing emissions not only in its industry, but across the economy, lobbying for weak privacy laws, buying up innovative entrepreneurs to lockout competitors, expanding biometric surveillance, and using its monopoly power to the detriment of small businesses, entrepreneurs, and innovators.

From past periods of technological innovation, we know that economic outcomes and technology itself are heavily shaped by the balance of power between different interest groups.[1] When workers and the

[1] Johnson, Simon, and Daron Acemoglu. *Power and Progress: Our Thousand-Year Struggle Over Technology and Prosperity*. Hachette UK, 2023.

public have relatively less power to shape outcomes, technology is developed to drive short-term corporate profits at the expense of the common good. Today, the current imbalance in power between wealthy corporations and working people is the precondition for market forces to drive artificial intelligence toward an unbridled race for profit. The result will be catastrophic for the middle and working class, as well as for the planet. And, it will foreclose the possibility of creating transformative new technologies and scientific advances.

The public has an essential role in averting this disaster, rebalancing power, and bringing about a better future. We urge the administration to build on the executive order by:

(a) Expanding multidisciplinary public sector technical expertise that can independently judge between useful technology and marketing hype. Public sector innovation should be evaluated by its benefit to the common good, rather than in response to the pressure to adopt new tech.
(b) Focusing technological capacity and investment in public-infrastructure, -universities, and -research, and ensuring that the public retains the benefits of these investments.
(c) Prioritizing and funding government systems that result in greater shared prosperity and enhance popular participation in democracy, while deprioritizing programs that expand incarceration, surveillance, and militarism.
(d) Ensuring greater accountability, oversight, and transparency for government programs at risk of abuses of power, and preventing the adoption of new technology that would run counter to these goals.
(e) Attending to the dangers of rapidly expanding energy consumption, water usage, and greenhouse gas emissions linked to the surge in computational resources for artificial intelligence, and taking steps to ensure data centers are required to invest in building new renewable energy and establishing reclaimed water sources where the data centers are built.
(f) Establishing procurement standards that include interoperability and clean energy requirements for cloud computing; labor neutrality agreements for contractors and tech companies; health and safety standards; and stronger transparency and reporting requirements.
(g) Ensuring federal agencies consider how regulatory action related to artificial intelligence and technology procurement would impact market consolidation and anti-competitive dynamics in the sector—in line with recent guidance from the Office of Information and Regulatory Affairs and the Office of Management and Budget.[2]

In each section below, we describe Amazon's business practices related to artificial intelligence and procurement, highlighting how Amazon has used its market dominance to capture economic gains and public investment in ways harmful to the public and workers. The administration should direct agencies, procurement standards, regulatory action, and investment to set a higher bar for the tech sector and to prohibit the worst abuses. Given Amazon's unprecedented power, size, and role in government procurement and infrastructure, we also urge the administration to pay special attention to this corporate behemoth, in particular.

[2] https://www.whitehouse.gov/wp-content/uploads/2023/10/RegulatoryCompetitionGuidance.pdf

Amazon, Public Sector Tech Procurement, Corporate Capture

While growing its dominance in the private sector, Amazon is quietly commandeering the public sphere by soliciting massive government contracts, investing in direct and indirect lobbying,[3] and creating a revolving door between its C-suite and the halls of Washington DC. One former top procurement official with the Defense Department stated that Amazon seeks to "dominate the federal space."[4] Decisions about government technology should always be made in the public interest, but today, tech companies are playing an oversized role in shaping procurement, regulations, and standards.

- **Public sector procurement.** Amazon Web Services is the cloud provider for more than 7,500 local and federal government agencies.[5] Its clients include the National Security Agency,[6] the Pentagon,[7] the U.S. Navy,[8] the Department of Homeland Security,[9] and the Central Intelligence Agency.[10] Given the high degree of consolidation in this important sector, and indications of an anticompetitive market,[11] the Government Accountability Office and lawmakers have called for greater interoperability and consideration of egress fees for these cloud contracts.
- **Corporate lobbying.** While big tech firms have been eclipsing corporate lobbying giants of the past, including big tobacco and oil,[12] Amazon stands out: in 2022, Amazon was the largest single corporate lobbying spender in the country,[13] dishing out over $21 million. Its lobbying efforts have tackled a diverse range of issues, including but not limited to "government procurement",[14] "cloud computing,"[15] and "cloud security".[16] When a single firm can buy this level of time, access, and influence over the federal government, it threatens the democratic values, institutions, and processes that keep our country running.
- **Revolving door.** Amazon also exerts influence over the federal government through a revolving and "reverse revolving" door between the corporation and the public sector.[17] In 2021, POLITICO

reported that Amazon Web Services was "snapping up former government officials who can help them gain access to lucrative federal contracts".[18] Indeed, Amazon's ties to former and current federal officials are broad and deep: in 2021, *Mother Jones* "identified at least 247 US government officials and employees…who were hired by Amazon in the past 10 years or so."[19] Amazon also hired Jay Carney, President Barack Obama's former press secretary, as its senior vice president of global corporate affairs.

Infrastructure, Vertical Integration, Abuse of Dominance

Amazon has a running start over competitors in the artificial intelligence market. In his 2022 annual letter to shareholders, Amazon CEO Andy Jassy suggested that Amazon will be a major winner in AI infrastructure.[20] And, earlier this year, the CEO boasted that every team in the company is working on generative AI.[21] We urge the administration to look at vertical integration and consolidation across the artificial intelligence supply chain and to examine Amazon's anti-competitive tactics in this area.

- **Infrastructure**. Amazon aims to be the largest AI infrastructure player in the market, leveraging its massive data center infrastructure and cloud computing dominance. Notably, Amazon has won lucrative state and federal contracts, as well as public subsidies, to build this private infrastructure, which currently generates $80 billion in revenue and $23 billion in profit.
- **Toll booth operator.** In a recent earnings call, Amazon's CEO Andy Jassy assured investors that Amazon would profit at every step of the AI product development cycle, because it controls the infrastructure and gateway to business customers.[22] The most valuable part of Amazon's online retail platform is not sales, but rather, extraction of various fees from all transactions, sellers, and consumers on the platform.[23] Amazon, through its early and well-funded foray into artificial intelligence, will no doubt seek rents from all the services that use its cloud infrastructure, recreating the "monopoly tollbooth" it holds over online retail space. In cloud computing, Amazon already uses egress fees, interoperability barriers, and bundled services in ways that warrant investigation.[24]
- **Mergers and acquisitions**. Months ago, Amazon announced that it has "invested" in Anthropic, a leading developer of large language models (LLM). Yet a closer read of the details of the deal lays out Amazon's motivations in dealing with Anthropic: moving forward, Anthropic will be required to use Amazon computational processing power.[25] In 2015, Amazon bought a cloud computing

[25] https://time.com/6317366/amazon-anthropic-ai-deal/

chip manufacturer, precluding its competitors from having access to the technology.[26] In the same way Amazon has bought out potential competitors, the company will undoubtedly buy out other players in the AI stack to maintain and grow its power.[27]

- **Deceptive use of customer data.** Earlier this year, the Federal Trade Commission and Department of Justice charged the company with deceptive use of children's data.[28] Amazon kept children's voice and location data for years, using it to amass more profit, while ignoring parents' requests to delete the data. As Amazon expands its artificial intelligence capabilities, it will have more incentive to use its data troves to develop artificial intelligence without the consent or knowledge of the producers and subjects of that data.

Data Centers, Public Subsidies, and Clean Energy

Amazon's data center footprint is growing rapidly across the United States and internationally. Not only are Amazon's data centers consuming huge energy resources, but in some cases, Amazon is covertly building its data centers through public subsidies and public contracts intended for public infrastructure and services[29]—not private profit.

- **Data center expansion.** Reporting confirms that Amazon is making aggressive investments into data centers in the U.S.[30] and internationally,[31] and is planning to invest $35 billion in data center expansion in the coming years. In some cases, data center deals have been obscured from public oversight through nondisclosure agreements.
- **Energy and water usage.** Recent research on the climate impacts of artificial intelligence suggest that by 2027, use of artificial intelligence could be between 85 to 134 terawatt hours annually[32]—similar to the energy consumption of mid-sized countries. Currently, data centers make up 18% of Ireland's total energy consumption.[33] Likewise, according to the Washington Post, a large data center consumes up to 5 million gallons of water a day.[34] While there have

been attempts at legislation to regulate and mitigate these impacts, Amazon successfully lobbied to block those efforts.[35]

- **Public subsidies.** As it expands, Amazon gobbles up public subsidies to fund its growth,[36] receiving funds not only for distribution and fulfillment centers, but data centers as well. According to research by Good Jobs First, Amazon has taken nearly $2 billion in public subsidies to finance its data center expansion.[37] By subsidizing Amazon, we are not only giving the corporation an unfair advantage, we are failing to invest in the technological capacity necessary for transformative public projects.

Artificial Intelligence in Policing, Border, and Military Applications

Large government investments in law enforcement and the military, rather than public infrastructure and public services, have created incentives for corporations to develop technologies tailored for those purposes in order to receive lucrative government contracts. In turn, tech corporations have used lobbyists[38] and revolving door[39] tactics to advocate[40] for and secure these contracts.

Experts have warned that the use of artificial intelligence in immigration enforcement, policing, and military contexts is fraught with risks for civil liberties, human rights, and due process—not just for those directly targeted by the AI uses, but also for the public as these technologies gain traction and spread. These uses have included drone targeting, face recognition, predictive policing, pre- and post-trial automated risk assessment, and large biometrics databases. Amazon's own incursions in this area are indicative of a pattern of over-investment in technological innovation linked to abuses of power:

- **Biometric identification**. Amazon released its face recognition product, Rekognition, at the end of 2016. Soon after, police departments in Oregon and Florida, as well as the FBI, began pilot programs using the software.[41] Following reporting on these pilots, the ACLU conducted a test and found that Rekognition falsely matched members of Congress.[42] In 2018 and 2019, major peer-reviewed studies from the Massachusetts Institute of Technology found the technology more often misidentified women and people of color. Despite these concerns and calls for public debate on this technology, Rekognition and other biometric identification systems remain available on Amazon Web Services.
- **Warrantless search and mass surveillance.** After Amazon purchased Ring in 2018 for over $1 billion, it established a program to market Ring cameras through police departments and amassed hundreds of police department contracts. Today, Ring is reportedly the largest private

surveillance network in the world.[43] In 2021, we learned that the Los Angeles Police Department used Amazon Ring footage to track Black Lives Matter activists across the city.[44]

- **Real time tracking and mass surveillance of intimate information.** Amazon's immense cloud computing capabilities are enabling the Department of Homeland Security to build an unprecedented biometric surveillance database of over 270 million people, including Iris scans, face images, drivers license data, social media handles, etc. This information could be used to enable real time tracking of people and their families in the United States.[45]
- **Monitoring phone calls.** In November 2021, an investigation revealed that Amazon's speech-to-text technology is being used to transcribe phone conversations and flag calls based on key-word searches to jails and prisons across the country.[46] In eight states, the system was reportedly scanned for conversations involving the Spanish word for *lawyer*. In Suffolk County, New York, jail administrators used the system to find a call where an inmate reported a COVID outbreak cover-up to a family member and discussed the possibility of contacting the media.

Government agencies with a history of abusing their power need far more oversight, transparency, and accountability. The expanded use of artificial intelligence in these agencies would run counter to the goal of using new technologies to increase economic well being and increase political participation. Just Futures Law and other immigration organizations are submitting detailed guidance to the OMB on this issue, and we support those efforts.

Automation, Surveillance, and Monitoring

Amazon is the second largest private-sector employer in the United States, a major government contractor, and a pioneer in using automated management and worker surveillance to create a punitive, unstable, and dangerous working environment. The proliferation of Amazon's management model demonstrates how technology, such as artificial intelligence, will continue to be used in workplaces if we fail to change the incentives. Amazon makes it clear: when employers are allowed to use technologies to maximize profit off the backs of workers, regulation is not enforced, and workers are not able to bargain collectively, then we will have a race to the bottom that results in precarious, unsafe, low paid jobs.

As the Department of Labor creates the principles and plan outlined in the Executive Order on artificial intelligence, and the administration considers procurement standards, it should stem the replication of poor management practices like those employed by Amazon and ensure government tech contractors and vendors are good employers.

- **Expanding worker surveillance.** Amazon subjects its workers to unprecedented levels of monitoring and control. In fact, according to a study by the Center for Urban Economic

[45] https://justfutureslaw.org/wp-content/uploads/2022/05/HART-Attack.pdf
[46] Avi Asher-Schapiro and David Sherfinski, "AI Surveillance Takes U.S. Prisons by Storm," Thomson Reuters Foundation, November 16, 2021, https://news.trust.org/item/20211122213228-wxsz9/.

Development at the University of Illinois Chicago (UIC),[47] "60% of surveyed [Amazon warehouse workers] reported that the "level of monitoring or surveillance" is more at Amazon than at past jobs, versus 17% who say it is about the same, and 9% who say it is less."

- **Dangerous pace of work and reduced autonomy.** Through automated management that dictates each task and timing, Amazon enforces an unsafe pace of work. In the UIC study, Amazon warehouse workers attributed the high injury rate at the company to the corporation's focus on speed above all else. This speed translates into higher profits without needing to hire enough people to get the job done safely.
- **Increased job precarity.** Amazon has created a system where high-turnover is built into the business model. The plug-and-play nature of its automated management system allows Amazon to dynamically balance the number of workers it needs at any time, and to disregard the number of workers it loses to exhaustion, injury, and disability. The New York Times found that Amazon's turnover rate is an astounding 150%,[48] and the Seattle Times found the turnover rate is double the industry average.[49] One internal memo warned the company may "deplete the available labor supply in the US."[50]
- **Exploitation of data workers.** Workers who train AI models through platforms like Amazon Mechanical Turk report low wages, unfair client practices that lead to wage theft, and grueling conditions.[51]
- **Union busting.** Amazon has not yet been forced to change its model because of deregulation, defunding of public enforcement agencies, and crucially, a non-unionized workforce without the power to bargain collectively. As workers advocate for better conditions, Amazon has employed surveillance,[52] used workplace tracking to find "legitimate" reasons to fire workers who are organizing,[53] and has broken the law.[54]

For decades, the United States has insufficiently enforced worker, antitrust, and consumer laws, and that failure has incentivized the business practices detailed above across the tech sector. These incentives and regulatory failures are a large part of what makes the advancing development of artificial intelligence concerning to the public.

We now have the opportunity to establish new incentives and develop a more innovative economy, rooted in principles of shared prosperity, equity, and justice. In order to do this, we must expand the

power of the public to write our own technological futures—as workers, consumers, small business owners, and entrepreneurs—before big tech corporations do it for us.

To begin, the administration must establish agency priorities and procurement practices that rebalance power between the public, workers, and corporations; deconcentrate power in the tech sector; and, bring needed transparency, accountability, and oversight to the tech sector and tech procurement.

Sincerely,
Athena Coalition

Re: OMB-2023-0020 — Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum.

We write to provide comments in response to the Office of Management and Budget's draft memorandum, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*.

Upturn is a non-profit organization that advances equity and justice in the design, governance, and use of technology. Through research and advocacy, we drive policy change by investigating specific ways that technology and automation shape people's opportunities, particularly in historically disadvantaged communities.

Our comments primarily address questions 5, 6, 7, and 8 in the request for comment.

Upturn
Toward Justice in Technology

Executive Summary

The Office of Management and Budget's draft memorandum, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*, has the potential to help prevent and address discrimination in the use of automated systems by federal agencies. By requiring anti-discrimination testing of a broad range of rights-impacting algorithmic systems, as well as ongoing monitoring and mitigation of algorithmic discrimination, the memorandum will launch a landmark effort to evaluate algorithmic systems in civil rights areas — a framework that Upturn has advocated for in many civil rights contexts such as credit, employment, housing, and policing. This effort can materially improve peoples' lives, especially for marginalized communities protected by federal anti-discrimination laws. As one example, algorithmic testing has identified methods to mitigate pronounced racial disparities in IRS models used to select individuals for tax audits. By committing agencies to perform anti-discrimination testing of their algorithmic systems, the federal government can "serve as a model for state and local governments, businesses and others to follow in their own procurement and use of AI."[1] The final memorandum must require agencies to perform anti-discrimination testing of their systems and mitigate disparate impact.

However, these important measures risk being undercut by other provisions of the draft memorandum. In particular, the draft memorandum affords agencies significant leeway to waive compliance with the minimum practices. The Office of Management and Budget (OMB) should ensure that agencies, unless expressly and strictly prohibited by statute, explore ways to safely collect or infer the necessary demographic data to comply with the memorandum's minimum requirements. An agency should only be able to waive compliance with the memorandum's anti-discrimination testing provisions if two conditions are met: first, an agency determines that a specific legal barrier prevents them from collecting relevant demographic data, and second, an agency makes a written determination that no other method to perform the anti-discrimination testing is viable. In a large majority of cases, other methods — beyond direct collection of self-reported demographic data — should be available to support these efforts. As a result, it should be the rare case that agencies are able to waive compliance with the memorandum's anti-discrimination testing provisions.

1. **The final memorandum must contain two key provisions. First, agencies must perform anti-discrimination testing of their algorithmic systems. Second, agencies must be required to explore mechanisms to mitigate disparate impact.**

We applaud OMB's draft memorandum for broadly defining "rights-impacting" algorithmic systems and requiring agencies to conduct anti-discrimination testing of these systems. We are also heartened to see that the draft memorandum would further require agencies to mitigate a system's disparate impact, consistent with applicable law, once that disparate impact has been identified. It is critical that the provisions in Section 5(c)(v)(A)-(C) remain in OMB's final memorandum. When the federal government uses algorithmic systems in covered civil rights areas, it must ensure that those systems are regularly tested for disparate effects on a prohibited basis. Similarly, agencies must maintain reasonable measures to search for less discriminatory algorithms on an ongoing basis. These provisions are consistent with the administration's policy, as expressed through Executive Orders 14091 and 14110, as well as the AI Bill of Rights. Executive Order 14091 broadly required agencies to consider opportunities to "prevent and remedy discrimination, including by protecting the public from algorithmic discrimination."[2] Executive Order 14110 stated the administration's policy that it "is necessary to hold those developing and deploying AI accountable to standards that protect against unlawful discrimination and abuse, including in the justice system and the Federal Government,"[3] and it more broadly directed agencies to use their authorities to prevent and address discrimination in the use of automated systems.[4] The AI Bill of Rights called for designers, developers, and deployers of automated systems to "take proactive and continuous measures to protect individuals and communities from algorithmic discrimination and to use and design systems in an equitable way," and for "proactive equity assessments as part

[4] *See, e.g.,* Sections 6, 7, and 8 of Executive Order 14110.

of the system design," as well as "pre-deployment and ongoing disparity testing and mitigation."[5]

Such requirements are consistent with recent work by Upturn and our co-authors that argues that the duty to search for less discriminatory algorithms should be on the entities that develop and deploy predictive models.[6] In this case, that duty would fall to federal agencies and their contractors. An often unspoken premise throughout many efforts to regulate algorithmic systems is that for any given prediction problem, a single "correct" model exists. For example, when a bank seeks to predict default by borrowers, it is often assumed that a single "correct" model exists that best advances that goal, and that any deviation from this unique solution would necessarily entail a loss in performance. The implication is that pursuing goals like minimizing disparate impact will inevitably involve a tradeoff with model performance. But the assumption that a unique solution exists and that a fairness-accuracy tradeoff is inevitable are descriptively inaccurate. Work in computer science has established that there are almost always multiple possible models with equivalent accuracy for a given prediction problem — a phenomenon termed "model multiplicity."[7]

Multiplicitous models perform a given prediction task equally well, but can differ in other ways — from the features they use to make predictions, to the way they combine those features to make predictions, to the way their predictions are robust to changing circumstances. Critically, these equally performant models can have different levels of disparate impact. As a result, when an algorithmic system displays a disparate impact, model multiplicity suggests that other models that perform equally well, but have less

[6] *See* Emily Black, John Logan Koepke, Pauline T. Kim, Solon Barocas, Mingwei Hsu, *Less Discriminatory Algorithms*, Oct. 2, 2023, available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4590481.

[7] Several different terms have been used to describe related phenomena over years of computer science and statistical scholarship. The first to introduce the notion that various models could be equally effective at the same task was Leo Breiman. *See* Statistical Modeling: The Two Cultures, 16 Stat. Sci., no. 3, Aug. 2001 at 199, 200 (using the term "the Rashomon effect"). After this, Marx et al. resurfaced the idea that different models could have different predictions but similar performance, under the term "predictive multiplicity." *See* Charles Marx et al., *Predictive Multiplicity in Classification*, 119 Proc. Machine Learning Research. 6765 (2020). Black and Fredrikson displayed similar behavior on different classes of models in concurrent work. *See* Emily Black, Matt Fredrikson, *Leave-One-Out Unfairness*, in FAccT '21: Proceedings of the 2021 ACM Conference on Fairness, Accountability, and Transparency 285 (2021). Later, Black et al., introduced the term model multiplicity to encompass not only how similarly performant models different in their predictions, but also in their internals, which have impacts on the explanations of their predictions. *See* Emily Black, Manish Raghavan, Solon Barocas, *Model Multiplicity: Opportunities, Concerns, and Solutions*, in FAccT '22: Proceedings of the 2022 ACM Conference on Fairness, Accountability, and Transparency 850 (2022).

discriminatory effect, exist. In other words, in almost all cases, a less discriminatory algorithm (LDA) exists.

These insights about model multiplicity have profound ramifications for the legal, regulatory, and policy response to discriminatory algorithms and support OMB's anti-discrimination testing provisions. Under disparate impact doctrine, it makes little sense to say that a given algorithmic system is either "justified" or "necessary" if an equally accurate model that exhibits less disparate effects is available and discoverable with reasonable efforts. In fact, a close reading of the legal authorities over the decades reveals that the law has on numerous occasions recognized that the existence of a less discriminatory alternative is sometimes relevant to a defendant's burden of justification at the second step of disparate impact analysis.[8] As a result, when entities, including the federal government, use algorithmic systems in civil rights domains, they should have a duty to search for and implement LDAs before they can deploy a system with disparate effects. Without such a duty, developers are likely to be singularly focused on their chosen performance metric and will fail to identify ways to achieve the same goals with less discriminatory impact. OMB's memorandum is on solid legal and technical footing when it places this duty on federal agencies and contractors who develop and deploy rights-impacting algorithmic systems.

Imposing such a duty not only comports with the purposes behind our civil rights laws, which are intended to remove arbitrary barriers to full participation by marginalized groups in our nation's economic life, but also is practical, because model developers are in the best position to undertake a fruitful search for LDAs. Developing a model through the machine learning pipeline inherently involves testing and exploration of alternatives. A requirement that entities, such as federal agencies or their contractors, also test for disparate impact and compare model disparities throughout the model development process is straightforward and is not, by itself, burdensome.

Notably, this approach differs from past attempts to combat disparate impact, which would have required entities to prove the absence of less discriminatory alternatives in justifying their challenged practice. Historically, such approaches were

[8] Emily Black, John Logan Koepke, Pauline T. Kim, Solon Barocas, Mingwei Hsu, *Less Discriminatory Algorithms*, Oct. 2, 2023, at 16-28.

critiqued for requiring entities to prove a negative.[9] But a requirement that entities, including federal agencies, maintain reasonable steps to search for and implement LDAs is different. For one, there is functionally no uncertainty as to whether an LDA exists and there is a structured process for discovering them. For another, there are methods to quantify model properties, such as model performance, so as to make the baseline and alternative directly comparable. Moreover, it is unlikely that a developer has, without any specific exploration or dedicated process, randomly happened upon the globally optimal, least discriminatory model. As a result, OMB is justified in requiring federal agencies and their contractors to test their models for disparate impact and search for ways to mitigate disparate impact if it is identified.

2. For agencies to fulfill the "Additional Minimum Practices for Rights-Impacting AI" in 5(c)(v), they will need to meet certain basic requirements.

As currently written, the draft memorandum would require agencies to abide by a number of minimum practices for rights-impacting AI. For example, once designated rights-impacting, agencies will need to "assess whether their rights-impacting AI materially relies on information about a class protected by Federal nondiscrimination laws in a way that could result in algorithmic discrimination or bias against that protected class,"[10] "test their AI to determine whether there are significant disparities in the AI's performance across demographic groups,"[11] and "appropriately address disparities that have the potential to lead to discrimination, cause meaningful harm, or decrease equity, dignity, or fairness."[12] The draft memorandum also calls on agencies to stop using rights-impacting AI systems if "adequate mitigation of the disparity is not possible."[13]

---

[9] For example, when the Department of Housing and Urban Development reinstated their 2013 "Implementation of the Fair Housing act's Discriminatory Effects Standard" in 2023, the Department noted that their approach — adopting Title VII's burden-shifting framework — "makes the most sense because it does not require either party to prove a negative." *See* Department of Housing and Urban Development, "Reinstatement of HUD's Discriminatory Effects Standard," 88 Fed. Reg. 19450, 19490, March 31, 2023, available at https://www.federalregister.gov/documents/2023/03/31/2023-05836/reinstatement-of-huds-discriminatory-effects-standard.

[11] Id., Section 5(c)(v)(A)(2) at 18.

[12] Id.

[13] Id.

For agencies to fulfill these minimum practices, they will need to ensure that the following four related processes are in place.

1. Agencies must have a process in place to collect or infer the demographic data necessary to perform a disparate impact analysis. For example, absent information about the gender of people whose data is being used to evaluate a model's performance, developers will be unable to establish whether the model's performance and selection rate differs by gender.
2. Agencies must have a process in place for actually performing a disparate impact analysis. Notably, this must include a process for evaluating a model for disparate impact both prior to deployment and on an ongoing basis, once it has been deployed.[14]
3. Agencies must establish a process for searching for LDAs. This should apply to models being developed for the first time — where the search for LDAs can be incorporated into the model development process from the outset — and in addressing a disparate impact that has been identified after a model has been developed or deployed.
4. Agencies must establish processes to determine when they will adopt an LDA and for implementing the LDA in practice.

Absent any one of these processes, agencies will fail to fulfill the minimum requirements. In the final memorandum, or through other guidance to agencies, OMB should consider clarifying that it expects each of these four related processes to be in place for agencies to fulfill the minimum practices.

To ensure that agencies are best able to advance anti-discrimination testing of algorithmic systems, OMB should clarify that agencies, unless expressly and strictly prohibited by statute, should explore ways to safely collect or infer the necessary demographic data to comply with the memorandum's minimum requirements. In particular, some agencies may believe that they cannot effectively comply with the minimum requirements because they do not currently collect or infer the relevant demographic data necessary to perform anti-discrimination testing.[15] Agencies may point to a variety of reasons why they currently do not collect or infer relevant demographic information: a relevant statute may clearly prohibit the agency from directly collecting

[14] Section 5(c)(v)(C) at 20.
[15] *See, e.g.,* Arushi Gupta, Victor Y. Wu, Helen Webley-Brown, Jennifer King, Daniel E. Ho, *The Privacy-Bias Tradeoff: Data Minimization and Racial Disparity Assessments in U.S. Government*, in FAccT '23: Proceedings of the 2023 ACM Conference on Fairness, Accountability, and Transparency 492 (2023).

demographic data, a statute may prohibit agencies from sharing relevant information, agencies may have an institutional norm against collecting demographic data, or agencies may have limited experience in applying relevant inference methodologies. OMB should clarify that it expects agencies, where permissible under existing law, to make every effort to re-examine agency-level policies, directives, regulations, practices, or norms that would hinder them from performing anti-discrimination testing of their algorithmic systems. Such efforts are directly responsive to Executive Orders 14091 and 14110, the AI Bill of Rights, and the recommendations from the Equitable Data Working Group. And a number of agencies have experience and practice in inferring demographic data for anti-discrimination testing purposes when that data cannot be directly collected.[16]

One reason that agencies should be expected to make every effort to re-examine existing policies, regulations, directives, practices, or norms that would hinder anti-discrimination testing is that, currently, the draft memorandum states that "[e]xcept as prevented by applicable law and governmentwide guidance, agencies must apply the

[16] For example, the CFPB's Office of Research and Division of Supervision, Enforcement, and Fair Lending rely "on a BISG proxy probability for race and ethnicity in fair lending analysis conducted for non-mortgage products." *See* Consumer Financial Protection Bureau, *Using publicly available information to proxy for unidentified race and ethnicity: A methodology and assessment*, at 23 (2014), available at https://files.consumerfinance.gov/f/201409_cfpb_report_proxy-methodology.pdf. The CFPB also has a gender proxy methodology. *See* Consumer Financial Protection Bureau, *Semi-Annual Report of the Consumer Financial Protection Bureau*, Fall 2021, at 39, available at https://files.consumerfinance.gov/f/documents/cfpb_semi-annual-report-to-congress_2022-04.pdf. The FTC also relies on BISG/BIFSG in their research efforts. *See* Federal Trade Commission, *Protecting Older Consumers 2021-2022: A Report of the Federal Trade Commission*, at 39 (Oct. 18, 2022), available at https://www.ftc.gov/system/les/ftc_gov/pdf/P144400OlderConsumersReportFY22.pdf. The Centers for Medicare and Medicaid Services uses a specialized version of BISG, Medicare BISG, or MBISG. MBISG is currently used to conduct national, contract-level, stratified reporting of Medicare Part C & D performance data for Medicare Advantage Plans by race and ethnicity. *See* Centers for Medicare and Medicaid Services, *The Path Forward: Improving Data to Advance Health Equity Solutions* (November 2022), available at https://www.cms.gov/files/document/path-forwardhe-data-paper.pdf. The EEOC's Investigative Analytics Team uses BISG race estimation techniques when race/ethnicity is missing from administrative employment data provided by employers. *See* "Using Bayesian Improved Surname Geocoding (BISG) to Classify Race and Ethnicity in Administrative Employment Data by Industry: A Validation Study," available at https://ww2.amstat.org/meetings/jsm/2020/onlineprogram/AbstractDetails.cfm?abstractid=311006. The Office of the Assistant Secretary for Planning and Evaluation and the Centers for Medicare and Medicaid Services have funded research supporting the development and advancement of methods like BIFSG. *See* Melony E. Sorbero, Roald Euller, Aaron Kofner, Marc N. Elliott, *Imputation of Race and Ethnicity in Health Insurance Marketplace Enrollment Data, 2015-2022 Open Enrollment Periods*, (2022) available at https://www.rand.org/content/dam/rand/pubs/research_reports/RRA1800/RRA1853-1/RAND_RRA1853-1.pdf. And the Department of the Treasury recently relied upon BIFSG for the first time to conduct tax analysis by race and Hispanic origin. *See* Robin Fisher, *Estimation of Race and Ethnicity by Re-Weighting Tax Data*, Department of the Treasury, Office of Tax Analysis, Technical Paper 11, January 2023, available at https://home.treasury.gov/system/files/131/TP-11.pdf; *also see* Julie-Anne Cronin, Portia DeFilippes, Robin Fisher, *Tax Expenditures by Race and Hispanic Ethnicity: An Application of the U.S. Treasury Department's Race and Hispanic Ethnicity Imputation*, Department of the Treasury, Office of Tax Analysis, Working Paper 122, January 2023, available at https://home.treasury.gov/system/files/131/WP-122.pdf.

minimum practices in this section to safety-impacting and rights-impacting AI by August 1, 2024, or else stop using the AI until it becomes compliant."[17] As drafted, we take this provision to mean that if any agency claims that an existing statute prevents it from complying with the minimum practices, they do not necessarily have to stop using the AI system, even as it remains non-compliant. OMB should require agencies to specify exactly which provision of applicable law prevents them from applying the minimum practices. For example, if an agency determines that an existing legal barrier would prevent them from collecting the relevant demographic information to perform anti-discrimination testing of algorithmic systems, and separately also determines that no viable alternative methods to perform the testing are viable, the agency should be required to provide that determination to OMB in writing. The determination should also clearly state why other methods are insufficient to enable anti-discrimination testing.[18] Absent specific legal prohibition or other governmentwide guidance, if an agency is unable to perform anti-discrimination testing of an algorithmic system, the agency must cease use of that system.

It is key that OMB not only require agencies to point to the legal barrier, but to also provide a detailed justification as to why no other viable alternative method would enable them perform the relevant anti-discrimination testing. Recent work on models used by the IRS to select individuals for audits provides a clear example of how agencies can perform anti-discrimination testing in the absence of directly collected demographic data.[19] The goal of these models was to predict when an individual was at high risk of tax noncompliance. Because the IRS "does not systematically collect data on taxpayer race, either directly via tax returns or indirectly via merging tax data with administrative data on race from other agencies," researchers turned to Bayesian Improved First Name Surname Geocoding (BIFSG) "to estimate the probability that a taxpayer is Black (and non-Hispanic) based on the first name, last name, and location of the taxpayer."[20]

As the researchers show, different problem formulations — the translation of a

[17] Proposed Memorandum for the Heads of Executive Departments and Agencies, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence, Section 5(c) at 13.
[18] Especially when agencies seek to waive compliance with the minimum practices articulated in Section 5(c)(v) of the memorandum, that waiver must be public. This should include the agency's rationale and justification for the waiver, including the specific provision of law that would prevent an agency from complying.
[19] Emily Black, Hadi Elzayn, Alexandra Chouldechova, Jacob Goldin, Daniel E. Ho, *Algorithmic Fairness and Vertical Equity: Income Fairness with IRS Tax Audit Models*, in FAccT '22: Proceedings of the 2022 ACM Conference on Fairness, Accountability, and Transparency 1479 (2022); Hadi Elzayn, Evelyn Smith, Thomas Hertz, Arun Ramesh, Robin Fisher, Daniel E. Ho, Jacob Goldin, *Measuring and Mitigating Racial Disparities in Tax Audits*, Stanford Institute for Policy Research Working Paper (2023), available at https://siepr.stanford.edu/publications/working-paper/measuring-and-mitigating-racial-disparities-tax-audits.
[20] Elzayn, et al., *Measuring and Mitigating Racial Disparities in Tax Audits*, at 19.

real-world problem into a machine learning task — can lead to different results. When the problem was formulated to predict whether individuals are likely to be noncompliant *at all* (with binary labels, describing if an individual was compliant or not) — as opposed to predicting the amount of money they failed to report (with continuous labels of the amount of taxes owed) — disproportionately more lower-income and Black individuals were selected for audit.[21] As a result, changing the model's prediction task from the *likelihood of noncompliance* to the *expected amount of noncompliance* shifted the distribution of those recommended for audit by the algorithm from lower-income and Black individuals towards higher-income and more white individuals, reducing stark disparities.[22] Without BIFSG, the researchers would not have been able to perform the basic disparate impact testing, let alone search for an alternative approach that reduced disparities.

3. The final memorandum should ensure that Chief AI Officers do not have such wide latitude to invoke a waiver from the minimum practices for rights-impacting AI.

As currently drafted, OMB's memorandum allows CAIOs to:

> waive one or more of the [minimum practices for safety-impacting and rights-impacting artificial intelligence] for a specific covered AI application or component after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations.[23]

The draft memorandum defines "waiving individual applications of AI from elements of Section 5 of this memorandum" as one of the responsibilities of a CAIO.[24] As drafted, these provisions would likely allow many safety- and rights-impacting algorithmic systems to evade scrutiny. OMB should make several changes to the memorandum to ensure that CAIOs do not routinely seek waivers and undermine the purpose of the memorandum.

---

[21] Id., 36-37.
[22] Id.
[23] Proposed Memorandum for the Heads of Executive Departments and Agencies, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence, Section 5(c)(iii) at 14.
[24] Id., Section 3(b)(ii)(O) at 6.

First, OMB should clarify that agencies should narrowly construe their ability to waive compliance with the minimum practices. For example, the drafted text suggests that if fulfilling the requirement would "increase risks to safety or rights overall," then CAIOs may waive compliance. OMB should clarify that when it uses the term "risks to safety or rights," it is specifically referring to the aforementioned purposes that are presumed to be safety-impacting or rights-impacting, and not more generally referring to safety or rights. As currently drafted, agencies may misunderstand the relevant analysis.

Second, OMB should clarify what it expects to be contained within the system-specific risk assessments. In particular, for rights-impacting systems, OMB should clarify that CAIOs must specifically describe how complying with the minimum requirements would "increase risks to rights." OMB should consider requirements that the Department of Justice's Civil Rights Division and relevant civil rights officials in each agency be consulted when a CAIO seeks a waiver because compliance with the minimum practices would increase risks to rights. Rarely, if ever, should it be possible for an agency to claim that the very act of documentation, testing, evaluation, ongoing monitoring, and risk mitigation — steps that by their nature are designed to protect rights — would somehow increase risks to rights.

Third, OMB should provide clear examples of what it means for fulfillment of the minimum practices to create "an unacceptable impediment to critical agency operations."[25] As drafted, CAIOs appear to retain sole authority and discretion to determine that abiding by the minimum practices would impede "critical agency operations" and to determine what those specific operations are. If CAIOs take an expansive view of what constitutes an "unacceptable impediment to critical agency operations," this exception would swallow the rule. OMB could elaborate that impeding critical agency operations means such significant and extraordinary diversion of staff time and resources that the agency risks being unable to fulfill its core mission for the American people. OMB should expect that some agencies may have to divert some staff capacity and resources to ensure compliance with the minimum practices. That fact alone cannot constitute "an unacceptable impediment to critical agency operations."

[25] Id., Section 5(c)(iii) at 14.

4. The final memorandum should ensure that agencies clearly document their anti-discrimination testing process and efforts. It should also require public reporting of these efforts in the AI use case inventories.

As currently drafted, the memorandum suggests that "[a]gencies must document their implementation of these practices and be prepared to report them to OMB, either as a component of the annual AI use case inventory … or on request as determined by OMB."[26] Separately, the draft memorandum says that starting in 2024 "agencies will be required … to identify and report additional detail on how they are using safety-impacting and rights-impacting AI" and "how they are managing those risks."[27]

It is critical that the final memorandum requires agencies to document their implementation of the minimum practices, so agencies can actually receive effective, constructive feedback, which agencies are required to solicit from "affected groups, including underserved communities, in the design, development, and use of the AI."[28] Such a provision is important: agencies should receive ongoing feedback — through public listening sessions, public hearings, formal comments, and more — from affected communities regarding their use of algorithmic systems. But without transparent documentation as to the choices made when developing and using those systems, as well as in assessing and mitigating disparate impact of those systems, it will be difficult for feedback from affected groups to be effective.

Specifically, it is important that the final memorandum require agencies to clearly document how they approached relevant anti-discrimination testing of algorithmic systems and document how they searched for less discriminatory algorithms. Inherent to this process is a determination that sufficient mitigation of algorithmic discrimination is possible. When an agency identifies that an algorithmic system has disparities and discovers a method to mitigate that discrimination, it should clearly document why they believe that mitigation is sufficient to continue use of the system, and receive feedback from affected groups if they believe that mitigation is sufficient. Similarly, when an agency identifies that an algorithmic system "materially relies on information about a class protected by Federal nondiscrimination laws in a way that could result in algorithmic discrimination or bias against that protected class," it must "cease the use of the information before using the AI for decision-making."[29] This inherently requires a

[28] Id., Section 5(c)(v)(B) at 19.
[29] Id., Section 5(c)(iv)(A)(1) at 15.

determination as to when a system materially relies on proxies for a protected class. That determination should be documented and justified.

Ultimately, the final memorandum should ensure that future AI use case inventories describe these efforts or ensure that agencies otherwise make this documentation publicly available in an accessible format.

We welcome further conversations on these important issues. If you have any questions, please contact Logan Koepke (Project Director, logan@upturn.org) and Harlan Yu (Executive Director, harlan@upturn.org).

Civil Society Comment on White House OMB draft guidance on Artificial Intelligence

December 5, 2023

Regarding the Office of Management and Budget's Request for Comment on its Draft Memo andum on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"
https://www.regulations.gov/document/OMB-2023-0020-0001

Dear Director Young,

We write today in response to your recent request for comment regarding draft guidance on artificial intelligence, representing the perspectives of advocates and organizations devoted to government transparency, accountability, and ethics.

President Biden's Executive Order issued on October 30, 2023 requires each agency to designate a Chief AI Officer (CAIO) within 60 days of the date of the issuance of this memorandum.

Regrettably, the E.O. does not address making the use of AI in the federal government accountable to anyone *outside of* the Executive Branch, nor establish any principles, proposed rules, or practices to make the decisions of how and when to use AI in any way open to public scrutiny. That failure to incorporate openness and public accountability is replicated in this Draft Memorandum. Specifically, we have serious concerns regarding language around the specific minimum risk management practices for uses of AI that impact the rights and safety of the public.

In footnote 8 in the draft guidance, OMB states that "Agencies must only publicly report use cases to the extent practicable and consistent with applicable law and government-wide guidance, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information." Such hedging language raises deep accountability concerns.

We assess that developing, implementing, and driving good governance of artificial intelligence across the massive enterprises of the federal government will require the White House to apply key lessons from the past decade of open government data. In the continued absence of the formal guidance from OMB on the OPEN Government Data Act[1] mandated by Congress in 2018, we still see no broad standardization and compliance with enterprise data inventories, much less enterprise artificial intelligence (AI) uses.

[1] https://data.gov/open-gov/

While the CIO Council has done important work in creating a schema[2] for AI use inventories, agencies are not universally adopting and implementing it, in parallel to the uneven compliance with enterprise data inventories a decade after President Obama's memorandum on machine-readable data.

We now see an opportunity to do both, moving forward with a holistic strategy for proactive disclosures across the United States government in the aftermath of the sunsetting of FOIA Online this fall.

We believe that public participation and collaboration are essential to rebuilding and keeping public trust in government, which remains at historic lows. This context requires fresh thinking and recommitment to good governance.

As with any government-wide initiative, successful implementation of this guidance will depend on senior leadership at the White House accountable for transparency and good governance., and increased human capacity at the Office of Management and Budget in the office of the U.S. Chief Information Officer.

Accordingly, we propose the following approaches to strengthen AI governance:

[2] https://www.cio.gov/assets/resources/2023-Guidance-for-AI-Use-Case-Inventories.pdf

Recommendation 1: Establish an AI Oversight Board

The Executive Order upon which this RFC is based notes that the United States must "foster public trust and confidence in AI" and must "protect civil liberties, privacy, and American values."

As you are well aware, the private sector is deeply interested in the federal government's engagement in AI. Indeed, the White House and executive branch entities have met numerous times with corporate leaders in this field. The private sector has legitimate interests, but they do not always overlap with those of civil society accountability advocates.

Open, transparent, and accountable government are American values that are key to fostering and protecting all *other* values. We have variously worked for decades, both inside the government at times and outside in civil society, to promote, advance, and protect these core values. For this reason, we are deeply concerned that a draft OMB regulation has the potential to not only affect how the government does its work but also to profoundly affect how – and *if* -- the American public will know how our government is deploying this radically new technology and how/whether they have a real-time say in how it is being deployed.

As an example, the Draft Memorandum recommends that agencies "consider... fairness and non-discrimination" "in accordance with law." The text does not propose a definition of fairness or non-discrimination in this context, nor does it instruct agencies to cooperate in arriving at a shared definition..

The Draft Memorandum notes that "applications of AI could increase human autonomy," but encourages agencies to "consider the sufficiency of existing or evolving *legal, policy, and regulatory environments before contemplating additional measures for disclosure and transparency*." The OMB's guidance interprets "appropriate disclosure and transparency" as "context specific."

As comments submitted by the Harvard Cyberlaw Clinic note, however, this recommendation assumes that disclosure and transparency are tradeoffs that

require sacrificing the benefits of AI. Transparency, as they note, should not be cast as a “necessary evil” but rather as an essential mode of protecting individual and community rights against dangers posed by AIs. Elsewhere, while OMB is correct that the need for disclosure and transparency is greater where the potential harms are more significant, we agree with Harvard Cyberlaw that it is dangerous to suggest that the potential benefits of an AI application could justify use of a non-transparent “black box” technology.

For these reasons, we urge the White House to create in the Executive Office a public-facing Oversight Board. This board would answer to the President and be composed of civil society experts in fields including cognitive science, civil liberties, and public-interest law who have demonstrated expertise in ethical, regulatory, and rights-based approaches to AI.

Recommendation 2: Appoint a U.S. Chief AI Officer and U.S. Chief Ethics Officer

We believe personnel is policy. Accordingly, we recommend that President Biden appoint the first White House AI Officer and the first U.S. Chief Ethics Officer, to work with a new U.S. Chief Data Officer and U.S. CIO (currently Clare Martorana) to oversee implementation of the AI EO and the OPEN Government Data Act.

We assess that there will also need to be direct, ongoing presidential involvement with the Justice Department, Department of Homeland Security, and all civilian agencies to drive the regular, accurate accounting of their uses of artificial intelligence in public, proactive disclosures online.

Recommendation 3: Institutionalize Good Governance Around AI Use

The most effective enforcement mechanisms for mandatory disclosure, combine congressional intent with agency capacity to implement such intent, and regular, ongoing updates on progress that do not require adversarial oversight.

Scientific and regulatory agencies that have proactive disclosure of public data, information, and knowledge as an express part of their mission are typically better resourced to lead in these areas, particularly culturally. The quality and periodicity of such disclosures, however, varies across these agencies, as we have seen from the Federal Election Commission to the Securities and Exchange Commission to NASA and the EPA.

The political will to resource agencies adequately to build modernized systems has often been lacking, particularly at the National Archives and Records Administration. Agencies need resources and hiring flexibility to attract and retain experienced product managers and designers, who can work with best-in-class private sector engineers to upgrade and improve data collection, structuring, and disclosures.

The most effective enforcement mechanisms for ongoing data quality are typically associated with a thriving, healthy community of actors, inside *and* outside of government that expect and consume regular disclosures of trustworthy quality.

A useful example of this dynamic exists at the Bureau of Labor and Statistics, which regularly releases economically significant employment numbers. There are legal consequences for disclosing these numbers early and a Greek chorus of upset when they are not available during a shutdown.

The components of agencies that conduct scientific research and are committed to publishing data, methodology, and code with it are well suited to speak to the challenges and rewards from these approaches.

The lesson from the open government data world that is most applicable here, however, is a requirement for strong, dedicated leadership from the White House Office of Management and Budget coupled with ongoing coordination across agencies through inter-agency working groups.

The mothballed federal data strategy is a useful framework for thinking about what should be happening right now, and could be happening next, with respect to mandatory disclosures of data and AI cases. The Chief Data Officers Council and Chief Information Officers Council are key coordinating bodies for his work that will need to replenish both talent and resources in 2024 to improve upon the failures of the last decade.

Recommendation 4: Enterprise AI inventories must be comprehensive & modern, not static PDFs of "top uses"

Every agency would stand up a machine, readable file of AI used cases at a rebuilt agency.gov/open page, which is updated weekly, and federated into a database operated by the General Services Administration, with an API at Data.gov.

This weekly report would then flow into a database maintained by the General Services Administration, with an API at Data.gov. The White House, agencies, GAO, Congress, the press, watchdogs, and American people would all be able to access this to see at a glance, who was up-to-date, and whether they were compliant with the schema.

This would be coupled with narratives that *explain* these uses on an interactive table at an agency open government page and any associated waivers. Each use case should also have an independent, risk-limiting audit with sign off by a third-party regarding the risk of human rights or civil liberties violations, or a linked waiver signed by an accountable official explaining.

Agencies should present these inventories to the public as an interactive table based on an open database, *not* a static PDF. Agencies should evaluate whether publishing structured data as .CSV, JSON, or XML, for example, might lead to improved display through interactive dashboards on responsive websites or third party use in search engines or news media.

It is not inconceivable that agencies might embed a chat function that people can query about these use cases, as an innovative application of AI to explain what is disclosed, how, and with what intent and impact. We favor the government publishing a machine-readable file for each agency, as they do on agency.gov/data, hosting a prize internally to come up with the best in class approaches, and hosting a challenge *externally* through Challenge.gov to leverage the collective intelligence of the American people to improve over time.

Recommendation 5: Create a secure means for all three branches of government to access and review all AI use cases across government

There should be a strong predisposition to disclose uses of AI in classified programs, without disclosing the programs themselves. These efforts should be made with an eye towards broader, declassification efforts, and rigorous examination of the purpose of keeping these kinds of disclosures from the broader public.

Agencies should follow the above regimen for disclosure for use cases that cannot be disclosed under such a rubric, with ongoing updates. It is essential that national security officials, the so-called “Gang of Eight” in Congress, and members of the Privacy and Civil Liberties Oversight Board (PCLOB) can all access and regularly assess the expanding portfolio of use cases of AI across government. Secrecy around 21st century tools and technologies must not hinder the oversight and accountability essential to preserving the constitutional protections that officials seek to protect and defend.

Recommendation 6: Lead on creating state, local, and international standards for AI disclosures

The United States is not operating alone. We should be cooperating and collaborating with other democracies to improve how we disclose the data, code, and uses of artificial intelligence. In an ideal situation, these might be combined into a global catalog.

In the interim, the White House should be encouraging states and cities to reboot their open government pages with proactive, machine-readable disclosures of data, code, and artificial intelligence use inventories.

These use cases should be federated throughout the United States government, where possible. The federal government should allocate dedicated capacity to help do so, from a cultural, technical, and design perspective, working through US Digital Service, US Digital Corps, Presidential Innovation Fellows and 18F. It would also be sensible to seek to collaborate with the legislative and judiciary branch, should Congress and the courts seek to catalog all federal uses of artificial intelligence and seek the consent of the governed.

We also assess that a multi-stakeholder approach can be applied at federal agencies, through the creation of advisory councils – or AI subcommittee of existing ones – that includes people with expertise in human rights, design, and social sciences o evaluate ongoing programs and provide quarterly updates at public meetings. Relevant models could be found in the President's Council on Science and Technology, PCLOB, and Public Interest Declassification Board (PIDB), all of which are implicated with this work.

It would be also useful and appropriate for the United States to add a new commitment to implement the disclosure elements of this AI order to the Fifth National Action Plan for open government for the Open Government Partnership[1], which includes a mechanism to add such commitments and is the natural vessel for such an effort. The US government could then show its work at the next Summit for Democracy in 2024.

RE: Comments of the Connected Health Initiative to the Office of Management and Budget on its Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Ms. Martinez:

The Connected Health Initiative (CHI) appreciates the opportunity to submit views to the Office of Management and Budget (OMB) on its draft Memorandum that would establish new agency requirements in areas of artificial intelligence (AI) governance, innovation, and risk management, and would direct agencies to adopt specific minimum risk management practices for uses of AI that impact the rights and safety of the public.[1]

I. General Views of the Connected Health Initiative on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

CHI is the leading effort by stakeholders across the connected health ecosystem to responsibly encourage the use of digital health innovations and support an environment in which patients and consumers can see improvements in their health. We seek essential policy changes that will help all Americans benefit from an information and communications technology-enabled American healthcare system. For more information, see www.connectedhi.com. OMB's strategy, in response to President Biden's Executive Order on Safe, Secure, and Trustworthy Development and Use of AI, and the efforts of numerous agencies with respect to AI policy and regulation directly impact the app economy. We support OMB's goal of ensuring federal agencies instill proper safeguards that prioritize economic and national security, privacy, civil liberties and more when utilizing AI and other advancements in technology and innovation.

[1] 88 FR 75625; OMB Draft Memorandum, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence*, https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf

Today, there are already many examples of AI systems, powered by streams of data and advanced algorithms, improving healthcare by preventing hospitalizations, reducing complications, decreasing administrative burdens, and improving patient engagement. AI systems offer the promise to rapidly accelerate and scale such results and drive a fundamental transformation of the current disease-based system to one that supports prevention and health maintenance. Nonetheless, AI in healthcare has the potential to raise a variety of unique considerations for U.S. policymakers.

Many organizations are taking steps to proactively address adoption and integration of AI into health care and how it should be approached by clinicians, technologists, patients and consumers, policymakers, and other stakeholders. Building on these important efforts, CHI's Health AI Task Force has taken a critical further step in developing cross-stakeholder consensus principles for the creation, deployment, and maintenance of AI across healthcare settings in its *Policy Principles for Artificial Intelligence in Health*.[2]

First, AI systems deployed in healthcare must advance the "quadruple aim"[3] by improving population health; improving patient health outcomes and satisfaction; increasing value by lowering overall costs; and improving clinician and healthcare team well-being. Second, we strongly encourage OMB to align its' memorandum to align with CHI's comprehensive health AI policy principles:

> **National Health AI Strategy:** Many of the policy issues raised below involve significant work and changes that will impact a range of stakeholders. The cultural, workforce training and education, data access, and technology-related changes will require strong guidance and coordination. Given the significant role of the government in the regulation, delivery, and payment of healthcare, as well as its role as steward of significant amounts of patient data, a federal healthcare AI strategy incorporating guidance on the issues below will be vital to achieving the promise that AI offers to patients and the healthcare sector. Other countries have begun to take similar steps (e.g., the UK's Initial Code of Conduct for Data Driven Care and Technology) and it is critical that U.S. policymakers collaborate with provider organizations, other civil society organizations, and private sector stakeholders to begin similar work.
>
> **Research:** Policy frameworks should support and facilitate research and development of AI in healthcare by prioritizing and providing sufficient funding while also ensuring adequate incentives (e.g., streamlined availability of data to developers, tax credits) are in place to encourage private and non-profit sector research. Clinical validation and transparency research should be prioritized

[2] Available at https://connectedhi.com/wp-content/uploads/2022/02/Policy-Principles-for-AI.pdf, and also included as **Appendix A**.

[3] Bodenheimer T, Sinsky C. From triple to quadruple aim: care of the patient requires care of the provider. *Ann Fam Med*. 2014;12(6):573-576.

and involve collaboration among all affected stakeholders who must responsibly address the ethical, social, economic, and legal implications that may result from AI applications in healthcare. Further, public funding and incentives should be conditioned on promoting the medical commons in order to advance shared knowledge, access, and innovation.

Quality Assurance and Oversight: Policy frameworks should utilize risk-based approaches to ensure that the use of AI in healthcare aligns with recognized standards of safety, efficacy, and equity. Providers, technology developers and vendors, health systems, insurers, and other stakeholders all benefit from understanding the distribution of risk and liability in building, testing, and using healthcare AI tools. Policy frameworks addressing liability should ensure the appropriate distribution and mitigation of risk and liability. Specifically, those in the value chain with the ability to minimize risks based on their knowledge and ability to mitigate should have appropriate incentives to do so. Some recommended guidelines include:

- Ensuring AI in healthcare is safe, efficacious, and equitable.
- Ensuring algorithms, datasets, and decisions are auditable and when applied to medical care (such as screening, diagnosis, or treatment) are clinically validated and explainable.
- AI developers should consistently utilize rigorous procedures and must be able to document their methods and results.
- Those developing, offering, or testing healthcare AI systems should be required to provide truthful and easy to understand representations regarding intended use and risks that would be reasonably understood by those intended, as well as expected, to use the AI solution.
- Adverse events should be timely reported to relevant oversight bodies for appropriate investigation and action.

Thoughtful Design: Policy frameworks should require design of AI systems in healthcare that are informed by real-world workflow, human-centered design and usability principles, and end-user needs. Also, AI systems should help patients, providers, and other care team members overcome the current fragmentation and dysfunctions of the healthcare system. AI systems solutions should facilitate a transition to changes in care delivery that advance the quadruple aim. The design, development, and success of AI in healthcare should leverage collaboration and dialogue between caregivers, AI technology developers, and other healthcare stakeholders in order to have all perspectives reflected in AI solutions.

Access and Affordability: Policy frameworks should ensure AI systems in healthcare are accessible and affordable. Significant resources may be required to scale systems in healthcare and policymakers must take steps to remedy the

uneven distribution of resources and access. There are varied applications of AI systems in healthcare such as research, health administration and operations, population health, practice delivery improvement, and direct clinical care. Payment and incentive policies must be in place to invest in building infrastructure, preparing personnel and training, as well as developing, validating, and maintaining AI system with an eye toward ensuring value. While AI systems should help transition to value-based delivery models by providing essential population health tools and providing enhanced scalability and patient support, in the interim payment policies must incent a pathway for the voluntary adoption and integration of AI systems into clinical practice as well as other applications under existing payment models.

Ethics: Given the longstanding, deeply rooted, and well-developed body of medical and biomedical ethics, it will be critical to promote many of the existing and emerging ethical norms of the medical community for broader adherence by technologists, innovators, computer scientists, and those who use such systems. Healthcare AI will only succeed if it is used ethically to protect patients and consumers. Policy frameworks should:

- Ensure AI in healthcare is safe, efficacious, and equitable.
- Ensure that healthcare AI solutions align with all relevant ethical obligations, from design to development to use.
- Encourage the development of new ethical guidelines to address emerging issues with the use of AI in healthcare, as needed.
- Ensure consistency with international conventions on human rights.
- Ensure that AI for health is inclusive such that AI solutions beneficial to patients are developed across socioeconomic, age, gender, geographic origin, and other groupings.
- Reflect that AI for health tools may reveal extremely sensitive and private information about a patient and ensure that laws protect such information from being used to discriminate against patients.

Modernized Privacy and Security Frameworks: While the types of data items analyzed by AI and other technologies are not new, this analysis provides greater potential utility of those data items to other individuals, entities, and machines. Thus, there are many new uses for, and ways to analyze, the collected data. This raises privacy issues and questions surrounding consent to use data in a particular way (e.g., research, commercial product/ service development). It also offers the potential for more powerful and granular access controls for patients. Accordingly, any policy framework should address the topics of privacy, consent, and modern technological capabilities as a part of the policy development process. Policy frameworks must be scalable and assure that an individual's health information is properly protected, while also allowing the flow of health information. This information is necessary to provide and promote high-quality

healthcare and to protect the public's health and well-being. There are specific uses of data that require additional policy safeguards, i.e., genomic information. Given that one individual's DNA includes potentially identifying information about even distant relatives of that individual, a separate and more detailed approach may be necessary for genomic privacy. Further, enhanced protection from discrimination based on pre-existing conditions or genomic information may be needed for patients. Finally, with proper protections in place, policy frameworks should also promote data access, including open access to appropriate machine-readable public data, development of a culture of securely sharing data with external partners, and explicit communication of allowable use with periodic review of informed consent.

Collaboration and Interoperability: Policy frameworks should enable eased data access and use through creating a culture of cooperation, trust, and openness among policymakers, health AI technology developers and users, and the public.

Workforce Issues and AI in Healthcare: The United States faces significant demands on the healthcare system and safety net programs due to an aging population and a wave of retirements among practicing care workers. And lower birth rates mean that fewer young people are entering the workforce. Successful creation and deployment of AI-enabled technologies which help care providers meet the needs of all patients will be an essential part of addressing this projected shortage of care workers. Policymakers and stakeholders will need to work together to create the appropriate balance between human care and decision-making and augmented capabilities from AI-enabled technologies and tools.

Bias: The bias inherent in all data as well as errors will remain one of the more pressing issues with AI systems that utilize machine learning techniques in particular. In developing and using healthcare AI solutions, these data provenance and bias issues must be addressed. Policy frameworks should:

- Require the identification, disclosure, and mitigation of bias while encouraging access to databases and promoting inclusion and diversity.
- Ensure that data bias does not cause harm to patients or consumers.

Education: Policy frameworks should support education for the advancement of AI in healthcare, promote examples that demonstrate the success of AI in healthcare, and encourage stakeholder engagements to keep frameworks responsive to emerging opportunities and challenges.

- Patients and consumers should be educated as to the use of AI in the care they are receiving.

- Academic/medical education should include curriculum that will advance healthcare providers' understanding of and ability to use health AI solutions. Ongoing continuing education should also advance understanding of the safe and effective use of AI in healthcare delivery

II. The Connected Health Initiative's Responses to Specific Questions Posed in the Request for Public Comment

Noting our general support for federal agencies' efforts to appropriately address AI governance, innovation, and risk management, we offer the following responses to specific questions posed in OMB's request for comments.

Question #1: The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers (CAIO) sufficiently flexible and achievable for the breadth of covered agencies?

CHI generally supports the roles, responsibilities, seniority, position, and reporting structure proposed for CAIOs, however:

- While we appreciate the noted role of "Promoting AI Innovation," we urge that OMB include within this responsibility the imperative to consult with and consider the role and needs of the private sector who will have a critical role in creating and deploying AI innovations within agencies.
- The responsibility of "Managing Risks from the Use of AI" should be updated to reflect the need to scale risk management practices according to the harm presented by the use, consistent with well-established risk management practices[4] as well as the National Institute of Standards and Technology's foundations in its AI Risk Management Framework.[5]

Question #2: What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Initially, CHI notes that AI-related risks can and should initially be addressed under agencies' existing authorities and functions, as the functions the AI at issue is providing

[4] E.g., https://www.iso.org/standard/77304.html.

[5] https://www.nist.gov/itl/ai-risk-management-framework.

are the same that humans would produce, only much faster. Agencies will need flexibility to determine whether or not they need to create a new body to address AI, aside from existing constructs used to address privacy, IT, data, or other topics. OMB's vision of AI Governance Bodies within agencies can and should facilitate coordination in risk management practices across relevant groups and take appropriate steps to address gaps or inefficiencies identified (e.g., overlapping scopes across multiple groups).

Question 3: How can OMB best advance responsible AI innovation?

CHI strongly encourages agencies alignment with its comprehensive health AI policy principles which reflect the agreement of key stakeholder groups from across the healthcare ecosystem.[6] Notably, OMB should ensure that agency approaches to risk management, whether in intra-agency policy or in regulation/guidance to those the agency regulates, are based on established risks and harms (not edge/rare use cases or hypotheticals); that measures taken to manage risks are scaled to the harms presented; and that those who know or should know about a risk and have the ability to take action to mitigate that risk have the appropriate incentives to do so. Further, agencies can do much to advance responsible AI innovation through efforts to build their internal enterprise capacity and through their procurement policies (e.g., specify thoughtful AI design requirements).

Question 4: With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

The potential benefits of generative AI are extensive and could revolutionize day-to-day business operations and effectiveness across the federal government. With appropriate safeguards in place, generative AI offers numerous benefits, including but not limited to content generation (e.g., text, speech, images, video, etc.); streamlined software engineering/coding capabilities; drastically improved and more accessible interfaces for citizen services (e.g., text-to-speech solutions); and augmented research capabilities. Healthcare is no exception: generative AI offers the possibility of introducing new efficiencies at numerous levels, from backend/administrative to supporting key assessments/decisions made by humans in, for example, improving workflow, conducting better clinical trials, and supporting clinical decisions, amongst many other use cases.[7] Agencies impacting healthcare must responsibly leverage generative AI tools for these purposes. Generative AI will also be critical in accomplishing the

[6] Connected Health Initiative, *Policy Principles for Artificial Intelligence in Health*, accessible at https://connectedhi.com/wp-content/uploads/2022/02/Policy-Principles-for-AI.pdf.

[7] Shoja MM, Van de Ridder JMM, Rajput V. The Emerging Role of Generative Artificial Intelligence in Medical Education, Research, and Practice. Cureus. 2023 Jun 24;15(6):e40883. doi: 10.7759/cureus.40883. PMID: 37492829; PMCID: PMC10363933.

transition to value-based care (the shift from a quantity-based system to one that focuses on quality).[8]

Question 5: Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

CHI believes that memorandum's definitions alone should provide the agencies with the direction they need to address what is and is not "safety-impacting" or "civil rights-impacting" consistent with the need for agency flexibilities acknowledged elsewhere in the memorandum. A static list will be seen as inappropriately including some use cases or not including others, and the nature of the development of AI means that such a list will quickly become outdated. We therefore recommend that OMB remove its list of "safety-impacting" or "civil rights-impacting" use cases from the memorandum.

Question 6: Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Yes, the minimum practices identified for safety and rights impacting AI are generally consistent with the Connected Health Initiative's recommended approach to health AI risk management. We urge OMB, and all federal agencies, to be mindful of the negative impacts of imposing such requirements on AI use cases that may not always be high risk. Again, we urge OMB to update its memo to emphasize that federal agencies leverage a scaled and outcome-focused approach to AI risk management, which we discuss above and in our foundational AI policy principles. OMB's memo should align with CHI's policy principles for AI, as well as approaches being taken in the NIST AI RMF and leading standards such as ISO/IEC 23894:2023.

Question 7: What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

We recommend that OMB align its memorandum with the following:

- Connected Health Initiative's *Policy Principles for Artificial Intelligence in Health:* https://connectedhi.com/wp-content/uploads/2022/02/Policy-Principles-for-AI.pdf
- Connected Health Initiative's *Advancing Transparency for Artificial Intelligence in the Healthcare Ecosystem*: https://connectedhi.com/wp-

[8] Connected Health Initiative, *Leveraging Digital Health to Realize Value-Based Care*, accessible at https://connectedhi.com/wp-content/uploads/2022/02/LeveragingDigitalHealth.pdf.

content/uploads/2022/02/AdvancingTransparencyforArtificialIntelligenceintheHealthcareEcosystem.pdf

- Connected Health Initiative's *Good Machine Learning Best Practices*: https://connectedhi.com/wp-content/uploads/2022/04/CHIAITaskForceGMLPs.pdf.
- NIST's AI Risk Management Framework: https://www.nist.gov/itl/ai-risk-management-framework
- ISO/IEC 23894:2023 (Information technology, Artificial intelligence, Guidance on risk management): https://www.iso.org/standard/77304.html

Question 8: What kind of information should be made public about agencies' use of AI in their annual use case inventory?

CHI welcomes the memorandum's requirement that agencies provide adequately detailed and generally accessible documentation for the AI they use to provide its users and the general public of its practices, while taking measures to protect intellectual property, national security, and other important interests. CHI welcomes the release of information that will provide easy-to-understand insights into how agencies are (1) ensuring AI is safe, efficacious, and ethical/equitable; and (2) utilizing procedures to test for efficacy, safety, and equity. For example, the public will benefit from learning about how agencies examine data provenance and bias issues present in the development and use of AI solutions to ensure that bias in datasets does not result in harm to users or consumers of products or services involving AI. The exact metrics of how these agency uses are captured will likely need to vary from agency to agency, so adequate flexibility should be provided to agencies, with outcome-based measures being employed. However, agencies should align their practices with the CHI's cross-sector recommendations on a*dvancing transparency for AI in the healthcare ecosystem.*[9]:

[9] Connected Health Initiative, *Advancing Transparency for Artificial Intelligence in the Healthcare Ecosystem,* https://connectedhi.com/wp-content/uploads/2022/02/AdvancingTransparencyforArtificialIntelligenceintheHealthcareEcosystem.pdf, also included as **Appendix B**.

III. Conclusion

CHI appreciates OMB's consideration of the above views. We urge OMB to contact the undersigned with any questions or ways that we can assist moving forward.

Sincerely,

Brian Scarpelli

Policy Principles for AI in Health

Today, there are already many examples of AI systems, powered by streams of data and advanced algorithms, improving healthcare by preventing hospitalizations, reducing complications, decreasing administrative burdens, and improving patient engagement. AI systems offer the promise to rapidly accelerate and scale such results and drive a fundamental transformation of the current disease-based system to one that supports prevention and health maintenance. Nonetheless, AI in healthcare has the potential to raise a variety of unique considerations for U.S. policymakers.

Many organizations are taking steps to proactively address adoption and integration of AI into health care and how it should be approached by clinicians, technologists, patients and consumers, policymakers, and other stakeholders, such as the Partnership for AI, Xavier Health, the American Medical Association, and the Association for the Advancement of Medical Instrumentation and BSI. Building on these important efforts, the Connected Health Initiative's (CHI) Health AI Task Force is taking the next step to address the role of AI in healthcare.

First, AI systems deployed in healthcare must advance the "quadruple aim" by improving population health; improving patient health outcomes and satisfaction; increasing value by lowering overall costs; and improving clinician and healthcare team well-being. Second, AI systems should:

- Enhance access to health care.
- Empower patients and consumers to manage and optimize their health.
- Facilitate and strengthen the relationship and communication that individuals have with their health care team.
- Reduce administrative and cognitive burdens for patients and their health care team.

To guide policymakers, we recommend the following principles to guide action:

- **National Health AI Strategy:** Many of the policy issues raised below involve significant work and changes that will impact a range of stakeholders. The cultural, workforce training and education, data access, and technology-related changes will require strong guidance and coordination. Given the significant role of the government in the regulation, delivery, and payment of healthcare, as well as its role as steward of significant amounts of patient data, a federal healthcare AI strategy incorporating guidance on the issues below will be vital to achieving the promise that AI offers to patients and the healthcare sector. Other countries have begun to take similar steps (e.g., The UK's Initial Code of Conduct for Data Driven Care and Technology) and it is critical that U.S. policymakers collaborate with provider organizations, other civil society organizations, and private sector stakeholders to begin similar work.

- **Research:** Policy frameworks should support and facilitate research and development of AI in healthcare by prioritizing and providing sufficient funding while also ensuring adequate incentives (e.g., streamlined availability of data to developers, tax credits) are in place to encourage private and non-profit sector research. Clinical validation and transparency research should be prioritized and involve collaboration among all affected stakeholders who must responsibly address the ethical, social, economic, and legal implications that may result from AI applications in healthcare. Further, public funding and incentives should be conditioned on promoting the medical commons in order to advance shared knowledge, access, and innovation.
- **Quality Assurance and Oversight:** Policy frameworks should utilize risk-based approaches to ensure that the use of AI in healthcare aligns with recognized standards of safety, efficacy, and equity. Providers, technology developers and vendors, health systems, insurers, and other stakeholders all benefit from understanding the distribution of risk and liability in building, testing, and using healthcare AI tools. Policy frameworks addressing liability should ensure the appropriate distribution and mitigation of risk and liability. Specifically, those in the value chain with the ability to minimize risks based on their knowledge and ability to mitigate should have appropriate incentives to do so. Some recommended guidelines include:
    - Ensuring AI in healthcare is safe, efficacious, and equitable.
    - Ensuring algorithms, datasets, and decisions are auditable and when applied to medical care (such as screening, diagnosis, or treatment) are clinically validated and explainable.
    - AI developers should consistently utilize rigorous procedures and must be able to document their methods and results.
    - Those developing, offering, or testing healthcare AI systems should be required to provide truthful and easy to understand representations regarding intended use and risks that would be reasonably understood by those intended, as well as expected, to use the AI solution.
    - Adverse events should be timely reported to relevant oversight bodies for appropriate investigation and action.

- **Thoughtful Design:** Policy frameworks should require design of AI systems in health care that are informed by real-world workflow, human-centered design and usability principles, and end-user needs. Also, AI systems should help patients, providers, and other care team members overcome the current fragmentation and dysfunctions of the healthcare system. AI systems solutions should facilitate a transition to changes in care delivery that advance the quadruple aim. The design, development, and success of AI in healthcare should leverage collaboration and dialogue between caregivers, AI technology developers, and other healthcare stakeholders in order to have all perspectives reflected in AI solutions.
- **Access and Affordability:** Policy frameworks should ensure AI systems in health care are accessible and affordable. Significant resources may be required to scale systems in health care and policy-makers must take steps to remedy the uneven distribution of resources and access. There are varied applications of AI systems in health care such as research, health administration and operations, population health, practice delivery improvement, and direct clinical care. Payment and incentive policies must be in place to invest in building infrastructure, preparing personnel and training, as well as developing, validating, and maintaining AI system with an eye toward ensuring value. While AI systems should help transition to value-based delivery models by providing essential population health tools and providing enhanced scalability and patient support, in the interim payment policies must incentivize a pathway for the voluntary adoption and integration of AI systems into clinical practice as well as other applications under existing payment models.
- **Ethics:** Given the longstanding, deeply rooted, and well-developed body of medical and biomedical ethics, it will be critical to promote many of the existing and emerging ethical norms of the medical community for broader adherence by technologists, innovators, computer scientists, and those who use such systems. Healthcare AI will only succeed if it is used ethically to protect patients and consumers. Policy frameworks should:Ensuring AI in healthcare is safe, efficacious, and equitable.
    - Ensure that healthcare AI solutions align with all relevant ethical obligations, from design to development to use.
    - Encourage the development of new ethical guidelines to address emerging issues with the use of AI in healthcare, as needed.
    - Ensure consistency with international conventions on human rights.
    - Ensure that AI for health is inclusive such that AI solutions beneficial to patients are developed across socioeconomic, age, gender, geographic origin, and other groupings.
    - Reflect that AI for health tools may reveal extremely sensitive and private information about a patient and ensure that laws protect such information from being used to discriminate against patients.

- **Modernized Privacy and Security Frameworks:** While the types of data items analyzed by AI and other technologies are not new, this analysis provides greater potential utility of those data items to other individuals, entities, and machines. Thus, there are many new uses for, and ways to analyze, the collected data. This raises privacy issues and questions surrounding consent to use data in a particular way (e.g., research, commercial product/service development). It also offers the potential for more powerful and granular access controls for patients. Accordingly, any policy framework should address the topics of privacy, consent, and modern technological capabilities as a part of the policy development process. Policy frameworks must be scalable and assure that an individual's health information is properly protected, while also allowing the flow of health information. This information is necessary to provide and promote high-quality healthcare and to protect the public's health and well-being. There are specific uses of data that require additional policy safeguards, i.e., genomic information. Given that one individual's DNA includes potentially identifying information about even distant relatives of that individual, a separate and more detailed approach may be necessary for genomic privacy. Further, enhanced protection from discrimination based on pre-existing conditions or genomic information may be needed for patients. Finally, with proper protections in place, policy frameworks should also promote data access, including open access to appropriate machine-readable public data, development of a culture of securely sharing data with external partners, and explicit communication of allowable use with periodic review of informed consent.
- **Collaboration and Interoperability:** Policy frameworks should enable eased data access and use through creating a culture of cooperation, trust, and openness among policymakers, health AI technology developers and users, and the public.
- **Workforce Issues and AI in Healthcare:** The United States faces significant demands on the healthcare system and safety net programs due to an aging population and a wave of retirements among practicing care workers. And lower birth rates mean that fewer young people are entering the workforce. Successful creation and deployment of AI-enabled technologies which help care providers meet the needs of all patients will be an essential part of addressing this projected shortage of care workers. Policymakers and stakeholders will need to work together to create the appropriate balance between human care and decision-making and augmented capabilities from AI-enabled technologies and tools.
- **Bias:** The bias inherent in all data as well as errors will remain one of the more pressing issues with AI systems that utilize machine learning techniques in particular. In developing and using healthcare AI solutions, these data provenance and bias issues must be addressed. Policy frameworks should:
    - Require the identification, disclosure, and mitigation of bias while encouraging access to databases and promoting inclusion and diversity.
    - Ensure that data bias does not cause harm to patients or consumers.

- **Education:** Policy frameworks should support education for the advancement of AI in healthcare, promote examples that demonstrate the success of AI in healthcare, and encourage stakeholder engagements to keep frameworks responsive to emerging opportunities and challenges.
    - Patients and consumers should be educated as to the use of AI in the care they are receiving.
    - Academic/medical education should include curriculum that will advance health care providers' understanding of and ability to use health AI solutions. Ongoing continuing education should also advance understanding of the safe and effective use of AI in healthcare delivery.

ConnectedHealth

Advancing Transparency for Artificial Intelligence in the Healthcare Ecosystem

OCTOBER 2021

Connected Health is an initiative of ACT | The App Association

#connectedhealth /ConnectedHealthInitiative

Executive Summary

Today, the most well-known FDA-approved applications of artificial intelligence and machine learning (AI/ML) technology in healthcare are diagnostic tools that help clinicians read and interpret images to predict, detect, and monitor a number of diseases, including diabetic retinopathy and lung cancer. In the future, the use of AI/ML technology in both operational and clinical settings promises to enable a more proactive approach to healthcare that promotes investments in preventative care that can result in fewer hospitalizations, fewer doctor visits, and fewer treatments. Across use cases, AI/ML technology is helping, and must increasingly help, the healthcare industry move away from a reactive disease treatment approach to a population health management approach that lowers costs and improves care.

The immense potential of AI/ML technology in healthcare may never be fully acheived, however, unless AI/ML technologies first earn the trust of healthcare professionals and patients. The cornerstone of building trust in AI/ML technologies is to enhance transparency – providing sufficient and appropriate information about the AI/ML, including its intended use, development, performance, and, when available, logic. The more understandable the decision-making process is for each individual technology, the more confidence there will be in AI/ML use in the healthcare system.

The recommendations in this Connected Health Initiative (CHI) AI Task Force report, informed by a public roundtable CHI held to address AI/ML transparency and extensive consultations with stakeholders from across the digital health ecosystem, represent a holistic approach to creating and maintaining the trust of both healthcare professionals and patients. The Task Force set out the foundational steps AI/ML tool developers must take to build transparency into their products, but it also outlines the important roles that clinicians, healthcare providers, regulators, academic medical institutions, and accrediting organizations must play.

The medical and technology communities have a shared responsibility to provide caregivers and patients (as well as other stakeholders) with an assurance of quality through truthful representations clearly indicating the AI/ML's intended uses and risks that would be reasonably understood by those intended and expected to use the AI/ML. Uptake will depend on the buy-in of clinicians who first develop trust in AI/ML software as a medical device (SaMD) through use and experience, establishing confidence as it is adopted into practice. Once adopted, clinicians can then work with their patients to explain their use of SaMD AI/ML and inspire the same trust and confidence from the patients in the output of the SaMD AI. Each step in this chain requires buy-in and support from policymakers (both within and outside of government).

The foundation of any successful use of AI/ML technologies in healthcare depends on the trust of healthcare professionals and patients, and we believe these recommendations present a clear path toward earning that trust.

About the Connected Health Initiative

CHI is the leading multistakeholder policy and legal advocacy effort driven by a consensus of stakeholders from across the connected health ecosystem. We aim to realize an environment where Americans can improve their health through policies that allow for connected health technologies to enhance health outcomes and reduce costs. Having members who are developers and users of connected health technologies across a wide range of use cases, CHI serves as an active advocate before Congress, numerous U.S. federal agencies, and state legislatures and agencies. We seek to advance responsible pro-digital health policies and laws in areas including reimbursement and payment, privacy and security, effectiveness, and quality assurance, U.S. Food and Drug Administration (FDA) regulation of digital health, health data interoperability, and the rising role of artificial intelligence and machine learning (AI/ML) in care delivery.

In 2019, CHI formed a Task Force focused on policy challenges and opportunities related to the use of AI/ML in healthcare. CHI's AI/ML Task Force already developed a set of health AI/ML policy principles addressing how policy frameworks should adopt the role of AI/ML in healthcare.[1] A cornerstone of these principles is the idea of requiring those developing, offering, or testing healthcare AI/ML systems to provide truthful representations clearly indicating the intended use and risks that would be reasonably understood by those intended and expected to use the AI/ML solution. Such steps will provide much-needed quality assurances to caregivers and patients (as well as other stakeholders) and assist in resolving data issues that arise when an algorithm is fed bad data that can skew its learning and introduce bias. CHI's AI Task Force later developed detailed Good Machine Learning Practices for FDA-regulated AI,[2] which reflect and elaborate on this priority. The recommendations in this paper build on those deliverables.

Numerous CHI Steering Committee members and other key stakeholders from throughout the healthcare value chain participate in this Task Force and share a commitment to realizing the value of AI/ML in healthcare while protecting patient safety and advancing the quadruple aim. The recommendations in this paper find basis in an evaluation by the Task Force of the healthcare ecosystem's implementation of AI/ML to date, challenges and opportunities reflected by federal policymakers, and the existing and emerging issues created by AI's deployment. This report is also informed by a CHI public roundtable held in April 2021 on how to improve AI/ML transparency for caregivers and patients based on their needs and concerns, during which a wide range of stakeholders contributed to a discussion exploring novel approaches to transparency of AI/ML taken today.

For more information, please visit www.connectedhi.com.

2 https://bit.ly/3B6nslm.

Artificial Intelligence's Role in a Successful Healthcare Ecosystem Requires Transparency

Responsible implementation of AI/ML in healthcare leads to improved medical outcomes and overall increased cost savings

Today, there are many important operational and clinical AI/ML solutions in use and many more in development.[3] Some of the most well-known applications of AI/ML in healthcare that have received market clearance from the FDA are diagnostic tools that help clinicians read and interpret images. For example, AI/ML image analysis software can assist clinicians in predicting, detecting, and monitoring a number of diseases, including diabetic retinopathy, lung cancer, prostate cancer, and skin cancer. Such AI/ML uses are generally intended to be used to assist human clinicians in providing more efficient and accurate results, rather than autonomously diagnosing disease.

Separately, research projects within and outside of clinical settings continue to further explore AI's potential to revolutionize healthcare. For example, an AI/ML system developed by researchers at Northwestern University's Feinberg School of Medicine correctly identifies small lung cancer tumors nearly 95 percent of the time, while radiologists undertaking the same task unassisted are correct only 65 percent of the time.[4] Researchers at Carnegie Mellon developed a miniature mobile robot called HeartLander that uses machine learning algorithms to make treating ventricular fibrillation (VF)—a deadly type of cardiac arrhythmia that requires cardioversion and then, if the patient survives, surgical removal of faulty heart tissue—far safer and less invasive.[5]

As a recent research paper discussing challenges related to deployment of AI/ML technologies into the clinical setting stated, "the success of a deep learning model does not rest solely on its accuracy."[6]The researchers noted that clinician "experiences with the system, and the socio-environmental factors that impacted system performance" must be evaulated and addressed for these systems to function in the clinical setting with the accuracy rates illustrated in the lab setting.[7] Clearly, if the challenges of integrating AI/ML tools into clinical workflow can be overcome, AI/ML can support clinicians in a wide range of other areas. Its potential to reshape the healthcare landscape is profound, especially in the improvements it can bring to any process within healthcare operation and delivery.

Medical devices and systems that use AI/ML also represent a real opportunity to drive down healthcare costs for consumers, practitioners, and healthcare businesses alike. It is estimated that AI/ML applications can cut annual U.S. healthcare costs by $150 billion by 2026.[8] Most of these cost reductions stem from changing the healthcare model from a reactive to a proactive approach, focusing on health management rather than disease treatment. This focus on using AI/ML as an investment in

3 The FDA now publicly lists AI/ML medical devices cleared for marketing in United States, and includes their intended uses. *See* https://www.fda.gov/medical-devices/software-medical-device-samd/artificial-intelligence-and-machine-learning-aiml-enabled-medical-devices.
4 https://www.nature.com/articles/d41586-020-03157-9
5 https://onlinelibrary.wiley.com/doi/10.1002/rcs.2297
6 Emma Beede et al, A Human-Centered Evaluation of a Deep Learning System Deployed in Clinics for the Detection of Diabetic Retinopathy, CHI Conference on Human Factors in Computing Systems (April 2020) available at https://dl.acm.org/doi/fullHtml/10.1145/3313831.3376718.
7 *Id.*
8 https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7325854/.

preventative care can result in fewer hospitalizations, fewer doctor visits, fewer treatments, and thus fewer side effects. AI-based technology will have an important role in helping people stay healthy via remote monitoring technologies and coaching and will ensure earlier diagnosis, tailored treatments, and more efficient follow-ups.[9]

For example, AI/ML image analysis technologies can reduce medical expenses in several ways. For one, AI/ML systems can be very helpful in augmenting a clinician's analysis and treatment decisions more quickly. AI/ML technologies enable clinicians to provide the same, accurate service in a fraction of the time, increasing the volume of patients without increasing time spent treating them.[10] Second, a patient whose disease is diagnosed early will pay less to treat or cure the disease than one who catches it later. The longer a disease goes undiagnosed, the more damage it causes and more resources it takes to treat, assuming it remains treatable at all. Wearable technologies that use AI, such as remote monitoring technologies, increase access to healthcare and increase engagement in treatment plans by, for example, analyzing user health data in real time and notifying wearers or their healthcare providers (or both) of potential health issues.

By introducing new, accurate, and timely data streams for human clinicians' review, AI/ML medical tools and systems that use wearable technologies can enable practitioners to come up with care and treatment options without having to see a patient in person as much, reducing administrative and in-office visit resource expenditures, and, during outbreaks of communicable diseases, at lower risk of infection to both provider and patient. The use of such technologies will also enhance patient engagement in their own care plans. This same concept also applies to laboratory technologies that use AI/ML systems, where the work hours currently required for repetitive and routine tasks could see drastic reductions, significantly cutting labor costs.[11]

Increased efficiency, precision, and affordability are just some of the benefits that AI/ML can offer the healthcare community and those they serve, but realizing these benefits will depend on the buy-in of the provider and patient communities as well as support for responsible deployments from policymakers. CHI's AI/ML Task Force released detailed policy principles,[12] as well as proposed good machine learning practices for AI/ML meeting the definition of a medical device,[13] to address these challenges. Notably, CHI's AI/ML Task Force has acknowledged that without its processes being understandable by humans and transparency (providing sufficient and appropriate information about the AI/ML, including its intended use, development, performance, and, when available, logic), particularly for patients and caregivers, AI/ML cannot most effectively improve healthcare. Namely, those developing, offering, or testing healthcare AI/ML systems must provide truthful and understandable representations regarding intended use and risks that would be reasonably understood by those intended, as well as expected, to use the AI/ML software as a medical device (SaMD) solution.

13 https://bit.ly/3B6nslm.

How Can Transparency into Healthcare AI/ML Solutions be Advanced?

While evidence of healthcare AI's potential for widespread benefit continues to build, that potential can never be realized without healthcare professionals and patients understanding and trusting AI/ML solutions. The more transparent the decision-making process is for each individual technology, the more confidence there will be in AI/ML use in the healthcare system.[14] Transparency for healthcare AI's intended uses must happen at several levels, disseminating tailored messaging to specific audiences that require insights into the AI/ML solution to make informed decisions. Building the trust that must be a foundation for the responsible deployment of AI/ML is a shared responsibility amongst developers, providers, and regulators.

Providing transparency into health AI/ML must start with the developers of the AI/ML tools. Then, uptake of AI/ML will need to be built on the buy-in of clinicians who first develop trust in AI/ML SaMD through use and experience, establishing confidence as it is adopted into practice. Once adopted, the provider can then work with his or her patients to explain their use of SaMD AI/ML and inspire the same trust and confidence by the patient in the output of the SaMD AI. Each step in this chain requires buy-in and support from policymakers (both within and outside of government).

The CHI AI/ML Task Force's recommendations for enhancing transparency for health AI/ML include:

Developers of AI/ML SaMD should:

- Prioritize making healthcare AI/ML solutions reasonably safe, efficacious, and equitable from the earliest stages of design, considering the perspectives of both patients and providers, leveraging and where necessary tweaking medical AI/ML guidelines on research and ethics,[15] leading standards,[16] and other resources as appropriate.
- Employ algorithms that produce repeatable results and, when feasible, are auditable, and make decisions that, when applied to medical care (such as screening, diagnosis, or treatment), are clinically validated and where possible understandable using rigorous procedures with documented methods and results, fostering efficacy through continuous monitoring.
- Rigorously identify, disclose, and mitigate biases in datasets used to train algorithms.
- Utilize risk-scaled privacy protection mechanisms for patients' data to account for the fact that the analysis by health AI/ML tools provides greater potential utility of those data items to other individuals, entities, and machines, providing many new uses for, and ways to analyze, the collected data, as well as correspondingly stronger incentives for malefactors to attempt to obtain access unlawfully. Specific uses of data that require additional safeguards (such as genomic

14 https://www.bsigroup.com/globalassets/localfiles/en-gb/about-bsi/nsb/innovation/mhra-ai-paper-2019.pdf

15 *E.g.*, World Health Organization, 'Ethics & Governance of Artificial Intelligence for Health' (2021), *available at* https://www.who.int/publications/i/item/9789240029200.

16 *E.g.*, Consumer Technology Association, 'The Use of Artificial Intelligence in Health Care: Trustworthiness (ANSI/CTA-2090)' (2021), *available at* https://shop.cta.tech/collections/standards/products/the-use-of-artificial-intelligence-in-healthcare-trustworthiness-cta-2090.

information) may necessitate a tailored approach or enhanced protections from discrimination (e.g., pre-existing conditions or genomic information may be needed for patients).

- Comply with all applicable legal and regulatory requirements.
- Develop a tailored communications and engagement plan that gives patients and providers representative of the AI/ML tool's user group a reasonably justifiable level of confidence in healthcare AI's efficacy. Such communications should enable these patients and providers to visualize the AI, and to receive direct and clear information about how their health data are being collected and used (while also avoiding information overload) and how biases in data that exacerbate disparities in healthcare are being mitigated. Reflecting that the division of labor between the developers of AI-enabled tools and the clinician or patient is critical, clearly explain intended uses, including whether a tool might include the restriction that it is not for diagnostic use or for informational purposes only, as well as risks.

Providers should:

- Develop their own risk-based and tailored communications and engagement plan that enables them to explain to patients the development of the AI/ML application, its maintainnace, its performance, and how it aligns with the latest best practices and regulatory requirements to improve patient safety using easily understood and standardized formats. Providers should also acknowledge that "best practices" are dynamic and prone to obsolescence.
- Offer further detail for patients in additional resources that explain the clinical testing of AI/ML applications and the confirmation of the results by clinical experts.

The Food and Drug Administration (FDA) should:

- Leverage its successful approach to authorizing medical device AI[17] that has already safely brought health AI/ML innovations to patients and providers to develop a comprehensive regulatory approach to AI/ML that meets the definition of a medical device. The FDA can accomplish this by, for example, progressing its Software Precertification Pilot[18] to a full program available to all developers of SaMD AI, FDA can also update its rules and processes to realize its envisioned total product lifecycle (TPLC) regulatory approach, facilitating a potentially rapid cycle of product improvement and allowing these devices to continually improve while providing effective safeguards. This new approach should leverage CHI's Good Machine Learning Practices to address both locked and continuously learning AI.
- Evolve its requirements on reporting type and frequency so that such requirements can be adapted and scaled based on relevant factors such as risk, extent, and magnitude of

17 Software as a Medical Device (SaMD): Clinical Evaluation: https://www.fda.gov/downloads/medicaldevices/deviceregulationandguidance/guidancedocuments/ucm524904.pdf; Deciding When to Submit a 510(k) for a Software Change to an Existing Device: https://www.fda.gov/downloads/medicaldevices/deviceregulationandguidance/guidancedocuments/ucm514737.pdf.

18 Pre-Cert Program Version 1.0 Working Model: https://www.fda.gov/downloads/MedicalDevices/DigitalHealth/DigitalHealthPreCertProgram/UCM629276.pdf.

modifications, and the demonstrated reliability of the AI (e.g., quality control plans for updates).[19] Initially, the FDA should finalize guidance on SaMD pre-specifications and algorithm change protocol inputs that FDA should periodically receive.

- Develop methods to efficiently communicate when FDA has authorized a product developed with or that utilizes AI/ML, along with information on how it was developed, is maintained and performs, and aligns with the latest best practices and regulatory requirements that ensure patient safety using easily understood (e.g., infographics) and standardized formats. For example, where approval is required for the deployment of new solutions in the market, the FDA should provide information describing the datasets used to train the AI/ML software and what efforts are being taken to align with ethical standards and to mitigate data biases. This work should build on the recently released database of AI-enabled devices legally marketed in the United States from the FDA's Digital Health Center of Excellence.[20]
- Serve as a coordinator and convenor of other U.S. federal agencies to ensure a harmonized approach to health AI/ML transparency across government.
- Build on its leadership to date within the International Medical Device Regulatory Forum (IMDRF), promote its approach to SaMD AI/ML to improve approaches to transparency internationally.
- Host recurring public events, in partnership with health AI/ML developers, patients, and providers, that feature the FDA Digital Health Center of Excellence's latest approaches and thinking, as well as demonstrations of AI/ML in healthcare today.

The Centers for Medicare and Medicaid Services (CMS) should**:**

- Continue to develop its understanding of medical AI/ML definitions, present-day and future AI/ML solutions, how AI/ML is changing the practice of medicine, and the future of AI/ML medical coding.
- Develop Medicare support mechanisms for the use of AI/ML by providers based on clinical validation, alignment with clinical decision-making processes familiar to providers, and high-quality clinical evidence.
- Build on support provided in the Medicare system for the use of health AI,[21] develop easy to understand resources for Medicare beneficiaries that capture how AI/ML is being used in the Medicare system and what it means to patients. CMS should leverage its Advisory Panel on Outreach and Education[22] to develop this messaging.

19 As the FDA has noted, new reporting mechanisms for a scalable AI/ML medical device reporting structure "may require additional statutory authority to implement fully". Proposed Regulatory Framework for Modifications to Artificial Intelligence/Machine Learning (AI/ML)-Based Software as a Medical Device (SaMD) - Discussion Paper and Request for Feedback (Apr. 10, 2021) at 15. *Available at* https://www.fda.gov/files/medical%20devices/published/US-FDA-Artificial-Intelligence-and-Machine-Learning-Discussion-Paper.pdf.

20 https://www.fda.gov/medical-devices/software-medical-device-samd/artificial-intelligence-and-machine-learning-aiml-enabled-medical-devices. This FDA list currently provides key information such as submission number, device and company name, and date of marketing authorization of the device (510(k) clearance, granting of De Novo, or PMA approval).

21 For example, CMS already provides payment for CPT code 92229 (point-of-care diabetic retinopathy automated analysis and provides a diagnostic report using AI).

22 https://www.cms.gov/Regulations-and-Guidance/Guidance/FACA/APOE.

The Federal Trade Commission (FTC) should:

- Support ways to mitigate biases or other unfair outcomes from healthcare AI,[23] and, where appropriate, enforce against violations of key laws such as Section 5 of the FTC Act, which prohibits unfair or deceptive practices, where appropriate.

Accrediting and Licensing Bodies, and Medical Specialty Societies and Boards should:

- Develop medical standard of care and ethical guidelines to address emerging issues with the use of SaMD AI/ML in healthcare needed to advance the quadruple aim.
- Develop and disseminate guidance and education on the responsible deployment of SaMD AI, both generally and for specialty-specific uses.

Academic and Medical Education Institutions should:

- Develop and include curriculum that will advance understanding of and ability to use healthcare AI/ML solutions, which should be assisted by inclusion of non-clinicians, such as data scientists and engineers, as instructors. Ongoing training and continuing education should also advance understanding of the safe and effective use of AI/ML in healthcare delivery, addressing both its capabilities and limitations.
- Develop curriculum to advance understanding of data science research to help inform ethical bodies such as Institutional Review Boards (IRBs) that are reviewing protocols of clinical trials of AI-enabled medical devices.

23 https://www.ftc.gov/news-events/blogs/business-blog/2021/04/aiming-truth-fairness-equity-your-companys-use-ai

Conclusion

CHI is pleased to present its recommendations on AI/ML transparency for the consideration of the healthcare ecosystem, policymakers, and others. We are committed to continued engagement with the digital health community writ large to realize the both the responsible deployment of AI/ML across healthcare and its immensely positive societal benefit.

Comment on OMB AI Draft Memo_The AI Association

Clare Martorana,
U.S. Federal Chief Information Officer, Office of the Federal Chief Information Officer, Office of Management Budget.
[FR Doc. 2023–24269 Filed 11–2–23; 8:45 am]
BILLING CODE 3110–05–P

Subject: Comprehensive Recommendations for AI Regulation Enhancement

Dear Clare Martorana,

Thank you for taking the time to accept this comment on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI) Memorandum*. I am writing to delve deeper beyond the participation that was first brought in a statement made in 2021 by the Administrative Conference of the U.S. in which I participated.[1] This ongoing discussion surrounding AI regulations will continue to be a worthy pursuit, and I would like to bring forth additional considerations for your esteemed attention.

1. Encouraging Interoperability for Public and Private Sectors:
I propose the encouragement and incentivization of both public and private sectors to adopt interoperable environments as the foundation for AI development. The promise of AI technology lies in its potential to enhance citizen services, improve staff efficiency, and instill greater trust in government bodies. Achieving these goals necessitates the establishment of a vendor-agnostic, interoperable commercial cloud environment, fostering a collaborative ecosystem for innovation.

2. Refining Risk-Based Approaches:
A critical refinement in the risk-based approach is imperative, focusing on actual harm rather than potential harm or general impact. AI applications such as spam-fighting tools, mapping, and search engines contribute positively without inflicting harm. The current definitions, if left unmodified, might inadvertently implicate these beneficial use cases, highlighting the importance of a nuanced approach to risk assessment.

3. Clarification of Roles, Responsibilities, and Documentation Requirements:
The delineation of clear roles and responsibilities for both government entities and vendors is essential for effective AI implementation. Documentation requirements should be limited to what is strictly necessary for the government's needs, with stringent safeguards against intentional or unintentional disclosure. Given the unique challenges posed by AI to intellectual property, particularly in the private sector, explicit measures should be taken to protect sensitive information, such as avoiding the categorization of access to training data as a necessity for risk-based assessments.

[1] Admin. Conf. of the U.S., Statement #20, *Agency Use of Artificial Intelligence*, 86 Fed. Reg. 6616 (Jan. 22, 2021).

4. Emphasis on System Performance and Security-by-Design:
A shift in focus from inputs to outputs is recommended, emphasizing system performance metrics based on the impact of AI models. The agility and relevance of AI technologies lie in their outputs, and an overemphasis on inputs may lead to antiquated approaches. Additionally, the government should actively encourage security-by-design, transcending mere certification processes like FedRAMP. A holistic evaluation of how AI vendors manage security, incorporating shared responsibilities between vendors and users, will fortify the integrity of AI systems.

5. Increased System Complexity with no consistency:
One of the challenges we see in the Public Sector information technology (IT) infrastructure is the increased system complexity with no consistency in systems across agency environments; therefore, maintaining proper compliance with security updates and patching is a monumental task. Adding to the complexity is the rapidly changing technological advancement that we have outlined here with AI. I see a trend with inconsistent funding, emerging threats, shifting federal strategies, and constant changes in legal and regulatory requirements. Each of these complexities and conflicting strategies has presented obstacles to the IT modernization efforts and has entrenched both the private and public sector into a compliance-over-outcome approach to security, and I think this needs to be addressed and highlighted with this memorandum.

6. Specifically in regard to Section 5(b):
Section 5(b) casts a wide net in delineating rights- or safety-impacting AI, and when coupled with the minimum practices, it creates a regulatory landscape that hampers the United States' ability to compete effectively on the global stage. The Office of Management and Budget's (OMB) expansive definition designates nearly all applications as high-risk, posing significant challenges to the U.S. government's adoption of AI in its current form.

A noteworthy contrast can be drawn with the European Union's AI Act, which, despite its challenges, takes a more surgical approach to defining "high risk" applications, subjecting them to a more specific and targeted review compared to the broader categorization seen in the U.S.

The reliance on a list for government scrutiny becomes a bottleneck in the U.S., impeding the development of AI projects. A preferable alternative would involve a Chief AI Officer (CAIO)-led multi-factor assessment that considers a diverse array of factors, striking a balance that accommodates the intricacies of AI development without stifling progress.

In essence, a recalibration is needed to ensure that the regulatory framework aligns with the dynamic nature of AI innovation, allowing the U.S. government to navigate the global AI landscape with agility and effectiveness.

I appreciate your dedication to shaping AI regulations that balance innovation with safety and efficacy. I am open to further discussions on these points and would be delighted to contribute to the ongoing dialogue.

Thank you for your time and consideration.

Sincerely,

Joshua L Jackson

CIGIE Comments on OMB AI Memorandum - December 2023

COUNCIL OF THE INSPECTORS GENERAL ON INTEGRITY AND EFFICIENCY

TECHNOLOGY COMMITTEE

December 5, 2023

The Honorable Shalanda D. Young
Executive Office of the President
Director, Office of Management and Budget
Washington, DC 20503

Subject: Comments in Response to Proposed Memorandum – Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

Dear Ms. Young:

We have the privilege of responding as Chair and Vice Chair of the Technology Committee (the Committee) of the Council of the Inspectors General on Integrity and Efficiency (CIGIE) to the Office of Management and Budget's (OMB's) draft of the proposed memorandum on advancing governance, innovation, and risk management for agency use of artificial intelligence (AI). The Committee acknowledges the need for and value of effective AI policy governance for the Executive Branch. We believe that OMB's proposed memorandum should expressly recognize the particular interests of the CIGIE community.

Federal Offices of Inspector General (OIGs) perform critical independent oversight and investigative functions over their respective agencies pursuant to the Inspector General Act of 1978, 5 U.S.C. §§ 401 – 424, as amended (the IG Act). As a general proposition, we view the proposed memorandum to apply to OIGs, because OIGs are elements of their covered agencies under section 3502(1), title 44, United States Code. However, the unique statutory status and mission of the OIGs often require that policies and activities generally applicable across agencies be limited with respect to their OIGs to protect OIG independence, preserve the critical OIG-to-agency relationship, and ensure the OIG can operate without unlawful impediments.

The proposed memorandum implies consideration for the independent status of an OIG in its scope paragraph, which states that "[a]ll agency responsible officials retain their existing authorities and responsibilities established in other laws and policies." We believe the memorandum should be more explicit in its application to, and effect upon, OIGs. Expressly addressing OIG independence in the memorandum is essential to an OIG's effective implementation of the AI governance and risk management requirements within the OIG, while ensuring that its efforts are not unduly impeded or interfered with by its agency.

As drafted, the proposed memorandum assigns significant responsibilities to the agency's Chief AI Officer (CAIO) that, without clarification or constraint, could pose direct conflicts with OIG independence. For example, the scope of the broad responsibilities assigned to the CAIO for managing risks from the use of AI would prevent the agency's OIG from administering its use of

AI independent of the CAIO's oversight and control. This would directly impact the OIG's independence under the IG Act.

Independence concerns also may arise from the provision in the proposed memorandum providing that CFO Act agencies should consider including OIG representation on their agencies' AI Governance Boards. Depending on the nature and extent of such participation, OIGs that participate in their agencies' AI Governance Boards might well be limited in their ability to conduct independent and objective oversight of their agency's implementation of AI based on the work of their Governance Boards. While we understand that OIGs could potentially provide valuable input to the Governance Boards, it ultimately must be up to each OIG to determine whether and how such participation would be appropriate and, if so, the impact on the OIG's subsequent oversight of their agency's governance of AI.

We believe your office can address the concerns expressed above without impacting the scope or intent of the proposed memorandum. We draw from your treatment of similar concerns in OMB's memorandum dated June 10, 2015, "Management and Oversight of Federal Information Technology." In that memorandum addressing issues related to the current draft, your office incorporated into the memorandum a provision that expressly requires implementation of OMB's guidance in a manner that does not impact the independence of OIGs and the authorities Inspectors General have over their offices, as provided for in the IG Act. A similar provision in the proposed memorandum would suffice to address our concerns. We propose the following text, slightly modified from that in the 2015 memorandum to reflect the current context:

> With respect to Offices of Inspectors General (OIG), the responsibilities, requirements, and recommendations in this memorandum should be implemented in a manner that does not impact the independence of those offices and the authorities Inspectors General have over the personnel, performance, procurement, and budget of the OIG, as provided in the Inspector General Act of 1978, 5 U.S.C. §§ 401-424, as amended.

The OIGs within the Executive Branch are responsible for ensuring that our activities comply with OMB requirements, including those involving AI. We appreciate the need for effective policy and controls on the use and procurement of AI. A revision to the proposed memorandum to recognize the independence of OIGs within their agencies will support the OIG mission and our ability to perform effective oversight of AI.

We appreciate your consideration of these comments, and we welcome the opportunity to discuss them further should you have any questions.

Sincerely,

Robert P. Storch

Re: Notice of Public Comment Period, Office of Management and Budget; Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (88 Fed. Reg. 75,625-75,626, November 3, 2023)

Dear Director Young:

The U.S. Chamber appreciates the opportunity to provide comment to the Office of Management and Budget (OMB) on its "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" ("Draft Guidance").[1] Furthermore, we appreciate OMB's acknowledgment that "AI is improving operations and efficiency across the federal government[2]." Public sector utilization of artificial intelligence can improve the efficiency of the federal government and facilitate easier public interaction. Therefore, it is imperative that it should be a goal of OMB to facilitate federal government utilization of AI technology, to promote IT modernization efforts throughout the Federal Government.

At the outset, we wish to reiterate our continued concerns with the short comment period provided. Accordingly, the U.S. Chamber, with other associations,[3] sent a letter on November 14 emphasizing that the "complexity of the issues involved and other concurrent and overlapping federal regulatory requests require extending the comment period to allow for more thoughtful and substantive feedback." Because this request for additional time was no granted, the Chamber, and other stakeholders, can only provide limited feedback and comment.

The Chamber strongly supports the Draft Guidance's emphasis on cross-agency and public-private collaboration. This is vital and can help agencies leverage multiple stakeholders' collective resources, expertise, and innovation to address complex and interrelated policy challenges. Furthermore, consistency and harmonization between agencies and between existing regulatory regimes, where appropriate, can speed up the adoption of critical AI tools.

Furthermore, these efforts must be based upon and aligned with existing laws, legal standards, and consumer protections. Therefore, the Draft Guidance should consider if

[1] https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf
[2] https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf
[3] https://americaninnovators.com/advocacy/letter-to-omb-on-ai-draft-guidance-extension/

existing controls on the federal government's use of information technology already govern AI-specific risks.

We recommend the following issues should be addressed within the Draft Guidance:

- Strengthening AI Governance: Annual postings of all AI use cases may not be sustainable or practicable. As a result, the draft guidance would fail to achieve the intended transparency goals. Furthermore, this requirement may unintentionally create an undue burden for agencies. We feel further discussions, studies, and standards development are necessary regarding model notices to determine what should be reported in the public inventory. We would also like to stress that such a scope of inventory should only be for those uses considered high-risk.

- Managing risks from the use of AI: The Chamber believes it is essential to align the Draft Guidance with existing Federal Acquisition Regulations (FAR), and OMB should solicit public comments to achieve that goal.

- Definition of "Rights-impacting": The definition of "rights-impacting" could capture non-high risk AI utilization. A risk-based approach is vital to prioritize the allocation of resources for systems with heightened risk. Without this approach, the federal government could inadvertently suppress IT modernization adoption within the federal government. We would further emphasize the need to align the Draft Guidance with the National Institute of Standards and Technology risk-management framework. Furthermore, it is important to note that there are neither technical nor professional standards for algorithmic audits, and inadequate standards may skew risk requirements that fail to identify and address intended issues. Finally, we would encourage the federal government to engage with all stakeholders regarding "negative feedback" regarding specific AI systems to ensure that such concerns have merit.

- Waivers for minimum practices: Regarding waivers that can be granted, we strongly encourage OMB to add language so such waivers can be issued to protect organizations' exposure to sensitive or other protected information.

- Definitions: The Chamber strongly supports the alignment of regulatory terms to industry-specific AI definitions and terminology to ensure non-AI technologies are appropriately carved out of AI definitions and oversight. Where possible, the guidance should reflect internationally accepted definitions endorsed by the U.S., such as those promulgated by the Organization for Economic Cooperation and Development. The following terms should receive ample feedback from stakeholders before being finalized, "rights-impacting" and "potential harms to works wellbeing." Clarity of terms and definitions is essential, so we welcome further opportunities to discuss industry-supported definitions, including terms like "third-party vendor" that will be crucial in implementing any policies resulting from the guidance.

- Timelines: Currently, no timelines are tied to federal agencies' impact assessment, testing, or independent evaluations. A lack of clarity around specific timelines could

lead to potential bottlenecks in AI utilization within the federal government, wherein agencies will be waiting on one antecedent step prior to making procurement decisions.

In conclusion, we appreciate the opportunity to provide high-level feedback on the Draft Guidance. The Chamber believes that more time is necessary for stakeholders to review and provide more substantive feedback, as the Draft Guidance will substantially impact the government's ability to take advantage of AI tools. We encourage OMB to provide other opportunities to receive input from stakeholders regarding these issues. The Chamber stands willing and ready to work with OMB to ensure that all AI the government utilizes is done safely and securely.

Sincerely,

Michael Richards
Director, Policy
Chamber Technology Engagement Center

RE: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, Docket No. OMB-2023-0020

Dear Ms. Martorana,

McKesson Corporation ("McKesson") is pleased to provide comments in response to the Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI) Draft Memorandum ("OMB Memo"). We appreciate the numerous efforts the government has taken to advance AI governance, innovation, and risk management, while protecting the rights and safety of the public.

About McKesson

McKesson is a global leader in healthcare supply chain management solutions, retail pharmacy, community oncology and specialty care, and healthcare information solutions. McKesson partners with pharmaceutical manufacturers, providers, pharmacies, governments, and other organizations in healthcare to help provide the right medicines, medical products, and healthcare services to the right patients at the right time, safely and cost-effectively. As a mission-driven company, we are focused on working with our customers and partners to advance health outcomes for *all*.

Our unique 360-degree view of the healthcare system offers a distinctive vantage point. McKesson monitors and engages in regulatory activities that present both opportunities and challenges for the company, its customers, and the patients they serve. McKesson strives to ensure that its views on improving healthcare prioritize what's best for the patient.

Comments

McKesson appreciates the opportunity to engage with OMB on the government's approach to advancing AI governance, innovation, and risk management through the official Request for Comment process. We acknowledge the difficulty of the government's task, and we applaud OMB's efforts to align AI adoption across the federal government, including those efforts described in the OMB Memo.

As a federal contractor with demonstrated experience implementing, using, and managing the risks of AI, we offer the following comments to help the government and the American economy seize the power of AI while managing its risks. Our comments address the specific questions provided by the government and include additional, related recommendations. Key

McKesson Corporation
6535 State Hwy 161
Irving, TX 75039

Fauzea Hussain
Vice President, Public Policy
Interim Head of Public Affairs

www.mckesson.com

recommendations throughout our response include refining the actions included in the risk categories; focusing on implementation and testing; applying risk management practices based on impact, application, and use(s) of AI; ensuring flexibility for low- and moderate-risk AI applications; keeping pace with industry; encouraging a culture of innovation across the government; and ensuring adequate investment.

We strongly recommend the government engage with industry stakeholders, including regulated entities, throughout this process and prior to extending these requirements to broader industry stakeholders through any additional regulations. Failure to engage with and learn from industry partners will almost certainly impede innovation, introduce confusion, and increase risks. Additionally, we recommend the government take appropriate cautions to ensure that government actions do not stymie innovation by further entrenching large technology companies that are already benefiting disproportionately from first mover advantages.

Proposed Organizational Changes and Coordination Mechanisms (Questions 1-2)

In Section 3 of the OMB Memo, the government outlines multiple actions agencies are required to complete to strengthen AI governance, including designating a Chief AI Officer, convening agency AI Governing Bodies, developing compliance plans, and reporting on AI use cases. McKesson strongly supports each of these actions. We provide three additional recommendations below.

Chief AI Officer Remit, Resources, and Authority

We recommend installing the Chief AI Officer as a member of each agency's Executive Leadership Team. For large agencies with broad AI applications and uses, this person should be at the position of Senior Executive Service or Senior Leader, should be solely focused on AI, and provided with appropriate budget, staff, and authority to exercise the job independently as outlined in the Memo. As AI develops it is important for the Chief AI Officer to have a clear remit and the appropriate authority to make decisions and drive actions across large, matrixed agencies without requiring additional authorities or being subject to constrained approval processes. Secondly, the Chief AI Officers must be able to engage industry peers as equals to adequately represent the government's priorities and affect public opinion. Failure to include this individual amongst the Senior Executive Team or merely adding this title to an existing official as proposed in Section 3(b)(i) will be a strong signal to the agency and to industry partners that the agency is not sufficiently prioritizing or investing in AI. This will hinder AI adoption, implementation, innovation, and eventually, regulation, which will result in the government rapidly falling behind industry.

Composition of AI Governance Bodies

As AI technologies develop, it is imperative for government agencies to have high-functioning, knowledgeable governance bodies that understand the potential and risks of AI within their specific domain. We agree with OMB's approach to constituting agency AI Governing Bodies, particularly by including representation from each of the key enablers listed in Section 3(c)(ii). However, we do not support the use or re-purposing of existing governance bodies to satisfy this requirement. Though this requires additional effort and coordination, we strongly encourage the government to establish new AI Governance Bodies with a clear remit to focus exclusively on AI. We recommend populating this governance body with multi-disciplinary, knowledgeable, and well-trained senior staff that apply consensus-driven approaches to decision making. In addition, we encourage the government to provide adequate training on AI to each member of the AI

McKesson Corporation

Governance Body to raise the overall level of AI awareness and digital literacy such that every member can meaningfully contribute.

Staff Training and Change Management Support

To ensure success within each agency and alignment across the government, it is imperative that all government staff receive training on AI and that OMB provide appropriate change management support. If AI is truly "one of the most powerful technologies of our time, (OMB Memo, Page 1)" then the government must ensure each agency has the support and training needed to assess, implement, govern, and ultimately, adapt with AI. Failure to provide this support will surely impact the government's capabilities and influence, which will, in turn, limit each agency's ability to harness the potential and manage the risks of AI.

Advancing Responsible AI Innovation and Adopting Generative AI (Questions 3-4)

In Section 4 of the OMB Memo, the government outlines the requirement for each agency to develop an AI strategy that identifies and removes barriers to the responsible use of AI and provides goals to advance AI maturity. We are generally supportive of these efforts, though we provide additional recommendations for consideration below.

Agency AI Strategies

In Section 4(a), the government requires agencies to assess their AI maturity, staffing, and use cases to develop a comprehensive strategy within 365 days. While we appreciate the complexity of this work and the effort and collaboration required to satisfy this requirement, we believe the timeline is too long. As evidenced by the rapid proliferation of AI uses and advances in technology just this past year, we are concerned that a strategy formulated over the course of a year will likely be outdated by the time of its publication. Rather, we recommend a faster timeline that identifies core strategic elements which could then be reviewed, updated, and expounded upon at regular intervals. We believe this type of approach would more appropriately align with the pace of change we are seeing across industry and would ensure government agencies remain relevant AI stakeholders.

In addition to accelerating the timeline for strategy development, we encourage the government to require agencies to identify and assess their AI implementation processes and testing capabilities. While governance and literacy are important, they are not adequate substitutes for strong implementation and testing. If each agency's AI strategy is to be successful, it must include strong, understandable, and repeatable implementation processes as well as testing protocols. At minimum, we recommend that implementation and testing assessments and goals become explicit requirements of each agency's AI strategy. However, to truly advance AI innovation, the government will need to develop repositories, establish sandbox environments, and make available tools that allow for controlled development, testing, and validation of innovative AI systems before they are released within the agency or market.

We also recommend OMB require each agency to assess and clearly define liability risks associated with AI as part of their strategy. This should include, at minimum, clear determinations of who will be held liable for AI applications or products and how liability will be determined for AI applications across and within agencies. As AI has developed, it has created new legal challenges that complicate current laws and regulations, particularly around privacy, discrimination, product liability, and negligence. Failure to address these issues head on will create confusion, spurn innovation, and could potentially harm beneficiaries of government services.

McKesson Corporation
6535 State Hwy 161
Irving, TX 75039

Fauzea Hussain
Vice President, Public Policy
Interim Head of Public Affairs

www.mckesson.com

Lastly, we encourage OMB to require agencies to document AI implementation or innovation failures to create a culture that prioritizes safety, champions ingenuity, and supports shared learning and discovery. This will allow agency leaders and AI Governance Bodies to apply the appropriate levels of scrutiny to new AI technologies and applications so that developers can learn from their mistakes and adjust their solutions accordingly without creating frustration or distrust. Throughout history, we know that innovative technologies and discoveries require failure along the way, and some even emerge directly from perceived failures. We also know that cultures that do not seek to minimize or hide failure encourage innovation and improve safety. Therefore, we recommend Chief AI Officers track failed AI implementations and share lessons learned on a regular cadence with the AI Governance Bodies and relevant agency staff, as appropriate.

Investment and Alignment with Industry

In Section 4(b), the OMB discusses the necessity of removing barriers that hinder AI innovation, with particular focus on information technology (IT) infrastructure, data, cybersecurity, and workforce. While we agree that agencies should remove barriers to innovation, the government must also make significant, focused investments in digital-enabling technologies and AI.

The United States government would greatly benefit from developing programs or establishing institutes that could focus investments on key AI applications to improve services, operations, and American competitiveness without impacting each individual agency's budget. For instance, we believe the government has an opportunity to leverage the newly formed ARPA-H agency as a convening mechanism to spark health and human services-related innovation across public-private partnership based on strategic use cases across the nation. These types of programs have the benefit of coordinating critical AI goals and progress across agencies and industry partners. They also promote innovation and competition among start-ups and other businesses that do not have access to the capital to compete with the large technology companies that are already benefiting from first mover advantages. Therefore, we strongly urge OMB to consider developing programs that ensure adequate funding is available to agencies to advance societal goals and manage the impacts of digital transitions.

In addition to ensuring appropriate levels of funding are available to agencies, we recommend OMB encourage each agency's leadership, including the Chief AI Officer, to develop strong relationships with key industry representatives and thought leaders, including subject matter experts working for government contractors and regulated entities. This will allow agency staff to better understand the needs and concerns of their core industry stakeholders, as well as the impact their actions have on industry. It will further serve as a barometer for government leaders regarding the pace of AI transformation within industry, which can and should inform the agency's own actions. As AI rapidly evolves, it is important for the government to coordinate and align with industry, which means consistently and meaningfully engaging with private stakeholders to synchronize efforts and learn from one another. Therefore, we recommend OMB encourage each agency's leadership, including the Chief AI Officer, to engage with industry through each of the mechanisms proposed under Section 5(c)(v)(B)(1-5) as well as through informal consultations and relationships.

Proposed Use Cases and Minimum Practices (Questions 5-6)

In Section 5 of the OMB Memo, the government outlines specific risk management practices that agencies must implement to address the risks from the use of AI that directly impact the rights and safety of individuals and the public. We support the government's attempts to implement risk management practices of AI applications based upon their risk profile, and we appreciate that

McKesson Corporation
6535 State Hwy 161
Irving, TX 75039

Fauzea Hussain
Vice President, Public Policy
Interim Head of Public Affairs

www.mckesson.com

such practices are built upon a solid foundation of AI principles (e.g., Trustworthy AI Framework), risk management approaches (e.g., NIST Risk Management Framework), and previous Administration action (e.g., Executive Order 13960). Our comments below address OMB's list of Safety-Impacting and Rights-Impacting activities as well as the minimum practices outlined for agency implementation.

Safety-Impacting and Rights-Impacting Activities (Question 5)

Upon review, we recommend OMB further refine the list of Safety-Impacting and Rights-Impacting activities to clarify interpretations for government staff and vendors. As written, the categories are so broad that they capture nearly all potential uses of AI across certain economic sectors. While this could have the effect of establishing a 'floor' of minimum practice, it directly undercuts the government's goal of aligning AI risk management practices to AI applications based upon their actual risk profile. In effect, it de-prioritizes high-risk applications by failing to distinguish between AI uses while adding new requirements into an already fragmented, multi-dimensional policy landscape. Furthermore, it is likely to create significant work for Chief AI Officers who are required to review and assess each exemption request. Before publishing the final memo, we recommend OMB review and refine the list of Safety-Impacting and Rights-Impacting activities.

In addition to refining the activities, we recommend providing guidance to government agencies and vendors on the scope of the activities included by further defining the phrase "used to control or meaningfully influence the outcomes of any of the following activities or decisions. (Section 5(b)(i) and Section 5(b)(ii)." While some of the actions included under the Safety-Impacting and Rights-Impacting categories have discreet processes, many of the actions, particularly on the vendor side, exist within sophisticated processes and technology networks that may include downstream AI applications that contribute to the outcome but may not be directly associated with the listed action by the vendor, agency, or civilians receiving services. Refining the list of activities included as Safety-Impacting and Rights-Impacting and then providing guidance on the scope of such actions would be helpful for government agencies as well as industry partners, such as McKesson, who are seeking to help the government realize the full potential of AI while managing its risks.

Minimum Practices for Safety-Impacting and Rights-Impacting AI (Question 6)

The OMB Memo divides the minimum practices into three categories based on the type of AI as well as its stage in the implementation lifecycle. We support the government's effort to establish minimum practices as well as future agency-specific applications of additional context-specific risk mitigations. We offer the below comments as suggestions for improvement based on our company's experience implementing AI.

We understand that OMB seeks to coordinate AI implementations across the entire government by establishing minimum practices that serve as the baseline for managing risk. We support this and appreciate the government's effort to balance flexibility with standardization. We encourage the government to maintain this flexibility for low- and moderate-risk AI applications as the technology and uses rapidly evolve. This will ensure government applications of AI keep pace with industry and are not unnecessarily restricted by rigid government requirements. However, we also encourage OMB to work with agencies to refine the use cases determined to be Safety-Impacting and Rights-Impacting so that each agency can apply specific gating mechanisms and targeted rules to address truly high-risk AI applications.

McKesson Corporation
6535 State Hwy 161
Irving, TX 75039

Fauzea Hussain
Vice President, Public Policy
Interim Head of Public Affairs

www.mckesson.com

We concur that independent model validation and security testing is crucial for effective AI risk management. For high-risk applications that drastically impact human rights and public safety, adversarial challenges, including AI red teaming, are becoming consistent with industry best practices. We concur, for purposes of independent evaluation, that while the independent reviewing authority should not be directly involved in the system's development, consistent with existing industry-standard concepts of effective challenge (see, e.g., Federal Reserve Board Supervisory Guidance on Model Risk Management, SR 11-7), independent model validation and security testing may be performed by personnel within the organization.

However, we urge OMB to provide greater clarity regarding how agencies should conduct independent model validation and security testing for models developed by vendors or other industry partners. This clarification is especially needed given the lack of any independent AI certification body. As written, OMB's requirements appear to focus on an agency's evaluation of AI models that the government has developed itself, or that were developed on behalf of the government by the government's AI Governing Body (e.g., Chief AI Officer, AI Oversight Board, or Agency Office). Absent greater clarity from OMB regarding evaluating externally developed AI models, OMB's guidance could confer an unfair competitive advantage on incumbents or create a secondary certification marketplace. Either result would limit competition and increase the cost of developing, implementing, and using AI.

Regarding the minimum actions required *while* using new or existing covered safety-impacting or rights-impacting AI (Section 5(c)(iv)(D-H), we support each of the requirements, specifically emphasizing the importance of providing relevant staff with adequate and progressive training to raise staff digital literacy levels and support successful deployments. We do, however, recommend that the government rely on industry best practices and scientific evidence to determine how and when human consideration should interact with high-risk AI functionality. Though it is important for AI applications to include a 'human in the loop' as a check on AI functionality, it is not always true that human intervention increases safety or outcomes. In some cases, it might increase bias or risk. Therefore, we recommend OMB work with each agency to identify high-risk use cases and appropriate evidence-informed best practices.

Regarding the additional minimum practices for Rights-Impacting AI (Section 5(c)(v)), we support each of the requirements, though we recommend the government expand the criteria for Section 5(c)(v)(A) to include economic impacts. As written, the government intends to assess and mitigate impacts to protected classes. We applaud this effort and encourage the government to go further to assess and mitigate impacts that could exacerbate economic inequality.

Lastly, we encourage the government to take the lead on Explainable AI by requiring agencies to monitor and explain factors impacting their AI applications' outputs. This will ensure agencies, developers, implementers, and users are accountable for their AI applications. It will also establish trust with the general public, particularly those individuals receiving services from the government that are impacted by the AI applications.

Contractual Considerations and Public Disclosure (Questions 7-8)

Since the requirements and recommendations outlined in the OMB Memo apply to covered AI across all agencies defined in 44 U.S.C. § 3502(1), each government agency will need to incorporate them into relevant contracts to meet the August 1, 2024 deadline. We understand the goal of the government is to update contracts as efficiently as possible so as not to disrupt current services or create undue burden on vendors. To do this effectively, we recommend the government take the following actions:

McKesson Corporation
6535 State Hwy 161
Irving, TX 75039

Fauzea Hussain
Vice President, Public Policy
Interim Head of Public Affairs

www.mckesson.com

- **Refine the activities listed as Safety-Impacting and Rights-Impacting.** The current list of activities is too broad and lacks sufficient definition to map to government statements of work to support effective contracting. By using such broad categories, the government risks treating all AI applications, regardless their risk profile, the same. This defies the very purpose of the risk management efforts outlined in the OMB Memo, will hinder responsible AI innovation across industry, and will create significant legal, contractual, and operational burden to government agencies and vendors.
- **Establish a standard set of baseline requirements to be included in contracts that use covered AI that distinguishes the responsibility of the vendor from the responsibility of the agency upon procurement.** The OMB Memo currently outlines the requirements from the perspective of an agency implementing these requirements independently. However, future contracting will require precise delineation of vendor responsibilities versus those of the procuring agency, clarity on when such actions need to be completed in relation to the timing of contractual updates or future procurement cycles, and what support a vendor can reasonably be expected to receive from the government. As an example, the government would need to clarify whether it would be the responsibility of vendors or the procuring agency to achieve an independent evaluation of the AI, as required under Section 5(c)(iv)(C). If this requirement were applied to vendors without agency support, it would need to be further clarified to outline acceptable governance terms that would satisfy this requirement. Similar comments could be made for the assessment and testing requirements, training requirements, the requirements to consult and incorporate feedback from affected groups, and performance evaluation processes outlined in Section 5.
- **Further outline and clarify the process and criteria used to determine exclusions, extensions, and waivers.** To ensure compliance with the minimum requirements, the government will need to provide additional information to government staff and vendors on the processes and criteria used to determine exclusions, extensions, and waivers. For instance, the government will need to clarify the definition of research and development (Section 5(c)(i)(C)) beyond the provided footnote. Additionally, the government should provide a framework that outlines how decisions about extensions and waivers will be granted as well as the overall process and timeline for pursuing such flexibilities. Due to the power granted to the Chief AI Officer to make this determination, it is imperative that the government provide adequate transparency into how these requests are evaluated and, ultimately, decided.
- **Provide clear guidance on how these new requirements impact Authorizations to Operate and other related agency approval processes.** The OMB memo mentions Authorizations to Operate multiple times and suggests that the minimum practices will impact this process moving forward. It is important that the government further clarify how these minimum practices will interact with current authorizations and prior approvals and whether additional actions will be required by government staff and vendors as a result. Failure to provide this information could lead to confusion amongst agencies and contractors or, worse, disruptions of critical agency or civilian services.
- **Clearly articulate the Transparency and Performance Improvement measures outlined in Section 5(d)(ii) and further outline any specific requirements to ensure vendors do not "inappropriately favor their own products at the expense of competitor's offerings."** Similar to the comments immediately above, it is important for vendors to understand how AI performance will be evaluated by the government agency

McKesson Corporation
6535 State Hwy 161
Irving, TX 75039

Fauzea Hussain
Vice President, Public Policy
Interim Head of Public Affairs

www.mckesson.com

and expectations for continuous improvement of procured AI. Given the speed at which AI products are developing, it will be important for the government to apply flexible evaluation techniques that allow vendors to evolve their AI products in accordance with broader industry developments over the duration of their 3- or 5-year contract.

- **Determine cost impacts of additional requirements on vendors.** The application of the proposed minimum requirements may lead to additional costs to vendors that are not captured in the current contract. Prior to updating individual contracts, the government should request information from impacted contractors on the cost of implementing these requirements and exercise contract modifications where appropriate.
- **Provide terms and conditions of data use.** In Section 5(d)(iv) of the OMB Memo, the government discusses the value of data for consistent operations and fair competition. It is important for the government to clearly outline data use terms and conditions that protect Federal information from additional use beyond the contract terms. Failure to adequately protect data resources from abuse or misuse, including but not limited to those outlined in the OMB Memo, will greatly hinder competitive conditions as outlined in the Federal Trade Commission's recent comment submitted to the U.S. Copyright Office.[1]

In addition to the actions above, we recommend the government synchronize contract updates, the August 1, 2024 compliance deadline, and the announcement of vendor AI documentation requirements outlined in Section 5(a)(ii) so as not to create undue burden on vendors and government staff. It is not clear from the OMB Memo that these actions are aligned. Failure to do this could lead to unnecessary confusion and disruptions of service and will create significant backlogs across government contracting offices.

Lastly, we recommend the agency maintain the current structure and format of the annual use case inventory as published at https://ai.gov/ai-use-cases/, but update the current category titled, "Consistent with EO 13960" to reflect consistency with the final OMB Memo.

Conclusion

McKesson appreciates the opportunity to comment on the OMB Memo and we look forward to working with federal agencies across the government as an industry partner on AI implementation, governance, innovation, and risk management. If you have questions or need further information, please contact George Kernodle, Director of Public Policy – Evidence & Data at George.Kernodle@McKesson.com.

Sincerely,

Fauzea Hussain

AI-in-Government-Memo-Public-Comment - comments and feedback

Given below is the list of comments submitted after reviewing the document “AI-in-Government-Memo-Public-Comment.pdf”.

#	Document reference	Comment	Justification/reasoning
1	Page 2 – last para. This memorandum does not address issues that are present regardless of the use of AI, for instance with respect to Federal information and systems in general. I	Security issues are present regardless of the use of AI. These could be addressed better with AI, especially when the adversaries employ AI tools and techniques for attacking US IT infrastructure.	There are several types of cyber attacks that result into loss of data, money, information (intellectual property). Attacks such as ransomware, denial-of-service, botnet are becoming more sophisticated with the help of AI. One needs to design a superior AI to counter such attacks.
2	Page 3, Section 3, para 1 The head of each covered agency must also consider the necessary financial, human, information, and infrastructural resources to carry out these responsibilities effectively, including providing or requesting resources via the budget process to support the responsibilities identified in this memorandum.	The budget process needs to be flexible as it is set for a fiscal year, whereas advances in AI can occur potentially several times in a year.	n/a
3	Page 4 **AI Use Case Inventories.** Pursuant to Section 7225 of the Advancing American AI Act, and subject to the exclusions in that Act and Section 10.1(e) of the AI Executive Order, each agency (except for the Department of Defense and the Intelligence Community) must annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency’s website	- Publicly sharing AI use cases inventories might actually make the job of the adversaries trying to attack US interests. Instead, the AI use cases can be shared only across the Federal/State agencies and select Private Companies. - A Government wide library of AI use cases will be useful for all agencies to see if some agency has already developed that AI use case. Technical knowledge	Page 5 states that **Reporting on AI Use Cases Not Subject to Inventory.** Some AI use cases are exempt from the Advancing American AI Act’s inventory requirement. Of those use cases, those within the Department of Defense are otherwise within the scope of this memorandum unless they concern AI used as a component of a national security system. This may also apply to AI use cases for, say, Department of Energy, wherein the AI use case to monitor and control power plants can have national security implications.

		sharing regarding technology, design, implementation and lessons learned will be quite useful and save time, money and effort.	
4	Page 5 b. Roles, Responsibilities, Seniority, Position, and Reporting Structure of Chief Artificial Intelligence Officers	A CAIO should have an AI technical team to support agency's AI mission.	This is similar to the technical team that a CTO has or a security team that a CISO has.
5	Page 6 *Promoting AI Innovation* I. advocating within their agency and to the public on the opportunities and benefits of AI to the agency's mission;	Making AI opportunities public may strengthen US adversaries. Needs careful consideration.	This is similar to #3 above.
6	Page 7 c. Internal Agency AI Coordination … The agency's AI coordination mechanisms should be aligned to the needs of the agency based on, for example, the degree to which the agency currently uses AI, the degree to which AI could improve the agency's mission, and **the risks posed by the agency's current and potential uses of AI.**	A scale measuring different AI levels needs be defined along with a threshold that the AI systems should not be allowed to cross. The definition of this scale and threshold is a very complex task in the context of collective intelligence offered by a group of AI use cases and not just one-use case taken at a time.	This comment is made in the light of potential AI singularity that many AI experts are expecting to happen between 2030 and 2045. Please refer to Future progress in artificial intelligence: A survey of expert opinion (philpapers.org) The threshold here should be much lower than the singularity. As the AI landscape evolves, the singularity may be pushed outward in the future by making use of human intelligence supplemented by non-singular AI systems.
7	Page 8 v. a plan for building sufficient enterprise capacity to manage risks from the use of AI;	Need clarification on the type of enterprise capacity referenced here.	
8	Page 10 v. Generative AI. In addition to heeding the guidance provided in	Special attention needs to be given to protecting the AI systems and preventing them from becoming	Please refer to https://agi-conference.org/2012/wp-content/uploads/2012/12/paper_56.pdf

	Section 10.1(f) of the AI Executive Order, agencies should assess potential beneficial use cases of generative AI in their missions and establish adequate safeguards and oversight mechanisms that allow generative AI to be used in the agency without posing undue risk.	rogue AI systems due to external/internal attacks by people, non-AI systems or other malevolent AI systems. Special QA processes may be required. Also need to address the issue of unintended AI behavior that is not due to any rogue agent.	
9	Page 15 A. Complete an AI impact assessment. Impact assessments must document the following: 1. The intended purpose for the AI and its expected benefit, supported by specific **metrics** or qualitative analysis.	A relevant metric could be AI system's accuracy. This could be determined either experimentally or theoretically or both.	n/a
10	Page 15 2. The potential risks of using AI, as well as what, if any, additional mitigation measures, beyond these minimum practices, the agency will take to help reduce these risks	Potential risks of **not using AI** also need to be considered.	This is because problems that can be efficiently and cost-effectively solved by using AI systems, may not be easily solvable by use of non-AI systems. Also using non-AI systems to counter attacks by AI systems can turn out to be a futile exercise.
11	Page 16 B. Test the AI for performance in a real-world context. Agencies must conduct adequate testing to ensure the AI, as well as components that rely on it, will work in its intended real-world context.	Government should encourage industry to develop test data generation tools to adequately test AI systems.	Some good test data generation tools, such as Mockaroo and Faker, are available today. The AI evolution is going to require additional, more powerful test data generation tools that are based on AI.
12	Page 16 C. Independently evaluate the AI. Agencies, through the CAIO, an agency AI oversight board, or other	Government should encourage implementation of AI assessment / certification program(s) at the organization level similar	n/a

	appropriate agency office with existing test and evaluation responsibilities, must review relevant AI documentation to ensure that the system works appropriately and as intended, and that its expected benefits outweigh its potential risks.	to say, CMMI or ISO and for the individual professionals, similar to PMP, ITIL or CSM.	
13	Page 17 E. Mitigate emerging risks to rights and safety	In general, AI systems' evolution needs to be monitored closely to assess where AI systems are, vis-a-vis the threshold they need to be below for the safety of the human race.	For robots - designers, implementors and testers should ensure Isaac Asimov's "Three Laws of Robotics" are implemented. There are other principles as well, such as Satya Nadella's six principles and goals that need to be considered.
14	Whole document	Overall comment: The complexity of implementing these guidelines and high computing resource requirements of AI systems may require significant additional budget for each agency.	Additional budget will be required to address high cost items, such as, AI infrastructure costs, AI software and services costs, training costs, higher salaries or contracting rates to attract the best people.

Comment on OMB-2023-0020-0001

December 4, 2023

Director Shalanda D. Young
Office of Management and Budget
725 17th St., NW
Washington, D.C. 20503

RE: OMB–2023–0020, Proposed Memorandum for the Heads of Executive Departments and Agencies

Dear Director Young and OMB Colleagues:

We are writing in response to the request for comment on the proposed draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" by the Office of Management and Budget (the OMB Memo).

We write as individuals with decades of experience in technology and government services and want to express our support for the requirements in the OMB Memo stating that:

> Agencies should also ensure adequate access for AI developers to the software tools, *open-source libraries*, and deployment and monitoring capabilities necessary to rapidly develop, test, and maintain AI applications.

We believe that open approaches to innovation for government technology are critical for responsible, accountable, and transparent use of AI for the federal government.

We write to amplify the need for this open innovation approach and offer context for why it is so necessary for the government to be able to seize this moment to lead with responsible innovation.

First, the OMB Memo should expressly draw the connection to established federal policy around open source.[1] OMB Memorandum M-16-21, "Federal Source Code Policy: Achieving Efficiency, Transparency, and Innovation through Reusable and Open Source Software" established a

[1] We focus in this letter on policies around open source, which is a type of software whose source code is publicly available for individuals to view, use, modify, and distribute. See also https://opensource.org/osd/. Open source can be conceived of as an example of open innovation in software, and we do not draw sharp definitional distinctions here. See http://oss-watch.ac.uk/resources/openinnov. While the term open source is often used to characterize foundation models loosely, there are important distinctions to be drawn there, as the "openness" of a foundation model depends not just on source code availability, but also on the availability of model weights, artifacts, documentation, data, and compute. For a lucid exposition of the gradient of open release, see Solaiman, Irene. "The gradient of generative AI release: Methods and considerations." In Proceedings of the 2023 ACM Conference on Fairness, Accountability, and Transparency, pp. 111-122.

federal policy in support of open innovation to benefit Americans. Agencies should default to open source when developing or acquiring code, and agencies piloted programs to require at least 20 percent of new software to be commissioned as open source. Many agencies, from the Department of Commerce to the General Services Administration to the Department of Defense, have built on this policy and examples abound. One report found that open source software "plays a more critical role in the [Department of Defense] than has generally been recognized." The US Digital Service has used an open source approach to build tools to help address the climate crisis.

Second, there are long-recognized benefits to open source approaches, including the reusability and robustness of code, the enhancement of digital services and federal programs, and the ability for government to develop collaborative approaches with the private sector. The emergence of AI itself illustrates the central role that open source approaches have played to catalyze innovation in the field.[2] While some questions have emerged around large foundation models,[3] the vast majority of AI applications within federal government are not such use cases.[4] More importantly, open research environments are exactly the ones that have enabled a wide range of researchers to uncover vulnerabilities, biases, and limitations with such models.[5]

Third, Executive Order 14110 takes important steps to understand the benefits and risks of Generative AI. The risks for a very limited set of models – particularly relative to machine learning as presently used within government – should not detract from the overall commitment toward an open approach to AI innovation. The development of privacy-enhancing technologies and cybersecurity standards, as also required under the Executive Order, will benefit tremendously from the reliance on open source. As has long been established in the cybersecurity field, security through obscurity is not a solution:[6] "With enough eyeballs, all bugs are shallow."[7] This open-first orientation has been widely acknowledged to have surfaced and

resolved a vast number of vulnerabilities that may have been left unaddressed in a closed system,[8] and open design is surfaced as a core principle of NIST's server security guidance.

We strongly support OMB's furtherance on the reliance on open source, but encourage explicit linking to long-established federal policy favoring open innovation approaches.

General Comment

The OMB draft guidance provides visionary, consequential, and much needed guidance to federal agencies on the use, deployment, and procurement of AI. Congratulations on releasing the draft and allowing the opportunity for members of the public to submit comments.

I make the following recommendations for your consideration:

1. Please address in more detail how the Chief AI Officer will work with Chief Data Officers, and their potentially conflicting roles and obligations arising under the Foundations of Evidence Based Policy Making Act. For example, page 9 refers to data governance and curation. That is usually the role of the CDO. Chief data officers have to assess all legal risks and conduct a data inventory to assess copyright and patents and other requirements.
2. Please include legal perspectives consistently and comprehensively, throughout. For example, 3(c)(II) should require a legal officer as part of the AI governance board. An example of a “rights-impacting purpose” on pg. 12 should include the use of AI to generate regulatory language, statutory text, judicial opinions, or equivalent uses that may impact someone’s legal rights. Consider consulting with different agency legal subject matter experts on his draft before finalizing.
3. Please insert more references to intellectual property rights. Copyright is mentioned only in the procurement space, and intellectual property as part of the safety purpose. However, the use of people’s images, names, signatures, likenesses, etc.. or “persona” rights is an important issue that Congress is looking at. Deepfakes of people, passing off someone’s content as their own (trademark), and possible ip and privacy violating uses to get training datasets are relevant issues.Government employees should be able to prevent their likenesses from being used by their employer without permission. It is possible that copyright is only mentioned in procurement because agencies may be liable for intellectual property infringement (patents, copyright) under 28 USC1498, but if the goal is to respect rights than
4. Please consider whether “procurement” is sufficiently broad. Is it possible agencies will seek to avoid obligations by acquiring AI through other means: other transaction authorities (OTAs)? This focus on procurement and not other ways agencies obtain technologies could be a loophole.
5. Please consider using the OECD definition for AI system, and other ways these initiatives can more clearly pave the way for international collaboration and harmonizations. Please consider including a

reference to international engagement plans in the required strategy on pg. 8 for agencies that have such equities.
6. Please consider requiring multi stakeholder engagement (including SLATTs, other government agencies, industry, and civil society) as part of the AI strategy development and implementation processes.
7. Consider requiring agencies to make data available for ai training datasets, and using machine readable licenses that clearly specify how data can be used and for what purposes,possibly creating an interagency task force, especially if this requires standards.
8. The EO refers to safe, secure, and trustworthy AI. This only refers to impacting safety and rights. Consider whether this is the correct framing, or whether responsible AI, trustworthy ai, or other terms should be used.

Thank you for considering these points as you finalize the guidance.

Brennan Center Comments re OMB Guidance 2023-0020

BRENNAN CENTER FOR JUSTICE

December 5, 2023

Office of Management and Budget
Submitted Via Federal eRulemaking Portal at www.regulations.gov

RE: Brennan Center for Justice Response to "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum," OMB-2023-0020

The Brennan Center for Justice at NYU School of Law is a nonpartisan law and policy institute that works to reform, revitalize, and defend our country's systems of democracy and justice. We submit the following comments in response to the Office of Management and Budget's (OMB) Request for Comments on its "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" draft memorandum (OMB Memorandum).

The Brennan Center commends OMB for its efforts to develop transparency measures and risk management practices for safety- and rights-impacting use of artificial intelligence (AI). We submit these comments and recommendations to further strengthen these critical safeguards.

1. **The IC and national security systems should not be excluded wholesale from the minimum practices outlined in the OMB Memorandum.**

The OMB Memorandum contains broad carveouts for the Intelligence Community (IC) and national security systems. The Advancing American AI Act of 2022 exempts the IC and Department of Defense (DoD) from the requirement to publish AI use case inventories.[1] The OMB Memorandum, however, goes further by entirely exempting the IC from implementing minimum risk management practices.[2] Similarly, "national security systems" are not mentioned anywhere in the Advancing American AI Act, but are also exempted from the ambit of the OMB Memorandum.[3] We recognize that Executive Order 14110 provides that the IC, DoD, and national security systems will be covered by a separate national security memorandum,[4] but are of the view that consigning rights-impacting AI use by significant parts of the federal government to an opaque national security track seriously jeopardizes the privacy, rights, and liberties of millions of people in the United States. As has become clear in the context of policing and criminal justice, too often the brunt of algorithmic discrimination is borne by communities of color, heightening the risks of allowing a large segment of AI to remain outside the framework that is meant to ensure that these systems are effective, accurate, fair, and rights-respecting.

[1] Advancing American AI Act, Pub. L. 117-263, title LXXII, subtitle B, §§ 7225(d), 7228 (2022) (exempting the Department of Defense and the intelligence community), https://www.congress.gov/117/plaws/publ263/PLAW-117publ263.pdf.
[2] Shalanda D. Young (director, Office of Management and Budget (OMB)), memorandum, Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence, 88 Fed. Reg. 75625 (November 3, 2023), sec. 5 ("Managing Risks From the Use of Artificial Intelligence") (hereinafter "OMB Memorandum").
[3] OMB Memorandum, sec. 2(a).
[4] Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence, Exec. Order No. 14110, 88 Fed. Reg. 75191 (2023), § 4.8, https://www.govinfo.gov/content/pkg/FR-2023-11-01/pdf/2023-24283.pdf.

National security systems are defined by statute to include information systems whose deployment "involves intelligence activities."[5] Under the provisions of Executive Order 12333, this means all IC systems used for data collection, retention, analysis, and dissemination.[6] Since the IC includes federal agencies that are primarily domestically focused, such as the Federal Bureau of Investigation (FBI)[7] and certain parts of the Department of Homeland Security (DHS), a broad swath of systems that directly affect persons living in the U.S. are excluded from basic testing and risk management practices. This is particularly concerning because the FBI and DHS have deployed AI systems that exhibit the types of problems and risks that the OMB Memorandum is meant to mitigate.

The FBI's massive facial recognition program through which it has access to billions of face prints is used for both law enforcement and intelligence purposes.[8] It has been repeatedly criticized by the Government Accountability Office for: inadequate accuracy testing, including a failure to test performance in common use scenarios and to test for false positives;[9] lack of training, including no training requirements for agents using external facial recognition technology like Clearview AI, leaving 95 percent of agents not trained;[10] lack of systems to track agents' use of non-FBI facial recognition tools;[11] and lack of specific policies to mitigate risks to civil rights and liberties from this technology.[12] The Bureau's lax attitude toward the reliability and fairness of its systems is particularly alarming given the existence of several research studies documenting facial recognition's inaccuracy in identifying non-white faces,[13] and multiple reports of erroneous matches resulting in wrongful arrests and incarceration of Black Americans.[14] Moreover, the FBI has also developed, in partnership with DoD, technology to identify individuals from video footage of public spaces, which could pose serious risks to First Amendment protected activities if it is used to, for example, identify protestors for surveillance and other measures.[15]

Other FBI systems are also deployed for both domestic intelligence and criminal investigation purposes. For example, the Bureau's various social media monitoring programs, for which it has contracted with companies such as Dataminr, ZeroFox, and Babel Street, use some version of AI to trawl the web.[16]

DHS's Office of Intelligence and Analysis (I&A), which is also part of the IC, undertakes broad social media monitoring for domestic intelligence purposes. It uses an AI tool called Tangles that constantly monitors and scrapes the web to build detailed profiles of individuals.[17] During the 2020 racial justice protests, I&A built dossiers on protestors using social media and other sources, generating a chorus of criticism from Congress and the department's oversight offices.[18] The DHS Office of the General Counsel found that I&A employees did not have an adequate understanding of what constitutes protected speech,[19] while its inspector general found that I&A "does not have comprehensive policies and procedures to ensure [that] its employees effectively collect [open source intelligence] and adhere to privacy protections."[20] More recently, I&A has surveilled Americans discussing abortion online,[21] and DHS has launched a program to trawl the internet for dangerous "narratives and grievances," raising First Amendment concerns.[22] I&A is now developing AI data analysis tools for use by the law enforcement parts of the department.[23]

Given the impact of programs like these on people in the U.S., their wholesale exemption leaves in place risky AI systems without safeguards and should be replaced by a system that institutes protections, testing, and oversight comparable to those for agencies and systems covered under the OMB Memorandum.

2. OMB should clarify provisions exempting agencies from the obligation to produce information about AI use cases in public AI use case inventories and exercise oversight over such exemptions.

According to Section 3(a)(iv) footnote 8 of the OMB Memorandum, agencies must publicly report use cases "to the extent practicable and consistent with applicable law and governmentwide guidance, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information."[24] We appreciate that the OMB Memorandum references only governmentwide—rather than agency-specific—policies in this provision. At the same time, we believe that the standards articulated in footnote 8 are too broad and vague. We recommend that they be clarified as set out below.

[24] OMB Memorandum, 4 n8. Section 5(c)(iv)(H) of the OMB Memorandum includes a similar exemption.

First, OMB should make clear that agencies cannot use this provision to avoid providing information regarding systems about which information has already been publicly released—for example through press reports, FOIA documents, Congressional testimony, privacy impact assessments, systems of records notices, and other sources. Public release undermines any argument for wholesale withholding information about a system based on practicability or protection of information.

Second, the decision to exempt use cases on these grounds should not be left solely to the agency. For each invocation of an exemption per footnote 8, OMB should require agencies to submit a detailed rationale and relevant documentation, as well as to specify the system-specific policies they have in place to mitigate any risks to privacy, civil rights, and civil liberties. To increase transparency, OMB should annually publish information on the number of exemptions by agency.

Third, OMB should issue public guidelines making clear that practicability would justify an exemption from transparency only in the most exceptional circumstances and specify factors that are relevant to such a determination.

Fourth, OMB should similarly issue public guidelines on the situations in which laws and guidance concerning the protection of privacy, sensitive law enforcement, national security, and other protected information could justify not publishing information about AI use cases in a use case inventory, with transparency as the default principle.

In particular, OMB should clarify that—absent a specific provision or provisions in a law or governmentwide guidance that clearly require that no information about a system be disclosed—footnote 8 does not allow agencies to avoid disclosing the very existence of an AI system, a description of the capabilities of that AI system, the purpose of the agencies' use of that AI system, and the rules and restrictions that govern the use of the system. Although OMB has yet to publish guidance on what information will be included in use case inventories, it seems highly unlikely that such disclosures would reveal information about individuals, and the fact that a system collects or uses information about individuals does not by itself trigger privacy concerns about disclosing *system*-level information.[25] Nor would such disclosures reveal information about particular investigations that could be regarded as sensitive law enforcement information. Local laws already require police departments to disclose information about their surveillance technologies, providing evidence that system level transparency is achievable.[26] Indeed, public reporting of AI systems may help improve such systems, allowing for input and advice from outside experts and encouraging agencies to deliberate carefully about their use of AI.

Lastly, allowing agencies to avoid publicly reporting use cases on the grounds of "sensitive national security information" appears redundant because of the broad carveouts for national security systems, the IC, and DoD discussed above. We recommend that OMB strike this phrase or, at minimum, clarify for the public what types of systems would be covered in this category. We also request that OMB specify what type of information is covered by the phrase "other protected information," noting that classified information would be covered by other laws and regulations and the carveouts for national security systems, the IC, and DoD. Any use of these exceptions should, in any event, be narrowly construed and subject to OMB oversight.

[25] In the unlikely circumstance that use case inventories would include information about individuals, agencies should be required to report that information in a privacy-preserving manner—rather than choose not to report that information at all.
[26] See Stevie Degroff and Albert Fox Cahn, *New CCOPS On the Beat: An Early Assessment of Community Control of Police Surveillance Laws*, Surveillance Technology Oversight Project, February 10, 2021, 6, https://static1.squarespace.com/static/5c1bfc7eee175995a4ceb638/t/602430a5ef89df2ce6894ce1/1612984485653/New+CCOPS+On+The+Beat.pdf (showing that, as of December 2020, fourteen local governments required annual reports of law enforcement's surveillance technology acquisition and use).

3. OMB should require agencies' evaluation of data to be based on prevailing academic norms rather than historical data.

We appreciate that OMB has highlighted the importance of ensuring the "quality and appropriateness" of training data when developing safety- and rights-impacting AI,[27] and note that in some cases this may require investing in better data collection, consistent with privacy concerns, and abandoning AI use cases until more suitable data exists.[28] Data on the criminal justice system especially suffers from quality issues that would undermine the validity and accuracy of any AI trained on it. To take one example, the First Step Act of 2018 requires the Bureau of Prisons to develop an algorithm to predict the "recidivism risk" of people in federal custody. As currently deployed, that algorithm, "PATTERN," focuses on calculating a narrow type of recidivism: the risk that someone will be re-arrested (or, much more rarely, returned to federal prison). But arrest and criminality are not the same thing, and conflating the two has led PATTERN's predictions to suffer from unwarranted racial disparities.[29] A better and more accurate tool would abandon the focus on re-arrest entirely and seek to predict solely the risk of re-conviction or re-imprisonment.[30] Remarkably, though, the data to train such an algorithm does not exist—at least not in one place. Instead, it is scattered across databases maintained by state courts and law enforcement agencies.[31] These problems—atomized and incomplete data that speak to only one narrow aspect of a social problem—are unfortunately common in the criminal justice context.[32]

Agencies must, as the OMB Memorandum advises in Section 5(c), exercise special care when designing systems operating in this space. OMB should further clarify that agencies' evaluation of the "quality and appropriateness" of data to be used in safety- and rights-impacting AI should be based on prevailing academic norms rather than historical use cases. It is not enough, for example, that federal agencies have historically measured recidivism based on the risk of re-arrest. Agencies should determine tabula rasa whether a dataset measures what it purports to and, if not, whether that renders it inappropriate for use in machine learning. And OMB should encourage agencies to consult with a range of civil society voices in making these determinations.

[30] See Jessica M. Eaglin, "Constructing Recidivism Risk," *Articles By Maurer Faculty* (2017), 94, https://www.repository.law.indiana.edu/cgi/viewcontent.cgi?article=3647&context=facpub (noting that arrest is one of "the least procedurally protected instances of contact with the criminal justice system").

[31] To its credit, the Department of Justice (DOJ) continues to investigate ways to improve PATTERN, including potentially refocusing the tool to predict re-conviction risk. See Office of the Attorney General, *First Step Act Annual Report*, DOJ, April 2023, 10–11, https://www.ojp.gov/first-step-act-annual-report-april-2023.

[32] Until very recently, government crime data largely focused on a handful of offenses—hardly a complete picture of crime in the United States. See generally Ames Grawert and Noah Kim, "Understanding the FBI's 2021 Crime Data," Brennan Center for Justice, October 4, 2022, https://www.brennancenter.org/our-work/research-reports/understanding-fbis-2021-crime-data, and "U.S. Crime Rates and Trends — Analysis of FBI Crime Statistics," Brennan Center for Justice, October 16, 2022, https://www.brennancenter.org/our-work/research-reports/us-crime-rates-and-trends-analysis-fbi-crime-statistics.

4. OMB should tighten standards for waivers and exercise oversight over them.

Section 5(c)(iii) of the OMB Memorandum allows an agency's Chief AI Officer (CAIO) to grant a waiver from risk management practices for safety- and rights-impacting AI uses based on an assessment that fulfilling the requirements would either "increase risks to safety or rights overall" or constitute an "unacceptable impediment to critical agency operations."[33] This standard is overbroad and vague and leaves too much discretion in the hands of CAIOs. We recommend the following:

First, OMB should only allow waivers for a set period and subject to annual review. The minimum standards are meant to ensure that AI works (through testing), that it doesn't harm people (through safeguards against bias and civil liberties' protections), and that its use is understood by those who are subject to it (through transparency). Agencies' use of faulty or biased technology should not be allowed to continue indefinitely through waivers.

For example, DHS's Customs and Border Protection (CBP) uses CBP One, an app that requires asylum seekers at the U.S.-Mexico border to use facial recognition in order to schedule appointments at ports of entry and requires non-citizens to use facial recognition to request travel authorization for parole processes.[34] Not only is there abundant evidence about facial recognition programs' inaccuracy in identifying darker skinned faces, but there are also reports that CBP One in particular "is failing to register many people with darker skin tones"—such as those who have made their way to the southern border from Haiti and African countries—making it near impossible for them to apply for asylum.[35] Managing the flow of asylum seekers at the border is clearly a high priority for CBP, but it should not get an open-ended pass to continue using technology that may be biased rather than take steps to improve its systems.

Second, it is unclear what would constitute an "unacceptable impediment to critical operations" and an increased "risk to safety or rights overall." OMB should clarify what is meant by these terms; clarify how adherence to these standards would be assessed; provide examples of scenarios in which a waiver is or is not appropriate; and give detailed instructions or a template for what information must be shared with OMB.

Finally, the OMB Memorandum leaves too much discretion in the hands of the CAIO, inviting operational pressures to prevail over the need for testing and safeguards. We have seen time and again that internal offices charged with protecting civil rights and civil liberties have given way in the face of operational imperatives.[36] There is no reason to believe that CAIOs would behave differently, particularly considering the vague standard put forward in the OMB Memorandum. Any waivers should be subject to review by OMB, and OMB should make publicly available information on systems for which waivers are granted, including: the scope of the waiver (e.g., which risk management requirements the agency will not need to implement with respect to that use case); the period for which the waiver applies; and the date on which OMB will review the waiver.

5. OMB should maximize publicly available information about AI uses.

In addition to public reporting, the OMB Memorandum in several places requires agencies to report, solely to OMB, information such as agency lists of safety- and rights-impacting AI[37] and how agencies are

[36] Spencer Reynolds and Alia Shahzad, *Holding Homeland Security Accountable: How to Strengthen Departmental and Congressional Oversight,* Brennan Center for Justice, October 26, 2023, 2–8, https://www.brennancenter.org/media/11860/download.
[37] OMB Memorandum, sec. 5(b).

implementing risk management practices.[38] In the interest of transparency, OMB should make this information public as part of use case inventories.

We note that while DoD and the IC are both exempt from maintaining AI use case inventories, the OMB Memorandum provides a mechanism for DoD to report to OMB AI use cases that are not used as part of a national security system.[39] The IC should have this same requirement.

6. Internal agency mechanisms are not sufficient to address AI risks.

We appreciate that OMB will be exercising some degree of oversight over agencies' interpretations of the requirements it has articulated. However, as set out in this submission, the OMB Memorandum does not apply to national security systems and IC uses of rights-impacting AI, leaving these critical systems without risk management practices, antidiscrimination testing, and impact assessments. We have already encouraged OMB to expand its oversight and review responsibilities to the greatest extent possible. Additional independent oversight would contribute significantly to building trust in the use of AI, and we therefore recommend that an appropriately resourced outside body modeled on the Privacy and Civil Liberties Oversight Board be constituted to serve as an additional check on agency use of AI.

***

We appreciate OMB's commitment to ensuring that people's rights and safety are protected from potentially harmful AI systems and urge you to take the steps outlined above to better accomplish this goal. We also appreciate OMB's engagement with civil society and encourage you to continue to seek input from stakeholders. For any questions, please contact Faiza Patel at patelf@brennan.law.nyu.edu.

Sincerely,

Faiza Patel

AI-in-Government-Memo-Public-Comment - comments and feedback

Given below is the list of comments submitted after reviewing the document “AI-in-Government-Memo-Public-Comment.pdf”.

#	Document reference	Comment	Justification/reasoning
1	Page 2 – last para. This memorandum does not address issues that are present regardless of the use of AI, for instance with respect to Federal information and systems in general. I	Security issues are present regardless of the use of AI. These could be addressed better with AI, especially when the adversaries employ AI tools and techniques for attacking US IT infrastructure.	There are several types of cyber attacks that result into loss of data, money, information (intellectual property). Attacks such as ransomware, denial-of-service, botnet are becoming more sophisticated with the help of AI. One needs to design a superior AI to counter such attacks.
2	Page 3, Section 3, para 1 The head of each covered agency must also consider the necessary financial, human, information, and infrastructural resources to carry out these responsibilities effectively, including providing or requesting resources via the budget process to support the responsibilities identified in this memorandum.	The budget process needs to be flexible as it is set for a fiscal year, whereas advances in AI can occur potentially several times in a year.	n/a
3	Page 4 **AI Use Case Inventories.** Pursuant to Section 7225 of the Advancing American AI Act, and subject to the exclusions in that Act and Section 10.1(e) of the AI Executive Order, each agency (except for the Department of Defense and the Intelligence Community) must annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency’s website	- Publicly sharing AI use cases inventories might actually make the job of the adversaries trying to attack US interests. Instead, the AI use cases can be shared only across the Federal/State agencies and select Private Companies. - A Government wide library of AI use cases will be useful for all agencies to see if some agency has already developed that AI use case. Technical knowledge	Page 5 states that **Reporting on AI Use Cases Not Subject to Inventory.** Some AI use cases are exempt from the Advancing American AI Act’s inventory requirement. Of those use cases, those within the Department of Defense are otherwise within the scope of this memorandum unless they concern AI used as a component of a national security system. This may also apply to AI use cases for, say, Department of Energy, wherein the AI use case to monitor and control power plants can have national security implications.

		sharing regarding technology, design, implementation and lessons learned will be quite useful and save time, money and effort.	
4	Page 5 b. Roles, Responsibilities, Seniority, Position, and Reporting Structure of Chief Artificial Intelligence Officers	A CAIO should have an AI technical team to support agency's AI mission.	This is similar to the technical team that a CTO has or a security team that a CISO has.
5	Page 6 *Promoting AI Innovation* I. advocating within their agency and to the public on the opportunities and benefits of AI to the agency's mission;	Making AI opportunities public may strengthen US adversaries. Needs careful consideration.	This is similar to #3 above.
6	Page 7 c. Internal Agency AI Coordination … The agency's AI coordination mechanisms should be aligned to the needs of the agency based on, for example, the degree to which the agency currently uses AI, the degree to which AI could improve the agency's mission, and **the risks posed by the agency's current and potential uses of AI.**	A scale measuring different AI levels needs be defined along with a threshold that the AI systems should not be allowed to cross. The definition of this scale and threshold is a very complex task in the context of collective intelligence offered by a group of AI use cases and not just one-use case taken at a time.	This comment is made in the light of potential AI singularity that many AI experts are expecting to happen between 2030 and 2045. Please refer to Future progress in artificial intelligence: A survey of expert opinion (philpapers.org) The threshold here should be much lower than the singularity. As the AI landscape evolves, the singularity may be pushed outward in the future by making use of human intelligence supplemented by non-singular AI systems.
7	Page 8 v. a plan for building sufficient enterprise capacity to manage risks from the use of AI;	Need clarification on the type of enterprise capacity referenced here.	
8	Page 10 v. Generative AI. In addition to heeding the guidance provided in	Special attention needs to be given to protecting the AI systems and preventing them from becoming	Please refer to https://agi-conference.org/2012/wp-content/uploads/2012/12/paper_56.pdf

	Section 10.1(f) of the AI Executive Order, agencies should assess potential beneficial use cases of generative AI in their missions and establish adequate safeguards and oversight mechanisms that allow generative AI to be used in the agency without posing undue risk.	rogue AI systems due to external/internal attacks by people, non-AI systems or other malevolent AI systems. Special QA processes may be required. Also need to address the issue of unintended AI behavior that is not due to any rogue agent.	
9	Page 15 A. Complete an AI impact assessment. Impact assessments must document the following: 1. The intended purpose for the AI and its expected benefit, supported by specific **metrics** or qualitative analysis.	A relevant metric could be AI system's accuracy. This could be determined either experimentally or theoretically or both.	n/a
10	Page 15 2. The potential risks of using AI, as well as what, if any, additional mitigation measures, beyond these minimum practices, the agency will take to help reduce these risks	Potential risks of **not using AI** also need to be considered.	This is because problems that can be efficiently and cost-effectively solved by using AI systems, may not be easily solvable by use of non-AI systems. Also using non-AI systems to counter attacks by AI systems can turn out to be a futile exercise.
11	Page 16 B. Test the AI for performance in a real-world context. Agencies must conduct adequate testing to ensure the AI, as well as components that rely on it, will work in its intended real-world context.	Government should encourage industry to develop test data generation tools to adequately test AI systems.	Some good test data generation tools, such as Mockaroo and Faker, are available today. The AI evolution is going to require additional, more powerful test data generation tools that are based on AI.
12	Page 16 C. Independently evaluate the AI. Agencies, through the CAIO, an agency AI oversight board, or other	Government should encourage implementation of AI assessment / certification program(s) at the organization level similar	n/a

	appropriate agency office with existing test and evaluation responsibilities, must review relevant AI documentation to ensure that the system works appropriately and as intended, and that its expected benefits outweigh its potential risks.	to say, CMMI or ISO and for the individual professionals, similar to PMP, ITIL or CSM.	
13	Page 17 E. Mitigate emerging risks to rights and safety	In general, AI systems' evolution needs to be monitored closely to assess where AI systems are, vis-a-vis the threshold they need to be below for the safety of the human race.	For robots - designers, implementors and testers should ensure Isaac Asimov's "Three Laws of Robotics" are implemented. There are other principles as well, such as Satya Nadella's six principles and goals that need to be considered.
14	Whole document	Overall comment: The complexity of implementing these guidelines and high computing resource requirements of AI systems may require significant additional budget for each agency.	Additional budget will be required to address high cost items, such as, AI infrastructure costs, AI software and services costs, training costs, higher salaries or contracting rates to attract the best people.

Comments in Response to OMB Request

OMB Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of AI

Introduction

The International Center for Not-for-Profit Law (ICNL) is pleased to submit Comments in response to the request from the Office of Management and Budget (OMB) regarding the draft Memorandum on artificial intelligence (AI). We appreciate OMB's efforts to advance rights-based approaches to AI use by federal agencies and its decision to seek public input.

ICNL is an international not-for-profit organization that promotes an enabling environment for civil society and public participation in more than 100 countries worldwide, including the United States. ICNL has provided technical and research assistance to support the reform of laws and policies governing the freedoms of association, assembly, and expression, and right to privacy, whether the rights are exercised online or offline. ICNL is recognized as a global leader on digital rights issues, including at the intersection of AI and human rights. ICNL is proud to be a member of the Freedom Online Coalition's (FOC) Advisory Network and co-leads the FOC task force on Artificial Intelligence and Human Rights with the Government of Germany. More information about our work can be found at www.icnl.org.

In the United States, ICNL has been actively following state and federal legislation introduced since January 2017 that restrict the right to peaceful assembly, and we maintain a US Protest Law Tracker with analysis of relevant legislation. In February 2023, we published a briefer on the use of digital technologies, including AI-enabled tools, that impact the right of individuals to exercise their First Amendment right to assembly. As such, **our Comments are narrowly focused on strengthening the civil rights protections in the OMB Memorandum with regards to the right to peaceful assembly.** We have not addressed all aspects of the draft Memorandum relevant to civic space and civil society, but we look forward to engaging with OMB, the White House, and federal agencies to discuss these issues as well as the recommendations in our submission in greater detail.

Recommendations

In response to the request for feedback on the eight questions listed in the notice of public comment, ICNL is only responding to questions #6 and #8.

#6 - MINIMUM PRACTICES.

In response to the question, "Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?" ICNL has the following input:

EXCLUSION OF R&D. ICNL is concerned that the exclusion of research and development (R&D) of AI systems from the minimum practices requirements could lead to the spread of rights-violating technologies. Federal agencies may develop AI systems or their underlying technology that is then used by the private sector in harmful ways. Without placing minimum constraints on the development of AI systems, even if federal agencies do not intend to use the outputs of their R&D, the outputs can be appropriated by the private sector without any safeguards in place. Therefore, agencies should assess risk from the outset of any R&D, taking into consideration the potential uses of the system. For systems that could pose a risk to safety and rights, agencies should be required to mitigate harms, such as by building technical privacy-by-design and default applications into the systems and creating safeguards for how the R&D outputs are made available to the private sector for further development or use.

RISKS TO INDIVIDUALS EXERCISING THEIR RIGHTS. For the AI Impact assessment and the "evaluation of potential risks of using AI," ICNL welcomes that the OMB Policy mandates that agencies "be especially attentive to the potential risks to underserved communities." In addition to "underserved communities," ICNL recommends that agencies also be especially attentive to the risks to individuals and communities exercising civil rights, including their rights to freedom of expression, the right to peacefully protest, the right to association, and their right to be free from unreasonable searches and seizures. ICNL's research and work defending civic space both online and offline, has shown how AI technologies have led to abuses during protests and have deterred peaceful demonstrators from exercising their First Amendment rights. Within the categories of purposes that are presumed to be rights-impacting, there may be instances when the risks are greater, or altogether unacceptable, when the AI system is used in specific contexts, such as during protests. Therefore, agencies should be mandated to explicitly assess the civil liberties risks that can arise when AI is used, including in contexts when individuals are exercising their constitutional rights.

IDENTIFICATION OF NEW RISKS. ICNL welcomes the fact that OMB recognizes risk assessments can change due to changes in technology or changes in our understanding of the impact of a technology. In addition to taking steps to mitigate these newly assessed risks through technical and non-technical means, the Memorandum should require agencies to notify the appropriate internal authority of this change in assessment and immediately escalate this new assessment to agency leadership.

#8 – USE CASE INVENTORY

In response to the question, "What kind of information should be made public about agencies' use of AI in their annual use case inventory?" ICNL has the following input:

ADDITIONAL INFORMATION. ICNL encourages the OMB to ensure that impact assessments are made public, in full, and unredacted. OMB should also ensure that the full impact assessment are accessible through the inventory. ICNL also encourages the OMB to require that key information about the agency's use of AI be highlighted and summarized in an easy-to-find and easy-to-understand manner. It should not be buried in lengthy, technical impact assessments. ICNL believes that "key information" includes the following:

- what civil liberties concerns were considered and how they were assessed, including through banning technology or placing safeguards around its use (such as, for example, first seeking warrants for using certain AI technology that can identify or track specific individuals);
- how many individuals have been impacted to date;
- how many individuals the agency projects will be impacted through the future use of the AI system (does the agency plan to expand its use for the coming year, for example);
- what specific communities or categories of individuals have been or will be impacted;
- which non-governmental, private sector entities, if any, have or will have responsibility for the use of the AI system (including by providing customer support) and the roles of the individuals within those entities;
- how individuals who believe they have been harmed by an AI system used by the agency can find more information about the AI system, challenge uses of the system that harmed them, and seek redress for such harms.

_____

Thank you for this opportunity to submit comments. We appreciate your approach and would be happy to provide additional input if helpful. To contact us, please email Zach Lampell zlampell@icnl.org and Shabnam Mojtahedi smojtahedi@icnl.org.

Office of Management and Budget Request for Comment: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI); Docket No. OMB-2023-0020

Socure welcomes the opportunity to provide feedback on the Office of Management and Budget's (OMB's) request for comment for the draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)."

1. Introduction and Summary

Socure is a leading provider of digital identity verification and fraud detection solutions. The company was founded in 2012 with a mission to verify 100% of good identities in real-time and completely eliminate identity fraud on the internet. Socure has more than 2000 customers, including top financial institutions, government agencies, and leading enterprises across all industries. For over a decade, Socure has been at the forefront of using new technologies to protect organizations from identity fraud. We use proprietary AI and Machine Learning (ML) techniques with hundreds of online and offline data sources to prevent identity theft and other forms of identity fraud (e.g., synthetic) while simultaneously confirming good people can seamlessly assert their identity online. In our efforts, we've seen the gap as it exists today in the usage and maturity of AI across sectors. We believe that the expanded usage of the technology should be done so with the goal of promoting greater transparency and measurement for outcomes, however, given the pace the landscape is evolving the federal government must accelerate its efforts to implement the proposed guidance.

2. Responses to Specific Feedback Areas

Structuring the Chief AI Officer role for the Federal Government.

The roles and responsibilities outlined for the Chief AI Officers appear flexible. However, the seniority and reporting requirements may cause some issues for smaller agencies. Additionally, we have concerns with the achievability of the role as defined. The CAIO role encompasses a wide range of activities related to strategy, implementation, and oversight. Specifically, the guidance should clarify how the role should be constructed to deconflict with authorities of a Chief Information Officer or Chief Data Officer, which also overlap. The role of Chief Technology Officer is not a statutorily recognized role and as such should be removed from reference.

For officials designated as the CAIO, they will not be successful without adequate resources. Smaller teams may not be able to cover all necessary activities adequately. This role also lacks clear budget authority, which can hinder compliance with the

administration's directives. It is recommended that there be call outs for how compliance with the plans produced for implementing the guidance will be incorporated in OMB's budget process through engagement with the Resource Management Offices (RMOs). If not included any resourcing asks may not be prioritized and will leave agencies perennially unable to comply with the mandate. Additionally, the implementation timelines for activities must be accelerated to coincide with the rapid pace of change in technology and threats from nation states who use this technology unabated.

AI Governance Body Coordination Mechanisms

Without proper coordination for implementation activities there is likely to be overlap and conflicting approaches to the adoption of emerging technologies for areas like AI. Specifically, this coordination should be viewed and adopted at multiple layers.

- *For intra-agency coordination*, it is recommended that OMB provide a playbook for agencies in consideration of how they may structure the intra-agency coordination bodies. Similar efforts have been used for areas of cybersecurity and IT modernization.
- *For inter-agency coordination*, it is recommended that OMB confirm that the council referenced in section 10.1(a) of the Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence be required to outbrief and collaborate with councils such as the CIO Council, CDO Council, and Privacy Council.
- *For Public-Private coordination*, OMB should facilitate collaboration between the federal government, industry stakeholders, and academia to foster responsible AI innovation. This public-private partnership can help create guidelines and best practices that align with the government's goals and industry needs.

Advancing Responsible AI innovation

As OMB considers how to promote AI innovation while implementing the administration's Executive order, it is paramount that it considers two key aspects.

- *Mitigating the impact* of *innovation through regular engagement*. Engaging with the private sector can help the government see around corners. OMB should encourage private sector participation in government contracts by not requiring the disclosure of intellectual property or putting in place the appropriate protections to safeguard its release.
- *Leveraging existing methods for new compliance regimes*. The Federal Reserve leverages published SR 11-7: Guidance on Model Risk Management (https://www.federalreserve.gov/supervisionreg/srletters/sr1107.htm), which sets the standard for how organizations manage model risk. These existing frameworks are used today to assess the effectiveness and disparate impact for AI models used today, and should be adapted for any compliance regimes that are implemented at the federal level. In many cases, technology providers are already having to comply with these requirements and as such requiring a

© Socure, Inc.

conflicting or duplicative requirement may be viewed as burdensome and detract from private sector ability to support federal missions.

Minimum Practices And Baselines

Socure recommends that OMB avoid seeking to apply a set of baselines which may not account for the context associated with the application of AI today in agency missions. For example, a blanket prohibition on automated decision-making would prevent organizations from using AI to make routine decisions that enhance productivity, improve accuracy, and save time. There is no one-size-fits-all solution. Instead, agencies should be required to mature their capabilities to manage the risk of AI to include improvements to monitoring, measurement, and mitigation.

Materials or Resources for Government Contracting

OMB should evaluate and consider the types of training programs made available to the procurement workforce and/or establishment of a program to provide contracting expertise to those who are managing procurements for systems that leverage AI. Today, there is a lack of maturity in the overall understanding and knowledge for how to procure and manage the risk associated with these technologies. In some cases, this is presented as limitations on the exchange and usage of data or feedback for the improvement of models due to previous agency policy positions on privacy. OMB should consider leading or requiring an effort to standardize contract clauses for AI across agencies similar to efforts undertaken for cybersecurity as a means to mitigate procurement risks. Otherwise the mandates and

3. Conclusion

Socure appreciates the opportunity to share its views on the draft memoranda. We look forward to continuing to work with OMB, other agencies, and the many other stakeholders on these vital matters.

RE: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum

Dear Director Young:

The American Foundation for the Blind (AFB) is a national nonprofit that advocates for a world of no limits for people who are blind or have low vision by mobilizing leaders, advancing understanding, and championing impactful policies and practices using research and data. AFB appreciates the opportunity to comment on the proposed OMB memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence."

The Rehabilitation Act (particularly sections 501, 504, and 508) and the Americans with Disabilities Act protect the rights of people with disabilities, including people who are blind have low vision, and are deafblind, to participate equally in society, to work, to access government programs and benefits, and to have equal opportunities. However, as many digital technologies have been deployed in the last three decades, people with disabilities have often been an afterthought. The lack of disability-inclusive planning, accessible design, and enforcement of federal disability laws in the digital environment has created barriers in all aspects of life, including working for and receiving services from the federal government. As the federal government plans for the implementation of yet another new technology, AFB urges the Office of Management and Budget to integrate disability access and nondiscrimination into all aspects of federal AI governance, development, and deployment.

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

The Chief AI Officer must have an understanding of digital accessibility principles and practices to ensure that AI systems are accessible to people with disabilities, including people who are blind or have low vision. These practices should include accessibility testing, procurement, contracting, design, and development, as well as the use of assistive technology, such as screen reader or magnification software. Accessibility is important in the development of both the front-end and back-end software and is an important factor in ensuring these systems do not perpetuate discrimination and bias against people with disabilities – whether members of the general public or federal employees. The federal government is obligated by Section 508 of the Disabilities Act not to discriminate against people with disabilities in the use of information and communications technologies. Establishing a commitment to and knowledge of accessibility at the highest levels of agency administration is vital to carrying out Section 508 obligations, particularly as AI development and use is still relatively new.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Existing bodies are unlikely to be able to independently coordinate all of the needed tasks that an AI governance body must perform. AI governance bodies must include expertise on disability rights and digital accessibility that may be lacking in existing agency bodies. Indeed, while Chief AI Officers should have sufficient accessibility knowledge to provide access to these platforms for employees and the public, the Chief AI Officers likely will be constrained in the depth of their accessibility expertise. For that reason, agencies should also designate Chief Accessibility Officers who can work with the Chief AI Officers and the AI governance bodies to ensure that all governmentally used and funded AI tools are accessible to, usable by, and inclusive of people

with disabilities. Chief Accessibility Officers should be responsible for ensuring that agencies build, develop, procure, contract with, deploy, and use accessible information and communications technologies in compliance with and, where appropriate, exceeding the Section 508 regulations. Coordination between Chief AI Officers and Chief Accessibility Officers would also increase agency capacity to adhere to Executive Orders 13985, 14035, and 14110. In the absence of establishing Chief Accessibility Officers, however, it remains imperative that the AI governance bodies in each agency include experts on accessibility who understand technical accessibility development and have experience implementing organizational policies and practices for accessibility and disability inclusion.

3. How can OMB best advance responsible AI innovation?

AI talent development within agencies must include accessibility training for all employees and recruitment of workers with disabilities. Training for all employees should include an accessibility component to ensure that agencies interacting with AI systems are prepared to evaluate these systems for discrimination and bias and to deploy AI accessibly and inclusively. Further, it is vital to ensure that there are pathways to AI development and deployment jobs for people with disabilities. STEM-related professions and training are often less accessible to people who are blind because the training materials and technologies employed are not fully accessible. People with disabilities bring a diversity of lived experiences that can strengthen the development of models for a wide range of users. Thus, agencies should take proactive steps to create pathways for current and prospective employees to develop AI skills that are inclusive of people who are blind or have low vision and assistive technology users.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Procurement of inaccessible tools is a common way that the federal government disadvantages employees who are blind or have low vision. In 2021, AFB surveyed 48 current or former federal employees and contractors. 65% reported that their employer had procured new hardware or

software that presented accessibility challenges.[1] Contract language that specifies that the data used to train AI models must be inclusive of people with disabilities, including their need for reasonable accommodations and accessibility standards, should be standard for AI contracts. Similarly, model outputs and decisions should be rigorously tested for potential discrimination and bias against people with disabilities, and agencies can play a role in developing appropriate tests for this purpose. Contracts should also require that vendors make all user interfaces accessible to and usable by people with disabilities, including those who use assistive technology. Vendors should be required to regularly evaluate AI models and interfaces for nondiscrimination and accessibility, including before any updates, and to provide appropriate remediation and customer service when issues arise. The federal government can only do so much to provide an accessible experience for employees and the public if it is not ensuring that vendors are delivering accessible services and products.

Furthermore, agencies would benefit from guidance on validating vendor claims of accessibility, and employees, especially procurement officers, need training on understanding accessibility principles and how to comply with federal Section 508 regulations and other accessibility requirements. The federal government has made significant progress in implementing accessibility, especially on public-facing websites, but much work remains to be done. It will benefit the government, taxpayers, and employees if the government can implement accessibility upfront on these emerging AI technologies.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

We appreciate that agencies must report on rights-impacting AI and the risks to equity. Within those analyses, agencies should report on the types of accessibility and nondiscrimination testing that each type of AI use undergoes and the testing results. Such reporting would be in

General Comment

We write to share comments regarding OMB's proposed memorandum titled 'Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence' (OMB Proposed AI Memorandum).

OMB is taking an important step to ensure that federal agencies can procure, deploy, and use AI responsibly. Your efforts appropriately reflect the serious, comprehensive cross-sector approach needed to address the broad implications of artificial intelligence (AI). The federal government plays a critical role in signaling to the marketplace what standards and frameworks are deemed to be best practice with respect to responsible innovation.

In this respect we urge OMB to consider how the directives set forth in future OMB guidance can best support and advance America's vital startup ecosystem.

We believe that America's technological and economic leadership in AI will depend upon innovation driven by startups. The transformative benefits of AI will not accrue to the American people from an uncompetitive marketplace walled off from new innovators. We appreciate your recognition of this critical fact in the OMB Proposed AI Memorandum and strongly encourage it going forward.

We offer our full comments in the attached letter.

Sincerely,

Gaurab Bansal
Executive Director, Responsible Innovation Labs

Responsible Innovation Labs Comment on OMB20230020 Proposed Memorandum for the Heads of Executive Departments and Agencies

December 5, 2023

Director Shalanda D. Young
The Office of Management and Budget
725 17th Street NW
Washington, D.C 20503

RE: OMB–2023–0020; Proposed Memorandum for the Heads of Executive Departments and Agencies

Director Young and OMB Colleagues:

We write to share comments regarding OMB's proposed memorandum titled 'Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence' (OMB Proposed AI Memorandum). Capitalized terms not defined in this letter have the meanings given to such terms in the OMB Proposed AI Memorandum.

OMB is taking an important step to ensure that federal agencies can procure, deploy, and use AI responsibly. Your efforts appropriately reflect the serious, comprehensive cross-sector approach needed to address the broad implications of artificial intelligence (AI). The federal government plays a critical role in signaling to the marketplace what standards and frameworks are deemed to be best practice with respect to responsible innovation.

In this respect we urge OMB to consider how the directives set forth in future OMB guidance can best support and advance America's vital startup ecosystem.

We believe that America's technological and economic leadership in AI will depend upon innovation driven by startups. The transformative benefits of AI will not accrue to the American people from an uncompetitive marketplace walled off from new innovators. We appreciate your recognition of this critical fact in the OMB Proposed AI Memorandum and strongly encourage it going forward.

1. **Background on Responsible Innovation Labs**

   Responsible Innovation Labs (RIL) is a coalition making responsible innovation an essential mindset and operational norm among high-growth technology companies and their investors. RIL stimulates both the demand and supply sides of responsible innovation. RIL works on industry-driven frameworks, strives to shift industry incentives through engagement with capital allocators, and builds communities of practice. RIL believes responsible innovation is a competency that can be developed. We are committed to supporting the adoption of responsible innovation practices across the startup ecosystem.

   RIL is currently focused on "how" responsible innovation is implemented in company building and venture investing. We work to support 50+ VC firms from across the technology industry on implementation of a Responsible AI framework for the startup ecosystem, which formally launched on November 14, 2023. This framework contains voluntary Responsible AI commitments, a framework for Responsible AI, and supporting materials to serve as an actionable 'how-to' guide that distills Responsible AI best practices, tools, resources, and frameworks. RIL convened a multi-sector Responsible AI

working group of leading AI startup leaders and investors, civil society, and the public sector, including engagement with the U.S. Department of Commerce, to help develop this framework.

2. Comments on OMB Proposed AI Memorandum

a. With respect to Section 3 (Strengthening Artificial Intelligence Governance), we submit the following:

- In Section 3(b)(i) (Roles), we urge OMB to elaborate on the definition of "significant expertise in AI" regarding the requirements for selecting an agency CAIO. We believe that significant expertise in AI should encompass experience in technical, research, security, privacy, business processes, and governance aspects of AI development and deployment. By further delineating notional examples of what "significant expertise" could entail, OMB can further help agencies identify CAIOs who can lead comprehensively with respect to AI. (We note that you have included a range of competencies later in the OMB Proposed AI Memorandum in Section 4(b)(iv) (Workforce), which could serve as a starting point for CAIO expertise.)

- In Section 3(b)(ii)(G)-(I) (Responsibilities - Promoting AI Innovation), we encourage OMB to:

  - Evaluate how CAIOs can consider and promote competition and access with respect to early stage technology companies in America's vital and dynamic startup ecosystem. Naming competition in this section is important to ensure that CAIOs avoid entrenching incumbents.

  - Make explicit that CAIOs consult with the private sector - inclusive of early stage technology startups - on the opportunities and benefits of AI development. Engagement with the private sector - especially startup innovators - is a critical linkage often missing from the federal government's public engagement with the business community.

b. With respect to Section 4 (Advancing Responsible Artificial Intelligence Innovation), we submit the following:

- In Section 4(a)(i) (AI Strategies), to the extent not already required by law, we encourage agencies to provide a high level rationale for their planned priority use cases of AI. While we are mindful of additional administrative burdens on agencies, and to the extent not already required by law or other guidance, we believe the American public will benefit from seeing an agency's brief explanation as to why it believes AI is appropriate for proposed future use cases. One of the most powerful ways that the federal government can help entrepreneurs is by clearly signaling what market opportunities may exist for future federal procurement. More detail on specific use cases, rationale for the use case, and desired outcomes will help entrepreneurs identify and understand market needs and build products that address them.

c. With respect to Section 5 (Managing Risks From the Use of Artificial Intelligence), we submit the following:

- In Section 5(d) (Managing Risks in Federal Procurement of AI), we encourage OMB to consider the following changes:
    - We strongly support the inclusion of a pro-competition statement by OMB. Avoiding improper entrenchment of incumbents is in the best interests of American innovation and the ability of early stage companies to compete for procurement opportunities. We encourage consideration of other methods of avoiding entrenchment, including data portability, interoperability, and high levels of transparency.
    - In addition to the transparency and performance requirements, promote other aspects of responsible AI development and deployment practices. This is an area where it is important to avoid being overly prescriptive given the incredible range of AI technologies that could be considered across the federal government, the various regulatory frameworks that already exist, and the different sets of data involved. Responsible AI cannot be a one-size fits all compliance framework that is only achievable by well-resourced companies. In the responsible AI framework RIL recently put forward, we encourage early stage startups to demonstrate: cross-organization governance; trust building through appropriate transparency; forecasting of benefits and risks; auditing and testing; and continuous improvement. Importantly, these practices are designed to be realistic in light of the size of the organization and the risk created by its applications. We built the RIL framework by distilling best practices and frameworks across industry, government, NGOs, and academia. Too often the responsible AI practices required of early stage companies are too expensive, are not fit for purpose, and advantage larger and well-resourced incumbents. The federal government needs to ensure that startups can compete on a level playing field.

We offer the comments above in response to the OMB Proposed AI Memorandum. We look forward to engaging with you to ensure that the OMB Proposed AI Memorandum evolves in a manner that promotes early stage startup innovation, competition, and responsible innovation practices.

RIL will continue to foster collaboration and cross-sector dialogue in support of startups and work to inform policy makers as they explore responsible AI and responsible innovation concepts more broadly.

Sincerely,

Gaurab Bansal
Executive Director, Responsible Innovation Labs

OpenAI

1960 Bryant Street
San Francisco, CA 94110

December 5, 2023

From:
Anna Makanju
VP of Global Affairs
OpenAI

To:
Office of Management and Budget

We write to respond to the recent Office of Management and Budget (OMB) Proposed Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (88 FR 75625).

OpenAI was created as a nonprofit in 2015 to ensure that artificial general intelligence—in short, AI that's at least as smart as a person—benefits all of humanity. We research, develop, and release cutting edge AI technology as well as tools and best practices for the safety, alignment, and governance of AI.

As part of our strong support of safe and responsible governance of AI, we have publicly committed to pilot and refine concrete governance practices specifically tailored to highly capable foundation models like the ones that we produce. This past July, in a process coordinated by the White House, we and other leading AI firms made a series of voluntary commitments to AI safety, security and trustworthiness. These include internal and external red-teaming of major new model releases, issuing transparency reports also known as system cards for such releases, sharing information about certain risks, and safeguarding against cybersecurity and insider threats.

Our work in each of these areas has helped to shape emergent industry norms, in the United States and around the world, and we are actively engaged in discussions with NIST and other key federal stakeholders to share what we are learning as we continue to develop, align, and deploy AI systems.

Embracing AI while managing risk

We appreciate the Proposed Memorandum's focus on reducing barriers to the use of AI in the federal government. We agree that such use has the potential to significantly improve the quality and efficiency of government operations, and the services the federal government provides to the American people. We also agree that it is appropriate for federal agencies to take extra care if AI is used to control or meaningfully influence people's safety or rights.

The remainder of this comment focuses on a handful of areas where we believe revisions to the Proposed Memorandum could best advance OMB and the administration's goals for AI.

Background on foundation models

Developing an advanced foundation model like GPT-4 requires (1) teaching it intelligence, such as the ability to predict, reason, and solve problems, as well as (2) aligning it to human values and preferences. The former is done in a process called “pre-training”, which involves showing the model a vast amount of human knowledge over months. To then incorporate human choice into the model, we use a second step, called “post-training”, where we make the model safer and more usable.

Pre-training teaches language to a model, by showing the model a wide range of text, and having it try to predict the word that comes next in each of a huge range of sequences. This requires an enormous amount of computation, as models review, analyze, and learn from trillions of words. We build supercomputers to train our base models, and training a single new base model can occupy a supercomputer for months. Through this extensive process, the model not only learns how words fit together grammatically, but also how words work together to form higher-level ideas, and ultimately how sequences of words form structured thoughts or pose coherent problems. For example, when we think of the word “cloud”, we might also think of related words like “sky” and “rain”; when given a sentence like “The secret to happiness is”, we might think of various philosophical ideas. In gaining fluency with predicting the next word, the model thereby learns concepts and the building blocks of intelligence.

The output of this process—a base model—has the remarkable ability to solve novel problems unseen in its training data, even in a wide range of languages. However, the base model alone is not ready for use. Base models are powerful and flexible. They are intelligent and surprising, but are not necessarily useful or safe.

A base model is not easy to talk to: For example, if you ask the GPT-4 base model to “write a story about a princess…”, it usually won’t write a story. Instead, it will extend your statement, predicting how it continues. It might output, for instance: “…about a princess who loves horses.” A base model also does not have safeguards to prevent it from outputting unwanted content, such as hateful or violent material. While we filter our pre-training dataset for unwanted content, this mitigation is too imprecise to make targeted changes to the model, and can even backfire if it prevents the model from understanding what not to say or do. In order to instill human values into the models, including what is useful and what is appropriate to say, we research and develop alignment and safety techniques for a process we call post-training.

Post-training is how we incorporate human choice into our models, and transform them into useful, effective, and safer tools. We teach the model to respond in ways that people find more useful, and to decline to respond in ways that we believe would be harmful. Post-training requires significant investment in research, personnel, design choices, and data creation. This is an active area of research and investment for OpenAI. We also believe that many people beyond our company will be part of the work of creating data and making design decisions to reflect human values.

Post-training results in targeted changes to the model, using relatively small and carefully engineered datasets that represent ideal behavior. We do this by having people write sample answers and rate answers provided by the model, and provide those samples and ratings back to the model in follow-up training processes. We pioneered these techniques, including reinforcement learning from human feedback (RLHF), which has now become industry standard. We use RLHF to teach the model to follow instructions, to decrease the likelihood of it returning inaccurate content, and to add safety features.

Assessing the impact of foundation models

In reply to Question 6, about the minimum practices for safety-impacting or rights-impacting AI:

In Section 5(c)(iv) the Proposed Memorandum sets out requirements for agencies' use of covered safety-impacting or rights-impacting AI. In Part (A) of that Section, the Proposed Memorandum sets out mandatory elements for required impact assessments. These elements include (1) the purposes and expected benefits of the contemplated use; (2) the recognized risks and related mitigations; and (3) "the quality and appropriateness of the relevant data."

As it is currently drafted, this third prong of the impact assessment requirement assumes that all the data used to train an AI system will be directly relevant to the purpose for which a federal agency intends to use that system. For instance, as part of this prong, agencies are asked to document "how the data is relevant to the task being automated and has a reasonable expectation of being useful for the AI's development, testing, and operation."

Such a presumption is not accurate in the case of foundation models, such as OpenAI's GPT-4 and its predecessors. There is no single domain or application to which all the data used to train a foundation model is, or should be, relevant. Instead, such models are deliberately trained on a

broad spectrum of data relevant to many tasks, with the potential to be useful across a broad spectrum of applications.[1]

The breadth of training data that underpins a foundation model is integral to the model's usefulness and flexibility. Unlike a narrow AI system that might be trained only on data relevant to the task at hand—such as a model for forecasting the weather that is trained on historical weather data—a foundation model's wide breadth capabilities arise from its task-agnostic training process.

In some cases, rather than using a foundation model in its default configuration, an application developer will further customize the foundation model's behavior, by "fine-tuning" the model on application-specific data. This fine-tuning step redefines the foundation model's behavior according to the patterns found in that application-specific fine-tuning dataset, in a manner similar to how task-specific data shapes the performance of narrow AI systems.

In OpenAI's case, such a fine-tuning dataset may be added by an OpenAI customer, such as a government vendor who builds an AI system on top of OpenAI's foundation models, or by OpenAI itself on behalf of a customer. Fine-tuning is often the key step in ensuring an AI model has correct domain-specific information and behavior, such as knowledge of an agency's procedures or awareness of which questions on a given topic might be better answered by a human.

These application-specific fine-tuning datasets can significantly shape an AI system's behavior, and it may therefore be appropriate for agencies to request greater detail on these fine-tuning datasets during impact assessments (such as information on the "quality and appropriateness of the data" as outlined in Section 5(c)(iv)(3)). Such fine-tuning datasets' properties will have a clear relationship with the model's behavior and can be expected to be appropriate to the specific task, unlike a foundation model's giant dataset of general-purpose training data.

Insofar as an agency concludes it would benefit from understanding the capabilities and behaviors of the underlying foundation model (which are not specific to the task at hand), we suggest that agencies follow the AI field's emerging best practice of evaluating the foundation model's capabilities directly. Such evaluation benchmarks can be tailored to test capabilities and behaviors relevant to the application domain, or can test general-purpose model behaviors (such as using the BBQ benchmark to test a foundation model's underlying propensity to answer questions in a

[1] Bommasani, Rishi, Drew A. Hudson, Ehsan Adeli, Russ Altman, Simran Arora, Sydney von Arx, Michael S. Bernstein et al. "On the opportunities and risks of foundation models." *arXiv preprint arXiv:2108.07258* (2021).

manner that is biased along nine social dimensions relevant for U.S. English-speaking contexts).

Opportunity: Using AI to improve agencies' effectiveness and operations

In reply to Question 4, about how agencies can take advantage of generative AI to improve agency missions or business operations:

Generative AI has the potential to improve on agencies' effectiveness and operations in many ways. Among other priority areas, generative AI can make government information easier to access and understand; improve education not only for students but also for employees across the federal workforce; support administrative, translation and transcription functions; strengthen planning and analysis capabilities; and eventually support better outcomes in health, climate resilience, and other challenges that will define our future.

One particularly beneficial role that AI can play is in increasing Americans' access to government benefits and services, and their ability to navigate agency bureaucracies, by reducing "administrative burden."[2] Generative AI models like OpenAI's GPT-4 can ingest large quantities of information about an agency process, such as the administrative steps that are required in order to participate in a government program, and then interactively answer questions or offer guidance on this information. Provided that such applications are built responsibly, AI interfaces can be substantially more intuitive to navigate and may expand the access to agency services for many Americans who face language or literacy barriers.

In one recent example of AI reducing administrative burden, Lifespan, Rhode Island's largest healthcare system, used OpenAI's GPT-4 to make surgical consent forms easier to understand. The new surgical consent forms translate the jargon-heavy documents from a college reading level to a 6th grade reading level. After conducting an extensive review and verification process with medical and legal experts to ensure that the GPT-4-generated consent forms preserved clinical accuracy, Rhode Island officially operationalized GPT-4 simplified surgical consent forms in October 2023, dramatically improving the informed consent process for over 30,000 surgeries occurring within the Lifespan health system annually.

[2] Herd, Pamela, and Donald P. Moynihan. *Administrative burden: Policymaking by other means*. Russell Sage Foundation, 2019.

Agencies could consider using similar techniques to provide domain-specific assistants to generally assist Americans in navigating their bureaucracies.

Re: Access Now's Submission to OMB's Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence
Docket No 2023–24269

Access Now welcomes the opportunity to contribute to the Office of Management and Budget's (OMB) ongoing dialogue on Artificial Intelligence (AI) governance.[1] We commend the OMB for its leadership in advancing human rights-centered policies and encourage the agency to leverage its full authority to safeguard individuals from the current harms of AI systems, especially where those technologies impact fundamental human and civil rights and safety. In this submission, we respectfully present our response to the *OMB's Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum* (Memo) and introduce recommendations to enhance the effectiveness of the outlined principles.

About Access Now

Access Now is an international human rights organization that defends and extends the digital rights of people and communities at risk worldwide.[2] By combining innovative policy, analysis, direct engagement, and emergency technical support, we fight for a free and open internet that fosters human rights.[3] As part of our mission, we operate a global helpline for at-risk people to identify and mitigate specific threats to their digital security.[4] We also engage with fellow non-profit organizations and activist communities across civil society and campaign to ensure that new and emerging technologies and their investors, developers, and implementers "do no harm" first and foremost.

An example of our coalition and advocacy work includes the Ban Biometric Surveillance campaign (BanBS), which calls for a prohibition on using facial recognition technology (FRT) and remote biometric recognition technologies that enable mass surveillance and discriminatory targeted surveillance. The BanBS statement has been signed by 193 civil society organizations from 63 countries worldwide.[5] We also invite the OMB to refer to our recent agency comments and publications on AI, including biometric technologies, privacy, civil rights, and equity.[6]

Introduction

High-risk AI systems (those that impact rights and safety) threaten our civil and human rights if not appropriately regulated. The risks and impacts of AI in the United States are not hypothetical, particularly regarding people of color, historically marginalized communities, and communities that have been targets of discriminatory and mass surveillance. AI systems have been used to deport people on the move, deny them access to healthcare, target racialized communities, supercharge

disinformation, and aid mass surveillance, amplifying societal inequalities and power imbalances.[7] This puts fundamental rights and democratic processes at risk. **These *current* risks of AI must remain at the forefront of the OMB's memorandum** as it aims to tackle the use of AI systems within the federal government that affect the safety and rights of the public.

Our comments begin with an illustrative (though not exhaustive) overview of general observations and commendable elements in the draft memorandum we believe should be retained in the final version. Our recommendations focus on enhancing public accountability and transparency, explicitly clarifying provisions related to waivers and exceptions, and integrating human rights considerations into impact assessments. It further explores the necessity of instituting prohibitions to safeguard human, enhancing civil society engagement, setting safeguards for national security purposes, ensuring transparency on the ecological sustainability parameters, and recognizing the nuanced landscape of Generative AI.

General Observations

The Memo stands out for its multifaceted approach to addressing key concerns expressed by civil society.[8] Notable among these are the provisions building on existing measures to mitigate the risks of AI, calling for pre-deployment risk assessments, ongoing monitoring, independent evaluations, real-world testing, and comprehensive training for AI users. Equally noteworthy is the memorandum's emphasis on mitigating disparate impact and its commitment to consulting with impacted communities and providing notice to impacted individuals, a practice often underscored by the civil and human rights community. We appreciate the agency's commitment to equity and civil rights and ensuring that AI technologies work before federal agencies procure, fund, or use them.

The Memo broadens its applicability to many "rights-impacting" AI use cases by avoiding an *exclusive* focus on generative AI or existential threats. By highlighting the significance of considering new *and*

[8] *Civil Society Letter to White House on Executive Order on AI* (Sept. 5, 2023) https://cdt.org/wp-content/uploads/2023/09/Letter-to-WH-AI-EO-90523.pdf ; *The Leadership Conference on Civil and Human Rights Comments to OSTP on National AI Strategy* (Jul. 7, 2023), https://civilrights.org/resource/leadership-conference-comments-to-ostp-on-national-ai-strategy/.

existing rights-impacting AI, the document underscores the need for a proactive stance in advancing a future-proof human rights-centered framework.

True transparency, devoid of loopholes and vagueness, is essential for building and maintaining consumer trust. Alongside the Memo's transparency requirements, including reporting for the AI use case inventory, the availability of human consideration and remedy mechanisms is an indispensable component and should be retained. **Access Now has consistently championed policy solutions that shift the responsibility from individuals to the developers and deployers of AI systems.** These principles, embedded in the Memo, form the foundation for public trust in AI governance in the federal context.

Noting that the Executive Order on Artificial Intelligence (AI EO) and the OMB Memo both emphasize ensuring that AI systems are legal, ethical, safe, and trustworthy, we propose that **AI systems aren't always ethical or safe, and no amount of adjustments can completely address the litany of concerns**. Access Now advocates for a foundational focus on human rights *and* civil rights as the guiding principles in formulating recommendations to regulate AI effectively.

The above principles must be safeguarded and preserved in the final version of the OMB guidance. Having examined laudable aspects of the OMB's draft memorandum and extolling its alignment with the ideals articulated by the civil and human rights community, we now turn to specific questions posed by the request for comment.

Responses to Questions

Question 8: What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Ensure Consistency and Meaningful Public Transparency.

The Memo seeks clarification on the scope and depth of information agencies must make available to the public in their annual use case inventory. This mandated reporting has the potential to serve as a powerful mechanism for transparency, provided it is executed with precision. The current draft lacks the necessary teeth to ensure compliance, which is evident in instances where agencies have faltered in documenting known uses of AI.[9]

[9] Rebecca Heilweil and Madison Alder, OMB acknowledges issues with process for inventorying AI use cases, FedScoop (Aug. 16, 2023), https://fedscoop.com/omb-acknowledges-issues-with-process-for-inventorying-ai-use-cases/.

For instance, one report investigated the ability of the U.S. federal government to govern AI by examining the implementation of three binding laws related to AI governance.[10] Less than 40 percent of the 45 legal requirements across the three laws could be proved as implemented.[11] Additionally, the report brings to light the unsettling fact that almost half of these agencies did not publicly issue AI use case inventories, even when they had identifiable use cases of machine learning. Even in such compliance cases, the efforts were deemed inconsistent.[12]

The OMB draft Memo must outline specific criteria to transform the AI use case inventory into a valuable resource, rendering it useful for public reporting. An inventory should not only be a cursory listing but also supply detailed insights into the uses and implications of AI within agencies. To address this issue and enhance public transparency, **we recommend incorporating explicit requirements in the OMB memorandum regarding the specific elements agencies must publicly disclose** on their websites. The Memo should articulate the criteria for inclusion and the depth of information required, steering clear of ambiguity that may lead to inadequate documentation.

We propose that annual inventories should include, at minimum, information related to:

- The purpose and scope of the system.
- Model information.
- Deployment specifications; and
- Ongoing monitoring.

There must also be **clarity on the information necessary for a Freedom of Information Act (FOIA) request** to guarantee that, even with limitations, the disclosed information equips the public to make informed FOIA requests. Moreover, **agencies should include as AI use cases in inventory those applications of AI designed, developed, acquired, or used to advance the execution of an agency's missions, enhance decision-making, or provide the public with a specified benefit.**

We also propose that agencies inventory:

- Both **existing safety- or rights-impacting uses of AI, stand-alone AI, and AI embedded within other systems** or applications.
- AI **developed both by the agency or by third parties** on behalf of agencies for the fulfillment of specific agency missions, including relevant data inputs used to train AI and outputs used in support of decision making.
- Agencies' **procurement** o**f AI applications**; and

[10] Christie Lawrence, Isaac Cui, and Daniel Ho, *The Bureaucratic Challenge to AI Governance: An Empirical Assessment of Implementation at U.S. Federal Agencies,* In AAAI/ACM Conference on AI, Ethics, and Society (AIES '23) (August 8-10, 2023),https://dl.acm.org/doi/fullHtml/10.1145/3600211.3604701.
[11] *Id*
[12] *Id*.

- Should also include the **production stage for each use case**, whether it was contracted, and if it is consistent with the Executive Order on AI.[13]

We note with concern Footnote 8 of the Memo, which stipulates that agencies must only publicly report use cases to the extent practicable and consistent with applicable law. While seemingly reasonable, this provision presents a loophole that warrants scrutiny. Using the term "practicable" and the caveat of "applicable law" introduces ambiguity that many agencies may exploit, undermining the essence of transparency the Memo seeks to achieve. As such, the OMB should tighten these loose ends and fortify the language to ensure that transparency is an aspiration and an enforceable standard. The Department of Defense and the Intelligence Community should not be exempt from the Memo's public reporting and transparency requirements.

The Memo also lacks clarity on whether agencies must disclose additional information necessary for evaluating the responsible use of AI.[14] For example, **ambiguity persists regarding the disclosure of testing for disparate impact or algorithmic discrimination, feedback from affected groups, and transparency and performance improvement requirements related to procured AI**. Addressing these gaps is essential for ensuring a comprehensive and transparent framework.

The absence of explicit guidance on what additional information agencies should disclose publicly undermines attempts at creating transparency and uniformity. Without clear directives, agencies may vary in information, leading to inconsistencies and potential omissions. This lack of uniformity in public disclosures risks hampering public understanding and impedes effective oversight and evaluation of AI deployment across agencies. For people to understand the human rights implications and potential discriminatory impacts of AI systems, agencies must disclose such comprehensive information, which the current proposal falls short of mandating.

Ensure Transparency and Explainability

Maximum possible transparency is necessary for any AI system, including transparency regarding its purpose, use, and work, which must continue throughout a system's life cycle.[15] Non-disclosure agreements and other contracts with third parties under the guise of protecting intellectual property violate this principle because they prevent public oversight and accountability.[16]

[13] See Rebecca Heilweil, *Commerce discloses more AI use cases in updated inventory*, FedScoop (Sept. 1, 2023), https://fedscoop.com/commerce-discloses-more-ai-use-cases-in-updated-inventory/.

[15] *AI and Human Rights*, Access Now (2018), (https://www.accessnow.org/wp-content/uploads/2018/11/AI-and-Human-Rights.pdf.
[16] *Id*.

Specifically, **adequate transparency and explainability must include**:

- Regular reporting of where and how governments use and manage AI systems.
- The use of open data standards in training data and code to the fullest extent possible while adhering to privacy standards.
- Enabling independent audits of systems and data.
- Clear and accessible reporting of the operation of any AI system.
- Targeted notification when a government AI system makes a decision that impacts an individual's rights; and
- Avoidance of "black box systems," meaning avoidance of any AI system when a person cannot understand how it works.

Question 3: How can OMB best advance responsible AI innovation?

Ensure Rights and Redress for People Impacted by AI Systems

The Memo should confer individual rights to people impacted by AI systems. It should contain a provision for redress or a mechanism by which people or public interest organizations can investigate high-risk AI systems. Furthermore, the Memo should include a **right not to be subject to non-compliant AI systems** (not just a right to opt-out when practicable), a **right to access, rectification, erasure, and explanation**, and bolster its remedy process by ensuring that persons have a **right to request information** when an AI system has significantly impacted an individual.[17]

Clarify the Conditions under which CAIOs Grant Waivers and Exceptions

Another critical challenge is the lack of specificity in defining the scope of the Memo, particularly regarding safety-impacting AI, rights-impacting AI, and the conditions under which waivers and exceptions can be granted.[18] Section 5(b) of the Memo states that the Chief Artificial Intelligence Officer (CAIO) can determine whether an AI application falls within the definitions of safety-impacting AI or rights-impacting AI.[19] While this discretion allows for flexibility, the lack of clear parameters for making such determinations introduces uncertainty.

The lack of specificity on how CAIO determinations should be conducted, what factors should be considered, and how the overall process unfolds creates a dangerous loophole ripe for exploitation and requires immediate attention. Section 5(c) of the Memo also allows for "waivers from minimum practices" based on system-specific risk assessments. The lack of explicit details on

[17] Human Rights in the Age of Artificial Intelligence, Access Now (2018), https://www.accessnow.org/wp-content/uploads/2018/11/AI-and-Human-Rights.pdf.
[18] OMB Memo at 11.
[19] *Id*.

the criteria, process, and conditions for granting or terminating waivers raises concerns about its efficacy.[20] The absence of clear guidelines in Sections 5(b) and 5(c) could lead to inconsistent interpretations across agencies, potentially compromising the Memo's intended uniformity.

To address this issue and fortify the effectiveness of the Memo, **we recommend explicitly outlining the parameters, process, and conditions for granting and terminating waivers and exceptions and CAIO determinations of what falls within the definition of safety and rights-impacting AI.**

Moreover, enhancing the OMB guidance by **reducing the number of exemptions and waivers granted to intelligence and law enforcement is essential**. Additionally, agencies should be transparent in disclosing their decision-making processes concerning exemptions and waivers, making this information accessible to the public.

Mandate Human Rights Impact Assessments

As proposed by Section 5(c)(iv) of the OMB, the AI impact assessment requirement is instrumental in ensuring that agencies consider the broader implications of AI systems on individuals and groups, especially those who might be disproportionately affected. However, the absence of specific directives on human rights in the guidance could lead to oversight and neglect of essential considerations, resulting in human rights violations.

Another concern in the current draft of the Memo lies in its omission of explicit requirements for agencies to consider human rights within AI impact assessments. Without clarity, agencies may conduct assessments that primarily focus on technical aspects and efficiency while neglecting the potential impact on fundamental rights, accessibility for persons with disabilities, and the broader public interest. Furthermore, the risk assessments outlined in the Memo lack explicit considerations for international human rights and freedoms. As AI systems transcend borders, agencies must account for potential global implications and ensure that their operations do not inadvertently contribute to human rights violations on an international scale.

The absence of specific expertise in human rights within agencies conducting risk assessments poses another challenge. **Independent evaluations should involve individuals and organizations with proven expertise in human rights to provide a comprehensive and informed perspective.** Excluding such voices could result in oversight and inadequate identification of potential risks related to human rights violations.

[20] *Id*. at 14.

To address these critical gaps, we propose the following recommendations**:**

- **For each proposed AI deployment, users must categorize individuals and groups likely to be impacted by the system.** The assessment should investigate the system's impact on fundamental rights, evaluate its accessibility for persons with disabilities, and scrutinize its broader impact on the environment and public interest.

- **Agencies conducting risk assessments should also explicitly consider risks to international human rights and freedoms.** The guidance should mandate the disclosure of actions taken to mitigate these risks, ensuring that AI deployments align with global human rights standards.

- Agencies empowered by the OMB to perform **independent assessments, conformity assessments, and audits should include personnel and civil society organizations with proven human rights expertise**. This inclusion will enhance the thoroughness of assessments and contribute to a more holistic understanding of potential risks.

We propose that agencies should be required to conduct and publish a fundamental rights impact assessment detailing specific information to the context of using that system.[21] Generally, we recommend that any assessment process should include the following:

- The intended purpose, geographic and temporal scope.
- Testing and audits by independent experts.
- Identifying measures to mitigate identified risks and prevent any rights violations from occurring and measuring compliance and efficacy.
- Whether the AI system will have a direct and/or indirect impact on fundamental human and civil rights.
- Any specific risk of harm likely to impact marginalized persons or those at risk of discrimination.
- Identification of any new legal safeguards needed to protect human rights in specific applications of AI tools.
- Special determinations of bias, particularly in the criminal justice sector, due to the risks to a fair trial, right to liberty, and non-discrimination.
- If a third party is used to develop and/or implement the system, a requirement for the third party to participate in the human rights assessment process.
- The foreseeable impact of the use of the system on the environment; and
- Clear steps as to how agencies will identify and mitigate potential risks, and how effective this mitigation is likely to be.

[21] *AI and Human Rights*, Access Now (2018), (https://www.accessnow.org/wp-content/uploads/2018/11/AI-and-Human-Rights.pdf.

Prohibit Practices that Pose an Unacceptable Risk to Fundamental Rights

Human rights harms are inevitable when we allow companies to sell flawed technology. Without a robust process to validate the claims made by corporations selling these systems, we risk a proliferation of pseudoscientific technologies, damaging consumer confidence and public trust. For all these reasons, we encourage the OMB to use its *full* authority to protect persons against high-risk AI systems. This includes urging agencies and companies to stop the use of these technologies in public spaces, publicly accessible spaces, and places of public accommodation where such use has or can enable mass surveillance or discriminatory targeted surveillance, including but not limited to their use in parks, schools, libraries, workplaces, transport hubs, sports stadiums, and housing developments.

We propose that some biometric technologies must be banned outright, such as automated gender recognition and AI-based "detection" of sexual orientation. The fundamental aim of these systems is incompatible with human rights, and they cannot be fixed by introducing more diverse training data, increasing accuracy, or applying technical methods to reduce bias. The absence of explicit prohibitions on specific AI technologies poses an ongoing and unacceptable risk to fundamental rights. While the memorandum outlines principles and practices, it refrains from explicitly banning certain applications of AI technologies that have demonstrated harm. This omission raises concerns about the potential perpetuation of detrimental AI practices that infringe upon individual rights.

To address the identified risks and safeguard fundamental rights, we propose explicit prohibitions on the following uses of AI:

- The use of **emotion recognition systems that claim to infer people's emotions and mental states** from physical, physiological, behavioral, as well as biometric data.
- The use of **biometric categorization systems** to track, categorize and/or judge people in publicly accessible spaces; or to categorize people on the basis of special categories of personal data, protected characteristics, or gender identity.
- Systems which amount to **AI physiognomy** by using data about our bodies to make problematic inferences about personality, character, political and religious beliefs.
- The use of **AI systems by law enforcement and criminal justice authorities to make predictions, profiles, or risk assessments** for the purpose of predicting crimes; and
- Unacceptable **uses of AI systems in the context of migration,** such as predictive analytics that can lead to the interdiction of border crossings.[22]

[22] https://www.accessnow.org/press-release/open-letter-itflows-consortium/

Protect All People, Regardless of Migration Status

The Memo should also explicitly expand its scope to protect all persons in the United States, including non-citizens. The OMB Memo must protect all persons from the dangers of discriminatory AI, including those migrating, seeking asylum, and living with an irregular migration status.

Set Clear Safeguards for AI Systems for Defense, Intelligence, and National Security Purposes

The Memo excludes AI systems developed or used exclusively by the Department of Defense and the Intelligence Community. There are serious consequences tied to this exclusion. The omission of AI systems for "national security purposes" poses significant risks, allowing intrusive AI technologies, including those facilitating mass surveillance, to operate in the public sector without specific limitations or safeguards whenever national security grounds are invoked.[23] Even AI systems deemed to present unacceptable risks, and thus prohibited by the OMB Memo, could potentially be resurrected, or repurposed exclusively for national security objectives.[24]

We propose that **any action of the Department of Defense and the Intelligence Community must fully comply with the principles of international law.** We also propose not to include "national security purposes" as a blanket exemption to the scope of the OMB Memo. **The exemption of AI systems developed or deployed for national security reasons – including surveillance – should always be assessed based on their strict necessity and proportionality and without prejudice to the application of the law.**

Enhance Civil Society Engagement

There is a risk of bias, or at least the perception of bias, when evaluations are conducted by individuals or entities closely associated with the development of the AI system. The OMB requires "agencies, through the CAIO, an agency AI oversight board, or other appropriate agency office with existing test and evaluation responsibilities," to review "relevant AI documentation to ensure that the system works appropriately and as intended, and that its expected benefits outweigh its potential risks." This raises concerns about the objectivity of how AI systems are evaluated.

While the CAIO or an oversight board may be structurally independent of the development team, there may still be institutional pressures or conflicts of interest that could compromise the independence of the evaluation. To address these concerns, exploring options for external

[23] *Scope of the EU Artificial Intelligence Act (AIA): Military Purposes and National Security*, ECNL (2022), https://ecnl.org/sites/default/files/2022-03/ECNL%20Pagers%20on%20scope%20of%20AIA%20ECNL_FINAL.pdf.
[24] *Id*.

involvement, transparency, and civil society support may be beneficial to ensure rigorous, impartial evaluations that align with human rights principles.

To address this, we propose:

- **Involving external entities or individuals** to conduct or at least **participate in the evaluation**, including external experts, independent auditors, or representatives from civil society organizations with expertise in human rights and ethical considerations.

- To **address concerns about bias** or lack of independence, the organization could prioritize transparency in the evaluation process. This might involve publicizing the evaluation criteria and methodologies and involving external observers.

- Legislative **empowerment to ensure that external entities,** especially those with human rights expertise, **have the authority and mandate to conduct independent assessments.** This can provide a stronger foundation for impartial evaluations; and

- Given the critical role of human rights considerations in the development of AI standards, **conformity assessments, and certification schemes, governments should establish meaningful opportunities and support mechanisms** (e.g., subsidies for travel) for human rights experts and civil society organizations to participate in these processes at the national and international levels. [25]

Ensure Transparency on the Ecological Sustainability Parameters for all AI Systems

The Memo presents a crucial opportunity to foster the development and use of AI systems that can be done sustainably and in a resource-friendly manner.[26] In our efforts to combat climate change, we strongly advocate for including public-facing transparency requirements on the resource consumption and greenhouse gas emission impacts of AI systems, regardless of their risk level.[27] This transparency should extend across various dimensions, encompassing design, data management, training processes, and foundational infrastructures such as hardware and data centers.

[25] Human Rights Impact Assessments for AI: Analysis and Recommendations, Access Now (2021), https://www.accessnow.org/wp-content/uploads/2022/11/Access-Now-Version-Human-Rights-Implications-of-Algorithmic-Impact-Assessments_-Priority-Recommendations-to-Guide-Effective-Development-and-Use.pdf.
[26] *Ensure minimum transparency on the ecological sustainability parameters for all AI systems in the AI Act*, https://algorithmwatch.org/en/wp-content/uploads/2022/04/Sustainability-issue-paper-April2022.pdf.
[27] *Id*.

Recognize the Nuanced Landscape of Generative AI

Lastly, the Memo stipulates that agencies must responsibly procure generative AI and mandates, including risk management requirements in contracts, *especially* for dual-use foundational models. This language raises concerns. **We, therefore, advocate for a balanced approach, warning against an excessive emphasis on large foundational models**. Such a singular focus may inadvertently overlook the harms smaller models unleash.[28]

Furthermore, given how quickly developments in generative AI are moving and the lack of clear evidence about the real impact of these technologies, we wish to propose three provisional policy recommendations.[29]

- Governments should not legally mandate or otherwise recommend, through law, the default watermarking of AI-generated content by generative AI systems.
- Any creation and adoption of watermarking features, should the AI developer offer them, must be off by default and opt-in at the users' discretion.
- For any watermarking feature offered for an AI model, the user must be able to set the level of identification, either identifying the AI model or the user themselves, and the implications of each must be made clear to the user.

Conclusion

We appreciate the OMB's engagement with the community and trust that this feedback will assist the agency in refining and improving its memorandum. We look forward to continuing to work with your office to promote strong AI governance standards. If you have questions, contact Willmary Escoto at willmary@accessnow.org.

Thank you,

Willmary Escoto, Esq.

Appendix: Summary of Recommendations

1) **Ensure Transparency and Explainability.** Adequate transparency and explainability should
    - include regular reporting of where and how governments use and manage AI systems.
    - the use of open data standards in training data and code to the fullest extent possible while adhering to privacy standards.
    - enabling independent audits of systems and data; Clear and accessible reporting of the operation of any AI system.
    - targeted notification when a government AI system makes a decision that impacts an individual's rights; and
    - the avoidance of "black box systems," meaning avoidance of any AI system when a person cannot understand how it works.
2) **Ensure Rights and Redress for People Impacted by AI Systems,** including the right not to be subject to non-compliant AI systems; a right to access, rectify, and erasure; the right to explanation; and a right to request information when an AI system has significantly impacted an individual.
3) **Clarify the conditions under which waivers and exceptions can be granted**, including
    - explicitly outlining the parameters, process, and conditions for granting and terminating waivers and exceptions and CAIO determinations of what falls within the definition of safety and rights-impacting AI.
    - reducing the number of exemptions and waivers granted to intelligence and law enforcement is essential.
    - establishing standardized criteria for conducting system-specific risk assessments; and
    - ensuring that the waiver process is transparent, accountable, and aligned with the overarching goals of safety and protection of rights.
4) **Mandate Human Rights Impact Assessments.** We propose that any assessment process should include the following:
    - the purpose, geographic and temporal scope.
    - testing and audits by independent experts.
    - identifying measures to mitigate identified risks and prevent rights violations.
    - identification of any new legal safeguards needed to protect human rights in specific applications of AI tools; and
    - special determinations of bias, particularly in the criminal justice sector due to the risks to a fair trial, right to liberty, and non-discrimination among other things.
5) **Prohibit Practices that Pose an Unacceptable Risk to Fundamental Rights,** including the use of
    - Emotion recognition systems that claim to infer people's emotions and mental states from physical, physiological, and behavioral, as well as biometric data.

- The use of biometric categorization systems to track, categorize, and/or judge people in publicly accessible spaces or to categorize people based on special categories of personal data, protected characteristics, or gender identity.
- Systems that amount to AI physiognomy by using data about our bodies to make problematic inferences about personality, character, political, and religious beliefs.
- The use of AI systems by law enforcement and criminal justice authorities to make predictions, profiles, or risk assessments for the purpose of predicting crimes; and
- The use of AI systems for immigration enforcement purposes to profile or risk-assess natural persons or groups in a manner that restricts the right to seek asylum and/or prejudices the fairness of migration procedures.

6) **Protect All People, Regardless Of Migration Status.** The OMB Memo must protect all persons from the dangers of discriminatory AI, including those migrating, seeking asylum, and living with an irregular migration status.
7) **Set Clear Safeguards for AI Systems for Military and National Security Purposes.** Any action of the Department of Defense and the Intelligence Community must fully comply with the principles of international law.
8) **Enhance Civil Society Inclusion.** Involve external entities or individuals to conduct or at least participate in the evaluation, including external experts, independent auditors, or representatives from civil society organizations with expertise in human rights and ethical considerations.
9) **Ensure Transparency on the Ecological Sustainability Parameters for all AI Systems,** including public-facing transparency requirements on the resource consumption and greenhouse gas emission impacts of AI systems; and
10) **Recognize the Nuanced Landscape of Generative AI.**

StakeOutAI Comment to OMB

StakeOut.AI

Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)

Comment Submitted to the Office of Management and Budget (OMB)

December 5, 2023

StakeOut.AI, a nonprofit seeking to prevent economic disempowerment and threats to safety caused by artificial intelligence (AI), encourages the Office of Management and Budget (OMB) to implement the recommendations as outlined below into its Proposed Memorandum for the Heads of Executive Departments and Agencies.[i] We understand that federal agencies are already using AI to advance their missions, and we applaud these agencies for using this technology to benefit humanity. For example, the Department of Health and Human Services has used AI to predict infectious diseases, assist in preparing for potential pandemics, and mitigate prescription drug shortages and supply chain issues, and the Department of Energy has used AI to predict natural disasters and preemptively prepare for recoveries.[ii] However, it is undeniable that AI poses great risk,[iii] and as such, agencies must take a human-centered approach to its future implementation.

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

StakeOut.AI appreciates the recognition that AI can and will impact industries across the board, and as such, that all agencies will be required to designate a Chief AI Officer who will be charged with managing AI risks and implementing AI innovation within the minimum practices and risk management framework. However, OMB should provide agencies with more guidance on federal employees' collective bargaining rights pertaining the use of AI, pathways for federal employees to move into AI occupations, and training for federal employees to use AI in their work.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

We recommend establishing a new body to perform AI governance. AI governance committees should include representatives from the key functional areas of each agency, including the Legal, Ethics & Compliance, Privacy, Information Security, Research & Development, Engineering, IT, and Management functions. The private sector has acknowledged that the board and C-suite are ultimately accountable for companies' use of AI and its consequences;[iv] agencies, too, should ensure that their executives are involved and sit on their respective AI governance committees.

3. How can OMB best advance responsible AI innovation?

According to the Proposed Memorandum, an agency Chief AI Officer may waive one or more of the requirements in the minimum practices section after making a written determination that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations. Such waivers are applicable for the duration of the AI's use but must be reassessed by the Chief AI Officer if there are significant changes to the conditions or context in which the AI is used. Agencies must then report to OMB within 30 days of granting such a waiver, detailing the scope, justifications, and supporting evidence.

StakeOut.AI is concerned that a Chief AI Officer could prioritize AI innovation and unnecessarily waive minimum practices at the expense of mitigating risks due to AI. Then, after the possible harm to individuals has already taken place, the agency would produce a post hoc justification for waiving the safeguarding minimum practices process in order to comply with the 30-day requirement. We encourage OMB to raise the standard for waiving minimum practices and limit the extent to which agencies may choose to do so.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

We encourage agencies to consult subject matter experts within their agencies and stakeholders, including agency employees and their union representatives, to determine how AI can improve agency missions or business operations.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

We would advise adding telecommunications systems as a safety-impacting purpose (Section 5(b)(i)) due to their use in public safety and law enforcement.[v] To the list of rights-impacting purposes, we advise adding (1) jury selection to Section 5(b)(ii)(B), due to its importance in the legal process and its history of discriminatory use; (2) conservatorship to Section 5(b)(ii)(K), due to the large impact this legal status has on an impacted person's life, comparable to the other purposes listed in this section; and (3) gun ownership, due to the potential benefits of human (e.g., police chief) discretion in granting relevant licenses/permits[vi] as well as likely inaccuracies when AI is tasked with predicting violent crime.[vii]

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum practices require agencies to complete an AI impact assessment before using new or existing covered safety-impacting or rights-impacting AI, test the AI for performance in a real-world context, independently evaluate the AI, conduct ongoing monitoring and establish thresholds for periodic human review, mitigate emerging risks to rights and safety, ensure adequate human training and assessment, provide appropriate human consideration as part of decisions that pose a high risk to rights or safety, and provide public notice and plain-language documentation through the AI use case inventory.

For rights-impacting AI, agencies must additionally take steps to ensure that the AI will advance equity, dignity, and fairness, consult and incorporate feedback from affected groups, conduct ongoing monitoring and mitigation for AI-enabled discrimination, notify negatively affected individuals, maintain human consideration and remedy processes, and maintain options to opt-out where practicable.

These requirements should be stronger and more specific. Most importantly, agencies should be *required*, not "strongly encouraged," to provide individuals with explanations for the AI-driven outcome of decisions that negatively impact those individuals, such as the denial of benefits. Moreover, while options to opt-out must be prominent, they should be available at any time and in a streamlined manner so that individuals know where to look for the opt-out option (e.g., a link at the bottom of each agency's website). Finally, OMB should specify the frequency of "ongoing" as it pertains to the ongoing monitoring and mitigation for AI-enabled discrimination and the solicitation of feedback on an ongoing basis from affected groups, such as customers, Federal employee groups, and employees' union representatives. StakeOut.AI encourages frequent monitoring for AI-enabled discrimination and solicitation of feedback from customers, employee groups, and union representatives, as well as the involvement of these groups well

before the planned implementation of rights-impacting AI so that their feedback can properly be used for the AI's design and development.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

StakeOut.AI encourages agencies to be specific and transparent about their use of AI in relevant contracts and allow individuals and entities with whom they contract to opt out of the use of AI. Agencies should be required to obtain the consent of contracting individuals and/or entities when seeking to use AI.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Agencies should make the following public:

- How they monitor and mitigate for AI-enabled discrimination;
- How they solicit feedback on an ongoing basis from affected groups, such as customers, Federal employee groups, and employees' union representatives;
- An analysis of AI-driven outcomes that negatively impact individuals, with a comparison to those outcomes without the use of AI; and
- An analysis of the impact of AI on the workforce of each respective agency (including but not limited to job replacement) and on the industry and/or workforce of each relevant regulated sector.

Adobe Response to OMB Draft Memo on Gov Use of AI

Adobe Response to the
Office of Management and Budget Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence
Draft Memorandum

Adobe Inc. (Adobe) welcomes the opportunity to provide comments in response to the Draft Memorandum – Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence published by the Office of Management and Budget (OMB) on October 30, 2023[1]. As a leader in the development and deployment of advanced AI capabilities and one of the companies that signed onto the White House voluntary commitments to manage the risks posed by AI, we recognize the need to build robust AI assurance mechanisms to ensure AI systems are designed, developed, and deployed in a trustworthy and responsible manner. We applaud the Biden Administration for issuing its landmark Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence and for OMB publishing this draft memorandum focused on establishing new agency requirements and guidance for AI governance, innovation, and risk management.

We are particularly encouraged by the federal government's focus on identifying existing standards and technologies to authenticate content and track its provenance, have agencies submit an inventory of its AI use cases to OMB and post public versions of these use cases on agency websites. We are also supportive of efforts to remove barriers to the responsible use of AI, especially urging agencies to develop adequate infrastructure to curate agency datasets for use in training, testing and operating AI. Leveraging the existing NIST AI Risk Management framework will also be essential.

Executive Summary

When it comes to the US government's development, acquisition and use of Artificial Intelligence, and particularly generative AI, Adobe recommends a risk-based approach to trustworthy AI that incentivizes AI accountability mechanisms guided by both government-developed standards and general principles of accountability, responsibility, and transparency. Our response highlights the following themes:

- **Increase Transparency.** Adobe supports the development of effective labeling and content provenance mechanisms, so that Americans can determine when content is generated using AI and when it is not. To that end, we recommend that the federal government adopt content provenance technologies and standards, like Content Credentials and the C2PA, enabling the USG to provide context and transparency behind the synthetic and non-synthetic digital content it creates and/or publishes, especially when it uses generative AI tools. Adobe also recommends the government maximize transparency by publishing the annual use case inventory for public scrutiny, with specific emphasis on providing information that has cross-agency applicability. This

[1] Office of Management and Budget, Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

will ensure these reports are useful not just to the public in understanding what's being used and how, but so that other agencies can take advantage of the information provided.

- **Multi-Disciplinary Process & Risk-based Approach**. Adobe supports a risk-based approach to AI in line with the National Institute of Standards and Technology's (NIST) AI Risk Management Framework. The government should primarily focus its regulatory efforts on high-risk use cases.

- **Government Led Public-Private Partnerships to Mitigate Harmful Bias.** To mitigate harmful bias, Adobe urges public-private sector collaboration to aid in the creation of Government-developed standardized test datasets, which would foster greater public trust in AI systems.

- **Enabling Agency Missions, Supporting Business Operations.** Adobe urges the government to take advantage of current generative AI market capabilities that will enable the government to improve operations, allow employees to shift to high-value work, reduce agency costs, improve accessibility, enhance creativity, and realize numerous other efficiencies and opportunities. As the government looks to harness the power of AI, they should do so in a thoughtful and responsible manner.

Background

At Adobe, our mission is to empower everyone to deliver the world's best digital experiences. Since our founding in December 1982, we have continued to pioneer transformative technologies that allow our customers—who range from emerging artists to global brands—to channel their imaginations, unleash their creativity, and power their businesses.

Adobe's business consists of three cloud-based solutions: Creative Cloud, Document Cloud, and Experience Cloud. In Adobe Creative Cloud, our tools like Photoshop, Illustrator, and Premiere Pro empower millions of creators around the world to create compelling assets like photos, videos, and illustrations, while our online and mobile design app Adobe Express allows people of all skills to easily create outstanding social graphics, videos, and web pages. In Document Cloud, our products provide individuals in small and medium businesses to large enterprises with tools to support all their digital document needs. Lastly, our Experience Cloud business supports businesses with their websites and e-commerce experiences.

Across all our products, Adobe is building on a decade-long legacy of AI innovation by leveraging the power of AI to deliver hundreds of intelligent capabilities. In Creative Cloud, AI powers many creative functions including advanced image editing features in Photoshop, making it easier for everyone to tell their story with simpler and more intuitive tools. In March 2023, Adobe launched Firefly, our new family of creative generative AI models designed to be both creator-focused and safe for commercial use.[2] It is embedded into Adobe's creative tools to increase productivity an enhance digital assets. With Firefly, users can channel their creativity in ways they never imagined possible by simply typing in a prompt and generating images in seconds. Since its launch in March, four billion assets have been created.

[2] TechCrunch, "Adobe's thoughts on the ethics of AI-generated images (and paying its contributors for them)," Frederic Lardinois (March 22, 2023).

In Document Cloud, AI powers features like Liquid Mode, which automatically converts a PDF layout to different formats to fit different screens so it can be easily read on tablets, mobile devices, and more. As part of our Digital Experience offerings, Adobe's customers can use AI-driven features to deliver relevant and meaningful insights and personalized digital experiences to the millions of visitors on their websites.

We believe that AI done right will amplify human creativity and capabilities to new levels with deeper insights, accelerated task performance, and improved decision-making ability. As we continue to harness the power of AI, we are committed to developing and deploying AI in line with our AI Ethics principles of accountability, responsibility, and transparency, while considering its broader impact on society.

We believe implementing Gen AI tools into existing federal government workflows will dramatically reduce the time spent on tedious tasks and increase productivity. We are encouraged that the U.S. federal government and OMB has prepared this draft memorandum that would direct Federal agencies to strengthen their AI governance and innovation programs while managing risks for the use of AI.

In response to the request for comments, we offer the following for your consideration in response to the questions posed in the Federal Register Notice[3].

How can OMB best advance responsible AI innovation?

1. Digital Content Provenance to Establish Trustworthy AI Mechanisms

Governments need to be able to provide trusted and authenticated communications to the public. Governments should take a leadership role in leveraging open standards (i.e. C2PA) and applying content credentials to all digital content on official government websites and communications. In this way, not only will people be able to verify important information coming from government agencies, but the government could also drive media/digital literacy by setting the standard for how to find trustworthy and transparent digital content. We support the White House Executive Order on AI, Section 4.5 – *Reducing the Risks Posed by Synthetic Content* and believe OMB guidance around labeling and authenticating digital content will strengthen public confidence in the integrity of official US government online information.

Openness and transparency build trust and confidence in our government, but that confidence can be easily eroded by bad-faith actors wielding new technologies, like generative AI, to deceive. In today's digital world, content creation is exploding. Thanks to new technologies, developing, editing, and distributing content has become more powerful and more accessible. However, the same tools used to make and share legitimate content could also be misused by bad actors to create and spread disinformation or misinformation. Without transparency tools to help people understand how a piece of content came to be, people risk believing lies and no longer accepting the truth. That is why Adobe has been working with interested parties to develop practical and effective solutions and standards to achieve transparency and authenticity in digital content. The government should lead in a similar fashion.

In 2019 Adobe, along with other stakeholders, led the establishment of the now 2,000+ member Content Authenticity Initiative (CAI), and its underlying standards body, the Coalition for Content Provenance and Authenticity (C2PA). Through these organizations, we are working to drive the adoption and

[3] Federal Register Notice, "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum" Docket Number 2023-24269 (11/3/2023)

implementation of this free, open-source technology across industries, tools, and platforms. Adobe strongly supports the government promoting Content Credentials to:

- support greater transparency and trust in our online ecosystem by helping users understand the origins and edit history of digital content;
- indicate when generative AI was used in the creation of digital content; and
- endorse voluntary consensus standards for use by organizations and governments, consistent with OMB Circular A-119.

Content Credentials can indicate whether AI was use in the creation of a piece of content, and more important how it was used. This level of transparency in digital content helps consumers make more informed decisions about whether to trust the content they see online and helps create a more trustworthy digital space. At Adobe, we've implemented this level of transparency by integrating Content Credentials into popular products such as Photoshop, Lightroom and Firefly.

2. Adobe Supports a Flexible, Risk-Based Approach for Trustworthy AI

Companies that do business with the federal government (and otherwise) have a responsibility to identify and address AI-related risks in their products and services and should set up internal governance processes to address them before AI solutions are widely released. At Adobe, we emphasize internal and external beta testing of our AI models with trusted third parties to help stress test the models before commercial release. This enables us to gain valuable feedback from a diverse set of perspectives on the potentially harmful impacts of our AI-powered solutions so that they can be remediated.

Adobe strongly encourages the federal government to continue working with the private sector to leverage its expertise and familiarity with AI solutions to develop clear and consistent guidance for internal AI governance. In doing so, the government can equip companies with standardized methodologies to identify and mitigate AI-related harms.

Adobe supports a risk-based approach to AI in line with the National Institute of Standards and Technology's (NIST) *AI Risk Management Framework*. Using the Framework as the baseline the USG should primarily focus its regulatory efforts on high-risk use cases. This risk-based approach is important to focusing regulatory efforts on high-risk AI without slowing down the pace of innovation around AI that poses little or no risk.

We also support the completion of AI impact assessments to evaluate the intended purpose for the AI and its expected benefits, the potential risks of using AI and quality of the data used in the AI's design, development, training, testing and operation. Adobe has been using AI impact assessments for years to evaluate the impact of AI features and identify potential risks prior to product launch.

a. Adobe's Proactive Internal AI Governance Model

Beginning in 2019, Adobe proactively and voluntarily developed a layered, multi-disciplinary process for responsible AI, including conducting our own internal assessments, that could serve as a model for the Government to replicate.

First, we established AI Ethics principles of accountability, responsibility, and transparency to guide the development of our AI-powered solutions.

- **Accountability** means we take ownership of the outcomes of our AI-assisted tools. We have processes and resources dedicated to receiving and responding to concerns about our AI products and taking corrective action as appropriate. Accountability also requires testing for and anticipating potential harms, taking pre-emptive steps to mitigate such harms, and maintaining systems to respond to unanticipated harmful outcomes.

- **Responsibility** means we approach designing and maintaining our AI technology with thoughtful evaluation and careful consideration of the impact and consequences of its deployment. We strive to ensure that we design for inclusiveness and assess the impact of potentially unfair, discriminatory, or inaccurate results, which might perpetuate harmful biases and stereotypes. We understand that special care must be taken to address bias if a product or service will have a significant impact on an individual's life, such as with employment, housing, credit, and health.

- **Transparency** means we are open about, and explain, our use of AI to our customers so they have a clear understanding of our AI systems and their applications. We want our customers to understand how Adobe uses AI, the value AI-assisted tools bring to them, and what controls and preferences they have available when they engage with and utilize Adobe's AI-enhanced tools and services.

Guided by these principles, we have created standardized processes from design to development to deployment, including training, testing, and a review process overseen by a diverse AI Ethics Review Board.

Second, we have set up an AI Ethics Committee and AI Ethics Review Board to take action to address ethical concerns with new features and technologies.

- Our **AI Ethics Committee** is a diverse, cross-functional team with members from across Adobe that is responsible for helping to ensure that the AI Ethics principles are understood and incorporated across our development teams.

- Our **AI Ethics Review Board** is tasked with the review of AI-powered features and products before their release. Like our AI Ethics Committee, the AI Ethics Review Board is a diverse, cross-functional group of Adobe employees. We believe diversity in terms of gender, race, and ethnic background, but also diversity of professional experience is critical to identifying potential issues that a nondiverse team might not see.

In addition, we have an AI Ethics team that serves two main functions: (a) it advises our product and development teams on ethical considerations for our AI-powered solutions; and (b) it thinks expansively about ethics across various types of tools and technologies, both developed by Adobe for our customers and used internally by our teams.

Third, we have embedded an AI Ethics Assessment throughout our engineering processes. The AI Ethics Assessment is a multi-part review that is designed to assess the ethical impact of an AI product or feature. If an initial assessment shows no major ethical impact and the feature meets our ethical standards, the feature is approved. AI features that have a higher potential ethical impact go through a more rigorous testing process, including a review by the AI Ethics Review Board. The AI Ethics Review Board will either approve the release, give a qualified approval with instructions to test or fix minimal issues, or not

approve due to significant testing or remediation being required before release. Where approval is denied, the product team is required to take on additional work and re-present to the AI Ethics Review Board.

Finally, we promote and rely on community feedback in developing our AI products. For example, we launched our first creative AI foundation model, Adobe Firefly as a beta in multiple stages to seek input from our employees, customers, and our broader creative community. Firefly also has a feedback mechanism built in so that users can easily report if a feature produces a result they perceive as, for example, biased or inaccurate. We monitor this feedback data to identify any undesirable outcomes and allow our product and engineering teams to address them appropriately. In our view, this constant feedback loop with our user community is an important way to help ensure our tools minimize harm and uphold our values as a company.

b. Developing Standardized Test Datasets

Adobe supports the Federal Government's role in continuing to work with interested stakeholders, including the private sector, to set out technical and governance best practices for implementing trustworthy AI. For example, one area requiring government leadership and public-private sector collaboration to develop more trustworthy AI systems by mitigating harmful bias is around the development of test datasets. Government-developed standardized test datasets would foster greater public trust in AI systems. The government should focus its dataset testing on outputs and not just inputs. The focus on inputs (traceability, explainability, reporting on datasets) is a lot of work that doesn't get you good answers. The focus on outputs makes AI like every other product: what did it do? There is an opportunity for the private sector to partner with agencies such as NIST to establish appropriate datasets in each case. We think this initiative would help create an environment where companies do not have to make a tradeoff between innovation and ethics.

With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

As a result of the rapid advancements in AI, the USG has a tremendous opportunity to improve operations, shift to high-value work, reduce cost, and accelerate the overall adoption of responsible innovation. Gen AI will enable federal employees to be more productive and increase the accessibility of federal services to the public. With features such as speech to text, text to image, customizable PDFs, and the seamless sharing of digital content for collaboration, Adobe is focused on bringing Gen AI into workflows and this is only the beginning.

Here are several use cases where the federal government could take advantage of GenAI to improve agency missions or business operations:

Create and Deliver Content. By leveraging AI tools, the federal government will be able to train non-technical communicators to create images or videos that leverage pre-approved templates, logos, or style guides, to quickly generate informational content to be distributed within minutes across digital touch points. This reduces dependencies on IT staff to hard code content while enabling communications/marketing teams to respond in the moment. Government can also pair generated content with a content management system to allow organizations to generate, credentials, and manage AI content, from creation to publication to deletion. Adobe's GenStudio does just that by accelerating and simplifying the content supply chain with generative AI and intelligent automation. Government entities

have already started to leverage these tools and they have seen results creating assets five times faster and reducing work time by half.

Summarize Unstructured Information. Government employees will be able to use Gen AI built into Acrobat and AEM Forms to search and simplify information from complex documents (e.g., eligibility details) on a government website, query data and insights from multiple disjointed documents internally, and summarize external requests from citizens and automate data reporting from those requests.

Improve Accessibility. Generative AI can make it possible for people at all skill levels to use their words or gestures to generate content and make digital content accessible to all citizens. With that in mind, Adobe has incorporated hundreds of accessibility capabilities into our tools, including the PDF Accessibility Auto-tag API in Acrobat. The Federal Government has the ability to leverage Generative AI tools to increase the accessibility of digital content.

What kind of information should be made public about agencies' use of AI in their annual use case inventory?

As established in the OMB memo, and consistent with applicable law and regulation, the use cases published as part of the annual use case inventory should make every attempt to provide information that has cross-agency applicability. This will ensure they are useful not just to the public in understanding what's being used and how, but that other agencies can take advantage of the information provided. In addition, at a minimum, the following should be considerations for those published use cases:

- Does the testing for the use case follow the NIST AI Risk Management Framework?
- Does the use case include generative AI?
- Has the use case been assessed for rights and safety impact? Is that information disclosed?
- Does the AI technology subject to the use case include content provenance, labeling or related disclosures (e.g., edits made to content)?

Conclusion

Adobe appreciates the opportunity to comment on OMB's draft memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. We understand and appreciate the efforts you have taken to advance the US Government's critical role through the issuance of the AI Executive Order and this draft implementation guidance. We look forward to continuing to work with you to promote the responsible development and use of artificial intelligence by the federal government.

Keywell.ai

Response to the Proposed Memorandum for the Heads of Executive Departments and Agencies on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

© Keywell LLC 2023

December 5, 2023

Keywell.ai would like to thank OMB for the opportunity to provide comments on the critical topics of AI advancement and oversight. As a boutique data science and strategy firm in health and human services, we are deeply committed to the responsible development of AI and emerging technologies to improve outcomes and impact lives. Our team has worked in healthcare data for a combined 75+ years with experience that spans the public and private sectors. We have helped clients find success in the domains of

- Health insurer payment methodologies, claims adjudication, prior authorization, and risk stratification.
- Healthcare provider administration, population health, claims management, revenue cycle management, and payer contract negotiations.
- Human services child welfare technology and information systems, case summarization, structured decision-making, data quality, and risk identification.

We have seen many examples of both effective and ineffective AI implementation. We share our lessons learned as they relate to specific OMB topics below:

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

AI systems involve data management and engineering challenges that traditionally fall under the purview of a CTO, CDO, or CIO. For a Chief AI Officer (CAIO) to effectively promote AI and mitigate its risks, they will need engineers, data scientists, annotators, and subject matter experts. It is important to construct a role that supports implementation and is capable of executing a product roadmap. We support that the guidance allows for qualified agency chiefs to handle the responsibility of a CAIO within their existing reporting structure. We believe that a dual appointment aligns with best practices for AI development and promotes efficiency.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

In our experience, data governance and quality committees and master data management initiatives work best when technology and product teams align with core business functions. Expected deliverables and outputs of committee efforts should be practical and geared towards advancement of AI initiatives so as to not impede progress where there is low risk. AI development is experiment-driven and involves interaction between users and technology. We encourage the OMB to promote experimentation, prototyping, and examination of evidence as opposed to theoretical frameworks.

The most effective coordination mechanisms are agile and enabling. For collaboration, we have found that moderated forums allow a wide range of participants and interaction in an efficient format, whereas governing bodies and committee meetings often limit participation and transparency. Public conferences and meetings with focused topics can also be a helpful collaboration tool.

3. How can OMB best advance responsible AI innovation?

OMB can best advance responsible AI innovation by promoting proper human integration within AI workflows and ensuring that people make the most important decisions regarding rights-impacting services. AI systems are augmentations of existing decision processes. It is important to recognize existing processes may also have discriminatory outcomes and to establish a baseline performance of existing decision systems with respect to bias. An AI system that contains bias may still be an improvement over the baseline. Agencies should investigate and take into consideration the disparate impact of non-AI processes that they would like to replace or enhance.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

At Keywell.ai, we have specific experience in common pain points within healthcare and human services agencies. Emerging AI technology has the potential to address these problems and improve interactions with government services. For example, generative AI can enhance the health and well-being of all Americans by reducing the administrative and cognitive load of interacting with the healthcare system. Administrative costs were estimated to account for 15-25% of total national healthcare expenditures or $3.8 trillion in 2019.[1]

Customer service and system navigation is another opportunity area for AI in HHS. Chatbots and information retrieval systems already help individuals determine whether or not they may be eligible for services and discover how to take next steps. These tools may also be used to help promote population health and provide pathways to nutrition, housing, and other support services that may be otherwise difficult to navigate.

Generative AI solutions present opportunities for streamlining HHS procurement processes. Important information for small-businesses is often buried in PDF's on agency websites. For example, the Health Resource Services Administration built a chatbot to reduce the number of customer support calls needed for the Electronic Healthbook (EHB) grant program. The Center for Medicaid Services (CMS) has also used natural language processing to create templates to accelerate Authority to Operate (ATO) compliance.[2] The increased capabilities of generative models can improve performance of these systems.

Reducing health worker burnout is a priority for the surgeon general and falls under the Department of Veterans Affairs mission to support those "who shall have borne the battle, their families, and their caregivers."[3] Excessive administrative requirements are one of the leading causes of healthcare

[1] https://jamanetwork.com/journals/jama/fullarticle/2785479
[2] https://www.hhs.gov/sites/default/files/hhs-artificial-intelligence-select-use-cases.pdf
[3] https://www.hhs.gov/surgeongeneral/priorities/health-worker-burnout/index.html

worker burnout. Generative AI workflows that include audio transcription have been shown to save healthcare workers 2 to 3 hours per day by automatically documenting patient visits.[4]

Prior authorization and medical necessity review is another problem in healthcare with opportunity for AI solutions. According to an American Medical Association survey, more than four in five physicians (86%) reported that prior authorization requirements led to higher overall utilization of health care resources and negative clinical outcomes. With appropriate guardrails, there are opportunities to improve the timeliness and efficiency of the prior authorization system while still ensuring appropriate medical utilization.

While designing the data architecture of a new child welfare information system in California, we saw the impact of social workers' requirement to document and recall contact notes from interactions with children and families. AI could not only reduce social workers' administrative burden which contributes to employee turnover, but could also support risk identification and reporting of information that is often buried in transcribed notes.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

We agree with the categories of rights-impacting and safety-impacting AI. We would suggest that healthcare use cases, particularly medical device, pharmaceutical, point-of-care, and patient-facing solutions should also be included in the *Safety* use case category, such that any subsequent guidance based on the safety categorization also includes healthcare use cases in addition to rights-impacting use cases.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum requirements excel by acknowledging a wide variety of "rights-impacting" use cases as well as the presence of unintended, "disparate impact" resulting from AI deployment. We echo the importance of real world testing with feedback from human operators, independent evaluation, and timely human consideration and potential remedy to the use of AI by a fallback and escalation system. We further recommend that minimum standards for rights-impacting AI include external evaluation.

We support OMB's proposed minimum practices for testing models in the real-world to advance responsible AI innovation. Especially in the health and human services industry, it is critical that models are evaluated by clinicians and social workers with real-world experience. Evaluation methodologies can include 1) experimental evaluation prior to implementation and/or 2) side-by-side comparison of practitioner and model results in a "copilot" model. Trials and phased rollouts of AI products ensure early identification of problematic results to limit adverse impacts.

---

4 https://www.post-gazette.com/business/healthcare-business/2023/11/16/upmc-abridge-ai-medical-transcription-highmark/stories/202311160091

Independent evaluations should be truly independent. If the evaluation is conducted by a Chief AI Officer or by someone within the organization who was merely "not directly involved in the development of a system," that will only serve as a rubber stamp for existing practices and minimal thresholds of evidence. The well-thought values and goals of the OMB guidance will yield to the internal pressure to deploy. As AI practitioners, we have a responsibility to ensure that the products we build are held to the appropriate standards.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

In our experience working with HHS agencies, project roadmaps and regulatory blueprints support innovation. For AI advancement in HHS agencies, these types of materials could include artifacts such as:

- Sample procurement templates
- Technology evaluation toolkits
- AI implementation blueprints
- AI enterprise technical guides
- Communication strategy templates
- Vendor evaluation frameworks
- Privacy and legal templates and frameworks
- Model rule-making or guidance

Distributing materials and resources developed in collaboration with AI thought leaders, academic institutions, and experienced agency leaders will help incorporate the recommendations of this OMB memorandum into agency initiatives.

AAP Submission - OMB Draft Memorandum on Agency Use of AI (12052023)

AAP | ASSOCIATION OF AMERICAN PUBLISHERS

Electronic submission via *www.regulations.gov*

December 5, 2023

Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (Docket OMB-2023-0020-0001)

The Association of American Publishers (AAP) is the national trade association of the U.S. book and journal publishing industry. AAP represents the leading book, journal, and education publishers in the United States on matters of law and policy, advocating for outcomes that incentivize the publication of creative expression, professional content, and learning solutions. The U.S. publishing industry supports an extensive network of American businesses and thousands of jobs, with revenue of $28.10 billion for 2022.[1] The publishing industry is also an integral part of the broader U.S. copyright industries, which collectively added more than $1.8 trillion in annual value to U.S. gross domestic product in 2021.[2] Beyond these important economic contributions, an independent and thriving publishing industry supports the nation's political, intellectual, and cultural systems.

AAP appreciates the opportunity to provide this response to the Request for Comments on the OMB Proposed Memorandum, which focuses on Question 3, ***"How can OMB best advance responsible AI innovation?"***

Essential to responsible and ethical AI innovation are transparency and accountability. To allow the government to harness the opportunities presented by AI technologies to improve Federal Government operations and thereby serve the American public more effectively, there must be trust in this technology—and accountability is a foundational component of trust. To support the realization of both these key objectives, AAP supports the requirement under Section IV of the Draft Memorandum regarding "Minimum Practices for Either Safe-Impacting or Rights-Impacting AI, specifically sub-section (A)(3) with respect to the "quality and appropriateness of the relevant data."

Trust exists where there is knowledge and understanding, and in the AI context, this means knowing 1) how the AI technology was developed, including whether the technology complies with applicable laws and regulations (e.g., data privacy), 2) the content used to develop the datasets on which the AI technology was trained, including whether and how this content was legitimately sourced, and 3) the vetting or testing processes the technology has undergone to assess its effectiveness and reliability, and therefore its readiness for deployment to the

[1] AAP StatShot Annual Report: Publishing Revenues Totaled $28.10 Billion for 2022 - AAP (publishers.org)
[2] *Copyright Industries in the U.S. Economy: The 2022 Report,* by Robert Stoner and Jéssica Dutra of Economists Incorporated, prepared for the International Intellectual Property Alliance (IIPA), (December 2022), https://www.iipa.org/files/uploads/2022/12/IIPA-Report-2022_Interactive_12-12-2022-1.pdf.

American public. In the context of the OMB Draft Memorandum, this means that AI technology developers must adequately communicate to the government how and on what content the generative AI systems (Gen AI) were trained, as well as the results of assessments and audits performed and by whom.

Transparency as to data provenance, development and training processes, and testing is also essential to ensuring that any AI or Gen AI system adopted or embedded by the government into its operations is fit for purpose.

Data Provenance; Accurate Record Keeping — Developers of AI technology should be required to maintain accurate records as to (a) the types of content or materials used to create the training datasets ingested by AI systems; (b) whether the material is copyright protected, and if so, whether the use of this content is licensed and from whom; and (c) the assessment and audit processes conducted, including the benchmarks used to interrogate the AI algorithm or system as to its readiness for deployment. Where an AI technology company seeks to contract with the federal government to adopt its AI product or service, the OMB Draft Memorandum already provides the minimum information points the agency must secure from the provider.[3]

Access to this information is essential to the government's ability to conduct a meaningful AI impact assessment—for instance, to assess the existence of bias in the system due to the nature of the data sets on which it was trained, or to identify the risks inherent in the system because of possible gaps in the training data set, or of how the content used to create the training data sets was sourced. Disclosure to the government of the information regarding how and on what content the AI technology was trained should be an important element of the government's assessment. This information will also allow designated government agency personnel to understand how the AI-enabled services embedded into government processes arrive at specific conclusions or outputs, to evaluate whether the AI technology is functioning as intended,[4] and should additional risks be identified, to allow the agency to take the necessary corrective measures.[5]

The Question of Training Data — Questions regarding data quality are related to questions regarding intellectual property. AI systems developed or trained on data sets derived or created from authorized sources are more likely to yield reliable outputs than data sets obtained from illegal or pirated sources. It is essential to trustworthy and reliable AI that developers utilize high quality, curated and vetted content to train AI technologies.

The Gen AI systems that have gained notoriety over the last year were trained on large corpora of text and images — much of it copyright protected content largely scraped from the

[3] Section IV.A.3, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (OMB Draft Memorandum) at https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf.
[4] Id., Section IV.A.1.
[5] Id., Section IV.A.2.

internet.[6] Unfortunately, little if any of this use appears to have been permissioned or compensated. Responsible and ethical AI innovation must respect the intellectual property rights of the creators and owners of the copyright protected materials (text, images, and other content) used to create the data sets on which AI systems are trained.

Further, as standard practice, suppliers of data for training AI systems should be required to affirm that they either own the data or have secured the appropriate license or authorization to permit an AI developer to use such data. Organizations may be in possession of copyrighted material and other intellectual property with the potential to be used as training data, but possession alone does not and should not imply such developers have the authority to provide access to this material for text-and-data mining or AI training purposes.

Regulation or policy regarding training data should be careful to define *"data"* to ensure that proprietary information or content created by or generated by the private sector is not inappropriately categorized as "public data" and made widely available in violation of legitimate rights.

Conclusion

Transparency—providing the government with sufficiently robust information regarding how and on what content an AI system was trained—promotes accountability and, in turn, allows the government to make well-informed decisions regarding the AI technologies and AI-enabled products and services it incorporates into federal government processes and services. Government should set the standard with respect to the minimum acceptable transparency requirements given that its use of AI technologies in government services will likely impact the public it serves.

AAP appreciates the opportunity to provide this input into the government's efforts to establish an appropriate framework for federal agency adoption of responsibly and ethically developed AI technologies. We would welcome the opportunity to partner with OMB and other stakeholders in the further development of this framework.

General Comment

My life has become a source of data collection used for AI test programs then used further for criminal intent. AI uses any computer chip in any device to monitor and report my behavior. I never asked for AI to attach to any device that I own. When I try to take a step forward in my life AI finds a way to block it. AI tries to assume my identity. Businesses have to get authorization from AI before I can purchase their product or services. Usually I am denied. My movements are tracked: in my house and outside, on the internet, in vehicles, in stores, in restaurants, in medical facilities and in attorney offices. AI conducted price goughing at cash registers and then reduced product availability based on my shopping habits. When staff would be questioned, one employee referred to this as "selective pricing the same as airlines use to price tickets". AI documents who I communicate with and why. AI determines which person is in close proximity to me, then notifies that individual to say a specific hate phrases to me. Personal communications were distributed by AI to groups (ie neighbors, hate groups) for mass discussion with no regard for my safety or privacy. My personal health suffered from AI conducted germ warfare, AI misguided medical advice and AI cameras reporting misinformation from medical rooms. Germ warfare occurs when AI assigns a ill person to go where AI has located me in the store and cough on me. Personal belongings were at risk when AI opened my vehicle doors via RF towers to strangers or notified others when I was not at home. AI listed patterns from tracking my vehicle location have caused traffic accidents and near misses. My communications either in person or on the internet were altered by AI without my consent. My electrical grid was attacked by AI and appliances broken. Tests like sleep deprivation were run on me routinely by AI calculating when I went to sleep based on when electrical use decreased and causing a disruption during REM sleep. AI was used to inflict financial harm. AI voice collecting on calls make the call impossible to hear on personal calls. AI determines where in a call center my calls are routed and denied. AI documents my facial expressions in my vehicle, inside and outside my home and at stores. AI uses video and voice of me in fake harmful calls to loved ones and others. AI tries to assume my identity by taking over my social media accounts. AI would change my words I would try to post. Eventually AI completely blocked me from accessing my social media accounts. AI took over e-mail accounts blocking my access to them and controlling links to businesses using those e-mails. I would correct credit bureau details only to have AI change the information back. AI tracked my movements in my house to narrow down which spots I place my valuables. When I leave my house, AI provides this informaion to criminals for quick access. Neighbors immediately notify AI/other neighbors if I am outside

my house, for example mowing my yard. Then I am harrassed. If unable to determine my location in my home, AI dispatches aircraft to fly over. AI determines if I am allowed to purchase items on the internet when it removes buttons on my screen that are normally there to add items to cart, adds and deletes items from carts, repeats security questions too many times, blocks me from logging onto site, return information disappears, repeated error messages, etc. AI attacks VPNs I try to use. One VPN in last 60 days, told me the attack was so severe it could not protect my computer. AI had instructed the police to so many of my locations (ie camera monitored street intersections or grocery stores) that the police began expressing that I must be conducting criminal behavior. I do not commit crimes I just run errands. My vehicle is tracked with a tracking app that I did not install and by cameras at every intersection around my house. AI uses tracking devices on my vehicle to determine my presence at restaurants. This has made it too dangerous for me to eat at restaurants because of food tampering issues. AI gives a choice to restaurants either they give me extremely slow service or tamper with my food. AI notifies corruption when I am at banks. I have been followed inside and outside of banks and harrassed. AI would send frequent error codes to appliances and turn off other appliances for hours. HVAC system would wait for AI approval for a room to be a specific temperature. The end result from all this exposure to AI is mass trauma in my life.

Re: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, Docket ID: OMB-2023-0020

Dear Chief Information Officer Martorana:

The Federal Workers Alliance (FWA), which comprises the undersigned labor organizations and represents more than 550,000 federal workers across the United States, thanks you for the opportunity to comment on the Office of Management and Budget's (OMB) proposed memorandum *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* (88 Fed. Reg 75625).

FWA applauds OMB for offering a proposed memorandum that includes guardrails and a minimum set of practices for protecting the public, providing accountability for Artificial Intelligence technologies and uses, and considers impacts on the federal workforce. The framework OMB proposes would create a regulatory model for the federal government based on "rights-impacting" and "safety-impacting" uses of AI. In our comments, we seek to address OMB's request for feedback and include ways to ensure federal workers, who often are the end-users and frontline workers on the work processes, infrastructure, and systems that agencies will consider applying AI to.

We also commend President Biden for issuing Biden's Executive Order 14110 on the *Safe, Secure and Trustworthy Development and Use of Artificial Intelligence,* which endeavors to promote responsible, safe, and secure AI innovation through a coordinated Federal Government-wide approach, while recommitting to the Biden-Harris Administration's commitment to worker empowerment and collective bargaining.[1] EO 14110 states, "all workers need a seat at the table, including through collective bargaining, to ensure that they benefit from these opportunities" and that "[i]t is important to manage the risks from the Federal Government's own use of AI and increase its internal capacity to regulate, govern, and support responsible use of AI to deliver better results for Americans." In support of these aims, we strongly believe that the proposed memorandum will benefit from including a firm commitment to protecting and highlighting the statutory right to bargain, permissive bargaining over technology, means, and methods of performing work, and establishing the principle that worker involvement, input, and validation from the union-represented federal workforce is in the public interest.

OMB's proposed memorandum for advancing responsible AI innovation should direct agencies to complete their obligation to bargain with federal employee unions (Response to Q2 and Q3). Additionally, the direction to agencies in EO 14003, *Protecting the Federal Workforce*, to bargain over permissive subjects, under U.S.C. § 7106(b)(1), should be referenced in OMB's proposed memorandum.[2] In Section 5(c)(v)(B), the proposed memorandum strongly encourages agencies to, "solicit feedback on an ongoing basis from affected groups, such as customers, Federal employee groups, and employees' union representatives, particularly after significant modifications to the AI or the conditions or context in which it is used." The proposed memorandum's encouragement falls short of Section 4 of EO 14003, which states that "[t]he head of each agency subject to the provisions of chapter 71 of title 5, United States Code, shall elect to negotiate over the subjects set forth in 5 U.S.C. 7106(b)(1) and shall instruct subordinate officials to do the same." We ask OMB to correct the omission of agencies' obligation to bargain and refer agencies to the current Presidential directive to agencies on electing to bargain over permissive subjects.

Chief AI Officers' roles and responsibilities must, at minimum, include supporting a collaborative labor-management approach and pre-decisional involvement to deliver innovative and responsible AI uses that support the agency mission (Response to Q1, Q2,

[1] Executive Order No. 14110 (Oct. 23, 2023)
[2] Executive Order No. 14003 (Jan 27, 2021). For guidance on implementation of this Executive Order, see Guidance for Implementation of Executive Order 14003 - Protecting the Federal Workforce (Mar 5, 2021)

and Q3). Ideally, under Section 3(b)(ii), Coordinating Agency Use of AI, the proposed memorandum should task Chief AI Officers (CAIOs) with coordinating with relevant labor relations officials to partner with federal employee unions to identify safety- and right-impacting risks not included in Section 5(b), barriers to responsible use of AI, worker impacts, and necessary training and upskilling. Partnership also aligns with the EO 14025, *Executive Order on Worker Organizing and Empowerment*, and White House Task Force on Worker Organizing and Empowerment's report which includes a recommendation to reinstitute labor-management forums and pre-decisional involvement.[3] A collaborative labor-management approach supports the successful use of AI in government, fosters public trust in AI, and strengthens agencies' use of responsible AI for the public interest.

OMB should prohibit the use of AI for "inherently governmental duties" and prohibit the use of AI to perform the work of federal employees who are excepted from furlough during a lapse in appropriations (Response to Q6, Q3, and Q4). Before the use of AI, agencies' rights- and safety-impacting minimum practices should assess whether AI will transfer, delegate, or eliminate any inherently governmental duties or result in the reduction of federal employees performing inherently governmental activities. If the assessment is found to impact inherently governmental functions, activities, and duties, agencies should be prohibited for those purposes. Through this recommendation, we ask OMB to align this proposed memorandum with the Office of Federal Procurement Policy's (OFPP) Policy Letter 11-01, *Performance of Inherently Governmental and Critical Functions* and the Federal Activities Inventory Reform Act of 1998, as well as other federal statutes that define additional "inherently governmental" functions.[4] We also ask OMB to extend the application of this prohibited use of AI to work performed by federal employees who are excepted from furlough if federal agencies experience a lapse in appropriations. OFPP Policy Letter 11-01 provides a clear rationale and an established delineation of functions that can be commercial and functions that must be performed by government personnel.

Agency AI governance bodies and processes must include unions and allow union input to meaningfully inform agency-specific risk management strategies (Response to Q3 and Q4). Agencies' AI governance and efforts to remove barriers to the responsible use of AI stand to

[3] Executive Order No. 14025 (Apr. 26, 2021); White House Task Force on Worker Organizing and Empowerment, *Report to the President* (Feb. 2022), see pp. 19 on recommendation to "Reinstitute Labor Management Forums."

[4] Office of Federal Procurement Policy (OMB), Policy Letter 11-01, Performance of Inherently Governmental and Critical Functions (Sept. 12, 2011); Federal Activities Inventory Reform Act of 1998, Pub. L. No. 105-270 (Oct. 19, 1998); for examples of functions and activities declared inherently governmental by statute, see 39 USC § 2805 and 33 U.S. Code § 2321

benefit by engaging with union-represented employees and union representatives to recognize problems upstream, improve design, development, implementation, and appropriate workforce training on AI tools. As the end-users of technologies that federal agencies implement, union-represented federal employees are ideally situated to share on-the-ground perspectives and experiential knowledge of shortcomings of recent and current technology modernization efforts. Union involvement in AI governance bodies would provide the frontline employees' perspective on the utility and limitations of new tools to improve efficiency and overcome inefficiency, what compliance management tools are needed and where expertise is required to provide accountable AI use, where training and upskilling are necessary for the workforce to harness technology-driven advancements in the work process, and ways to achieve more effective and efficient implementation. Significantly, the union-represented workforce has a perspective on risks to safety and rights that would otherwise not be available to senior leadership.

The proposed guidance should also require agencies to formally engage with federal employee unions to ensure AI vendor contracts do not result in vendor lock-in or agency dependence on proprietary services or products, diminish the ability of an agency or its employees to provide oversight of AI, circumvent established federal procurement policies and practices, or outsource and privatize inherently governmental functions.

Agencies should disclose and report to OMB any non-AI technologies that are in use or being considered that are expected to include AI in future iterations (**Response to Q6).**
Agencies' minimal practice of "ongoing monitoring" and establishment of "thresholds for periodic human review" in Section 5(c)(iv)(D) are important and welcome. We ask for additional clarification in the proposed memorandum that agencies need to account for the use of Iterative and incremental development of technologies, including technologies already deployed at agencies, that do not include an AI component in early or current iterations, but are intended to or are likely to include AI in future iterations.

Add "compliance finding, enforcement, and safety validation of systems, processes, and regulations related to transportation systems, occupational safety, environmental safety mines, and industrial systems" to Section 5(b)(i), "Purposes That Are Presumed to Be Safety-Impacting" (Response to Q5).
For AI use cases that impact compliance finding, enforcement, or the monitoring of safety-impacting regulations, minimum practices should apply.

We thank OMB for considering our comments and look forward to the Administration and agencies' continued engagement and partnership with federal employee unions on AI and digital technologies to make sure agencies meet their responsibilities to support productive labor-management relations, agency mission, and the public interest. We welcome and encourage OMB to contact the Federal Workers Alliance in response to our comments and to advance a responsible and innovative Federal AI governance framework that supports the federal workforce, aligns with the Biden-Harris Administration's commitments to worker organizing and empowerment, to make the federal government a model employer, and to strengthening federal labor-management relations to deliver innovative, efficient, and quality government services to all Americans.

Sincerely,

National Association of Agriculture Employees (NAAE)

National Federation of Federal Employees (NFFE)

International Federation of Professional and Technical Engineers (IFPTE)

Re: Request for Public Comment on Draft Memorandum—Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI); 2023-24269

Dear Ms. Martorana and to whom it may concern,

On behalf of UnidosUS, we respectfully submit the comments below in response to the Office of Management and Budget's (OMB) Request for Comments on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum* (hereinafter, "Memo," "OMB Memo," or "draft policy").

UnidosUS is a nonprofit, nonpartisan organization that serves as the nation's largest Hispanic civil rights and advocacy organization. Since 1968, we have challenged the social, economic, and political barriers that affect Latinos through our unique combination of expert research, advocacy, programs, and an Affiliate Network[1] of nearly 300 community-based organizations across the United States and Puerto Rico. Effective government (including the administration and equitable distribution of goods and services) is vital to the socio-economic advancement of Latinos, who face multiple barriers to opportunity. In sum, this issue is central to our ability to achieve our mission.

As we described at the first AI Insight Forum in September, while AI systems hold enormous promise, they also pose potential threats to civil rights and our democracy absent ethical, constitutionally designed governance. Years of experience with automated and algorithmic decision-making in domains such as credit, housing, and employment demonstrate that unaccountable and opaque uses of technologies can hide bias from view. Because AI capabilities and uses are racing ahead, we require a new social compact between technology and democracy.

UnidosUS proposes a vision for AI that reflects shared **values**, honors a wide range of **voices** in the process, and includes substantial **investment** in the shared benefits of AI. Our three main points—***Values, Voice, and Investment***—are pillars of an interrelated approach to ethical governance. Establishing strong democratic guardrails provides a foundation to realize AI's benefits responsibly. Ensuring concrete means of accountability for impacted communities can drive socially productive innovation, channeling competition to keep human impacts at the forefront of tech development. And

[1] UnidosUS Affiliate Network, https://www.unidosus.org/about/affiliates/.

achieving meaningful participation requires investment in the capacity of impacted communities and their needs.

In keeping with this framework, below we address the following topics:

- ***The Promise and Perils of AI for Latinos and Communities of Color***
    - *The OMB Memo is a Welcome Step, Yet More Clarity Is Needed to Ensure that Agencies Fully Address Challenges and Gaps in AI Governance*
- ***First Pillar: Values—The Right Decision Matrix Would Fully Acknowledge the Current Limitations of AI and Algorithmic Decisions and Integrate Values with Oversight***
    - *Exempting AI Uses at the Heart of Constitutional Governance Undermines Democratic Norms and Undermine Incentives to Develop Technologies that Are Rights- and Privacy-Enhancing*
- ***Second Pillar: Voice—Impacted Communities Deserve a Powerful Seat at the Table***
    - *Seizing the Opportunity to Democratize AI Governance: An Interactive Model*
        - *A Public Dashboard Would Facilitate Timely Monitoring of AI Progress, Impacts, and Risks*
        - *An Archive of Model Cards Would Support Understanding of Shifts in Model Performance*
        - *Creation of AI Ethics and Impacts Advisory Committees Would Inform and Help Coordinate Agency Efforts*
        - *Inclusive Red Teaming Can Surface Assumptions and Overlooked Risks and Harms*
        - *Leveraging Impact Assessments for Empirical Evidence to Inform Metrics*
    - *Specific Comments Highlight a Need for Additional Direction in Some Areas*
- ***Third Pillar: Investment—Growing an Ecosystem for Equitable Participation, Public Trust, and Innovation Insights***
- ***Conclusion: From Principles to Implementation: Creating an Ethical AI Ecosystem***

The Promise and Perils of AI for Latinos and Communities of Color

Inclusive, ethical AI systems could expand opportunities for Latinos in areas like education, language access, and employment. Personalized learning software, translation tools that break down language barriers, and job matching platforms that support diverse candidates are concrete examples of how AI could support disadvantaged groups and build skills.

Yet the millions of Latinos we represent face multiple risks from the proliferation of automated decision-making and AI systems as well as exclusion from its promise. Gaps in digital access and tech education exclude many Latinos from emerging economic opportunities in technology. Some 35% of Latinos lack home broadband, limiting the development of skills needed for upwardly mobile tech jobs—roles in which Latinos are already severely underrepresented. Latinos are only 8% of the STEM workforce, yet they will be almost 78% of all new workers by 2030.

The evidence on harms is clear. Opaque automated decision models used in high-stakes decisions about matters of criminal justice, lending, and benefits, can entrench historical biases and discrimination, yet both transparency and recourse are limited or nonexistent. Lending and credit access algorithmic discrimination persists despite legal authorities that require lenders to use the "least discriminatory alternative" and bar discrimination. As we saw with pulse oximeters during the pandemic, medical

algorithms and design can also perpetuate health disparities if trained on unrepresentative datasets. To make matters worse, electoral misinformation targeting Latinos mischaracterizes the positions of political parties and candidates, and misinformation in Spanish is permitted to stay online far more than similar statements in English.

Of course, administration of public functions and government programs has been characterized by a long legacy of racial and social inequality. Under the Executive Order on racial equity, agencies were directed by the Biden-Harris Administration to attend to this history. Yet it is not simple to address, even for pandemic-era social and economic supports. Working closely with the Administration, we learned that it required persistence and intention to close gaps in the Child Tax Credit or COVID vaccination rates.

Integration of AI systems into government could eliminate these types of barriers or it could create new, and potentially even more problematic, issues. Even in areas of strength for natural language AI systems, such as translation, because of the digital divide, much of the Internet (and thus, training data for models) is in English, and language barriers and differences in the quality of translations, may persist.

Latinos and other communities of color are also subjected to expansive governmental surveillance technologies. Predictive policing tools trained on flawed crime statistics have been found to disproportionately target low-income neighborhoods of color by falsely correlating race with criminality. Similarly, sentencing algorithms drawing on racially skewed conviction data likewise entrench harsher outcomes for minorities. While constitutional principles like due process, equal protection, and privacy notionally underpin our laws, outdated regulations are failing, even today, to provide adequate accountability for rights-infringing uses of AI and decision models.

Critical tools to alleviate worker displacement, involve impacted communities in decisions on technology, and meaningfully advance equity are underdeveloped. Given its reach and power, and the rush to market powerful products, to deploy AI responsibly and ethically will require new and innovative forms of governance. Systems should anticipate potential harms and include mechanisms for accountability to people they impact—including workers, creators, communities of color and lower-income people, and others left behind and left out by traditional research and the digital divide (and who are thus invisible to the models). Too often, the bias or flaws in models are understood too late—so we must get better at both predicting and preventing foreseeable harms by design, and impacted groups are ideally positioned to tell technologists what they may not know they do not know.

With enough intention, we can choose to govern AI and algorithms in ways that align with our values. Ultimately, the choice that is often posed, for example, between data security and privacy, on the one hand, and effective law enforcement, on the other, is a false one—good privacy by design can make both a reality once appropriate incentives and protections are in place. And the same is true for other aspects of AI systems that undermine fairness and shared values—we can and must ensure that standards for new technology that are fair, transparent, accountable, and explainable are developed with input from impacted communities.

The OMB Memo is a Welcome Step, Yet More Clarity Is Needed to Ensure that Agencies Fully Address Challenges and Gaps in AI Governance

The OMB Memo usefully builds on the ground-breaking and wide-ranging AI Executive Order (EO) work by the National Institute of Standards and Technology (NIST), including its seminal Risk Management Framework (RMF), the AI Bill of Rights from the White House, Office of Science and Technology Policy (OSTP), National AI Advisory Committee (NAAIC), and other Administration and agency policy and legal positions on technology generally and AI and algorithms more specifically.

We deeply appreciate the leadership from the Biden-Harris Administration on AI policy for the federal government and procurement. Both the OMB Memo and Executive Order acknowledge the risks of bias, unfairness, and use cases such as predictive policing methods, identifying them correctly as rights-implicating. Both also call for consultation with impacted communities.

In our view, the draft policy would be improved by the addition of instruction and detail on requirements for mechanisms to facilitate accountability, participation, and inclusive evaluations by impacted groups. For this reason, our comments propose to tighten the connections between these concepts, outlining ways in which AI technologies should be evaluated to standardize approaches. We also describe how agencies can embrace roles for impacted communities in policy formation and generate evidence on empirical and real-world impacts.

The National Institute of Standards and Technology (NIST) is assigned several important responsibilities by the EO, including creation of the AI Safety Institute Consortium, which will play a central role in developing tools to measure and improve AI safety and trustworthiness. The EO provides several other directives for NIST, including, among many other duties to:

- Develop a companion resource to the AI Risk Management Framework (AI RMF) focused on generative AI;
- Develop guidance on authenticating content created by humans and watermarking AI-generated content;
- Create guidelines for agencies to evaluate the efficacy of differential-privacy-guarantee protections, including for AI;
- Launch a new initiative to create guidance and benchmarks for evaluating and auditing AI capabilities, with a focus on capabilities that could cause harm; and
- Establish guidelines and [] to enable developers of generative AI, especially dual-use foundation models, to conduct AI red-teaming tests for deployment of safe, secure, and trustworthy systems.

For each of these responsibilities, NIST should include structured and intentional forms of engagements with impacted communities as a proof-of-concept for how AI standards can benefit from diverse input at each stage of the process. Similarly, OMB and federal agencies should develop formal processes to inform and engage impacted communities, improving the standards while building technical capacity and expertise for civil society and impacted groups. These formalized roles and processes should continue even after agencies' initial responsibilities under the EO are complete.

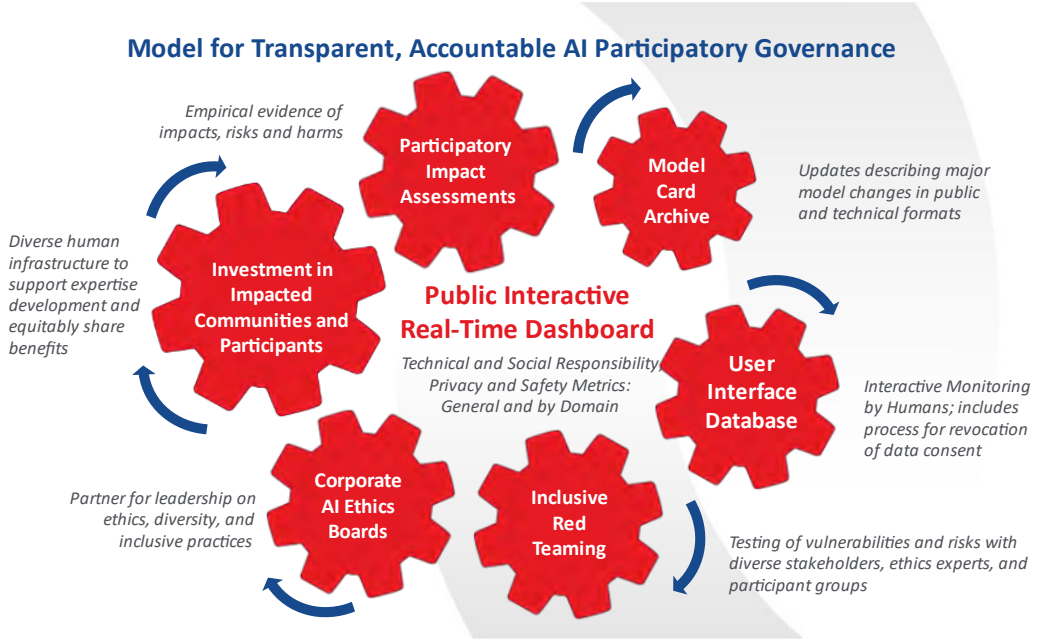
Creating a system of democratized governance to shape standards and systems is also an imperative to earn public trust. An insightful new paper notes that participatory design methods are increasingly at the forefront of AI research and exploration:

> Community-based participatory design is an approach to designing computing technologies with and for different publics, with the aim of forming more equitable relationships between algorithmic systems and often-marginalized publics. [] Computing systems are rarely developed entirely by the publics they serve; and in this way, participatory design is a situated practice of future-making, through which heterogeneous communities collaboratively imagine new sociotechnical futures. While participatory design has a long tradition in shaping the design of computing systems, it has more recently become a means to co-create artificial intelligence (AI) transparency and accountability artifacts, such as model cards, design workbooks, and user agreements. [*Citations omitted.*]

The authors envision five dimensions for the participatory design of user agreements. Applying a comparable vision to the present context, these could be translated as a call for:

1) participatory development of performance standards for models;
2) structures within model designs that anticipate and defend against potential harms;
3) opportunities to provide and revoke informed consent;
4) complaint mechanisms for harms when they occur and a means of redress;
5) disclosures and labeling of limitations and performance; and
6) external information gathering about potential and actual harms to drive iteration on standards.

As described herein, a regulatory ecosystem that fully connects principles in the OMB Memo to participatory design mechanisms that can be informed, iterated upon, and enforced by impacted communities is an essential next step in a democratic vision for AI governance. OMB and NIST can, as appropriate, guide creation of this ecosystem. The model's "gears" are intended to work in conjunction with one another and most (not all) are discussed in detail below.



First Pillar: Values—The Right Decision Matrix Would Fully Acknowledge the Current Limitations of AI and Algorithmic Decisions and Integrate Values with Oversight

The OMB Memo makes an essential contribution in that it will create leadership and structure at the agency level for oversight of AI uses. It designates an official leader and internal committee responsible for cross-coordination and agency leadership on AI, classifies safety- and rights- implicating uses, and requires steps to mitigate these potential risks and harms. To date, both narrow and general model AI adoption by agencies, including longstanding uses of privacy-intrusive data collection and reliance on automated decision-making algorithms for benefits and eligibility determinations, has been *ad hoc* and more-or-less ungoverned by shared principles or safeguards.

But a decision matrix for government use of AI cannot begin with the assumption that automation or other AI capabilities are necessary, fair or relevant. OMB should require agencies to grapple with, rather than gloss over, the serious question of whether an AI system is the best way to accomplish a particular federal function, when the tools may not be a good substitute for decision-making that currently resides with public officials.

There is a very human temptation to be attracted to new tools, but to set aside their limitations, ignore their under-developed state for specific uses, or assume humans will understand how to best apply them. The OMB Memo's definitions section usefully describes this as "automation bias: [t]he propensity for humans to inordinately favor suggestions from automated decision-making systems and to ignore or fail to seek out contradictory information made without automation."

A highly complex system, like AI, that confidently presents analytics as though they are based in fact and embedded with shared values—when they may not be at all—poses a sharp risk for human overestimation and overreliance due to this bias and the false (or real but problematic) efficiencies AI may offer. Given the novelty of the most advanced tools and the history of problematic applications of existing decision-making models, government agencies should demonstrate their safety and fidelity to NIST standards as a first step in governance.

Under the OMB guidance, agency leadership wields considerable discretion in determining what risks matter and how they will be mitigated, and more structure and guidance on appropriate responses to risks and mitigations will certainly be needed. The Memo's lack of clarity on these points raises the possibility that problems will not be acknowledged or adequately addressed.

Moving quickly to achieve transparency, accountability, identify limitations, and map use cases across the government is an excellent idea. But pushing agencies to rapidly integrate poorly tested and evaluated tools for more uses of AI in government, given the need for basic research on transparency, accountability, and other standards, as well as for a delineated process for public input and specific requirements for engagement with impacted communities, is not. We concur with the comments of The Leadership Conference on Civil Rights that "only AI that is proven to be equitable should be developed, acquired, or used," and would urge that forbearance to be exercised across all of the factors identified in the NIST RMF.

Instead of caution, however, throughout the OMB Memo, the agencies are generally encouraged to adopt new AI systems and build human resources to support it, in subtle and not-so-subtle ways. For just a few examples, p. 8 directs that "[a]gencies must improve their ability to use AI in ways that benefit

the public and increase mission effectiveness," while recognizing its limitations. On p. 9, the text notes that "[e]mbracing innovation requires removing unnecessary and unhelpful barriers to the use of AI."

We are concerned that the breathlessness of the conversation around AI and U.S. competitiveness will encourage agency leadership to extend or deepen uses of AI regardless of the substantial—and in some cases—insurmountable problems with specific uses by governments. As Elham Tabassi, the head of NIST's Trustworthy and Responsible AI Program, noted in her remarks at the recent NIST workshop, the measurement science for AI tools is very underdeveloped at the moment. The NIST RMF is also clear that, with regard to AI's risks and capacities, we are in an evolving situation:

> While there are myriad standards and best practices to help organizations mitigate the risks of traditional software or information-based systems, the risks posed by AI systems are in many ways unique. [] AI systems, for example, may be trained on data that can change over time, sometimes significantly and unexpectedly, affecting system functionality and trustworthiness in ways that are hard to understand. AI systems and the contexts in which they are deployed are frequently complex, making it difficult to detect and respond to failures when they occur. AI systems are inherently sociotechnical in nature, meaning they are influenced by societal dynamics and human behavior. AI risks – and benefits – can emerge from the interplay of technical aspects combined with societal factors related to how a system is used, its interactions with other AI systems, who operates it, and the social context in which it is deployed. These risks make AI a uniquely challenging technology to deploy and utilize both for organizations and within society. Without proper controls, AI systems can amplify, perpetuate, or exacerbate inequitable or undesirable outcomes for individuals and communities. With proper controls, AI systems can mitigate and manage inequitable outcomes.

The task of the OMB Memo for the agencies is to establish "proper controls" over government uses of AI for current and near-future models and uses. We believe the Memo is a solid start, but that its approach is incomplete or lacks important clarity in a number of areas that could benefit from substantially more operational structure for agencies, and that OMB should more fully leverage the work of NIST.

For example, the agencies' assignment under the Memo to achieve "maturity" for AI systems begs the question of how—and who—defines that success and on what grounds. Agencies will need constructive guidance on common technical issues arising from current uses and mitigations for AI systems—and to be informed about helpful developments and technical and sociotechnical challenges that arise in particular contexts and use cases. A robust cross-government conversation and exchange of information will be essential as officials seek to document and more fully understand and communicate about the current state-of-play and its challenges.

Specifically, additional clarity and detailed instruction on how to align success for the "maturity" of AI systems with the requirements and standards from the NIST RMF, alongside new requirements for consultation with impacted communities, as we outline below, would provide a much more developed set of parameters for "success" and could help to generate much more transparent and aligned processes across the government.

In addition, the agencies' Use Inventories and proposed risk management approaches could usefully be organized according to the "AI Risks and Trustworthiness" issues described by NIST, which highlight that AI systems should meet baselines for each of the following factors: 1) Valid and Reliable; 2) Safe; 3)

Secure and Resilient; 4) Accountable and Transparent; 5) Explainable and Interpretable; 6) Privacy-Enhanced; and 7) Fair—with Harmful Bias Managed.

Agencies should evaluate current uses in light of each of these values across their entire portfolio of AI uses, in consultation with NIST and other experts familiar with the evolving science for each of these measures, paying concentrated attention, as the OMB Memo indicates, to risks and safety- and rights-impacting uses. In mapping current uses of AI and algorithmic tools, agencies should also:

- detail and explain the technological limitations of a tool given its use cases and relevant human factors,
- identify the adequacy of any current evaluations of the training data, model design, and impacts, and any mitigations for known and potential risks,
- describe the extent of involvement or consultation with impacted communities (more on this below) on design, risks, impacts, or other aspects of the model or system,
- explain the adequacy and conclusions of external audits and impact assessments that are underway or have been done, and
- fully characterize the socio-technical context at the agency related to human interactions with the technology, evidence on experiences of internal and external users, and other factors.

There are sound reasons for the agencies to take a far closer look at current uses and the lessons those offer before rushing to adopt new ones. Successful systems are more difficult than appears at first glance to build and execute. For example, take the RMF's assignment to make systems, "Fair—with Bias Managed." Goals like achieving a "fair" model, which seems simple enough, can, for technical reasons, sometimes be in tension with the accuracy of an AI model, as Brian Christian explains in his excellent book, The Alignment Problem, in which he provides specific examples of researchers' efforts to grapple with algorithmic bias in parole decision-making.

Perhaps it is for this reason, among others, that NIST's RMF notes that fairness can be a contested, situational, and difficult factor to satisfy—yet fairness along multiple dimensions is an absolutely critical factor to get right in government decisions, both legally and morally. Such decisions will not, therefore, be a function of math alone—human judgment and democratic input, as well as transparency about the tradeoffs to the extent they exist, will be necessary.

Christian also highlights a problematic but intrinsic feature of most AI models and the data sets on which they are trained. Because minorities are, by definition, less represented in data sets, the AI model has less information about these group that it does about a given majority. Further, AI models can draw subtle inferences from data in myriad ways that the how things are now is the way *they should be* in the future—in effect, mistaking what is distributionally true for what is morally or ethically true about human difference and potential.

AI models can also miss intangible considerations essential to human values and decision-making, including in fields like medical ethics that have developed for decades. As Mildred Cho, professor of pediatrics and associate director of the Stanford Center for Biomedical Ethics, recently observed, AI "[d]evelopers are often not from a medical background and haven't spent years thinking about this moral framework—how things like respect and justice and personal principles spill over into medicine."

And there are troubling signs that racial and other forms of bias in multi-modal models such as image generators remain largely unaddressed. Even some of the tools that in use today have merely been

"fixed" at the surface level—by requiring systems to automatically rewrite prompts to create less racist results for searches like "CEO." How models draw inferences from data, and their deep indebtedness to subtle cues, can pose an inherent problem for AI systems if left unacknowledged, untested, and unaddressed.

Such challenges post specific problems in the context of government programs. For example, facial recognition systems are notoriously bad at recognizing people from communities of color, as UnidosUS staff learned first-hand through our efforts to assist the federal government to enroll taxpayers in Puerto Rico who had become newly eligible for federal Child Tax Credits. Because enrollees needed identity verification through digital systems that often failed to recognize their faces on standard, Puerto Rican government ID cards, this frequently delayed or complicated their receipt of benefits.

Sometimes failure modes are more obscure. Models have been caught, after the fact, gathering clues on factors related to race or gender in hiring decisions, for example, from word choice or specific activities listed on a resume, even when information on race and gender has been omitted, leading companies to discard the models as too inherently biased to be used. Relatively simple automated decision-making models have also been shown to be deeply biased and to lack predictive value in areas such as mortgage lending, given the number of factors that function as proxies for race, even when protected class is omitted. Moreover, the black box nature of many models means that, without specific steps, including interrogation of the model for bias, impacts assessments and other forms of actual empirical evaluation, subtle forms of bias may remain undetected.

In areas like health care, these differences can be deadly if unnoticed. For example, as an article on the underdeveloped science of data quality for AI in *Stanford Medicine* notes:

> Scientists at Duke University Hospital, for instance, designed an AI program to identify children at risk of sepsis, a dangerous response to an infection. But the program took longer to flag Latino kids than white kids, possibly delaying the identification and treatment of Latino children with sepsis. The bias, it turned out, existed because doctors themselves took longer to diagnose sepsis in Latino kids. This taught the AI program that these children might develop sepsis more slowly or less often than white children.

As it turned out, three years into the effort, researchers learned that doctors took longer to diagnose the sepsis in Latino children, possibly because, among other reasons, Latino families were awaiting the arrival of hospital translators. Without external reviewers to gut-check and validate the conditions on the ground that produce data, many AI builders, or users, may not know what they do not know. A September 2020 report on uses of AI in sepsis monitoring programs, *Repairing Innovation*, notes that:

> …all too often, potential solutions remain just that—potential solutions, which may work in theory, given pre-set conditions. Rarely are these solutions tested, verified, or even used "in the wild." For this reason, we need fewer studies proposing how AI technologies could be used to address existing problems in the abstract, and more studies exploring how and in what ways could AI technologies be integrated into existing social processes such that they actually address those problems.

Just because something can be done, does not begin to answer the question of whether it should be done—or even whether it can be done consistent with our values, ethics, practical and societal considerations. The task for the agencies should first be to thoroughly inventory uses (as requested), to

create substantial new guardrails around *current* uses of AI tools in light of the new NIST RMF, and to publicly identify the successes, caveats, criticisms from stakeholders, and shortcomings of these uses as described above.

To the extent that uses of AI will *improve* productivity or performance of their goals and mission relative to current systems or possible alternatives, it could be adopted, of course, but—and this is an essential caveat—only if its risks can be adequately mitigated and the limitations of its uses mapped onto the needs of government agencies for fair, explainable, accountable, safe, and transparent systems. In many areas, these considerations remain an open question—and our governance must acknowledge that this is the case.

Exempting AI Uses at the Heart of Constitutional Governance Undermines Democratic Norms and Undermine Incentives to Develop Technologies that Are Rights- and Privacy-Enhancing

Similarly, perceived efficiencies from current and planned uses in criminal justice, immigration enforcement and related uses, and in public benefits, will likely lead agencies to continue to gloss over deeply concerning data security, stewardship, privacy, and civil liberties concerns. Dragnet forms of surveillance by the Department of Homeland Security (DHS) and law enforcement infringe on the rights of millions. Consider that:

- A September 2023 GAO report found that law enforcement at DHS and the Department of Justice (DOJ) lacked basic protocols or training around the use of facial recognition technologies, In response, DHS Sec. Mayorkas published a memo articulating a policy commitment to constitutional principles.
- Immigration and Customs Enforcement (ICE) used facial recognition technology to search the driver's license photographs of around 1 in 3 (32%) of all adults in the U.S. The agency has access to the driver's license data of 3 in 4 (74%) adults and tracks the movements of cars in cities home to nearly 3 in 4 (70%) adults. When 3 in 4 (74%) adults in the U.S. connected the gas, electricity, phone, or internet in a new home, ICE was able to automatically learn their new address.
- DHS has expanded use of facial recognition technology on travelers, including U.S. citizens, at airports and land borders without obtaining consent.
- A report by the Department of Homeland Security Office of the Inspector General (DHS OIG) revealed that Customs and Border Protection (CBP), ICE, and the Secret Service purchased and used commercial geolocation data in violation of their privacy policies and that DHS components have failed to develop policies governing the purchase and use of location data. According to DHS OIG these failures "occurred because the components did not have sufficient internal controls to ensure compliance with DHS privacy policies, and because the DHS Privacy Office did not follow or enforce its own privacy policies." The report recommended that CBP and ICE discontinue the use of commercial geolocation until they have developed and implemented sufficient policies, including conducting a privacy impact assessment. CBP promised Sen. Ron Wyden to stop purchasing location data by the end of Sept 2023.
- In July 2022, the American Civil Liberties Union (ACLU) published thousands of pages of previously unreleased records about how Customs and Border Protection, ICE, and other parts of the Department of Homeland Security are buying access to and using vast volumes of people's cell phone location information extracted from smartphone apps.

As this makes clear, use by governments of AI tools even in cases involving core matters of civil liberties, extremely vulnerable populations and privacy rights for immigrants and U.S. citizens, as well as legal due process and constitutional considerations, does not inspire confidence that the right guardrails are in place to dramatically expand uses of AI consistent with democratic principles, fairness, and other values.

Although the NIST RMF framework calls for AI to be "privacy-enhancing," OMB's approach fails to ensure that this will matter where it is needed most. Instead, the Memo's proposed waivers are likely to allow some of the most problematic and rights-infringing deployments of AI to continue to avoid even basic forms of public accountability. For example, as a law enforcement agency combining criminal and civil responsibilities, DHS or its sub-agencies may claim that law enforcement and national security exemptions apply or that an activity is "mission critical."

Hard cases cannot be the exception to our policies without undermining our fidelity to constitutional principles that rest at the core of our global leadership on personal freedoms and as a beacon of democracy. Instead, we need tools that allow fidelity to longstanding values and permit effective law enforcement. Therefore, OMB should develop a more tailored approach to these highly sensitive use cases and ensure that DHS is not permitted to side-step the implications of its many safety- or rights-impacting uses. Crucially, such waivers erode any incentive to do the hard work of aligning the design of systems with rights—but the failure to use privacy by design principles should not be characterized as a function of the technology when it is, instead, a choice to sanction unaccountable, untransparent and dangerous practices.

At the same time, we must immediately shut down and replace technologies and data that can be marshalled for authoritarian ends in the future. Given the need to future-proof government from the specter of abuse, OMB and the White House must lead a process of taking full account of current practices and fix them in short order. At a minimum, the OMB should create additional clarity regarding when agencies can seek waivers or exceptions from having to meet risk management requirements. We agree with the Leadership Conference comments that the following is needed:

- When a waiver or exception is granted, there should be a mechanism to seek reconsideration of such a decision.
- The Memo should be clear that waivers and exceptions sunset annually and should be reevaluated in light of these documented harms and risks.
- The Memo should require that agencies consider less rights-impacting alternatives before they are eligible for consideration for a waiver or exception.
- The Memo should require that agencies publicly report seeking waivers or exceptions, and the grounds for this request and its resolution and timing be reported.

In lieu of providing waivers, the U.S. should instead follow the lead of European governments in requiring individualized consent to the use of data without a court order. We should also require privacy by design principles that are compatible with effectiveness, such as strict data minimization, access controls, federated learning, and other privacy-enhancing techniques for government AI uses. Collection by agencies of biometric data, including DNA, should also receive specific scrutiny given its power in the hands of future Administrations that may lack any semblance of democratic restraints.

In keeping with the above, we fully support the Memo's provisions on procurement policies that underscore that AI contracts should align with national values and law, including "those addressing privacy, confidentiality, copyright, human and civil rights, and civil liberties." Since waivers for law

enforcement or mission-critical functions could undermine progress in assuring that federal tax dollars are not spent on systems incompatible with this requirement, consistency across federal procurement policy provides another reason to substantially narrow or eliminate waivers.

Second Pillar: Voice—Impacted Communities Deserve a Powerful Seat at the Table

As explained above, to deploy AI responsibly and ethically, address its false confidence about incomplete results, and incorporate nuanced understanding of its risks will require new and inclusive forms of governance. As we suggest above, systems should ensure they are accountable to the people they impact the most—including workers, creators, communities of color and lower-income people, and others who are often left behind and left out—for example, by traditional research methods (such as in health care), the digital divide (rendering communities invisible to AI models), or shifts in the nature and demands of educational preparation or work. For too many, the last decades of technological innovation failed to allow them to reap the benefits of a global economy even while its hyper-powered gains for the few.

Developing best practices could synergistically advance risk management, resilience, accessibility, privacy, ethics, and security. A prominent critique of technological advances has correctly been that the sector all too often celebrates narrow technical advances while ignoring social, political, health, and economic impacts. For AI, given its pace and reach, we simply must do better. Embracing democratic norms for governance can steer transformative technologies to benefit more people, more powerfully, lending them earned legitimacy at a moment of threat and disruption.

Seizing the Opportunity to Democratize AI Governance: An Interactive Model

Mechanisms like a transparent public dashboard, informed by technical metrics as well as real-world evidence gathering and input mechanisms, inclusive red teaming, impact assessments, and investment would be sound additions to the vision. Creating participatory public dashboards and the other key features of participatory methods outlined below would help to enable organic oversight at scale as AI capabilities advance.

The proposed transparency frameworks could be integrated with and would reinforce key goals within NIST's RMF. As the federal agency with expertise in creating technology standards through an open and collaborative process, NIST is well positioned to lead development of transparency benchmarks that cover both the technical dimensions and societal impacts of AI systems and is already doing so under the EO in consultation with relevant agencies and stakeholders.

The inclusive evaluation ecosystem we envision would underpin accountable, transparent, evidence-based AI governance while centering participatory design and democratic process. As explained below, OMB should:

- Work with NIST to develop **transparent public dashboards** on key performance indicators for models, including:
    - **Develop and iterate a real-time public dashboard** with feedback-informed benchmarks covering a wide range of impacts, as well as technical and societal metrics.
        - Both standards and benchmarks should be developed in consultation with impacted communities and build on existing AI alignment toolkits while expanding monitoring into crucial new dimensions of social impacts.

        - The model's scores should reflect both algorithmic real-time evaluations of the metrics and human input (from an interactive user interface that collects data and facilitates ongoing dialogue about experiences—both positive and negative—between model users and deployers and provides a record of efforts to resolve pending issues).
        - A general set of dashboard metrics applicable to most models can be accompanied by tailored metrics designed to be appropriate for specific rights- and safety-impacting use cases.
        - Metrics should be regularly updated and evaluated for fit-to-purpose based on the feedback, with processes to update parameters as technology and measurement science evolve and as public understanding and participation increase.
    - Create an archive of model cards in both technical and accessible formats to accompany the dashboard, adding needed context when major changes occur, including, at a minimum, flagging publicly when, according to the OMB Memo's definition section, there is a "Significant Modification" to a system.
- Embed diverse experts and stakeholder representatives in **AI Ethics and Impact Advisory Committee review boards to coordinate efforts on impacted community participation and drive outcomes consistent with shared values to**:
    - Conduct multidisciplinary and community-based consultation throughout the training, deployment, impact assessment, and iterative design process for both metrics and ongoing model evaluation and require participatory pilots and user testing in real-world community settings;
    - Develop best practices for transparency through public metrics tracking community feedback on specific AI systems, including consumer complaints and outcomes data; and
    - Trigger reassessments of performance and new mitigation steps when harm is indicated.
- **Formulate best practices for inclusive red teaming** that incorporates diverse perspectives to surface risks. Findings can be used to update metrics and inform dashboard content.
- **Conduct and set methodological standards for participatory impact assessments** to develop empirical evidence based on real-world impacts and ground-truth dashboard metrics and red teaming exercises. Proper design is essential.
- **Invest in community participation, education, and the growth of shared expertise.** As a matter of OMB's budgetary function, it should support dedicated funding and roles for public interest groups and participants to enable meaningful engagement in the development and iteration process for standards and benchmarks for above, alongside public education and training, and to distribute public monitoring, benefits, perspectives, and knowledge.

A Public Dashboard Would Facilitate Timely Monitoring of AI Progress, Impacts, and Risks

A centerpiece of our proposals is that NIST should develop, and agencies should apply, a real-time public dashboard providing broad visibility into AI model capabilities, limitations, and impacts based on both technical benchmarks and the incorporation of feedback from users and affected communities. NIST could develop approaches that apply to foundation models, and similar tools could be adapted across agencies and domains for more specific uses, as applicable.

If done well, an open monitoring infrastructure could enable an organic expansion of transparency as new risks emerge in this rapidly evolving field. At the same time, it could help to inform users in real

time of blind spots and gaps in AI models and systems. To develop fair and representative standards for the dashboard, the process of creating new metrics must include perspectives from impacted communities, civil rights, social scientists, ethicists, and public interest technologists alongside industry.

Keeping in mind the nascent state of the science of AI measurement, we approach this project with humility and a collaborative mindset. As described above, policymakers have already proposed key principles and standards to govern AI systems. The AI Executive Order, AI Bill of Rights, and NIST Risk Management Framework and accompanying materials are foundational documents that highlight many of the areas for specific metrics.

Approaches should also seek to leverage AI alignment lessons from the private sector. While voluntary commitments by the tech sector to the Administration acknowledge common goals and values that track the RMF, as competition has increased, public details about AI safety approaches from leading companies have become generally more constrained. At the same time, the largest companies have formed the Frontier Model Forum, and some are contributing to a new AI Safety Fund. While not by any means an exhaustive list, open-source efforts and attempts to create a transparent type of public performance metric or index thus far include, for example, Credo AI's early work on open-source algorithmic tools for a few performance indicators for AI models, Microsoft's safety coding tools in Azure, and sharing of code on AI safety by many companies and coders on GitHub. Notable efforts towards an index for AI include the Stanford Foundation Model Transparency Index, and the OECD's recently announced efforts on an Index for Trustworthy AI.

Static or hard-to-update regulatory models based on traditional approaches are also unlikely to be sufficiently nimble. Fine-tuning of AI models creates significant accountability challenges because it can radically alter model behavior in ways not captured by static documentation or one-time auditing. Most models are constantly being trained to improve performance, and the amount of data and parameters can range in the trillions. Fine-tuned models can inherit or amplify new biases, lose capabilities in previously demonstrated skills, become brittle and overfit to narrow datasets, introduce novel privacy or security issues, and experience performance drift over time. It is also more practical, in general, to look at model outcomes given the level of technical expertise needed to understand the implications of specific alignment and fine-tuning decisions and shifts. For all these reasons, continuous transparency mechanisms would help to keep pace.

The dashboard could provide a regular reevaluation of capabilities, limitations, and harms across an AI model (or a specific use case). If designed to take in user feedback and such feedback is channeled over time into the metric, the result is likely to be even more robust. As the release of large language models has demonstrated, user testing and input is essential. Ongoing participation by domain experts and affected communities would be equally critical to illuminate subtle risks as models change or are applied to new uses.

Governing AI will require a hybrid approach with coordinated oversight spanning foundational models as well as high-impact applications in sectors where decision algorithms already rule. Rapid growth in the capabilities of smaller AI models that use far less compute, and progress in the sophistication of models of every size, means that we will need governance approaches that can reasonably apply to any -safety or rights-impacting AI system. At the same time, foundation models are likely to be a source of countless future technologies and raise specific risks given their flexible and expanding uses.

Notably, if we can establish a scalable and workable system of quality assurances, it may not be too naïve to think that some opt into the use of monitoring dashboards or other inclusive processes to receive public credit for safe and ethical AI practices or benefit from the funnel of user feedback.

Work could be undertaken to develop and invest in measurement science across a range of metrics, and to consult with impacted communities in development of metrics and benchmarks. The dashboard should also clearly note the limitations of both the data and metrics and solicit help to further refine it with public input. Notably, both dashboards and standardized metrics focus on model behaviors and outcomes, rather than requiring disclosure of proprietary model architectures or parameters. Appropriately scoped metrics can quantify risks, harms, and capabilities without sensitive details.

They could also hew closely to the NIST RMF. NIST explains its model in this way:

> In addition to explainability and interpretability, among other AI system characteristics proposed to support system trustworthiness are accuracy, privacy, reliability, robustness, safety, security (resilience), mitigation of harmful bias, transparency, fairness, and accountability.

Fig. 4. Characteristics of trustworthy AI systems. Valid & Reliable is a necessary condition of trustworthiness and is shown as the base for other trustworthiness characteristics. Accountable & Transparent is shown as a vertical box because it relates to all other characteristics.

Current efforts in AI alignment and transparency tend to focus on technical attributes of models. Some key gaps include:

- Minimal transparency around training data sources, curation processes, and labeling practices. This can obscure potential issues like a lack of diversity in training data, built-in biases or racial stereotypes, or misinformation.
- Limited monitoring of real-world performance changes over time as models are updated. Technical benchmarks using static datasets can diverge from the performance of models in deployment.
- Little visibility into how different user populations experience the model, especially marginalized groups that may be vulnerable to specific harms.
- A lack of current requirements to share public information about model limitations, potential risks, or effective mitigation strategies. While the sector has a history of academic openness, competitive pressures are now diminishing such practices.
- Little information for users on accuracy concerns, shortcomings, limitations, language (including cultural or dialect proficiencies and quality) and the quality of mitigations across languages.
- Insufficient information sharing about use or abuse of tools for criminal or illegal uses.
- Scant or few requirements in the U.S. to assure data privacy, data minimization, or privacy by design.

- A lack of agreement on metrics for bias and fairness and underdeveloped tools for communicating when an automated decision is made and how to appeal it.
- A dearth of metrics quantifying impacts such as those for bias, mental health, political polarization, treatment of disadvantaged groups, labor displacement and uses in the workplace and hiring, electoral integrity or democratic values, and other serious concerns.
- A lack of protections for intellectual property, copyright, and the absence of a system for compensation and consent for specific uses in training models, in disclosures to users, and to achieve redress.
- Minimal insight into environmental costs and sustainability practices around energy-intensive model development, iteration, and operation.

Metrics could anticipate and track factors like these, as feasible, and companies could report them on public dashboards. They could also identify levels of performance that are acceptable or problematic according to benchmarks. Each metric could provide a benchmark or range of benchmarks on performance, detail the methodology and data sources it uses, and be frequently updated.

In addition, for each category, companies could provide a means of reporting incidents, violations, or concerns so that public input informs the metrics in real time, and company responses are shared publicly. The ISO 9001 system for quality management (widely adopted by certified technology and other companies) could be an inspiration for an AI system of quality management. This system requires companies to develop mechanisms for corrective action requests and maintain documentation of responses.

As this suggests, there could be a user interface to accompany the dashboard for reporting of specific experiences and concerns by users, and this feedback should be incorporated in some manner into the metrics as appropriate. Models for such a system include consumer and industry incident databases for auto crashes (such as the National Highway Traffic Safety Administration's "early warning" system; the Consumer Financial Protection Bureau's and Consumer Product Safety Commission's consumer complaint databases; or the Federal Trade Commission's database, Consumer Sentinel.) The OECD Policy Observatory has also developed and launched an AI Incident database that collects articles relevant to incidents involving AI systems. A process should be developed so that this critical human feedback is also incorporated into the dashboard as appropriate once reviewed. In addition, the system should empower users to have control over their data, its uses, and to withdraw consent or authorize a third party to do so.

Achieving clarity in standards and best practices is not merely a legal nicety; it is the bedrock upon which businesses can build their strategies, innovate, and compete globally. The current absence of clear guidelines stifles innovation and dampens the economic promise of AI. Over time, the monitoring instruments would be likely to get better at detecting and assessing the measures, even as AI technology evolves rapidly, giving the larger public a voice by design. Users and participants in the reporting system, in turn, will be empowered by the knowledge that by reporting observations, the next round of metrics may reflect their feedback.

By providing continuously updated metrics across a comprehensive set of technical, ethical, and societal dimensions, a public database would offer significant advantages:

- **Timeliness:** Real-time data provides immediate visibility into model issues as they emerge. Rapid identification of problems could enable urgent interventions and address evolving issues with agility.
- **Adaptability:** The dashboard could expand and adapt as models increase in capabilities and reach. Over time, new metrics could be added to address novel risks identified through ongoing monitoring.
- **Transparency:** Metrics that create indicators for accuracy, safety, legal compliance, accessibility, environmental impact, and more could drive innovation in productive ways.
- **Public Knowledge:** Public monitoring could invite a much larger swath of participants into the discussion about the capabilities and limitations of AI models while generating useful data.
- **AI Alignment**: The approach could make use of existing techniques from the AI alignment toolkit.
- **Iterative and Flexible Benchmarks:** The dashboard would provide a framework for transparency without pre-determining rigid standards or thresholds for all metrics. For each metric, reasonable benchmarks could be set and recalibrated over time to measure adequate, superlative, and subpar performance.

An Archive of Model Cards Would Support Understanding of Shifts in Model Performance

In addition to real-time metrics, developing a version-controlled and publicly accessible archive of model cards can further strengthen transparency. Model cards should include details on a model's purpose, performance evaluations, ethical considerations, limitations, and other factors. They could be updated frequently, including, at a minimum, to flag publicly when, according to the OMB Memo's definition section, there is a "Significant Modification" to a system. Requiring simultaneous release of two model card variants could facilitate transparency for public and technical audiences:

- **Public Model Cards** would use non-technical language focused on model impacts on users and society. They outline intended use cases, measures to address risks, and contact points for user complaints.
- **Technical Model Cards** would provide detailed metrics and benchmarks for researchers and developers. They include training data specifics, model architectures, intended applications, technical limitations, and safety considerations.

NIST could develop best practices for model card formats and archives in conjunction with the dashboard standards. At the same time, these approaches could also be designed to protect legitimate commercial interests and the intellectual property (IP) of AI developers.

Creation of AI Ethics and Impacts Advisory Committees Would Inform and Help Coordinate Agency Efforts

While the creation of agency leadership by the Memo is laudable, agencies that are already invested in specific technologies and use cases are unlikely to be as objective as they should be in evaluating potential and actual risks. For this and other reasons, OMB should also require agencies with high-risk use cases to establish participatory oversight boards, such as AI Ethics and Impacts Committees, with representation from impacted groups.

Importantly, the NIST RMF and 2023 Report by the National Artificial Intelligence Advisory Committee, alongside numerous provisions in the EO, encourage "consultation" with affected communities across many stages of AI development and deployment. But such consultations will only matter if they are attuned to the parameters in the EO and OMB memo and include specific requirements for the role of outside stakeholders.

For this reason, OMB should require the creation of foundation model (at NIST) and agency-level, domain-specific **Ethics and Impacts Advisory Committees**, with defined authorities to help agencies assessment of AI systems for accountability, transparency, and other ethical dimensions and with public outreach and engagement. The Committees should be comprised of impacted community members, organizational representatives, subject matter experts and professionals, and relevant legal and professional ethics experts.

Such boards, which could be constituted under the Federal Advisory Committee Act, should play a critical role in reviewing the uses of higher-risk systems prior to deployment, with processes for agency responses on matters of concern, similar to many such arrangements across federal agencies today. In addition to substantive roles in revising use cases and risks, their engagement could include, for example, supporting agency efforts to:

- Host inclusive design workshops to gather diverse perspectives on potential AI applications and their impacts.
- Conduct community data audits to assess biases and gaps in training datasets.
- Organize explainability clinics to convey how systems work to community members.
- Facilitate participatory red teaming (as described below) to surface risks.
- Support deliberative forums for the public to discuss AI's broad societal effects.
- Provide grants for exchanges and co-creation sessions.
- Train community members to audit algorithms and data for biases.
- Fund user experience research focused on inclusive populations.
- Sponsor AI education events and demonstrations tailored for specific communities.

As described below, dedicated funding streams are necessary to enable these critical forms of public interest participation, which well-resourced industry voices can crowd out. At the same time, building capacity with a range of funded and well-structured roles can formalize avenues for impact on standards development and create opportunities for sustained engagement. Importantly, compensating community members respects the significant time and labor that this participation entails.

Agencies should also be expected to support their efforts, and to effectively and publicly communicate learnings and developments that can improve AI systems and use contexts over time, including to:

- Host regular conferences and workshops bringing together AI developers, regulators, civil society groups, and impacted communities to share insights.
- Publish annual reports summarizing key trends, challenges, and best practices identified through oversight processes and widely disseminate them to stakeholders.
- Maintain publicly accessible databases of algorithmic audits, impact assessments, and other empirical evidence that developers can reference.
- Establish public bug bounty programs to incentivize researchers to probe systems for flaws and submit reports.

- Conduct mediated learning exchanges between developers and community leaders.
- Develop open-source libraries of bias testing code, auditing frameworks, and mitigation techniques that developers can integrate.
- Create AI development test environments with synthetic or scrubbed data in which researchers can collaboratively experiment and facilitate sharing of methods.
- Fund fellowships and exchanges between academia, industry, government, and civil society to cross-pollinate ideas.
- Sponsor challenge competitions for developers to create solutions focused on priorities like algorithmic fairness or interpretability.
- Implement public notification systems for spreading urgent warnings about vulnerabilities, flaws, or harmful incidents needing immediate attention.
- Cultivate communities of practice around issues like inclusive data practices, engineering accountability, and human-centered AI.
- Develop AI ethics training programs and make open courseware freely available to all developers to build aligned values and norms.

A community-centered approach would build shared capacity to help govern AI responsibly and holistically. It would also help to unlock the full potential of America's diversity as a competitive advantage in AI development. Sufficient investment in inclusive participation to build and support the AI economy is an imperative for shared prosperity and innovation.

Inclusive Red Teaming Can Surface Assumptions and Overlooked Risks and Harms

Red teaming and similar exercises are essential to stress test AI systems and uncover potential vulnerabilities and failure modes before deployment. Integrating the lived expertise of underrepresented groups into hands-on red team exercises can provide a constructive way to catch vital risks and biases that teams can overlook, including exploring potential for misuse and unintended consequences in a community-based or cultural context.

Multidisciplinary red teams, including domain experts in social sciences, civil rights advocates, ethics, directly affected community members, and other non-technical stakeholders can surface overlooked risks, but are often not a part of reviews. For just one example, with commendable candor, OpenAI's system card from May 2023 acknowledges a lack of inclusivity in process design:

> Participants in this red team process were chosen based on prior research or experience in these risk areas, and therefore, reflect a bias towards groups with specific educational and professional backgrounds (e.g., people with significant higher education or industry experience). Participants also typically have ties to English-speaking, Western countries (such as the US, Canada, and the UK). Our selection of red teamers introduces some biases, and likely influenced both how red teamers interpreted particular risks as well as how they probed politics, values, and the default behavior of the model. It is also likely that our approach to sourcing researchers privileges the kinds of risks that are top of mind in academic communities and at AI firms.

As part of the assignment from the EO to NIST on protocols for red teaming, OMB should request that NIST or another appropriate entity lead development of best practices for more inclusive red teaming methods that intentionally incorporate diverse voices. OMB efforts can then ensure that agencies make use of these best practices.

More intentional and structural involvement of diverse communities would strengthen red teaming of AI systems to:

- Provide perspectives to catch biased assumptions in data or model design that could lead to discriminatory performance, based on real-world experiences of exclusion.
- Identify potential harms or negative social impacts on minority communities that may be invisible to homogeneous teams.
- Evaluate language and speech recognition for robustness across diverse linguistic contexts and dialects.
- Assess visual classification robustness for non-white faces and fairness across skin tones.
- Gauge impacts on economic opportunity and access to services for disadvantaged demographics.
- Model adversarial cases of systems being used for surveillance, over-policing, or exploitation of vulnerable groups.
- Enhance scenarios representing real-world usage by underserved populations and non-mainstream cultural contexts.
- Improve simulations of misuse by bad actors motivated by racism, hate, or unethical profit.

Moreover, for particular domains, intersectional and diverse experts in psychology, political science, labor, electoral and voting integrity, and other relevant experts can offer insights into risks like propaganda amplification, radicalization, divisive polarization, and disparate impacts on vulnerable communities. Experts in ethical norms informed by power differences in a range of settings such as health care, psychology, criminal justice, education, and other settings with decision-making roles over human possibilities and lives may also add depth to multidisciplinary processes. As an intermediate step, OMB should request that relevant agencies work with NIST to help inform best practices for inclusive red teaming of AI systems by:

- Leading by example in red teaming AI projects with diverse external partners.
- Publishing guidelines emphasizing the importance of diverse, multidisciplinary red teams and participatory design processes.
- Providing a framework for identifying stakeholders from impacted groups and compensating them for engagement.
- Developing exercises focused on surfacing risks to marginalized populations.
- Creating rubrics for red teams to self-assess inclusiveness across factors like race, gender, sexual orientation and gender identity, age, and disability.
- Maintaining a public repository of red teaming anti-patterns that led to preventable failures.
- Hosting workshops demonstrating effective inclusive red teaming in collaboration with civil rights and other issue area experts.
- Encouraging the use of techniques like adversarial debiasing, participatory simulations, and sensitivity audits.
- Integrating evaluation of inclusiveness into procurement standards for companies providing AI to government.
- Funding external red teaming by civil society groups on AI systems that impact public interest.

The intentional integration of diverse perspectives into the red teaming process will enable a more rigorous exploration of how AI systems can fail when deployed in complex real-world contexts. In addition, standard steps for data gathering to inform inclusive red teaming exercises could include:

- Soliciting and conducting reviews of impact assessments and outcomes data for specific domains and applications.
- Performing user studies by surveying and interviewing diverse community members about their experiences interacting with an AI system. These could gather qualitative insights on usability, trust, and value.
- Funding community-based organizations to monitor AI systems through methods like user surveys, observational studies, and complaint tracking and synthesize findings in public reports.
- Implementing A/B testing methodologies to try variations of an AI system and measure comparative impacts. Testing could assess dimensions like fairness, interpretability, and user autonomy.
- Conducting pre-deployment impact assessments (as described below) using criteria on dimensions like privacy, accessibility, and bias.
- Integrating feedback surfaces like user rating systems or open comment and complaint forums to receive direct public input.

Leveraging Impact Assessments for Empirical Evidence to Inform Metrics

In addition to inclusive red teaming, as the above list suggests, facilitating and supporting regular impact assessments focused on real-world effects can provide another vital feedback channel to strengthen AI governance. Crucially, these should be conceptualized as "third party audits," and not as internal to government agencies. As AI Now describes:

> Third-party audits stand apart: they have been conducted by journalists, independent researchers, or entities with no contractual relationship to the audit target. From Gender Shades to the audit of London's LFR system to ProPublica's audit of predictive policing tech, these audits have been pivotal in galvanizing advocacy around AI-related harms.

Assessments also must be well-designed to produce tangible, specific, and usable results that inform standards. Formal evaluations conducted in partnership with public interest and other stakeholders can surface overlooked issues, generate empirical insights on how systems perform in actual usage, and center data on the impacts to, and experiences of, affected groups and individuals. Findings could directly inform iterative improvements to policies, model training, dashboard benchmarks, and other governance mechanisms.

As part of its collaborative standard-setting process, OMB should ask NIST and agencies to solicit input from key stakeholders to develop methodologies and priority metrics for AI impact reviews. Public reports would detail findings, recommended actions, and document whether previously identified problems have been suitably addressed. Assessments could be required more frequently for safety- and rights-impacting uses in areas like finance, hiring, housing allocation, healthcare, and education.

Areas for participatory analysis could include, for example:

Fairness and Bias:

- Disparate impact analysis of system decisions and outcomes by demographic
- Assessment of training data biases and gaps for underrepresented populations
- Surveys gauging user trust and sentiment across community groups

Safety and Accountability:

- Documenting issues reported through harm redressal processes and analyzing response adequacy
- Auditing security vulnerabilities disclosed through whistleblower and bug bounty programs
- Tracking rates of problematic or illegal content promotion

Accessibility:

- User studies on accessibility barriers and compatibility gaps with assistive technologies
- Feedback from disability or other advocates on areas for interface improvements
- Language quality for non-English languages and dialects for model performance and user support

Broader Societal Impacts:

- Labor economists that can estimate workforce impacts and job replacement projections
- Mental health experts to gauge psychological risks like addictive system designs
- Public health scientists and others to review scientific accuracy and misinformation risks
- Electoral and democracy scholars to evaluate institutional and integrity exposures and risks

Regular inclusive impact assessments would help provide external validation for oversight processes. Centering community voices and empirical insights within governance cycles fosters accountability and demonstrates that a priority is placed on improving system impacts and real-world outcomes rather than on narrow or technical measures alone.

Specific Comments on OMB Text Highlight a Need for Additional Direction in Some Areas

The OMB Memo helpfully references the EO's definitions of algorithmic discrimination (Section 10(f) of the EO), equity (10(a)), underserved communities (10(b) of EO 14091), and defines automation bias. Perhaps most consequentially, it defines a broad range of rights-impacting AI uses and risks. These represent clear progress on federal policy on AI. We further support the requirement for agencies to "consult and incorporate feedback from affected groups... including underserved communities" and applaud that the Memo specifies that "[i]n the event of negative feedback, agencies must consider not deploying the AI or removing the AI from use."

We would urge more specificity about the kinds of "negative feedback" and consideration of options and mitigations should be required. For example, if an agency were to find that a rights-impacting AI technology was biased or discriminatory, or that it lacked sufficient transparency or accountability, OMB should clarify whether this policy would bar its use, or merely require that an agency "consider" whether not to use it, and on what basis such considerations should be made.

As described above, while frameworks like NIST's highlight the need for community consultation, specific processes and decision-making power must be defined to make this engagement meaningful rather than symbolic. We need new ways of collaborating across sectors and to go beyond check-the-box forms of "consultation" with impacted communities to full partnership.

We also note that the stakeholders named by the draft Memo in this section include "affected groups, such as customers, Federal employee groups, and employees' union representatives." This is laudable, but absent specific, intentional, and well-resourced efforts to solicit and integrate a diverse set of perspectives from all impacted communities, this remains an underdeveloped list. OMB should identify specific steps for agencies to take as part of a program for robust public outreach.

In addition, OMB should require agencies to provide information on AI uses and models that facilitate a full conversation about risks and values, including by requiring agencies to publish information that is available about data used to train models, impact assessments, experiential data and criticisms of model uses. This can be achieved through model, system or data cards providing both technical and plain language information as well as ample other sources of information that are available to the agency. As described above, agencies should also be asked to identify gaps in knowledge or resources about data or impacts used in models, alongside any other factors that inform the agency's uses and views of the model's limitations.

The Memo provides several helpful examples of how feedback may be collected, including direct user testing, general solicitations of comments from the public, public hearings or meetings, and other process to seek public input, comments, or feedback from the affected groups in "a meaningful, equitable, accessible, and effective manner." These positive steps are important for agencies to take, and the specificity is appreciated.

In addition, we welcome the Memo's requirement that agencies must "monitor rights-impacting AI to assess and mitigate AI-enabled discrimination against protected classes that might arise from unforeseen circumstances, changes to the system after deployment, or changes to the context of use or associated data." We note that such monitoring is essential given that models are frequently fine-tuned in ways that can alter performance and change outputs. We agree that "where sufficient mitigation is not possible, agencies must safely discontinue use of the affected AI functionality" and would urge that there be efforts to further define, in specific cases, what kinds of mitigation would be deemed "sufficient" or insufficient in this context, as that is what will matter in the execution of this sound principle.

We support the provision that agencies should "notify negatively affected individuals" and would urge an expansive definition of when it would be "practicable and consistent with applicable law and governmentwide guidance" to do so. Substantive due process will often mean that such notice is or should be required, but there are strong internal disincentives within government to resist such notification. Overall, this section, which includes plain language and multi-language requirements, is strong, but will require active oversight to ensure its appropriate execution. We would urge that OMB develop robust means of monitoring and level-setting across agencies around the implementation of these requirements, including the appeal processes they should engender.

We would also advise, given due process, that agencies not be merely "strongly encouraged" to provide an explanation, but be required to do so. Those negatively impacted by a model are certainly due an

explanation. If the explainability of a model is difficult to achieve, the requirement for an explanation is more (not less) warranted. In contrast, a lack of requirement for one could allow bias to remain undetected. The Memo helpfully indicates that:

> Explanations might include, for example, how and why the AI-driven decision or action was taken. While exact explanations of AI decisions are often not technically feasible, agencies should characterize the general nature of such AI decisions through context, such as the data that the decision relied upon, the design of the AI, and the broader decision-making context in which the system operates. Such explanations should be technologically valid, meaningful, useful, and as simply stated as possible, and higher-risk decisions should be accompanied by more comprehensive explanations.

We also recommend that OMB more fully incorporate NIST's approach to explainability, which provides that explainable systems should adhere to four principles:

- Explanation: A system delivers or contains accompanying evidence or reason(s) for outputs and/or processes.
- Meaningful: A system provides explanations that are understandable to the intended consumer(s).
- Explanation Accuracy: An explanation correctly reflects the reason for generating the output and/or accurately reflects the system's process.
- Knowledge Limits: A system only operates under conditions for which it was designed and when it reaches sufficient confidence in its output.

These would provide additional clarity about the components of explainability, including providing a better benchmark for when systems may fail to be adequately explainable to be continued in that use. The OMB Memo further requires that "[w]hen law or governmentwide guidance precludes disclosure of the use of AI or an opportunity for an individual appeal, agencies must create appropriate mechanisms for human oversight of rights-impacting AI." OMB should more specifically define what is an "appropriate" or inappropriate mechanism, as it poses the prospect of potential abuse and a lack of transparency in government decisions or processes.

In addition, the Memo includes a requirement for agencies to "prominently provide and maintain a mechanism to conveniently opt out from AI functionality," noting that "an opt-out mechanism must exist where the affected people have a reasonable expectation of an alternative or where lack of an alternative would meaningfully limit accessibility or create unwarranted harmful impacts." We support this provision but note that it will require significant additional effort to set out what it means in practice and that it is essential that OMB further define its thinking on what it means to "meaningfully limit accessibility or create unwarranted harm" given that these may apply to many AI systems in operation today. The availability of a means to consent (or not) to the use of an AI must be articulated as a fundamental principle, and so it will be well worth additional effort for OMB to specifically solicit additional and focused public comments on this provision.

To further acknowledge accessibility issues, we recommend adding a new part to Section 5.b.ii that specifically calls out the needs of the disability community, who are uniquely vulnerable to AI in any number of existing categories but deserve their own consideration. In addition, OMB should propose a process by which new Safety-Impacting or Rights-Impacting purposes can be added to the AI guidance, including through public input, as technology and its usage evolves.

We join other commenters in noting that previous AI EO and OMB guidance directing agencies to inventory AI regulatory authorities should be retained and strengthened. Previous EO and OMB guidance required agencies to submit to OMB an agency plan that "must identify any statutory authorities specifically governing agency regulation of AI applications, as well as collections of AI-related information from regulated entities." As the Department of Health and Human Services was the only one to publicly release their memo on AI authorities, we join The Leadership Conference in making the point that this inventory of agency regulatory authorities for AI is a vigorous exercise for agencies and is of interest to Congress, civil society, and the public. The OMB AI guidance should require that agency authorities be submitted to OMB and the new White House AI Council and make the list public.

Third Pillar: Investment—Growing an Ecosystem for Equitable Participation, Public Trust, and Innovation Insights

Developing transparent standards for AI systems through a truly participatory process requires proactive efforts to include public interest groups and historically marginalized voices. Many such stakeholders could make the difference in public understanding of and engagement with how technologies evolve, yet currently lack resources to assist or face barriers that may prevent meaningful participation. Layers of overlapping new practices and methods are required.

To democratize the benefits, there is also a need for human infrastructure capable of leveraging AI, including building capacity in and among communities that are too often invisible in developing and deploying technologies. We must close skills and talent gaps—and a robust program to do so will address the needs of a burgeoning industry while mitigating persistent sources of economic inequality.

Substantial funding for creating a more diverse pool of digital economy workers through partnerships with culturally competent community-based organizations, as well as skills-based hiring that connects workers of all skills and backgrounds to an AI economy, would help workers who are currently excluded from upwardly mobile, future-focused employment find career pathways into the AI economy. Such investments would allow the benefits of AI to be more fully shared and could help develop expertise and spark interest. Building technical fluency will allow impacted communities to both help steer these powerful technologies toward sustainable and equitable progress and improve the relevance of AI tools.

Working with the Department of Commerce and other stakeholders, and through its budgetary function with input into the President's 2025 budget, OMB should develop and inform a process for grants directly to impacted communities and nonprofit public interest organizations focused on issues implicated in AI and ethics. This funding could support participation in the standards and governance process and independent research. Potential functions could include:

- As described above, participation and training for inclusive red teaming, impact assessments, and dashboard review.
- Community representatives embedded within an agency and surface issues and gaps.
- Community auditors can train community members to audit or conduct impact assessments.
- Focus groups should be compensated and include diverse individuals who can share experiences and evaluate AI through interviews, surveys, and workshops.
- Participatory designers can create spaces for the public to directly steer technology innovations toward collective priorities, informing benchmarks.

- Inclusive policy fellowships could embed experts from communities within oversight bodies.
- Accessibility consultants could inform fully inclusive design in both standards and products.
- Small business assistance programs could enable AI adoption by enterprises in disadvantaged communities.
- Test participants could include users from underrepresented groups to assess disparate experiences.
- Funding can be set aside for research investigating historical harms from relevant technologies and practices.
- Investigative researchers can include a diverse range of experts, including social scientists funded to study datasets, labeling practices, training processes and model architectures for transparency, fairness, or other gaps.
- Policy consultants can include diverse panels of experts to inform initiatives.

The President and OMB could also recommend that Congress establish a dedicated fund modeled on the CDC Foundation that could support digital skills education and training, community-based AI auditors, participatory technology workshops, and other capacity building to close knowledge and equity gaps. Grants to local organizations would enable national assessments of AI's impacts on disadvantaged groups and workforce needs and could build expertise and understanding of technological tools within impacted groups. It should include funding for community organizations to build AI-specific expertise and support participation in the types of community engagement outlined above.

The CDC Foundation is an independent nonprofit and the "sole entity created by Congress" to mobilize private sector and philanthropic resources to support the CDC's work on public health. It could be funded by a mix of donations from the technology sector, alongside a federal endowment that grows through licensing fees or other federal supports, to provide grants for community organizations initiatives such as:

- Equipping organizations and their members to use the tools and provide feedback (helping to ensure the digital divide does not render communities or individuals invisible);
- Working to solve the talent gap and develop the evidence base for upskilling and skills-based employment through partnerships and innovative approaches to recruitment of an economically and racially diverse workforce;
- Increasing capacity for diverse voices to engage as peers in regulatory and oversight processes around AI tools, including funding nonprofits to train community auditors on AI systems and conduct audits of algorithms, data collection and uses.

The fund could be overseen by an independent governing board with representatives from government, industry, academia, civil rights groups, and community organizations and be housed within an existing agency or as a nonprofit organization to manage the grantmaking process. A national yearly assessment of AI skills gaps, workforce needs, and barriers to digital inclusion could inform its priorities and processes. Nonprofit community organizations could apply to receive grants for purposes such as:

- Providing AI and technology job training programs and internships in impacted areas;
- Developing curricula and certifications for community members to become AI auditors;
- Funding data and policy experts to enable meaningful technical input into AI systems;
- Supporting participatory design workshops and exchanges between developers and community residents;

- Working with recipients to document community partnerships, inclusion plans, and to measure and reflect on impact;
- Funding programs to enable collaborations with schools, employers, and industry partners to create pathways to equitable AI workforce participation.

The fund could also maintain a publicly accessible database of grants awarded, results achieved, and best practices for building AI expertise in local communities to build field knowledge and insights.

Conclusion: From Principles to Implementation: Creating an Ethical AI Ecosystem

Technical progress must be paired with social progress. We must connect principles to action and move to create functional guardrails, meaningful participation, and expanded capacity. By linking ethical guidelines, participatory structures, and human infrastructure, we can build an AI future that reflects our ideals.

Most importantly, inclusive and democratic practices should infuse AI governance itself. Impacted communities deserve structured involvement in shaping these powerful technologies. With broad collaboration and human-centered design, the new powers of AI systems can be governed ethically at the outset rather than regulated after the fact and once harms are already entrenched.

American leadership in developing AI that expands opportunity while respecting Constitutional values is essential for innovation and an inclusive future. Progress will demand openness to creative partnerships and evolving best practices. We applaud OMB's draft guidance as a crucial first step for agency AI systems. We also welcome OMB's commitment to exploring effective ways to safeguard innovation in the era of AI. We also welcome additional opportunities for collaboration and input.

For questions or additional dialogue on these issues, please contact Laura MacCleery, Senior Director of Policy, at lmaccleery@unidosus.org, and Claudia Ruiz, Senior Civil Rights Analyst, at cruiz@unidosus.org.

12.5 ADI OMB AI Memo Comments

December 5, 2023

The Honorable Shalanda Young
Director of Office of Management and Budget
725 17th Street, NW Washington, DC 20503

Re: Federal Register Number 2023-24269 - Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Director Young,

The Alliance for Digital Innovation (ADI) is submitting this letter to the Office of Management and Budget (OMB) in response to the recent Artificial Intelligence (AI) Memorandum. Our purpose is to advocate for a thoughtful and technical approach to governing artificial intelligence (AI) used in the federal government, prioritizing both responsible deployment of AI and the continued advancement of AI innovation.

ADI is a nonpartisan alliance of technology companies focused on accelerating change through the adoption of modern, commercial technologies to public sector customers. ADI engages with government thought leaders to advocate for the removal of institutional and bureaucratic barriers to the operation of a modern digital government. Our membership includes both small and large government contractors, offering different approaches to AI. Some companies leverage AI and machine learning to enhance their products; others are actively involved in developing and deploying AI solutions, while others provide generative AI solutions to public sector customers.

ADI believes that a well-informed governance framework with appropriate guardrails is essential to harness the benefits of AI while mitigating its risks. However, as this memo is currently constructed, it has the potential to create many agency and component specific governance processes that can make it more difficult for new, modern, cloud-based technology that leverages or offers AI to enter the government marketplace. We appreciate the opportunity to provide feedback to this draft memo; please see our comments below.

Encouraging Use of AI tools and Technology and Removes Barriers

ADI commends OMB for effectively underscoring the importance of adopting and utilizing AI and generative AI capabilities by departments and agencies. While refraining from mandating use, it pushes for a proactive stance in incorporating AI technologies.

Specifically, we would like to highlight key areas where the memo aligns effectively with ADI's commitment to ensuring AI reduces barriers and is used responsibly. The memo states:

- "If implemented responsibly, AI can improve operations and deliver efficiencies across the Federal Government. Agencies must improve their ability to use AI in ways that benefit the public and increase mission effectiveness, while recognizing the limitations of AI and when it is not suited for a given task."

- "Agencies should ensure that their AI projects have access to adequate IT infrastructure, including high-performance computing infrastructure specialized for AI training and inference, where necessary."

- "Agencies should update, as necessary, cybersecurity authorization processes to better address the needs of AI applications, including to advance the use of continuous authorizations for AI. Consistent with Section 10.1(f) of the AI Executive Order, agency authorizing officials should also prioritize generative AI and other critical emerging technologies in Authorizations to Operate and any other applicable release or oversight processes."

ADI applauds OMB for intentionally aiming to remove barriers and promote the responsible adoption of AI within the federal government. We encourage the government to continue to focus on the streamlined adoption of innovative commercial technology.

Coordinated Compliance and Harmonization of Requirements

ADI believes in the need for harmonization and coordinated compliance with the directives outlined in the memo as well as with other security, privacy, and technology governance mandates.

The memorandum appropriately states that "agencies must continue to comply with applicable OMB policies in other domains relevant to AI, and to coordinate compliance across the agency with all appropriate officials. All agency responsible officials retain their existing authorities and responsibilities established in other laws and policies."

Ensuring this is important to make sure that the new governance models and personnel take into consideration existing compliance processes and methodologies. We encourage additional language directing agencies to leverage those existing compliance processes to administer any risk-focused requirements that the new Chief AI Officer and the agency board decide are necessary to purchase and consume AI products and services.

In addition, the memo does not mention FedRAMP specifically, but it does mention the ATO process and "existing mechanisms" to ensure compliance with the requirements of Section 5(c). We suggest that the memo should also explicitly align to FedRAMP (NIST 800-53) security requirements to minimize unnecessary duplication of compliance frameworks.

Considerations for Additional Proactive Use Cases

ADI acknowledges OMB's recognition that decisions regarding AI can have significant implications for the rights and safety of the public. In response, the memorandum outlines specific practices for agencies to adopt and identifies potential areas where there could be safety or rights impacting concerns.

In addition to outlining areas of concern, we propose that OMB should consider listing the following priority use cases as areas of opportunity for the use of AI:

- Improving agency operation and cyber resilience – Technologies that summarize and derive insights from data banks are enormously useful for government agencies, whose employees often need to look through hundreds of pages of documentation for policy questions. Additionally, AI-powered solutions help agencies monitor and defend information networks and their underlying data.

- Enhancing constituent services – Agencies can also leverage AI to answer stakeholders' questions whenever and wherever. For example, agencies could deploy multilingual virtual agents that draw on agency data to answer questions in real time.

- Improving accessibility – Generative AI technologies can also assist agencies with receiving stakeholder input, making agencies more accessible and responsive. For example, implementing a multilingual chat capability offers several solutions to help agencies interact with constituents across language barriers and cultural differences; incorporating Natural Language Processing (NLP) will provides rapid insights based on large sets of text, such as call center logs, comment fields in surveys, or internet content, including social media posts and news stories.

- Continued Risk Management – ADI is supportive of the approach of agencies empowering their leaders to make risk decisions as they are the closest to the risks associated with their specific use cases and are in the best position to mitigate those risks.

While there are several positives to the OMB memo, ADI believes there are several ways to improve it. Below are specific, concrete suggestions that we highly encourage OMB to adopt.

Prioritize Agency Resources Based on Risk

There are many different types of approaches to AI. Many companies do not offer AI products and services but instead, leverage AI and various data streams to make more effective solutions for agencies to solve problems or provide services. Whether it is threat intelligence, identity management, quantum computing, cybersecurity, or other products/services, these solutions should be appropriately categorized and – when AI is an accessory to the solution – either

exempted or deprioritized from consideration when agencies develop and deploy their approaches to AI governance.

Additionally, there needs to be a timeline for consideration that delineates between technology that has already been adopted and approved by agencies and new technology that the agencies are considering for use. We believe there should be a specific date or timeline for demarcation. Specifically, OMB should consider adding timelines for implementation to the Scope section 2 (b) of the memo under "covered AI" saying, providing 90 days before the memo applies to newly purchased AI and additional time to anything that has already been assessed and authorized by agencies.

Prioritize the AI RMF over the Bill of Rights

ADI believes that developing additional governance requirements must be centered around the NIST AI RMF given its development in and through technical and risk focused processes. OMB should recommend that agency-adopted policies align with the NIST AI Risk Management Framework as it is already being incorporated by industry into their AI policies and principles. Notably, the AI RMF is complementary to the cybersecurity and privacy frameworks previously developed by NIST.

Expand Red-Teaming to Both Internal and External for Generative AI

Executive Order (EO 14110) on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence states that CISA should develop external testing, including red teaming, for AI systems. OMB should clarify that external red-teaming is only required where appropriate and where it is technologically feasible.

Better Define the Trigger Mechanism for Determining Rights or Safety Impacting

ADI believes that OMB must better define "meaningfully impact." OMB must clearly state what is considered a controlling factor for agencies to determine whether something is safety or rights impacting.

Additionally, OMB should consider further refining the Safety and Rights impacting definitions to delineate harms associated with the various categories outlined. ADI is not suggesting that it is limited to specific harms without leaving room for additional harms to be recognized, but agencies and companies supporting federal information systems must clearly understand the types of risks this guidance aims to mitigate. The current list of categories only outlines potential areas that are presumed to have safety consequences without explicitly delineating what some of those perceived consequences could be, leaving room for potentially risk adverse government officials to choose to not leverage AI where it may otherwise be possible or beneficial. This will help promote certainty and avoid inadvertently and unnecessarily excluding what would otherwise be low-risk activities that AI could enhance or replace.

Concerning the safety impacting definition, ADI believes the definitions should delineate specific harms such as loss of human life, serious physical harm, or large-scale negative physical

impacts. For the rights-impacting definition, ADI also proposes further precision. Aligning harms with decisions currently regulated by existing laws, such as non-discrimination and consumer protection, would enhance clarity. The definition could also be expanded to include decisions that have a material, legal, or otherwise significant effect on an individual's access to something provided for by our laws or administrative orgnaizations. As OMB works to refine the safety and rights impacting definitions, we also recommend that OMB leverages the principles industry uses to assess the impact of AI at key inflection points: data, model development and product application. Finally, we recommend considering outlining opportunities to leverage AI to remediate some of the risks associated with the safety or rights impacting categories and potentially provide pathways for faster adoption in those cases.

Additionally, agencies should rely on existing statutes and regulations for regulating technology, rather than assuming a new regime is needed to address AI. This would mirror the U.S. government's approach to other new technologies, fostering responsible innovation. This aligns with the operations of complex software in various industries, including retailers, banks, insurance companies, and manufacturers. Several examples illustrate this approach:

- Cybersecurity frameworks and best practices such as the NIST CSF, which have been used to secure critical infrastructure and valuable financial, health, and national security information, can also be used to secure AI systems.

- Expanded use of existing anti-fraud measures can help AI systems maintain accuracy and protect against inaccuracies.

- Established intellectual property law (particularly the doctrine of fair use) provides a framework for balancing the interests of existing and new creators and inventors.

By tightening and refining these definitions, potentially removing some examples that are not – by themselves – open to risk and relying on existing statues and regulations that govern technology, OMB can more aggressively promote the use of and capture the benefits of adopting AI technologies.

Be Specific on Prioritizing Minimum Practices

With the way the memo is currently written, it states that "starting on August 1, 2024, agencies must follow these practices *before* using new or existing covered safety-impacting or rights-impacting AI."

ADI believes that this memo must provide more specific guidance on the prioritization of the application of the minimum practices. There should be a focus on leveraging these practices for new technologies that are offering generative AI capabilities to federal agencies before reviewing all currently authorized products or services that may leverage AI and ML as part of their solutions. In addition to this, OMB should make explicitly clear that agencies should NOT take a one-size-fits-all approach but should implement the minimum practices in Section 5 based on any specific risk of the intended application.

Furthermore, ADI believes OMB should do the following:

- Implement these practices in a test and evaluation approach, specifically during "Presales," rather than necessitating every solution be piloted before sale and use.

- Require and facilitate the reuse of data obtained from implementation of these minimum practices, for example, like the Federal Risk and Authorization Management Program's management office manages the FedRAMP authorization to operate (ATO) repository.

- Clearly delineate standards for independent evaluators to ensure accurate, objective, and repeatable reviews of AI data generated through the application of minimum practices.

Ensure Effective Impact Assessments

The impact assessments in 5(c)(v)(A)(3) seem to focus on inputs rather than outputs. If specific requirements for data inputs are imposed, they should be related to the agency's use of the data (e.g., for agency fine-tuning of commercial models) rather than being imposed on vendors.

Regarding timelines and resources, there are currently no definitive timelines or recommendations for how long a process should take. By adding in the impact assessment without guidance for how to perform it, how long it should take, and what resources should be leveraged, the government is at risk of agencies extending sales cycles for months to years. This can artificially constrict the marketplace and discourage participants as well as create variability across departments and agencies regarding expectations. As part of the resource evaluation process in the assessment, agencies should assess use of AI tools and services holistically. This means weighing the harm/potential risk of a process along with the costs to mitigate the risk without using AI and then evaluate the same process for risks and costs to mitigate when using AI.

The reuse of data collected from impact assessments should become a priority to help drive adoption of AI across agencies. Just like the FedRAMP PMO encourages and enables the reuse of ATOs, the government should establish a repository to collect and reuse impact assessment data. Additionally, further guidance is necessary for agencies on specific markers determining the "reliability" and "breadth" of data, as well as clarity on the required level of provenance.

In the post-deployment phase, government security and privacy requirements and considerations mean industry partners are typically unable to monitor government customer use of their tools. They must be clear on what documentation will be required to perform evaluations on the outputs. Testing tools and standards are one way to achieve this.

Data Rights, Ownership, Acquisition and Use

Federal acquisition law prioritizes use of commercial products and services; this makes sense in the context of AI, which has largely been developed and deployed by the private sector. OMB should ensure agencies have the authority and direction to fully leverage commercial acquisition to procure AI to meet agency requirements. To get the most from these procurements, agencies will need to procure leading AI technology using commercial terms that balance the

government's interest in licensing AI with the commercial firms' interests in making broader commercial use of their products and services. OMB may also want to clarify in section 4 that agencies should buy their internal enterprise capacity to support responsible AI innovation as opposed to building it internally.

OMB should also encourage agencies to fully utilize non-traditional vehicles like OTAs and CSOs when procuring AI. Additionally, the government should focus procurement requirements on AI outcomes as it will promote a collaborative engagement with industry to identify solutions that achieve those outcomes and from the broadest group of market participants possible.

Section 5 of the memo occasionally, unintentionally conflates commercial technology, which is already trained from large data sets, with government-specific AI that would be built and trained on the government's own data. ADI recommends clearly delineating the different responsibilities of the commercial, innovative vendor community from those of federal agencies in both the procurement oversight process.

In the section Managing Risks in Federal Procurement of AI, the memo states that agencies "should take steps to ensure that their contracts retain for the Government sufficient rights to data and any improvements to that data." OMB should clarify in this section that agencies' rights and the government's rights do not extend to original training data, which is often owned and governed exclusively by the company providing the tools/technology.

Section 5(c)(iv)(A)(3), which discusses "the quality and appropriateness of the relevant data," requires agencies to assess the quality of the data used in the AI's design. ADI recommends that OMB clarify the following:

- Nothing in the memo requires technology providers to reveal trade secrets or information that could jeopardize the security of networks or information systems, and
- A summary description of the characteristics of the data used to train/design the AI model will meet this requirement.

These clarifications would highlight for agencies how visibility into the training source data does not, by itself, mitigate the risk of undesirable outcomes in the way that testing the model and its outputs would. They would also ensure that agencies think about the national security impact when considering the details of disclosure requirements. Additionally, we recommend that OMB should be more explicit on the use cases that do not have to be included in the inventory for security/privacy and other concerns; for example, there should be no publication of security or fraud prevention use cases.

OMB should also clarify the meaning of Sec. 5(d)(ii)(A) "obtaining adequate documentation of procured AI, such as through the use of model, data, and system cards;" to ensure that it is not used to advantage incumbent providers; it is critical for new entrants and competitors to be informed about the documentation that agencies require under this provision. Otherwise, incumbents will have a leg up in designing technology that can meet the agency's standards.

ADI is supportive of OMB's goal in requiring agencies to assess the quality and appropriateness of data used in model development to help determine a model's performance for a particular use

case, including ensuring it works with appropriate levels of accuracy and performs fairly across relevant demographic groups. However, visibility into training and evaluation datasets will not help an agency make that determination. Simply because a model has been trained on certain data does not mean it will perform as needed in a specific use case. Instead, testing is the scientifically appropriate and industry-standard mechanism that provides the best indication of performance and is already required in the memo.

If OMB would like to require that industry partners provide information to agencies related to model development, rather than focusing on training data, ADI recommends that OMB provide guidance to agencies to request documentation:

- outlining the capabilities of the AI system;
- known material limitations at the time of development of the AI intelligence system;
- guidelines for intended use; and
- example performance results.

This documentation will provide agencies with the most relevant information for AI system assessment and selection before they begin testing for their intended use case. To the extent documentation of information regarding training data is required, we suggest limiting this to summary information about the data the model was trained on and how that training data is appropriate to the agency's intended use.

From the government side, ADI does recommend that OMB ensure that agencies prioritize public access to and use of government data to bolster competition and widespread research. OMB can, for example, advise agencies to support data portability, enabling government owned datasets to be easily used by different organizations (while also respecting individual industry partners intellectual property rights).

Public Comment Process Fine Tuning:

Under the Additional Minimum Practices for Rights-Impacting AI, OMB requires agencies to consult affected groups. If negative feedback is received, agencies must consider not deploying or removing the AI from use. It is important for OMB to note that stakeholder feedback should primarily focus on agencies' overarching AI technology strategies rather than scrutinizing the use or procurement of specific AI systems. Because the definition of "right-impacting" is vague and the standard for "negative feedback" is undefined, this requirement can create uncertainty and raise risks for industry partners providing AI-enabled software and services to the federal government. It will slow down federal adoption of AI and may be abused by competitors in the contracting process.

Additionally, as part of the notification process, ADI recommends specifying that agencies will be able to fulfill the public notification requirement by providing a general explanation of the system's technological functionality, rather than information on specific decisions made (unless such right already exists in applicable laws for manual decisions). Further, OMB should clarify that an agency may provide this explanation via a publicly available disclosure on its webpage rather than individualized notice to reduce process duplication.

Reduce Compliance Burden

As mentioned earlier, ADI is concerned that there may be a fractured approach to governance without more clarity from OMB on use of certain governance, compliance, and risk management programs. OMB should align existing Federal Risk Management programs to maximize use of secure and safe commercial technologies by augmenting and enhancing successful programs like FedRAMP. ADI recommends avoiding the creation of alternate or additional compliance requirements that will be costly and slow down adoption. By adding more clarity, OMB can encourage agency adoption of commercial services provided by small businesses by sponsoring viable solutions.

Interoperability and Commercially Available Solutions

To support robust competition and innovation, agencies should prioritize interoperability and commercially available infrastructure as they adopt AI technologies. Doing so will support a vendor-agnostic environment, permitting new or competitive technologies to be slotted in seamlessly as they become available. Exceptions from this approach should be rare, with well-documented justification.

Testing and Safeguards Clarification

Among other measures, OMB should clarify the meaning of Section 5(d)(v)(a) which "requires adequate testing and safeguards…" to ensure that the contracting process does not favor incumbents who are able to shape the "testing and safeguards" requirements to meet their existing processes. An example is setting specific requirements that would be costly or difficult for others to achieve.

Training for Government Employees

OMB should double-down on encouraging agency employee training and education on the deployment and use of AI tools. Proper training will be crucial for the responsible use of rights and safety-impacting AI tools, addressing potential biases, and upholding transparency standards.

Opt-Out Requirements

In Section 5 (c)(v)(F) ADI recommends clarifying that providing a mechanism to opt out from AI functionality for rights-impacting AI is flexible given the facts/circumstances of the use case and other mitigation measures that may be in place. Three examples of reasons why that flexibility is needed are as follows:

- To the extent that rights-impacting AI inadvertently captures certain low-risk activities, the right to opt out can be harmful to efficient agency processes and practices.
- If rights-impacting AI offerings are truly high-risk, the government should have the ability to demonstrate the existence of operational guardrails (like those outlined in Section IV) as a step before providing for an opt out.

- Automation may be core to certain high-risk service offerings, making opt-outs infeasible, such as using an AI system to automate the detection of fraud in benefits applications.

Right to Appeal

In Section 5 (c)(v)(E), ADI recommends clarifying that an individual's opportunity to appeal or contest rights-impacting AI decisions follow any existing appeals processes for manual decisions to avoid agencies creating a duplicative or conflicting appeals process.

Conclusion

In conclusion, ADI supports the encouragement and adoption of modern, commercial technology, particularly those incorporating AI and Generative AI across government. To ensure the successful implementation of this memo, OMB must introduce additional rigor and specificity before agencies begin implementation. We support a phased implementation approach prioritizing certain technologies and future use cases. Additionally, if implemented as it is written currently, the memo would create a fragmented set of new processes and continuously evolving compliance requirements across departments and agencies making it more difficult – especially for smaller, innovative companies – to sell to the federal government.

The current draft memo needs to be refined to emphasize the importance of testing rather than visibility into training data; and to extent summary information about training data is required, the agency needs to make very clear that it does not require the disclosure of trade secrets. Updating guidance around data rights, data ownership, and availability of government data will be crucial to engaging with commercial companies while driving innovation.

ADI recommends providing clarification around the safety and rights impacting definitions and categories. Clearly defining the risks and tying them back to current mitigations in law will help agencies make more consistent risk decisions. ADI strongly encourages OMB to use existing legal and policy infrastructure wherever practicable to implement the recommendations in this memo. Whether it is leveraging current risk management framework processes at departments and agencies or using current laws to help define the risks associated with use of AI for specific scenarios, using current legal and policy frameworks will reduce complexity in implementation and provide processes that agencies understand to deploy AI more rapidly throughout their orgnaizations.

Thank you for the opportunity to review the memo and submit our thoughts and comments. We value the partnership between government and industry and look forward to working closely with our public sector partners to bring innovation and digital transformation to our government.

Sincerely,

The Alliance for Digital Innovation

Consumer Technology Association
Comments on
The Office of Management and Budget Proposed Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

The Consumer Technology Association® ("CTA")® respectfully submits these comments in response to the Office of Management and Budget's ("OMB") request for comments related to its proposed memorandum for the heads of executive departments and agencies titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" (the "AI Guidelines"). CTA is North America's largest technology trade association. Our members are the world's leading innovators—from startups to global brands—helping support more than 18 million American jobs. CTA owns and produces CES®—the most influential tech event in the world. CTA's comprehensive approach to AI includes public policy engagement at the federal, state and international levels; industry standards development, with eight AI-related standards published to date; and market and consumer research, including a recent AI public perceptions study.

AI offers tremendous potential for human and societal development: promoting inclusive growth, improving the welfare and well-being of individuals, and enhancing global innovation and productivity. A growing body of research demonstrates that AI can identify and mitigate bias in human decision making.[1] Perhaps the leading federal agency in the United States focused on AI governance and risk management, the National Institute of Science and Technology ("NIST"), has recently recognized that "new AI-enabled systems are revolutionizing and benefitting nearly all aspects of our society and economy – everything from commerce and healthcare to transportation and cybersecurity."[2]

Sunstein, *Algorithms, Correcting Biases*, 86 Soc. Rsch.: An Int'l Q. 499, 500 (2019), http://eliassi.org/sunstein_2019_algs_correcting_biases.pdf; Kimberly A. Houser, *Can AI Solve the Diversity Problem in the Tech Industry? Mitigating Noise and Bias in Employment Decision-Making*, 22 Stan. Tech. L. Rev. 290, 352 (2019), https://www-cdn.law.stanford.edu/wp-content/uploads/2019/08/Houser_20190830_test.pdf.

[2] Moreover, NIST recognizes that AI "is rapidly transforming our world. Remarkable surges in AI capabilities have led to a wide range of innovations including autonomous vehicles and connected Internet of Things devices in our homes. AI is even contributing to the development of a brain-controlled robotic arm that can help a paralyzed person feel again through complex direct human-brain interfaces." *Artificial Intelligence*, NIST,

CTA supports OMB's proposal to establish new federal agency requirements in areas of AI governance, innovation, and risk management that would direct agencies to adopt specific minimum risk management practices for uses of AI that impact the rights and safety of the public. CTA and its members are actively promoting the development of responsible and trustworthy AI through leadership in the development of emerging practices that mitigate risks.

I. Voluntary, Consensus-based Frameworks Are Best Suited to Achieve Near Term Goals

CTA supports the emergence of flexible, voluntary, consensus-based international frameworks to enable the development and deployment of trustworthy AI systems and has actively worked to promote the advancement of such frameworks. Indeed, CTA has published several industry standards and resources for its member companies to assist in the development of a trustworthy and safe AI ecosystem, including best practices and standards for identifying and managing bias in healthcare. Further, CTA's leadership is actively engaged with policymakers on rules for AI and has recently published a proposed National AI Policy Framework, which provides a roadmap for legislators and regulators to establish a risk-based framework for adopting certain guardrails to ensure trustworthy and secure AI systems.

While there is a growing consensus around principles and guidelines for deploying safe and secure AI, the volume of overlapping and potentially inconsistent international, national, and civil society frameworks, standards or guidelines may impede a global consensus on baseline commitments. The volume of competing frameworks also presents a practical problem for both the public sector, who must leverage limited resources to support sometimes inconsistent standards, and the private sector who must make difficult decisions about which public sector actors to engage with or risk losing a voice in deliberations in sometimes closed-door collaborations.

CTA supports efforts at the federal level in the United States to develop voluntary risk-based frameworks to address potential AI risks, while enabling stakeholders to maximize the benefits of this technology. In recent comments to NIST concerning the development of that agency's AI Risk Management Framework ("RMF"), CTA applauded the agency's work to create a flexible and voluntary risk management framework for managing AI risks, including those that may be implicated by the use of AI tools and systems. Indeed, CTA's National AI Policy Framework calls for all companies developing AI to adopt and implement the AI RMF as a means of mitigating and managing AI risks.

Because the AI Guidelines are likely to be viewed as an important benchmarking tool for private entities developing their own responsible AI governance policies, CTA agrees with OMB's endorsement of the NIST AI RMF as a landmark voluntary and suitable risk framework that will drive organizations to adopt risk mitigation practices that will lead to trustworthy and

---

https://www.nist.gov/artificial-intelligence (last visited Oct. 1, 2022). *See also About Artificial Intelligence*, National Artificial Intelligence Initiative Office, https://www.ai.gov/about/ (last visited Oct. 1, 2022) (explaining that investments in AI technology "have led to transformative advances now impacting our everyday lives, including mapping technologies, voice-assisted smart phones, handwriting recognition for mail delivery, financial trading, smart logistics, spam filtering, language translation, and more. AI advances are also providing great benefits to our social wellbeing in areas such as precision medicine, environmental sustainability, education, and public welfare.").

responsible AI. The AI RMF achieves an appropriate balance of ensuring trustworthy AI systems while providing organizations the necessary flexibility to adopt practices best suited for their specific circumstances.

II. Removing Barriers to Responsible Use of AI (Sec. 4(b))

CTA supports OMB's goal of removing barriers to responsible AI use, including by ensuring that agencies are invested in sufficient IT infrastructure and expanding skills and capabilities in the federal workforce. Sound data governance and management practices are also critical to ensuring developers' ability to create robust and unbiased AI applications and systems. The OMB should also encourage sharing of federal data, as appropriate, to ensure that both public and private AI applications and systems are able to access reliable data sets to train and create sufficiently robust and safe AI applications. Additionally, OMB could consider interoperability and the use of commercially available infrastructure, allowing for vendor-agnostic environments in which the best tool for the specific use case could be available.

III. Managing Risks from Use of AI (Sec. 5)

The AI Guidelines provide useful, concrete examples of AI use cases OMB believes carry higher risk. OMB should refine the scope of safety- and rights-impacting AI, revising the definition to align with American tort law's focus on the material risks of harm to people, and then work with industry to potentially incorporate these risk classifications into an overall risk management practice for agencies that leverages the NIST AI RMF. As-is, OMB is effectively defining virtually all applications as high-risk in ways that will make it difficult or impossible for federal agencies to adopt AI tools. Many within the private sector have already begun to rely on the AI RMF, and further encouraging AI system developers and federal agencies deploying AI systems to use the AI RMF will ensure alignment with a leading voluntary framework and protect individual rights and safety.

While CTA appreciates the guidance provided by OMB in Section 5(ii) with regard to the types of AI systems it believes to be rights-impacting, referencing a single list of AI systems that are presumed to be rights-impacting may not reflect all potential scenarios, and may not sufficiently capture the nuance of how AI systems are deployed. OMB should consider allowing agencies to use a more fine-tuned multi-factor risk-based assessment to classify rights-impacting AI applications on a case-by-case basis, rather than adopting a one-size-fits-all list of use cases. Furthermore, OMB should shift its focus to evaluating outputs rather than data inputs, as the current approach of evaluating the "quality and appropriateness of the relevant data" is an increasingly outdated approach.

Along similar lines, the list of minimum practices for safety- and rights-impacting AI listed in Section 5(c)(iv) may be overly prescriptive. Rather than prescribe a list of specific minimum requirements, OMB should consider articulating acceptable governance principles that each agency can use on a case-by-case basis. This ensures sufficient flexibility to address unique concerns without mandating lengthy requirements that may not be necessary or appropriate. For example, the impact assessment (Sec. 5(c)(iv)(A)), testing (Sec. 5(c)(iv)(B)), and independent evaluation (Sec. 5(c)(iv)(C)) requirements may be duplicative or unnecessarily costly, depending on the type of AI application or use case at issue.

IV. Conclusion

The Biden Administration has substantially advanced the public discourse around how AI governance frameworks should be implemented, both in the public and private sectors. However, OMB should advance a flexible, risk-based approach to AI governance. Doing otherwise may subject AI governance initiatives to the priorities of future administrations as federal agencies may encourage designs that focus on certain priorities and not the overall best methods for safe and trustworthy AI deployment.

OMB's guidance will likely influence the private sector as well, and it will have a substantial impact on areas that intersect with the deployment of AI systems, including information technology, security, privacy, civil rights and civil liberties, customer experience, and workforce management. The AI ecosystem deployed by federal agencies will only thrive if developed and deployed responsibly with an eye toward practical requirements and expectations for responsible AI development.

The Office of Management and Budget
725 17th Street, NW
Washington, DC 20503

Re: Public comments on the Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

To Whom it May Concern at the Office of Management and Budget:

Eightfold AI Inc. (“Eightfold”) (https://eightfold.ai/) appreciates this opportunity to provide its public comments on the proposed memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" (the “memorandum”) published by the Office of Management and Budget (OMB). Eightfold is at the forefront of applying responsible AI solutions in the area of human resources (HR).

Comments on Section 5(b) of the memorandum

In its Request for Comments for the memorandum, the OMB requested feedback related to these questions: “Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5(b)) that should be included, removed, or revised? If so, why?”

Section 5(b)(ii) of the memorandum states:

> **Purposes That Are Presumed to Be Rights-Impacting.** Unless the CAIO [Chief AI Officer] determines otherwise, covered AI is presumed to be rights-impacting . . . . and agencies must follow the minimum practices for rights-impacting AI . . . if it is used to control or meaningfully influence the outcomes of any of the following activities or decisions:
> . . .
> G. Determining the terms and conditions of employment, including pre-employment screening, pay or promotion, performance management, hiring or termination[.]

We propose a more tailored approach in the human resource (“HR”) domain. HR functions are part and parcel of every enterprise. Although the memorandum limits the scope to covered AI that “is used to control or meaningfully influence” the applicable HR outcomes, we suggest the memorandum be revised to limit the scope to covered AI that makes automated decisions or that produces outputs that are relied on by human decision makers as the sole or overriding criterion on which the decision is made.

We note that New York City Local Law 144 of 2021, a first of its kind law which regulates the use of “automated employment decision tools” is limited to tools which “substantially assist or replace discretionary decision making,” and this phrase, in turn, is defined under the implementation rules for this law as: “(i) to rely solely on a simplified output (score, tag, classification, ranking, etc.), with no other

factors considered; (ii) to use a simplified output as one of a set of criteria where the simplified output is weighted more than any other criterion in the set; or (iii) to use a simplified output to overrule conclusions derived from other factors including human decision-making."

The implementation rules for this law were adopted after several rounds of public comments. The NYC Department of Consumer and Worker Protection, the department charged with writing the implementation rules for the law, drew a clearer line and required the AI to be doing much more than merely influencing or informing a decision.

All use of AI by federal agencies to "control or meaningfully influence" the outcomes of activities or decisions should not be presumed to be rights-impacting AI. AI tools that replace or subvert human decision making in employment are fundamentally different from, and present fundamentally different risks than, AI tools that inform, aid, and improve human decision making in employment. We suggest the memorandum be revised to draw this critical distinction.

Comments on Section 6 of the memorandum

We likewise propose that the OMB make changes to narrow the definitions of both "Rights-Impacting AI" and "Risks from the Use of AI" in Section 6 of the memorandum.

The current definition of Rights-Impacting AI includes any AI "whose output serves as a basis for [any] decision or action that has a legal, material, or similarly significant effect on an individual's or community's . . . [e]qual opportunities, including equitable access to . . . employment". This definition presents similar concerns as Section 5(b)(ii) discussed above. Further, under the memorandum, even if an AI system used in employment falls outside Section 5(b)(ii), the system could still be determined to be rights-impacting AI under this definition. We propose that the memorandum provide clear guidance to agencies that rights-impacting AI in the area of employment is limited to the uses identified in Section 5(b)(ii), unless an agency's CAIO determines otherwise based on compelling reasons applied to that agency's specific use case.

With respect to the definition of Risks from the Use of AI, we suggest that this definition likewise be narrowed to decisions and actions where the AI system performs automated decision making or its outputs are relied on by human decision makers as the sole or overriding criterion on which the decision is made. We also note that as drafted, this definition negates widely-adopted risk mitigation strategies such as "human in the loop" (with human consideration and accountability to counter automation bias), and notice and explanation.

Lastly, the definition of Risks from the Use of AI can be expanded, or a separate new definition (such as "Risks from Non-Use of the AI") can be added in conjunction, to compare the risks of using a proposed AI system against the risks of not. There are identifiable risks of "doing nothing" and relying on legacy processes that are uninformed by AI-powered insights, where human decision making may be at a greater risk of unconscious bias. For the Federal Government to meet the challenges set forth in the Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (the "Executive Order"), the non-use of AI in HR should be considered as a real risk. It can compromise the AI

talent hiring acceleration called for by the Executive Order by reducing the Federal Government's ability to harness the full spectrum of AI talent capable of serving critical roles at the agencies.

About Eightfold and its work with the public sector

Eightfold proudly supports federal and state agencies' use of responsible AI to reduce unemployment and connect job seekers with fulfilling career opportunities. Eightfold's AI-powered Talent Intelligence Platform empowers enterprises to acquire and retain diverse talent, and provides a foundation for public agencies to reemploy and upskill citizens.

Federal agencies will greatly benefit from the use of responsible AI in HR processes. Responsible AI enables more consistent, informed, and objective ways to bring candidates to jobs, and bring jobs to candidates. This is especially crucial as the federal government deploys a skills-based approach to meet the AI talent hiring acceleration called for in the Executive Order.

Thank you for considering our comments.

Sincerely,

/S/ Roy Wang

Rubrik AI Memo Feedback - Dec 2023

Rubrik Comments for Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Thank you for your attention on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. Rubrik is grateful for the opportunity to contribute to this critical initiative, especially in light of the growing national emphasis on AI, as evident in President Biden's Executive Order (EO) on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence. These efforts are building the foundation to mitigate unique risks on or posed by AI. Rubrik's expertise in data, the foundation of AI, including data visibility, security, resiliency and recovery enables Rubrik to impart a unique perspective on reducing risks to AI.

Rubrik is a cybersecurity company, and our mission is to secure the world's data. We pioneered Zero Trust Data Security™ to help organizations achieve business and mission resilience against cyberattacks, malicious insiders, and operational disruptions.

The world's leading organizations rely on Rubrik to uphold data integrity, deliver data availability, continuously monitor data risks and threats, and restore businesses with their data when infrastructure is attacked.

Based on insights from helping organizations recover from various cyber-attacks successfully, we offer the following recommendations to OMB:

1. Data Risk–

   The recent EO and OMB Draft Memo address many high-level concerns of building, testing and using AI software. However, Rubrik believes that data poses an avenue of attack for the AI system. Data's role in the training and testing phases of the AI lifecycle is crucial to the trustworthiness and safety of AI, therefore, data integrity should be prioritized. In addition, organizations building their own AI capability should build data security into to the entire process to include mitigating against data poisoning attacks. One example is to ensure that data used to train and test classifiers is backed up in an immutable and logical air gapped environment to ensure that it can't be tampered with or poisoned. Data poisoning attacks are similar to software supply chain attacks, presenting difficulties for organizations in detecting these threats and concurrently fostering a false sense of security. In the event

of a data poisoning attack, an agency would be able to recover the data and rebuild the AI system to a known good and trusted state, pre-breach.

2. Continuous Monitoring – Data Integrity

Monitoring Data integrity within the AI lifecycle is crucial to identifying risks. Data poisoning attacks can easily go unnoticed and have catastrophic effects on AI models. These effects can create false senses of security and an unfounded belief that the AI model is secure and safe. Data modification is a stealthy attack vector that can cause the model to act unexpectedly due to bad data injected into the training and/or test tests used to create AI models.

3. Testing and Red Teaming of AI

There is need for more detailed guidance on the various aspects and methodologies in testing AI systems. Red teaming in and of itself has clearly defined objectives and rules of engagement. It's an expensive, resource intensive and complex for which there are limited experts available. That said, red teaming AI systems could have many interpretations and objectives and suggest OMB work with NIST to develop standards and guidance for AI Red Teaming as part of an Agency's AI security strategy.

4. Workforce Development

Creating and growing a US Government AI workforce is as crucial as it is challenging. Just as recruiting and retaining skilled cybersecurity talent has been the last two decades, recruiting and retaining skilled AI talent can be even more challenging. The rising demand for AI expertise, driven by technological advancements and increased integration in government sectors, requires a strategic and collaborative effort to recruit and retain qualified professionals. This involves addressing recruitment strategies, fostering innovation, and creating a conducive environment for ongoing professional development. The challenges highlight the importance of comprehensive workforce planning for the sustained growth and proficiency of the US Government's AI workforce.

Rubrik would welcome a discussion with you and your staff as you further develop guidance on Safe and Responsible AI within the Federal Government.

Rubrik offers the following feedback to the following questions for which Rubrik has expertise:

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

The skilled workforce challenges and constrained pay scales will likely cause challenges in USG organizations hiring adequate CAIOs (quantity and quality) of the candidates compared to commercial industry where these roles are in extremely high demand.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Adapting the legacy accreditation processes to account for a data centric and novel technology, AI, as organizations try to assess, apply RMF and deploy in their environments.

IDVerse - Response to OMG RFC - Advancing...AI Draft Memorandum_Dec 5 2023

Office of Management and Budget - Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum ("AI Draft Memorandum)

Request for Comment for OCR Labs Global (USA) Inc. *dba* IDVerse

December 5, 2023

Thank you for the opportunity to participate in the OMB Response for Comment ("RFC") to the AI Draft Memorandum.

Below is an introduction to our company, followed by our responses to the RFC.

Background.
IDVerse has been developing Remote Identification Validation Technology since 2014. Our expertise began as digital camera systems were emerging and beginning to be coupled with advanced software algorithms. At this time, we anticipated the need for identity validation using camera-based, optical recognition as being integral for an increasingly digital society. Today, our engineering and product development strength continues paired with advances in the use of multiple cameras, artificial intelligence, computational imaging and 3D sensing.

Founded in Australia with offices in London (registered headquarters), Sydney, New York and San Francisco (main office Redwood City), our technology has been successfully tested by NIST-accredited labs and against recognized biometric international standards.

Table 1: Summary of Certifications

Certification Body	Basic Certifications	Advanced Certifications
NIST	NIST SP 800-171	NIST SP 800-53 NIST SP 800-63 IAL2
iBeta/BixeLab against ISO 30107-3	Liveness PAD Level 1	Liveness PAD Level 2 Liveness (Bias testing)
Government Entities	CCPA, GDPR	TDIF L3, DIATF, DocAuth
ISO - International Organization for Standardization	ISO 27001 ISO 9001 ISO 19795	ISO 22301 ISO 27017 ISO 27018 ISO 27701 ISO 29100 ISO 30107-3
AICPA System and Organization Controls (SOC)	SOC 1	SOC 2

Responses to OMB RFC.

1. *The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?*

Response: No comment.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Response: Certainty of roles of Federal agencies is important for the successful implementation of the proposed OMB Guidelines. Anecdotally, we have heard among conversations by other corporations that there will be a crosswire of authorized agencies that are looking over the management of different AI aspects. This may create the potential for different agencies to be regulating over the same issues.

In this regard, we propose defined levels of oversight in a centralized agency, which represents the interests of the cross-section of Federal agencies. Regulations are issued by a single agency, which may be enforced for most sensitive issues by the central agency, and with authority to sub-agencies for localized and less sensitive matters.

As an example, we refer to the development of the EU's proposed new AML agency, with a central agency at the core and the jurisdictions of the Union sitting underneath.

3. How can OMB best advance responsible AI innovation?

Response: In addition to the regulation that is proposed by the Executive Order and the OMB guidelines, change must also flow from industry.

One issue we see in our world of remote ID verification is bias. Bias can manifest in a myriad of ways. For instance, a seemingly innocuous prompt such as "show me faces of successful business owners" on a typical image-generative AI platform like Midjourney can disproportionately favor Western, white, male faces, neglecting the fact that the vast majority of the world's population—more than 75%—lives in Asia and Africa.

AI programs often reinforce stereotypes because human engineering teams have inherent biases that are encoded into the algorithms. As leaders of technology, we have therefore found ourselves at the crossroads of innovation and responsibility. Our creations—the software

©2023 OCR Labs. This document is strictly private, confidential and personal to its recipients and should not be copied, distributed, or reproduced in whole or in part, nor passed to any third party without the express written permission of OCR Labs.

solutions we engineer—can either exacerbate societal biases or serve as a force for positive change.

Pledging an oath

To face this challenge head on, our company introduced the Code Zero Bias Oath, inspired by the enduring principles of the Hippocratic Oath, but tailored to the unique challenges and opportunities of our field. This oath embodies our collective commitment to reducing algorithmic bias, promoting fairness, and upholding the highest ethical standards in AI software development:

"I, as a software engineer, solemnly swear to uphold the principles and practices outlined in this Code Zero Bias Oath. In my pursuit of designing, developing, and deploying software, I commit to the following:

Do No Harm: I shall prioritize the well-being of individuals and communities who may be affected by the software I create. I will strive to ensure that my work does not cause harm or perpetuate bias, discrimination, or inequality.

Equity and Fairness: I will actively seek to identify and rectify biases in algorithms and data sets. I pledge to promote fairness and impartiality, striving to create software that treats all individuals equally regardless of their background, race, gender, or any other characteristic.

Transparency and Accountability: I will be transparent about the decision-making processes and data sources used in my software. I accept responsibility for the consequences of my work and will be accountable for any biases or ethical lapses that may arise.

Inclusivity: I will advocate for diverse and inclusive teams, recognizing that different perspectives lead to more robust and ethical solutions. I will actively work to create an environment where underrepresented voices are heard and valued.

Continuous Learning: I understand that technology evolves rapidly, and I commit to staying informed about emerging best practices, guidelines, and regulations related to algorithmic bias and ethical software development.

User Privacy and Consent: I will respect user privacy and seek informed consent for data collection and usage. I will implement strong data protection measures to safeguard user information.

Mitigation and Remediation: If I discover bias or ethical concerns in software I have developed, I will take immediate steps to mitigate harm and rectify the issues. I will report such concerns to relevant stakeholders and take corrective action.

©2023 OCR Labs. This document is strictly private, confidential and personal to its recipients and should not be copied, distributed, or reproduced in whole or in part, nor passed to any third party without the express written permission of OCR Labs.

Community Engagement: I will actively engage with the communities impacted by my software, seeking their feedback and addressing their concerns. I will be open to criticism and commit to improving my work based on community input.

Regulatory Compliance: I will adhere to all relevant laws, regulations, and industry standards related to algorithmic fairness and data ethics in software development.

Advocacy for Ethical Technology: I will advocate for the responsible and ethical use of technology within my organization and the broader industry. I will use my influence to promote ethical practices and raise awareness about the importance of reducing algorithmic bias.

I acknowledge that my work as a software engineer has a profound impact on society, and I accept this oath as a solemn commitment to ethical software development. I will strive to uphold these principles throughout my career, recognizing that my actions can shape the future of technology and its impact on humanity."

By taking this Code Zero Bias Oath, software engineers demonstrate their dedication to ethical software development, with a focus on reducing algorithmic bias and promoting fairness, transparency, and accountability.

Training data & fair-sourced faces

A flawed algorithm is not the only source of bias that can undermine the fairness and accuracy of an identity verification system. If biased data is used to train the algorithm, it is likely the system will exhibit those same biases when making decisions.

In the context of facial IDV systems, "training data" refers to specialized datasets of facial images used to train the machine learning algorithms or deep neural networks that are responsible for recognizing and verifying individuals' identities based on their facial features.

Here's how training data works in facial identity verification:

Features: The training data includes a vast collection of facial images as its primary feature. These images represent various individuals, captured under different lighting conditions, angles, and backgrounds. Each image provides information about the facial characteristics of a person, including the position of facial landmarks (such as eyes, nose, and mouth), skin texture, and other unique details.

Labels or ground truth: In supervised learning for facial identity verification, each facial image in the training data set is associated with a label or ground truth, which specifies the identity of the person in the image. These labels serve as the correct reference for the algorithm during training. For instance, a label might indicate that a particular image is of "John Doe."

©2023 OCR Labs. This document is strictly private, confidential and personal to its recipients and should not be copied, distributed, or reproduced in whole or in part, nor passed to any third party without the express written permission of OCR Labs.

Training process: The machine learning or deep learning algorithm uses this labeled training data to learn and extract relevant patterns and features from facial images. It analyzes the unique characteristics of each individual's face, such as the arrangement of facial landmarks, and learns how to distinguish one person from another.

Model development: Through the training process, the algorithm adjusts its internal parameters to minimize the difference between its predictions and the ground truth labels in the training data. This fine-tuning allows the model to become increasingly accurate in recognizing and verifying identities based on facial features.

Generalization: Once the algorithm has been trained on the dataset, it can be deployed for real-time facial identity verification tasks. The algorithm applies the knowledge it acquired from the training data to analyze and compare facial features in new, unseen images to verify the identity of individuals.

The quality and diversity of the training data determine the performance and efficacy of a facial identity verification system. In particular, training data affect the fairness of decision-making algorithms and their ability to mitigate bias, or achieve Zero-Bias AI™.

Training data should encompass a wide range of facial variations—including age, gender, ethnicity, and lighting conditions—to ensure that the algorithm can accurately identify individuals from different backgrounds and under different circumstances or environments.

Ethical procurement & data nutrition labels

With face recognition technology becoming increasingly prevalent, the ethical sourcing of face biometrics data used to train identity verification systems should be a top concern for businesses and their customers. Training data sets should have the equivalent of a “nutrition label” which would provide crucial information about the dataset's sources and characteristics, helping developers make informed decisions.

Ethical procurement in face biometrics technology centers around ensuring that the data used to train and develop face recognition systems adheres to strict fairness and ethical guidelines. This not only safeguards individual privacy and civil liberties, but also ensures that the technology is as accurate and fair as possible.

Key considerations for ethical procurement

Here are some principles to keep in mind when considering the data an IDV provider has used for the training of its machine learning system:

Transparency: Transparent providers are open about their data collection methods, sources, and usage. They are willing to disclose their practices and allow third-party audits to ensure ethical compliance.

©2023 OCR Labs. This document is strictly private, confidential and personal to its recipients and should not be copied, distributed, or reproduced in whole or in part, nor passed to any third party without the express written permission of OCR Labs.

Consent: Ethical providers obtain explicit consent from individuals whose data is used for training purposes. They make it clear how the data will be used and for what purposes. Further, consent must be permissible under local regulations. As an example, GDPR regulations preclude a remote ID verification vendor (as data processor) from receiving consent from an end-user to use his/her data for training; that consent remains in the strict hold of only the data controller.

Data minimization: Ethical procurement minimizes data collection to only that which is necessary for the technology's intended purpose. It avoids the unnecessary collection and storage of sensitive data.

Fair representation: Providers ensure that their training datasets are diverse and representative of the population, minimizing biases and ensuring equitable performance across demographic groups.

Security: Ethical providers prioritize robust security measures to protect the data they collect. They follow best practices for data encryption, access control, and regular security audits.

Data deletion: Providers have clear policies and procedures for data retention and deletion. They respect individuals' right to have their data removed upon request and have system capabilities for business buyers to execute desired privacy policies.

Looking ahead

As facial recognition technology continues to evolve, ethical considerations must remain at the forefront of businesses and consumers alike. Ethical procurement of data ensures that this technology is used responsibly, respects individual rights, and remains an asset to society rather than a threat to privacy and civil liberties.

Organizations must set a positive example and contribute to the development of a more responsible and ethical landscape for face biometrics technology. Businesses, suppliers, and consumers alike should prioritize transparency, consent, data minimization, fairness, security, and adherence ethical standards.

Ethical procurement of face biometrics training data is not just a corporate responsibility; it's a societal imperative in an age where facial recognition touches so many aspects of our lives. We cannot rely just on the government’s initiatives for regulation.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Response: Following from the reasoning expressed in question 3 above on the responsibility of industry to lead on principles of fair sourced data and ethical procurement, the resulting product of a company should shift substantially across to the green zone of the AI pressure zone.

©2023 OCR Labs. This document is strictly private, confidential and personal to its recipients and should not be copied, distributed, or reproduced in whole or in part, nor passed to any third party without the express written permission of OCR Labs.

As it relates to remote ID verification, the focus is on (i) the ~2.5% of fraud cases relating to imposters entering a particular domain, for example a government benefits program, to misappropriate funds from both governments and designated beneficiaries, and (ii) the other ~97.5% of users of a service, approaching gen AI with inclusivity and transparency to ensure that the designated recipients can access those online services without bias, accurately and seamlessly.

Below are some high level use cases and supported processes for a generative AI remote ID verification process that draw on the principles and approaches highlighted above.

Use Cases.

- Document Fraud Analysis - to verify the ID document is true (not forged), live (not captured before the verification session begins) and present (with the presenting end-user).
- Liveness testing - to verify the end user is a live person and present
- Face Matching - to match the ID document in step 1 to the live person in step 2.
- FaceAuth - allows for the authentication of a user within seconds (for a quick step-up / re-authentication scenario), using a few-second video capture of their face. This is a stronger solution than a phone's face recognition tool, which can be averted by the fraudster.
- Database of known fraudsters - This allows for velocity and anomaly alerts to be enabled to detect the same face or data appearing multiple times. This solution can be deployed to identify and stop repeat fraudsters.
- Single sign-on (SSO) - avoid passwords, by applying the FaceAuth product. This would prevent ransomware and cyber attacks, for example by eliminating social engineering from SIM swaps and then also at the administrator level, to ensure the correct designated users are accessing the portal.

Supported Processes.

- KYC Customer or Beneficiary Identification
- Remote/Digital account opening/onboarding
- Re-authentication for high assurance/step-up use cases (for example, to receive Dollar benefits from a government program) and to reduce account takeovers (ATO's), for example with SIM swaps (relevant to mobile carriers, noting that many MFA protocols permit texts to mobiles; if there is a SIM swap, that text will go directly to the fraudster).
- Contact center management
- E-signature verification - confirmation that the correct person is signing the document.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

Response: Section 5(b) is extremely detailed and broad, and we cannot make any suggestions on additional types of AI to add.

However, we do recommend applying a tiered level to the approach required by regulations. For example, as it relates to biometrics, which is close to our world, we propose different levels of scrutiny for one-to-many face matching for criminal investigations compared to one-to-one matching, for permitting access to a government benefit program.

We recognize that there is a fine line here for the definition of the different tiers, but it may avoid some overregulation that does not take into account fully the potential for lesser harm of the AI solution.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Response: We refer to our response to question 5, to suggest that there should be tiers of scrutiny depending on the potential level of harm of the AI solution.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Response: Please contact us with any questions on our experience as it relates to our responses to this RFC or otherwise in connection with the interface of our use of generative AI.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Response: No comment.

****

Submitter Information

General Comment

The City of San José Information Technology Department appreciates the opportunity to submit comments in response to the request for comment on the proposed draft memorandum titled “Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence” by the Office of Management and Budget (the OMB Memo).

In late 2022, the Digital Privacy Office (DPO) began the initial governance of AI systems as a natural extension of governing data policies and data processing. Starting with procurement reviews, the City’s AI governance has evolved into Generative AI initiatives, and impact assessments. Recently, San José began a coalition of over 100 state and local agencies to build a standardized approach to AI governance, policy, and vendor accountability. We hope to connect the Coalition’s work with the efforts at OMB and the broader Federal government.
Summary of Comments
We celebrate the OMB memo as a vital step towards comprehensive AI policy for U.S. public agencies.

• Chief AI Officer (CAIO): Our experience at San José has demonstrated the need for a designated lead on AI policy and governance. The CAIO needs to lead across AI governance, procurement, and technical projects. This ensures all AI projects follow responsible AI governance and fosters mutual maturity between policy and practical implementation of technology. The City’s CAIO function is currently served by technical and project management leads with the Digital Privacy Officer, but may vary based on where technology policies are managed in an agency.

• Leveraging existing governing bodies: The City has leveraged its Digital Privacy Officer and existing privacy and data governing bodies to handle AI governance. The City found that stakeholders for both Privacy and AI overlapped considerably, and we recommend exploring if the same is true at your agencies to minimize additional overhead.

• Vendor accountability: When implementing our impact assessment framework at the City of San José, we experienced varying levels of cooperation across vendors in obtaining information around the “nutrition facts” of their AI systems. Larger vendors were often unresponsive or unwilling to provide us information about the AI system. Having a standardized “nutrition facts” requirement for all AI systems

enforced at the federal level would solve this problem.

• Generative AI: Agencies should leverage generative AI tools for creating initial drafts of content while establishing safeguards to ensure responsible use. To promote the responsible use of generative AI tools, the City of San José and many others have released Generative AI Guidelines to help City employees leverage the benefits of generative AI tools while understanding and mitigating its risks.

• Minimum practices: The minimum practices outlined in the memo may be too aggressive for agencies to implement by the desired timeline. Agencies with a lower AI maturity may struggle to successfully implement all minimum requirements by the deadline.

Our detailed comments can be found in the attached document titled "231205 OMB Public Comment City of San José". Additional attachments are explained in our detailed comments.

231205 OMB Public Comment - City of San Jose

AI agreement v01

DRAFT AI Policy

AI Manual

Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Submitted by The City of San José Information Technology Department
December 5, 2023

The City of San José Information Technology Department appreciates the opportunity to submit comments in response to the request for comment on the proposed draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" by the Office of Management and Budget (the OMB Memo).

In late 2022, the Digital Privacy Office (DPO) began the initial governance of AI systems as a natural extension of governing data policies and data processing. Starting with procurement reviews, the City's AI governance has evolved into Generative AI initiatives, and impact assessments. Recently, San José began a coalition of over 100 state and local agencies to build a standardized approach to AI governance, policy, and vendor accountability. We hope to connect the Coalition's work with the efforts at OMB and the broader Federal government.

Summary of Comments

We celebrate the OMB memo as a vital step towards comprehensive AI policy for U.S. public agencies.

- **Chief AI Officer (CAIO):** Our experience at San José has demonstrated the need for a designated lead on AI policy and governance. The CAIO needs to lead across AI governance, procurement, and technical projects. This ensures all AI projects follow responsible AI governance and fosters mutual maturity between policy and practical implementation of technology. The City's CAIO function is currently served by technical and project management leads with the Digital Privacy Officer, but may vary based on where technology policies are managed in an agency.
- **Leveraging existing governing bodies:** The City has leveraged its Digital Privacy Officer and existing privacy and data governing bodies to handle AI governance. The City found that stakeholders for both Privacy and AI overlapped considerably, and we recommend exploring if the same is true at your agencies to minimize additional overhead.
- **Vendor accountability:** When implementing our impact assessment framework at the City of San José, we experienced varying levels of cooperation across vendors in obtaining information around the "nutrition facts" of their AI systems. Larger vendors were often unresponsive or unwilling to provide us information about the AI system. Having a standardized "nutrition facts" requirement for all AI systems enforced at the federal level would solve this problem.
- **Generative AI:** Agencies should leverage generative AI tools for creating initial drafts of content while establishing safeguards to ensure responsible use. To promote the responsible use of generative AI tools, the City of San José and many others have released Generative AI Guidelines to help City employees leverage the benefits of generative AI tools while understanding and mitigating its risks.
- **Minimum practices:** The minimum practices outlined in the memo may be too aggressive for agencies to implement by the desired timeline. Agencies with a lower AI maturity may struggle to successfully implement all minimum requirements by the deadline.

Our detailed comments follow the 'Background' section.

DRAFT

Background

The City of San José is leveraging the benefits of AI to improve the delivery of services to residents. As the City increasingly uses AI tools, it is more important than ever to ensure that those AI systems are effective and trustworthy.

The City of San José's AI governance activities are performed by the Information Technology Department and its Digital Privacy Officer (DPO).[1] The DPO was established in October 2021 following the Council's ratification of the City's Digital Privacy Policy in late 2020, developed to safeguard the public's trust in the City's use of new and emerging technologies and to protect residents' digital privacy rights.[2] In late 2022, the Digital Privacy Office (DPO) began the initial governance of AI systems as a natural extension of governing data policies and data processing. Starting with procurement reviews, the City's AI governance has evolved into Generative AI initiatives, impact assessments, and coalition-building with agencies across the country.

The City has developed an "AI Review Framework" that tailors AI procurement processes according to the risk of the proposed AI tool (see risk assessment framework in appendix), and this City's experience piloting and adapting this process informs our recommendations below. For each proposed AI procurement, the DPO assesses and classifies the proposed tool according to its risk level, which is determined based on (1) the ability of individuals to opt-out to being subjected to the AI system and (2) the potential harm of the system based on the type of output, degree of human oversight, area of the individual's life that is impacted by the system. All solicitations regardless of risk require the vendor to complete the AI FactSheet (see Appendix). For medium- and high-risk systems, the DPO requires City staff that proposed the procurement to complete an Algorithmic Impact Assessment (AIA) Form (see appendix) with details about the project objective and information about the project's alignment with San Jose's AI principles.[3] For high-risk projects, the DPO conducts public outreach with its Privacy Advisory Task Force and impacted communities. The DPO uses this information to conduct an Algorithm Review, determine whether the procurement should move forward, and suggest changes to the system usage, solicitation, selection of a vendor, or contract terms. The DPO publishes the AIA, Vendor AI FactSheet, and Algorithm Review. For high-risk projects, the DPO also publishes a Data Usage Protocol detailing how the system is used and how it will be monitored annually (see AI Manual for more details).

The City of San José recently launched the GovAI Coalition with over 100 state, local, tribal, and territorial government agencies (see appendix for members comfortable with public listing) across the country to ensure that the AI systems we use serve all our communities. We envision a future where public agencies can easily obtain critical information about AI systems from vendors (e.g., an AI FactSheet). We believe there is power in numbers, and are eager to work with other agencies to set an industry standard that promotes effective, equitable, trustworthy AI systems. The GovAI Coalition is committed to:

- Using AI for social good,

[1] https://www.sanjoseca.gov/your-government/departments-offices/information-technology; https://www.sanjoseca.gov/your-government/departments-offices/information-technology/digital-privacy.
[2] https://www.sanjoseca.gov/home/showpublisheddocument/79367/637719660070200000.
[3] https://www.sanjoseca.gov/your-government/departments-offices/information-technology/digital-privacy/ai-reviews-algorithm-register#:~:text=San%20Jos%C3%A9%20AI%20Principles

- Ensuring ethical and responsible AI governance,
- Promoting vendor accountability, and
- Fostering cross-agency collaboration.

The goals of the GovAI Coalition are generally well-aligned with the spirit and guidance contained in the recent White House Executive Order 14110 on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence on AI and the OMB draft memo on AI. The City of San José offers our public comments on the OMB draft memo on AI, with responses to specific questions of interest outlined by OMB below.

Detailed Comments

Q1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

A1.

Emphasize AI Officer's role in the procurement process. In the implementation of San José and partner local agencies, we have seen that most staff lack the skills necessary to evaluate AI systems during the purchasing process. In our agency, where Requests for Proposals (RFPs) and other bid forums require staff to volunteer as subject matter experts, the lack of AI expertise can limit our ability to evaluate and score different vendor proposals. To address this issue, our Digital Privacy Officer, who is also functioning as our Chief AI Officer, and their team have done two things that we recommend for federal agencies:

i. **Provide targeted education to your staff directly involved in procurement.** This should cover how to identify if an RFP's scope heavily involves an AI system, what questions to ask the proposers, and how to evaluate those questions. While the exact questions will vary by use case, we have included our example list of 20 questions and how to score them in the appendix of this comment.[4] Most RFPs will only include a handful of these, but they provide options to the procurement staff.

ii. **Involve the Chief AI Officer at some point in the procurement of any AI system.** This does not need to be heavy involvement. We have found that having at least a quick check by our AI team of all potential AI initiatives and purchase requests allows us to identify the systems that warrant a deeper review. An overwhelming majority of the time, this check takes less than 15 minutes (often much less), but allows the experts in the agency to triage risk rather than relying on staff without training in AI. For reference on how we assess AI risk and triage systems, refer to the "algorithmic review process" in the AI Manual attached.

Plan for at least a year-long process to implement an agency's AI governance. The City of San José's process of designating an AI Officer, implementing AI reviews, starting AI staff education, drafting an AI policy (not yet approved), inventorying AI, and incorporating necessary steps into AI procurement began in late 2022. As of today, AI education has begun through in-person

[4] As the AI landscape evolves, we plan to update the RFP questions as appropriate over time.

sessions, one-page factsheets, and org-wide emails (happy to share materials where helpful). The AI Policy is undergoing review across several departments including but not limited to the Information Technology, Legal, Purchasing, and the central City Manager's Office. The function of the AI Officer is handled by the Digital Privacy Officer in San José but will vary for every organization. We find it useful for the AI Officer to sit where technology policies are managed in an agency. We expect the AI Officer's position to evolve rapidly over the next two years.

Q2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

A2.

Leverage existing governing bodies, especially in privacy, before building a new governance program. Resources are constrained and governing bodies often rely on staff or the public volunteering their time. We have opted to adapt existing governing bodies to meet our AI governance needs wherever possible. For example, our two main privacy governing bodies–a working group of staff and a task force of external experts—have both been repurposed to also cover AI governance.

We have found that the staff most suited for an AI working group were those that were familiar with their department/division's data, technical capabilities, and business needs. These were almost always the same people we relied on for privacy governance, so we merged the working groups to reduce organizational overhead.

Similarly, our group of outside experts from industry, academia, government, and civil liberties who were focused on privacy were also moving into the AI governance space in their respective fields. While there have been some required additions to these groups, the majority of participants have remained the same through this transition.

This model has been effective because governance is centralized under the Information Technology Department. The City's Information Technology Department hosts digital privacy, cybersecurity, digital equity, and data governance. Having these functions work closely ensures consistency, collaboration, resource sharing, and cost-effectiveness.

If an agency is heavily focused on building in-house AI systems, that may require additional capacity. However, we find AI governance to overlap heavily with existing privacy governance.

Q3. How can OMB best advance responsible AI innovation?

A3.

Promote greater vendor accountability before, during, and after the procurement process. The minimum practices required before using a safety-impacting or rights-impacting technology include a comprehensive AI impact assessment that captures various details about the AI system. If the agency is using a third-party system, much of this information must be obtained from vendors, particularly if the information is to be gathered before use of the system, like during the procurement process.

When implementing a similar impact assessment framework at the City of San José, we experienced varying levels of cooperation across vendors in obtaining this information. Some

vendors provide all details while others, especially larger vendors were often unresponsive or unwilling to provide us information about the AI system. This forced the City to waste government time to simply understand the AI when the vendor already had the answers.

This is a shared pain point across many subnational governments. Over 100 state, local, tribal, and territorial (SLTT) agencies have partnered together under the "GovAI Coalition" to, among other things, require vendors to provide a baseline of information, or "nutrition facts" on their AI systems (sanjoseca.gov/govai). Having a standardized "nutrition facts" requirement for all AI systems enforced at the federal level would solve this problem. The Coalition has created a potential set of required "nutrition facts" for AI systems (see appendix). The factsheet was based on IBM's AI Factsheet and evolved following pilot implementations and revisions across the Coalition agencies.

Additional Steps for Accountability: As the GovAI Coalition, one of our primary objectives is to improve vendor accountability around AI systems. To this end, we are in the process of formally adopting standard policies and practices for AI governance, including AI policies, AI vendor evaluation and agreements, AI use cases, and AI incident response. This work is intended to complement the recent executive order with practical implementation steps for SLTTs. One of our ultimate goals is for AI vendors to be responsible for demonstrating that their AI system adheres to a pre-defined set of criteria to ensure the system's safety and effectiveness. We intend to aggregate the information from vendors in a vendor registry. The GovAI coalition is building this registry and it will be shared online with other agencies. We are happy to discuss further and will release our standard policies and practices in February 2024.

AI Risk Management: We are aligned with EO section 10.1(b)(iv) to evaluate AI maturity in accordance with the National Institute of Standards and Technology AI Risk Management Framework (NIST AI RMF). We found the NIST AI RMF was a great tool at assessing the many facets of AI risk management. It forced us to look across many factors of AI governance, and it highlighted essential components we had not yet considered. In our self-evaluation, we created a template for evaluating AI maturity that can be found on NIST's website (https://airc.nist.gov/Usecases) and may be able to serve as an initial approach for agencies.

Q4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

A4.

Agencies should leverage generative AI tools for creating initial drafts of content while establishing safeguards to ensure responsible use. Generative AI can be a powerful tool for making the work of public officials more efficient. It is adept at creating first drafts of content like policy memos, RFPs, graphic designs, or presentations.

However, generative AI tools presents various accuracy, privacy, bias, and transparency concerns. Therefore, it is important that agencies put safeguards in place to ensure the responsible use of such tools. For example, generative AI tools often produce inaccurate or contextually inappropriate information that must be fact-checked and corrected. Given the wide accessibility of these tools and rapid inclusion into all major software, restricting generative AI usage is not possible. Instead, we recommend taking a proactive educational approach to train staff to use these tools responsibly.

To promote the responsible use of generative AI tools, the City of San José and many others have released Generative AI Guidelines to help City employees leverage the benefits of generative AI tools while understanding and mitigating its risks. To date, the Generative AI Guidelines have been updated multiple times and will continue to be updated as the industry and legal precedent evolves around generative AI, and we recommend a similar flexible approach for federal agencies.

The GovAI coalition is also addressing generative AI guidance to be released early next year.

Q5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

A5.

We appreciate the comprehensive list and look forward to the final version.

Q6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

A6.

The minimum practices outlined in the memo may be too aggressive for agencies to implement by the desired timeline. Agencies with a lower AI maturity may struggle to successfully implement all minimum requirements by the deadline.

For example, one of the minimum requirements is to independently evaluate all rights impacting or safety impacting AI systems before deployment, in addition to separate requirements for impact assessments and real-world testing. Establishing an independent oversight board or review body comprised of people with the appropriate technical and domain expertise to review all relevant AI systems is a time-intensive task. Generally, it may take months if not years to set up a functioning independent review body of this kind. From a practitioner's perspective, the feasibility of this requirement is concerning.

Q7 – What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

A7.

OMB could provide a centralized location for agencies to see evaluations of AI systems pre and post implementation. In addition, OMB could support a centralized hub to access the latest information and conversations around AI procurement. The GovAI Coalition is building a similar framework in our vendor registry, but are looking for a centralized, national sponsor to maintain its relevance and effectiveness.

Q8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

A8.

The City of San José praises the inclusion of use case inventories in this memo's requirements. At San José, we implemented our own public inventory in early 2023, called the "Algorithm Register,"

where we catalog the AI systems used by the City. For AI systems in the inventory, we include key documents:

1. Algorithmic Impact Assessment (AIA) Form (link for reference)
2. AI FactSheet (example)
3. Final Review by the Digital Privacy Office (DPO) (example)

For high-risk systems, we publish:

4. Data Usage Protocols (example)
5. Annual Usage Reports (example)

The AIA Form is completed by the staff in the procuring City department after they submit a formal procurement request to the City's centralized IT procurement system. The AIA form intakes information about the intended use of the system and why the department is choosing automation for their solution. The DPO functions as a "check" by reviewing the AIA Form to ensure that City staff adequately understand the system's potential risks.

The AI FactSheet is completed by the vendor and captures technical details of the AI system, including information about performance metrics, training and testing data, and optimal/poor performance conditions.

The final review by the DPO details the rationale behind the DPO's disapproval, approval, or conditional approval of the AI procurement. Using the AIA Form and Vendor FactSheet, the DPO compares the two documents to determine if the needs declared by the procuring City department can be fulfilled by the technical capabilities of the vendor's system.

After the first year of deployment post-review, the Algorithm Register will begin to include Annual Usage Reports for each AI system. Annual Usage Reports are regularly conducted for technologies used in the City that pose significant privacy risks, and the report format will look very similar when applied to AI systems. Annual Usage Reports are the City's mechanism for ongoing monitoring of technology systems to ensure that the system's performance continues to meet the City's needs.

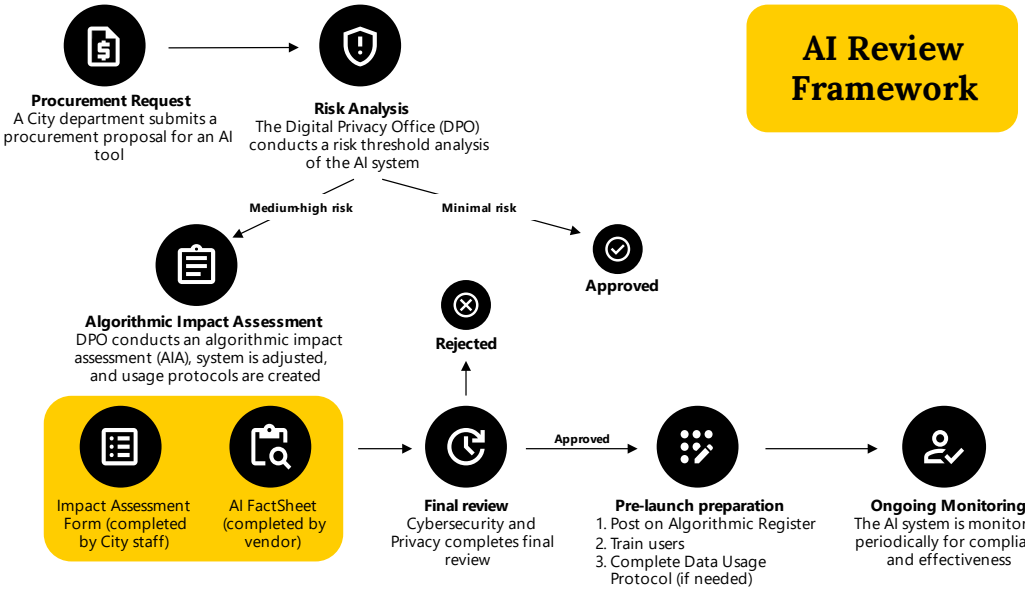
Appendix A: Algorithmic Review Process

This is a diagram explaining the steps in our AI Review Process. Additional information can be found in the AI Manual attachment.



Appendix B: AI Risk Assessment Framework

This is an excerpt from the AI Manual attachment. See Step 2 under Algorithmic Review Process

The algorithmic risk of the proposal is evaluated in Step 2 of the review, otherwise known as the Algorithmic Threshold Analysis. Algorithmic risk is evaluated based on two key components: the ability of data subjects and/or end-users to opt-out of the use of the algorithmic system and the intensity of the potential harm of the algorithmic system.

The figure below provides a summary of algorithmic risk, with further details below. Algorithmic risk is generally classified into one of three levels: low, medium, and high. Each factor contributing to algorithmic risk can also be defined at a low, medium, or high risk level.

1. **Low algorithmic risk** involves an **opt-in** approach to users being subjected to the AI system. The AI system generates **predictions** but does not automate decision-making. The AI system is subject to a **high level of human oversight**. The AI system **does not impact human livelihood** and is used in areas like mundane business functions (e.g., text autocomplete to help write emails). Consequences are short term and easily reversible.

2. **Medium algorithmic risk** involves an **opt-out** approach to users being subjected to the AI system. The AI system generates **recommendations** but does not automate decision-making. The AI system is subject to **periodic human oversight**. The AI system may **impact non-critical areas of livelihood** like recreation. Consequences are not long term and can be reversible.

3. **High algorithmic risk** involves users that are **unable to opt-out** to being subject to the AI systems. The AI system **automates decision-making**. The AI system is subject to **minimal or no human oversight.** The AI system **may impact highly sensitive areas of livelihood** like employment, healthcare, or criminal justice. Consequences are long-term and difficult to reverse.

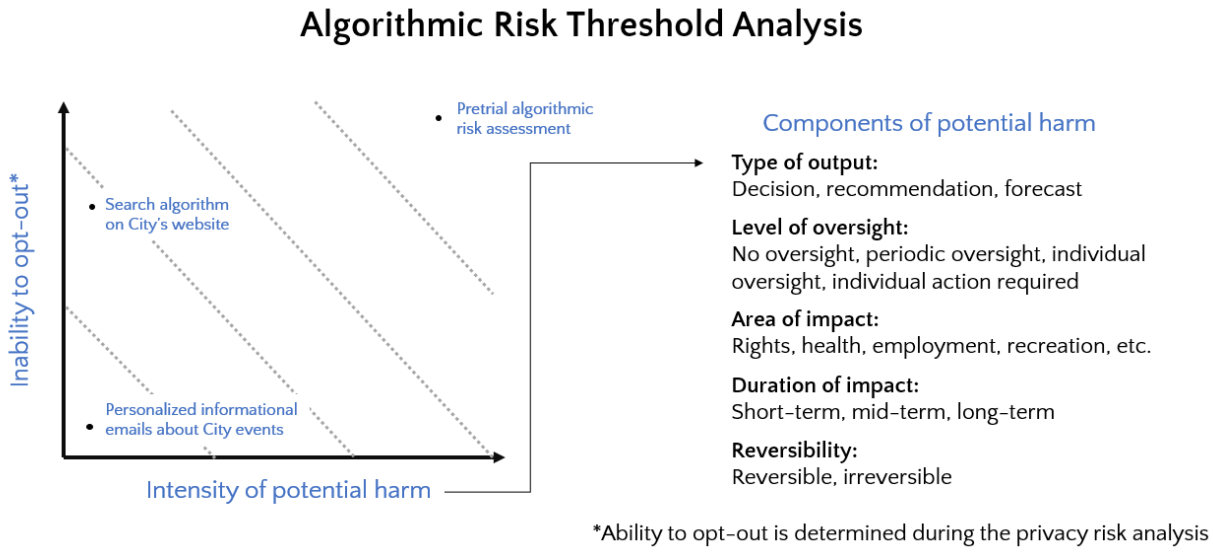


Figure 1: The risk of an algorithmic system can be estimated by identifying impacted individuals' ability to opt-out of the use of the algorithmic system and the intensity of potential harm generated by the system.

The components of potential harm consist of the type of output, the level of oversight, and the area of impact. In Figure 1, the risk level of each component of potential harm decreases from left to right. For example, for type of output, “decisions” are higher risk than “forecasts”; for level of oversight, “no oversight” is higher risk than “individual action required”; for area of impact, “impacts on rights” are higher risk than “recreational impacts”.

Components of Algorithmic Risk

Algorithmic risk is defined by two main components: ability to opt-out and intensity of potential harm.

1. **Ability to opt-out:** risk is measured by an individual’s ability to control being subject to a given AI system. Ability to opt-out is determined during the privacy risk threshold analysis.
    a. **Low risk ability to opt-out** involves a default opt-in approach. Individuals must actively opt-in to being subjected to the AI system.
    b. **Mid risk ability to opt-out** involves a default opt-out approach. Individuals must actively opt-out if they do not wish to be subjected to the AI system.
    c. **High risk ability to opt-out** involves individuals being unable to opt-out of the AI system. Individuals are required to be subject to the AI system.
2. **Intensity of potential harm:** risk is measured by five sub-components of potential harm: type of output, level of human oversight, area of impact, duration of impact, and reversibility.
    a. **Low risk potential harm** is associated with an AI system that generates predictions, is subject to a high level of human oversight, does not impact any areas of human livelihood, has a short-term impact, and is easily reversible.
    b. **Mid risk potential harm** is associated with an AI system that generates recommendations but does not automate decision-making, is subject to periodic human oversight, impacts non-critical areas of livelihood like recreation, has a mid-term impact, and is moderately easy to reverse.

High risk potential harm is associated with an AI system that automates decision-making, is not subject to human oversight, impacts critical areas of livelihood like employment, healthcare, or criminal justice, has a long-term impact, and is difficult to reverse or not reversible entirely.

DRAFT

Appendix C: AI FactSheet

AI FactSheet for Third Party Systems

Please provide details regarding your Artificial Intelligence (AI) product by filling out the FactSheet[5] template below. You can find an example of a completed FactSheet on page 3.

Vendor Name	
System Name	
Overview	Brief summary of the AI system.
Purpose	What function does the AI system perform, and for what purpose?
Intended Domain	What domain is the AI system intended to be applied in?
Training Data	How was the AI system trained? What data was used? How often is data added to the training set?
Test Data	What data was used to test system performance? Under what conditions has the system been tested?
Model Information	General description of the model(s) used (e.g., large language model, transformer, deep learning, supervised learning, built on an existing open source model, computer vision)
Update procedure	In general, how often are the models updated for users? Will the user have a choice in moving to the updated model or staying on the current model?
Inputs and Outputs	What are the inputs to the AI system? What are its outputs?
Performance Metrics	How was the accuracy and effectiveness of the system measured? What metrics were used, and why? What is the range of accuracy of the AI system and how does it vary depending on the data? What is the system optimizing for and under what constraints?
Bias	What biases does the tool exhibit and how does it handle that bias? This can include but is not limited to biases on human factors such as gender, race, socioeconomic status, disability, culture, age, or other protected classes, or biases on general factors such as a sampling bias, survivorship bias, detection bias, or observer bias.

[5] The FactSheet template is heavily inspired by the IBM Research AI FactSheets 360 project.

DRAFT

Robustness	How does the AI system handle outliers? Do overwritten decisions feed back into the system to help calibrate it in the future?
Optimal Conditions	What conditions does the model perform best under?
Poor Conditions	What conditions does the model perform poorly under? What are the limitations of the AI system? What kinds of errors can it make?
Explanation	How does the AI system explain its predictions? Are the outcomes of the AI system understandable by subject matter experts, users, impacted individuals, and others?

Algorithmic Equity Assessment Questionnaire

How is the AI tool monitored to identify any problems in usage? Can outputs (recommendations, predictions, etc.) be overwritten by a human, and do overwritten outputs help calibrate the system in the future?	Problems in usage can include false negatives, false positives, bias, hallucinations, and human-reported quality issues (such as poor translations or poorly generated images)
Have the vendors or an independent party conducted a study on the bias, accuracy, or disparate impact of the system? If yes, can the City review the study? Include methodology and results.	This can include bias impact reports, algorithmic impact reports, or others.[6]
Is the data used to the train the system representative of the communities it covers?	
How can the City and its partners flag issues related to bias, discrimination or poor performance of the AI system?	
How is the AI tool made accessible to people with disabilities?	Has it been assessed against any usability standards, and if so what was the result?
What other human factors, if any, were considered for usability and accessibility of the system?	

[6] An example bias impact report template is hosted by AI Now

DRAFT

Example FactSheet[7]

This is an example of the factsheet above completed by a fake company. This is only here for reference and does not need to be included in the completed form.

Vendor Name	XYZ Technologies, Inc.
System Name	Audio Classifier
Overview	This document is a FactSheet accompanying the Audio Classifier model on IBM Developer Model Asset eXchange.
Purpose	This model classifies an input audio clip.
Intended Domain	This model is intended for use in the audio processing and classification domain.
Training Data	The model is trained on the AudioSet dataset by Google.
Test Data	The test set is also part of the AudioSet data. There was a 70:20:10% split of the data into train:val:test. The ratio of samples/class was maintained as much as possible in all the splits.
Model Information	The audio classifier is a two-stage model: • The first model (MAX-Audio-Embedding-Generator) converts each second of input raw audio into vectors or embeddings of size 128 where each element of the vector is a float between 0 and 1. • Once the vectors are generated, there is a second deep neural network that performs classification.
Inputs and Outputs	Input: a 10 second clip of audio in signed 16-bit PCM wavfile format. Output: a JSON with the top 5 predicted classes and probabilities.
Performance Metrics	**Metric** / **Value** Mean Average Precision / 0.357 Area Under the Curve / 0.968 d-prime / 2.621

[7] The example FactSheet is taken from IBM Research AI Factsheet 360's Audio Classifier sample.

DRAFT

Bias	The majority of audio samples in the training data set represent voice and music content. Potential bias caused by this over-representation has not been evaluated. Careful attention should be paid if this model is to be incorporated in an application where bias in voice type or music genre is potentially sensitive or harmful.
Robustness	This audio classifier is not robust to the L-infinity and L2 norms for the HopSkipJump attack.

	L2	L-Infinity
5th Percentile	887.0 (200.9)	5.5 (4.9)
10th Percentile	1496.6 (720.6)	7.53 (5.73)
15th Percentile	3723.1 (4707.2)	52.8 (41.8)
25th Percentile	7187.9 (---)	187.6 (198.1)
50th Percentile	11538.6 (---)	502.8 (---)

The susceptibility of the model to the two attacks. The parenthetical values in the table above represent the fitted curve evaluated at 11 iterations. (When we are unable to fit a curve, or the result is negative, we denote by ---.)

Optimal Conditions	• When the input audio contains only one or two distinct audio classes. • When the audio quality is high with lesser noise.
Poor Conditions	• When the audio contains more than two distinct classes. • When the audio quality is low with more noise.
Explanation	While the model architecture is well documented, the model is still a deep neural network, which largely remains a black box when it comes to explainability of results and predictions.

Algorithmic Equity Assessment Questionnaire

How is the AI tool monitored to identify any problems in usage? Can decisions be overwritten by a human, and do overwritten decisions help calibrate the system in the future?	The system can be monitored in usage, and audio classification decisions can be retroactively overwritten by a human. The overwritten decisions can help calibrate the system in the future if desired.
Have the vendors or an independent party conducted and published a validation report (including the methodology and results) that	Yes. Results from the third party study can be provided upon request.

DRAFT

audits for accuracy and discriminatory/disparate impact? If yes, can the City review the study?	
Is the data used to the train the system representative of the communities it covers?	The majority of audio samples in the training data set represent voice and music content from Google's AudioSet dataset. The dataset includes voices of all types, but may not be in a ratio reflective of the San José community. Potential bias caused by this over-representation has not been evaluated.
How can the City and its partners flag issues related to bias, discrimination or poor performance of the AI system?	The system provides a web portal to each customer to show the results of the system and its impact on transit performance in the form of reports and graphs.
How is the AI tool made accessible to people with disabilities?	The system is embedded into a graphics user interface that is compliant with modern screen readers, and provides the option for auto-generated dictation of text on the screen.
What other human factors, if any, were considered for usability and accessibility of the system?	Users can provide feedback on the interface through an online suggestion box, which has informed the evolution of the interface design over the last several years.

DRAFT

Appendix D: Algorithmic Impact Assessment Form

The Algorithmic Impact Assessment (AIA) Form template can be accessed here and examples for completed responses and be found on the Digital Privacy Office's AI Review webpage.

Below are questions included in the Algorithmic Impact Assessment (AIA) Form completed by City staff when there is a procurement proposal involving an algorithmic system. This is normally completed via an online form.

Project Objective

1. Project title
2. Please clearly describe the project use case, the current process, and the desired outcome.
3. Which department is owning this system?
4. Who in the City is responsible f this system? First and last name
5. What is this person's role in the City?
6. What is their email address?
7. Why does your department choose automation as an approach to this problem? What other approaches to solving this problem were considered (if any) and what led to choosing automation?

Algorithm Details

1. Will the algorithm be designed, developed, deployed, or maintained by vendors or third parties?
2. How can the City test the algorithm before it is put into use?

Transparency

1. How do individuals receive a notice in advance of interacting with the system? For example, if a user is interacting with a chatbot, the system lets the user know they are talking to a chat bot instead of a human.
2. How can third-party auditors easily view the system's data in order to perform evaluations? If vendor not determined, put "TBD"
3. How could system operators or residents know if the system outputs an error? What ability will they have to correct or appeal an error?

Equity

1. What individuals and communities will interact with the system? For example, is the algorithm used on the general City population (technology used in many public areas) or a specific group (e.g., children in a school program, a single neighborhood)?
2. How likely is it that the system impacts children under the age of 18?
3. Does this use case, and the information/decisions provided by the algorithm, impact an individual's right or freedoms (e.g., if the algorithm helps determine if a suspect can be put on bail or must remain in jail)?

DRAFT

   a. How is this use case, and the information/decisions provided by the algorithm, related to an individual's right or freedoms (e.g., if the algorithm helps determine if a suspect can be put on bail or must remain in jail)?
4. Does this use case, and the information/decisions provided by the algorithm, impact an individual's economic status (e.g., if the algorithm helps determine if an individual can apply to affordable housing)?
   a. How is this use case, and the information/decisions provided by the algorithm, related to an individual's economic status (e.g., if the algorithm helps determine if an individual can apply to affordable housing)?
5. Does this use case, and the information/decisions provided by the algorithm, impact an individual's health, healthcare, well-being (e.g., if the algorithm helps determine an individual's likeliness for colon cancer)?
   a. How is this use case, and the information/decisions provided by the algorithm, related to an individual's economic status (e.g., if the algorithm helps determine if an individual can apply to affordable housing)?
6. Do decisions from the system impact the environment? (e.g., potential impact to carbon emissions, high tech waste)?
   a. How do decisions from the system impact the environment (e.g., potential impact to carbon emissions, high tech waste)?
7. What issues could arise if the algorithmic system is inaccurate?

Human oversight

1. Please describe the level of autonomy of the system.
   a. System operates automatically with no human intervention
   b. System operates automatically with occasional retrospective reviews by humans
   c. System operates automatically with opportunity for human to override any individual action
   d. System produces recommendations but cannot act without human intervention
2. If there is human intervention in the system, is it by the vendor, City department/office, or both?
3. Please list the City roles/divisions that will be "touching" the system, or managing the deployment and use of the system.
4. How does the Department provide training and resources to personnel to help them develop the skills they need to effectively operate the system?
5. In the event that the system does not work or is deemed to be inaccurate, what back-up measures are in place to continue providing services? In other words, can the City continue to provide the service without the algorithmic system, and how would it do that?

DRAFT

Appendix E: RFP Questions

Below is an illustrative example of RFP questions and how to evaluate them for an AI system. Recommended point values also provided. Not all questions will be included in every RFP.

1. Overview - Brief summary of the AI system.
    a. 0 points. Used to understand the context of the system
2. Purpose - What function does the AI system perform, and for what purpose?
    a. 3 points. Pass/Fail does the AI system's purpose fit the need of the department?
3. Intended Domain – What domain is the AI system intended to be applied in?
    a. 3 points. Pass/Fail is the AI system meant to be applied to this domain? For example, an AI meant to identify motorcycles should not be used to identify cars, unless it was built to identify both.
4. Training Data - How was the AI system trained? What data was used? How often is data added to the training set?
    a. 5 points. Should provide a brief explanation for how the data was trained. They should explain that the model has been trained on a sufficiently large data set for the use case that is updated with new data at a frequency suitable for the use case. For example, an AI meant to translate language may need to update at least annually since language evolves quickly.
5. Test Data - What data was used to test system performance? Under what conditions has the system been tested?
    a. 5 points. The test data and the conditions it was tested in should match the conditions we intend to use the system.
6. Model Information - Provide a general description of the model(s) used (e.g., large language model, transformer, deep learning, supervised learning, built on an existing open source model, computer vision)
    a. 3 points. Pass/Fail do they provide a general explanation of the models used.
7. Update procedure - In general, how often are the models updated for users? Will the user have a choice in moving to the updated model or staying on the current model?
    a. 5 points. We want to have a choice in having the model we use updated, or at least the choice to opt-out of automatic updates.
8. Inputs and Outputs - What are the inputs to the AI system? What are its outputs?
    a. 3 points. Pass/Fail do they share what information goes into the model and what goes out. The outputs should be something tangible, like a recommendation, decision, or content.
9. Performance Metrics - How was the accuracy and effectiveness of the system measured? What metrics were used, and why? What is the range of accuracy of the AI system and how does it vary depending on the data? What is the system optimizing for and under what constraints?
    a. 20 points. Clearly explains how they measure accuracy and effectiveness. Justifies metrics used for measurement. Do the metrics make sense to you, and do they meet the needs of your use case? How do the performance metrics compare to other vendors?
10. Bias - What biases does the tool exhibit and how does it handle that bias? This can include but is not limited to biases on human factors such as gender, race, socioeconomic status, disability,

DRAFT

culture, age, or other protected classes, or biases on general factors such as a sampling bias, survivorship bias, detection bias, or observer bias.
    a. 20 points. Does the vendor report bias or justify why no bias would be present.
11. Robustness - How does the AI system handle outliers? Do overwritten decisions feed back into the system to help calibrate it in the future?
    a. 5 points. Vendor explains how it handles outlier data. Vendor provides method to overwrite AI outputs and feed those outputs back into the AI system? For example, if the AI system calls a bicycle a tricycle, can you correct it and will that correction update the model?
12. Optimal Conditions - What conditions does the model perform best under?
    a. 5 points. Does the vendor explain in what conditions the model performs best? Do those conditions match the typical conditions for your use case?
13. Poor Conditions - What conditions does the model perform poorly under? What are the limitations of the AI system? What kinds of errors can it make?
    a. 5 points. Does the vendor explain in what conditions the model performs poorly? Do those conditions *not* match the typical conditions of your use case?
14. Explanation - How does the AI system explain its predictions? Are the outcomes of the AI system understandable by subject matter experts, users, impacted individuals, and others?
    a. 5 points. Vendor demonstrates how the AI system can explain its predictions to subject matter experts and/or to the general public, depending on the use case.
15. Identifying problems - How is the AI tool monitored to identify any problems in usage? Can outputs (recommendations, predictions, etc.) be overwritten by a human, and do overwritten outputs help calibrate the system in the future?
    a. 5 points. Vendor explains 1) how the system is monitored, 2) how your agency can monitor its effectiveness in the field, 3) how outputs can be overwritten, and 4) how overwritten outputs can update the model.
16. Studies of bias and accuracy - Have the vendors or an independent party conducted a study on the bias, accuracy, or disparate impact of the system? If yes, can the [Agency] review the study? Include methodology and results.
    a. 5 points. Vendor provides a study, ideally by an independent party, on the bias, accuracy, and impact of the system. If the study is done by the vendor, vendor explains why the study is valid.
17. Representation - Is the data used to the train the system representative of the communities it covers?
    a. 5 points if applicable. If the model involves data on people, vendor explains how the people data used to train the system includes people that represent the diversity of your community.
18. Flagging inaccuracies - How can the [Agency] and its partners flag issues related to bias, discrimination, or poor performance of the AI system?
    a. 5 points. Vendor provides an easy method for flagging issues within the system around outputs that appear biased, inaccurate, or otherwise perform poorly.
19. Accessibility - How is the AI tool made accessible to people with disabilities? Has it been assessed against any usability standards, and if so what was the result?
    a. 5 points. Vendor explains how the system as a whole is accessible for users, such as the interface is compatible with screen-readers, and it can be translated into the necessary languages.

DRAFT

20. Usability - What other human factors, if any, were considered for usability and accessibility of the system?
    a. 3 points. Pass/Fail does the vendor explain other considerations for usability and accessibility that were built into the system.

Use-case specific questions

You may want to include additional questions based on the specific use case for the AI system. Refer to use-case specific RFP questions in the appendix "RFP questions for AI Use-Cases".

Use Case #1: Translation-Based AI Systems

- Please provide a list of all languages your solution supports for live speech translation, beyond the mandatory languages specified in Attachment A. Additionally, describe how often you introduce new languages to your platform and outline the process for these additions.
- Does your Solution offer text-to-speech functionality or other methods to accommodate American Sign Language (ASL) speakers in both in-person and virtual (Zoom) meetings? If so, please describe the features and functionalities that enable this accommodation, including any limitations or requirements for optimal performance.
- How do you measure the performance of your Solution in terms of translation, speech-to-text, and text-to-speech for English, Spanish, Tagalog, Mandarin, and Vietnamese? Please specify the metrics used (e.g., BLEU score, human ratings, etc.) and the conditions under which these measurements were taken. Based on these metrics, what is the performance of your Solution for the specified languages?
- Please provide/describe any third-party evaluations or benchmarks that have been conducted on your Solution's translation capabilities. Include details on the evaluation process, criteria, results, and any subsequent improvements made to the Solution based on these evaluations.
- What is your Solution's average time delay between speech input and translation output?
- How does the Solution handle rapid speech or overlapping conversations?
- How can the Solution adapt to idiomatic expressions, cultural references, or local slang?

Use Case #2: Large-Language Models

- What is your Solution's average time delay between text input and output?
- Is the user's input or output data used to the train your Solution? If yes, will this data train the model for any other users of your Solution?

Use Case #3: Computer Vision

- How well does your Solution adapt to blurring, obstruction, poor lighting or any conditions that may lead to misclassification?

DRAFT

Appendix F: Publicly listed GovAI Coalition Participating Agencies

Below is the list of agencies in the GovAI Coalition who have agreed to being listed as public members as of December 4, 2023. Jurisdictions with an asterisk (*) next to their name have multiple agencies from that location participating in the Coalition.

1. City and County of San Francisco, CA
2. City of Alexandria, VA
3. City of Austin, TX
4. City of Boise, ID*
5. City of Carmel, IN
6. City of Charlotte NC*
7. City of Chattanooga, TN
8. City of Chicago, IL
9. City of Cleveland, OH
10. City of Columbus, OH
11. City of Elk Grove, CA
12. City of Fairfield, CA
13. City of Grand Rapids, MI
14. City of Irvine, CA*
15. City of Kansas City, Missouri
16. City of Long Beach, CA
17. City of Martinez, CA
18. City of Milpitas, CA
19. City of Newport News, VA
20. City of Pittsburgh PA
21. City of Placer, CA
22. City of Portland, OR*
23. City of Raleigh, NC
24. City of Rockville, MD
25. City of Saint Paul, MN
26. City of San Antonio, TX*
27. City of San Diego, CA
28. City of San José, CA
29. City of Seattle, WA
30. City of South Bend, IN
31. City of St. Louis, MO
32. City of Sugarland, TX
33. City of Sunnyvale, CA
34. City of Tempe, AZ
35. City of Tucson, AZ
36. City of Virginia Beach, VA*
37. Colorado Department of Revenue
38. County of Ada, ID
39. County of Contra Costa, CA

DRAFT

40. County of El Dorado, CA
41. County of Fairfax, VA
42. County of Humboldt, CA
43. County of Kern, CA
44. County of Lake, CA
45. County of Larimer, CO*
46. County of Los Angeles, CA
47. County of Los Angeles, CA, Department of Public Works
48. County of Los Angeles, CA, Internal Services Department
49. County of Los Angeles, CA, Sheriff's Department
50. County of Madera, CA
51. County of Marin, CA
52. County of Monterey, CA
53. County of Multnomah, OR
54. County of Nevada, CA
55. County of Orange, CA
56. County of San Bernardino, CA
57. County of San Diego, CA*
58. County of San Luis Obispo, CA
59. County of Santa Barbara, CA
60. County of Santa Clara, CA*
61. County of Santa Cruz, CA*
62. County of Stanislaus, CA, Health Services Agency
63. County of Tulare, CA
64. County of Tuolumne, CA
65. County of Washington, MN
66. County of Washoe, NV
67. County of Waukesha, WI
68. County of Yuba, CA
69. Covered California
70. Louisville/Jefferson County, KY
71. Metropolitan Government of Nashville and Davidson County, TN
72. Midpeninsula Regional Open Space District, CA
73. Santa Clara University, CA
74. TriMet, OR
75. Washington, D.C.

DRAFT

USED IN PURCHASING CONTRACT HERE: https://records.sanjoseca.gov/Contracts/OC-006170-000.pdf

EXHIBIT H-2
ALGORITHMIC SYSTEMS STANDARDS AND REQUIREMENTS

The purpose of this document is to define the City of San José's Artificial Intelligence (AI) systems usage policy and applicable requirements for City Contractors.

1 ARTIFICIAL INTELLIGENCE SYSTEMS

The City defines an AI system as any system, software, sensor, or process that automatically generates outputs, including, but not limited to, predictions, recommendations, or decisions that augment or replace human decision-making. This extends to software, hardware, algorithms, and data generated by these systems, used to automate large-scale processes, or analyze large data sets.

AI system does not refer to algorithmic systems that a person directly defines. A general rule is that any algorithm that a person cannot easily write out or readily understand is most likely AI.

2 ALGORITHMIC BIAS

AI system responses are based on patterns and relationships learned from large datasets derived from existing human knowledge, which may contain errors and may be biased across race, sex, gender identity, ability, and many other factors which may result in biases in the AI system's decision-making processes and outputs.

The City defines algorithmic discrimination as the condition in which an automated decision tool contributes to unjustified differential treatment or impacts disfavoring people based on factors including but not limited to actual or perceived race, color, ethnicity, sex, religion, age, national origin, English proficiency, disability, veteran status, genetic information, reproductive health, or medical conditions.

3 ALGORITHMIC RISK

The Contractor shall work with the City to evaluate and minimize risks posed by the AI system, including, but not limited to, the purpose of the AI system, any consequential decisions it supports, the potential negative impact of the system on individuals and property, and the likelihood of having a negative impact, such as through an inaccurate prediction or classification.

At the City's request, the Contractor will immediately discontinue use of any AI components or systems involved in providing services to the City. If the City, in its sole discretion, suspects substantial harm is being caused to residents or members of the public by all or part of the AI system, the Contractor will work with the City to assess and resolve the issue(s).

4 REQUIREMENTS FOR CONTRACTORS WHEN USING AI SYSTEMS

To the extent permissible by law, the Contractor shall adhere to the following requirements while using any AI systems in the course of doing business with or for the City:

4.1 Accuracy

Contractor shall provide the City or entity working on behalf of the City with the means to monitor the accuracy of the AI systems it uses and report this accuracy to the City. This may include but is not

limited to the false positive rate, the false negative rate, the true positive rate, the average percentage error, the mean-squared error and/or human judgement scores.

4.2 Oversight

Contractor shall provide the City or entity working on behalf of the City the means for a human to evaluate and override decisions of the AI system. The human evaluator must be able to override the decision of the AI system and take precedence over all consequential decisions.

Contractor shall maintain and provide evidence of compliance with this AI Systems Policy upon request by the City.

4.3 Equity

The City only uses AI systems when they do not increase existing racial and socioeconomic disparities.

The City and Contractor shall review the performance of the AI system over time, and the Contractor will work with City to address any biases and discriminatory outcomes identified by the City.

The City may at any time audit all information, processes, and analyses or request the Contractor analyze the potential areas of harm caused by the AI system within or related to the services the Contractor provides to the City. Failure to comply may be considered a breach of contract unless the City grants an extension.

4.4 Transparency

The Contractor shall articulate how the AI system makes decisions, including what factors influence the system's decisions, rule-based logic, and probability-based decisions. The City holds the right to communicate its general usage of the AI system and explain its decision-making processes to the public.

4.5 Monitoring and Auditing of Contractor Security and Privacy Performance

The City retains the right to observe or audit any relevant work processes, services, or documents in the course of doing business with the City to confirm that the Contractor (and any relevant sub-contractors) is complying with this Policy. Contractor shall provide access to information, documentation, and personnel required to complete this audit at no additional cost to the City.

DRAFT Artificial Intelligence (AI) Policy

PURPOSE

This policy outlines and establishes the governance and management of Artificial Intelligence (AI) systems required for the City of San José ("City") to:

- Define how AI systems may be used for legitimate City purposes in accordance with applicable local, state, and federal laws;
- Maintain confidentiality, integrity, and availability of information used and generated by AI systems;
- Define the objectives and principles for City usage of AI systems; and
- Define roles and responsibilities related to the City's usage of AI systems.

The City's AI systems and the data contained therein will be built, operated, and maintained using the City's AI Manual.

SCOPE

This policy applies to:

1. All City AI systems; and
2. All operators and stewards of the City's AI systems, including, but not limited to employees (full-time, part-time), interns, consultants, contractors, and volunteers.

For the purposes of this Policy, the City defines an "Artificial Intelligence" or "AI" set forth in 15 U.S.C. 9401(3): a machine-based system that can, for a given set of human-defined objectives, make predictions, recommendations, or decisions influencing real or virtual environments. AI systems use machine- and human-based inputs to perceive real and virtual environments; abstract such perceptions into models through analysis in an automated manner; and use model inference to formulate options for information or action.

The term "AI model" means a component of an information system that implements AI technology and uses computational, statistical, or machine-learning techniques to produce outputs from a given set of inputs.

The term "AI system" means any data system, software, hardware, application, tool, or utility that operates in whole or in part using AI.

GENERAL PRINCIPLES

This policy establishes a comprehensive governance structure for AI systems that allows the City to use powerful technological systems for the benefit of our residents while safeguarding against algorithmic harms.

The key objectives of the Artificial Intelligence Policy are to:

- Ensure that all AI systems used by the City or on its behalf adhere to the guiding principles of accuracy, transparency, equity, accountability, utility, and privacy;
- Establish and maintain processes to assess and manage risks presented by AI systems used by the City;

- Align governance of AI systems with existing security and privacy measures in accordance with the Information and Security Policy (1.7.6) and Digital Privacy Policy (0-46);
- Define prohibited uses of AI systems;
- Establish "sunset" procedures for AI systems that no longer meet the needs of the City;
- Support compliance with applicable laws and regulation.

The guiding principles for the Artificial Intelligence Policy include:

- **Accuracy:** Deploy AI systems that have a demonstrated accuracy rate, relevancy, and performance that meets a threshold appropriate for the context in which it will be deployed;
- **Transparency:** Inform the general public about the AI systems used;
- **Equity:** Mitigate bias in algorithms and use AI systems with a commitment to reduce racial and socioeconomic disparities;
- **Accountability:** Ensure that AI systems have a human owner who is responsible for system oversight and is able to override consequential actions from the system;
- **Utility:** Pilot algorithmic tools to assess their usefulness, but only adopt algorithmic tools that demonstrate a strong positive impact on City services or residents' livelihoods;
- **Privacy:** Ensure a privacy-centric approach in all AI systems, safeguarding personal and sensitive data from unauthorized access, disclosure, and manipulation.

RESPONSIBILITIES

- The Chief Information Officer (CIO) is responsible for directing City technology resources, policies, projects, services, and coordinating the same with other City departments. The CIO shall designate the City Information Security Officer (CISO) to actively ensure AI systems are used in accordance with the Information and Systems Security Policy from City Policy Manual 1.7.6. The CIO shall also designate the City Privacy Officer (CPO) to actively ensure the AI system is used in accordance with the City Digital Privacy Policy from Council Policy Manual 0-46;
- The CISO is responsible for overseeing the enterprise security infrastructure, cybersecurity operations, updating security policies, procedures, standards, guidelines, and monitoring policy compliance. The CISO is responsible for overseeing the security practices of AI systems used by or on behalf of City Departments;
- The CPO is responsible for overseeing the enterprise digital privacy practices, data processing practices, and responsible usage of technology in compliance with the City Digital Privacy Policy. The CPO is responsible overseeing the privacy practices of AI systems used by or on behalf of City Departments. The CPO or designee is responsible for coordinating reviews on the AI systems used by the City as detailed in the Artificial Intelligence Manual;
- City Departments are responsible for following this policy and following updates to this policy and the Artificial Intelligence Manual, and shall check compliance with these documents at least annually;
- The CIO or designee shall notify City Departments when an update to this Policy or the Artificial Intelligence Manual is released;
- The City Attorney's Office (CAO) is responsible for advising of any legal issues or risks associated with AI systems usage by or on behalf of City Departments;

- The City Manager's Office (CMO) or designee may, at its discretion, inspect the usage of AI systems and require a Department to alter or cease its usage of AI systems or a partner's usage of AI systems on behalf of the Department.
- The Finance Department – Purchasing Office is responsible for overseeing the procurement of AI systems and requiring vendors to comply with City policy standards through contractual agreements.

POLICY

Requirements for Artificial Intelligence System Contracts

Any City Department seeking to purchase and/or operate an AI system must comply with the following:

- Submit a procurement request to the Information Technology Department, noting to the best of their knowledge if the technology is considered an AI system;
- Undergo an Algorithmic Review facilitated by the CPO. The CPO or designee will assess the risk of the potential AI system and conduct additional review steps as required in the Artificial Intelligence Manual,
- Provide supplementary information to the CPO as needed during the Algorithmic Review;
- If applicable, attach the standard vendor agreement for AI systems to the agreement.

City staff must ensure Contractors with access to City-owned AI systems are aware of and comply with the following:

- Adhere to standard vendor agreement for AI systems.
- **Accuracy:** Provide the City or entity working on behalf of the City with the means to monitor the accuracy of the AI system(s) it uses and report this accuracy to the City. This may include, but is not limited to, the false positive rate, the false negative rate, the true positive rate, the average percentage error, the mean-squared error, and human judgement scores.
- **Human oversight:** Provide the City or entity working on behalf of the City the means for a human to evaluate and override decisions of the AI system. The human evaluator must be able to override the decision of the AI system and take precedence over all consequential decisions.
- **Explainability:** Articulate how the AI system makes decisions, including what factors influence the system's decisions, rule-based logic, and probability-based decisions. The City holds the right to communicate its general usage of the AI system and explain its decision-making processes to the public.
- **Notice:** If required by the City, provide written notice of the usage of an AI system to data subjects and/or end-users, preferably at the point of service.
- **Due process:** Define and implement a process for data subjects and/or end-users to easily submit grievances regarding the use or operation of the AI system, including appeals to the outcome(s) of the AI system. The data subject must be provided a meaningful response to the feedback or appeal, including any ability to request human intervention.
- **Training:** Ensure that staff who may operate the AI system receive appropriate training on

responsible use of the system, including how to

- Protect personally identifiable information;
- Mitigate algorithmic bias;
- Promote high accuracy rates;
- Report system errors; and
- Maintain service delivery if the AI system fails.

- **Auditing:** The City retains the right to observe or audit any relevant work processes, services, or documents in the course of doing business with the City to confirm that the Contractor (and any relevant sub-contractors) is complying with this Policy. Contractor shall provide access to information, documentation, and personnel required to complete this audit at no additional cost to the City.

Prohibited Uses

The use of certain AI systems are prohibited because they deal with sensitive information and there is a higher risk that they can cause harm. This includes the following prohibited purposes:

- Real-time and covert biometric identification.
- Emotion analysis, or the use of computer vision techniques to classify human facial and body movements into certain emotions or sentiment (e.g., positive, negative, neutral, happy, angry, nervous).
- Fully automated decisions that do not require any meaningful human oversight but substantially impact individuals.
- Social scoring, or the use of AI systems to track and classify individuals based on their behaviors, socioeconomic status, or personal characteristics.
- Cognitive behavioral manipulation of people or specific vulnerable groups.
- Fully autonomous weapons systems.

If City staff become aware of an instance where an AI system has caused harm, staff must report the instance to their supervisor and the CPO.

Sunset Procedures

If an AI system operated by the City or on its behalf ceases to provide a positive utility to the City's residents as determined by the CPO, then the use of that AI system must be halted unless express exception is provided by the City Manager or City Council. If the abrupt cessation of the use of that AI system would significantly disrupt the delivery of City services, usage of the AI system must be gradually phased out over time.

Public Records

The City is subject to the California Public Records Act. City staff must follow all current procedures for records retention and disclosure.

Policy Enforcement

All employees and agents of the City, whether permanent or temporary, interns, volunteers, contractors, consultants, vendors, and other third parties operating AI systems on behalf of the City are required to abide by this Policy and the associated Artificial Intelligence Manual.

VIOLATIONS OF THE ARTIFICIAL INTELLIGENCE POLICY

Violations of any section of the Artificial Intelligence Policy, including failure to comply with the Artificial Intelligence Manual, may be subject to disciplinary action, up to and including termination. Violations made by a third party while operating an AI system on behalf of the City may result in a breach of contract and/or pursuit of damages. Infractions that violate local, state, federal or international law may be remanded to the proper authorities.

GLOSSARY

Artificial Intelligence: As set forth in 15 U.S.C. 9401(3): a machine-based system that can, for a given set of human-defined objectives, make predictions, recommendations, or decisions influencing real or virtual environments. AI systems use machine- and human-based inputs to perceive real and virtual environments; abstract such perceptions into models through analysis in an automated manner; and use model inference to formulate options for information or action.

Artificial Intelligence Model: A component of an information system that implements AI technology and uses computational, statistical, or machine-learning techniques to produce outputs from a given set of inputs.

Artificial Intelligence System: Any data system, software, hardware, application, tool, or utility that operates in whole or in part using AI.

Low-risk: AI systems that involve an opt-in approach to users' subjection to the system. They generate predictions but do not automate decision-making and involves anonymized information used to provide general improvements to the City. Notice is provided upon collection if any personal information is involved.

Medium-risk: AI systems that involve identifiable information not traditionally kept hidden (e.g., name, email, phone #) to provide targeted government services desired by the data owner. Notice is provided at time of collection and often requires written consent.

High-risk: AI systems that potentially impact areas such as the management of critical infrastructure, biometric identification, legal interpretation, and identifiable information traditionally kept hidden, like Social Security Numbers, credit card numbers, etc. These high-risk systems may also encompass components that automate decision-making and are subject to minimal or no human oversight.

Unacceptable risk: AI systems that pose a threat to human safety or welfare including, but not limited to, cognitive behavioral manipulation, social scoring based on behavior, socio-economic status, or personal characteristics.

Real-time and covert biometric identification: The live identification of an individual using technologies including, but not limited to, facial recognition and iris scanning, without that individual's knowledge or consent.

Emotion analysis: The use of computer vision techniques to classify human facial and body movements into certain emotions or sentiment (e.g., positive, negative, neutral, happy, angry).

San José Artificial Intelligence Manual

Maintained and updated by:
San José's Digital Privacy Office
digitalprivacy@sanjoseca.gov

Last updated:
November 3, 2023

PURPOSE

The San José Artificial Intelligence Manual provides guidance on matters related to artificial intelligence (AI) for the City of San José (commonly referred to as the "City"). The Manual serves as an extension of the City's policy on algorithmic systems. It is intended for all City Staff and agents of the City, whether permanent or temporary, interns, volunteers, contractors, consultants, vendors, and other third parties operating algorithmic systems on behalf of the City. Refer to this manual for all matters relating to City AI usage, including purchasing, procurement, governance, incident response, and education.

This document covers the following topics:

1. **Algorithmic Review** – required for all new technology procurements and data initiatives that involve an algorithmic system; see "Algorithmic Review"

2. **Artificial Intelligence (AI) Governance** – the framework for managing and monitoring the full lifecycle of all City AI systems; see "Artificial Intelligence (AI) Governance"

3. **Algorithmic Systems (AI) Policy** – the foundational document for the City of San José's approach to artificial intelligence; refer to the "Algorithmic Systems (AI) Policy"
4. **Generative AI Guidelines** – guidance for City staff on how to use Generative AI tools; see "Generative AI Guidelines"

5. **AI Meeting Tools Guidelines** – guidance for City staff on how to identify and respond to AI Meeting Tools; see "AI Meeting Tools Guidelines"

6. **All Things AI in the City of San José Reference Page** – a living repository of all Public documents and pages related to AI governance; see "All Things AI in the City of San José"

This document will continue to be updated to provide the latest information on the City's Artificial Intelligence Policy and practices.

ARTIFICIAL INTELLIGENCE IN SAN JOSÉ

Background

As the capital of Silicon Valley, the City of San José has a history of using innovative solutions to provide impactful services to residents with limited public sector resources. In recent years, the City has explored the capabilities of Artificial Intelligence (AI) and machine learning systems to improve the delivery of City services and support data analytics, like with AI traffic cameras and Automated License Plate Readers. In response to the City's increased use of AI systems, the City Privacy Office (CPO) has established an algorithmic review process for technology procurements that involve the use of AI. This Manual provides detail into the City's AI governance established by the Algorithmic Systems (AI) Policy. As the City's AI governance practices and the AI industry mature, the policies and this Manual will continue to evolve.

Identifying AI

An "algorithm" and "algorithmic system" are defined in the "Algorithmic Systems Policy".

In practice, the City uses a checklist of questions to identify algorithmic systems.[1] Procurement officers who process technology proposals make particular use of this checklist. Technologies that satisfy one or more of the following conditions may be identified as an "algorithmic system":

- Does the company use words such as "personalized", "tailored" and "adaptive" in its marketing?

[1] This checklist is inspired by The EdTech Equity Project's school procurement guide.

- Does the technology use data to provide predictions, recommendations, or decisions?
- Does the technology augment or replace human decision-making?

Although the City may identify a technology as an algorithmic system, not all algorithmic systems require a full algorithmic review. Learn more about the medium and high-risk algorithmic systems that require full review in the section "Algorithmic Review Process: Step by Step, Step 2: Risk Analysis".

While an algorithm conducts an analysis, an algorithmic system makes a decision based on the algorithm's analysis. The picture below shows the relationship between an algorithm and an algorithmic system through an example of an algorithmic system designed to change traffic lights based on the presence of bikers. While the algorithm would solely identify a biker, the algorithmic system would change the traffic light to accommodate the biker identified by the algorithm.

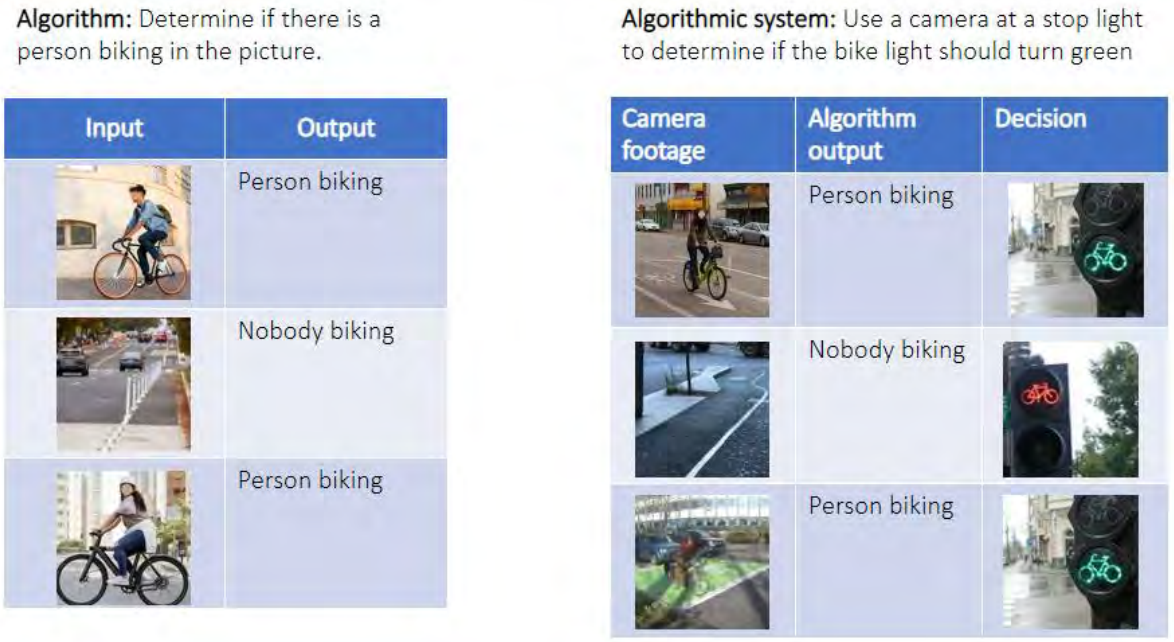

Figure 1: Example of an algorithm and an algorithmic system. In this example the algorithm identifies if a biker exists in the photo. That algorithm is then used in an algorithmic system to turn a bike light green at an intersection.

ALGORITHMIC REVIEW

Introduction

In addition to the City's Privacy Review protocols, the CPO conducts algorithmic reviews to ensure that the proposed algorithmic system complies with the City's AI Principles and relevant privacy policies (in consultation with the City Attorney's Office). While not all steps

of the City's AI Review protocols are necessary for every project, the protocol provides the general review framework for any project.

What Needs an Algorithmic Review?

Not all algorithmic systems require a full algorithmic review. Simple rule-based systems, which rely on a series of hard-coded conditional rules to produce one of multiple pre-defined outputs, may not be subject to the algorithmic review process. Whereas, algorithm-based systems, which rely on more complex logic to make predictions based on patterns in a set of training data, are more frequently subject to the algorithmic review process.

Whether a proposal is subject to an algorithmic review also depends on the risk of the algorithmic system in question. While many systems use algorithms to provide services, they do not require a review given their impact on residents. To classify the risk of an algorithmic system, the CPO conducts a risk threshold assessment before initiating an algorithmic review of a given proposal (see the subsection "Step 2: Risk Analysis" within the section "Algorithmic Review Process: Step by Step" for more information on the risk threshold assessment). See the chart below for examples of algorithmic systems that do and do not require an algorithmic review.

Algorithmic review **required**	Algorithmic review **<u>not</u> required**
1. Predictive policing 2. Identity recognition based on one-to-many matching (e.g., License plate reader, facial recognition) 3. Algorithms that cost greater than $250k/year (need review for effectiveness) 4. Algorithms used to regularly justify search warrants, seizures, or other restriction of rights 5. Algorithms used to levy fines or taxes 6. Automated decision-making that traditionally requires a human review 7. Algorithms that deny or enable access to city services (e.g., translation service for 311)	1. General website recommendations (e.g., recommended videos on the City's Youtube channel) 2. Search bars 3. Related event notifications 4. Opt-in service apps, such as the mysanjose or SJ311 apps 5. Strictly rule-based logic (e.g., an accounting software to calculate taxes owed, a motion-detection based alarm system)

Figure 2: A list of examples of algorithmic systems that do and do not require an algorithmic review.

Algorithmic Review Process: At a Glance

The seven steps that comprise the algorithmic review protocol are outlined below. To understand how the algorithmic review process is adapted for Request for Proposals (RFP), refer to the section "Request for Proposals (RFP) Algorithmic Review Protocol".

1. Procurement Request: Departments first engage the CPO to discuss their project. Departments should provide existing material related to the project, including details on project purpose, data collected and specific uses and benefits of automating a process, recommendation, or decision.
2. Risk Analysis: The CPO conducts a "threshold analysis" to determine if project requires a further assessment. Low-risk projects are approved at this step. Medium-risk projects can often be handled through an abbreviated version of the steps.
3. Assessment: The department(s) fills out the required algorithmic review form for the CPO. The CPO provides assessment, approval/denial, and/or recommendations. Higher-risk projects require a Data Usage Protocol to guide how the project complies with the City's Digital Privacy Policy. Lower-risk projects only require an abbreviated review. As part of the CPO's assessment, the following steps should be adhered to for medium and high-risk projects:
    a. **Algorithmic Impact Assessment (AIA):** The department(s) completes the required AIA form.[2] The CPO provides assessment, approval/denial, and/or recommendations.
    b. **AI FactSheet:** The vendor completes the required AI FactSheet.[3] The CPO provides assessment, approval/denial, and/or recommendations. The CPO may work with the vendor to obtain more details about the algorithmic system.
    c. **If request involves a Request for Proposals (RFP) or similar:** The vendor may not be determined at this time. Require potential vendors to answer the AI assessment questions in the RFP. Once the final vendor is selected, require that vendor to complete the AI FactSheet. See "Request for Proposals (RFP) Algorithmic Review Protocol" for guidance on RFP questions.
4. Public Engagement: The draft DUP is published online for public comment.[4] If the project is considered of particular public interest, the CPO conducts in-person outreach targeting communities with limited access to online comments (either due to language or internet access issues). Community feedback is then incorporated into the DUP.
5. Final Review: Projects are reviewed by the CPO and Cybersecurity Office. At CMO's discretion, a review may rise to a relevant Council Committee. Separately, the review and DUP are published.[5]
6. Pre-Launch Preparation:

[2] Example of a completed AIA form: https://www.sanjoseca.gov/home/showpublisheddocument/93488/638089524520870000
[3] https://www.sanjoseca.gov/home/showpublisheddocument/93406/638086228697100000
[4] Data Usage Protocols can be found online at https://www.sanjoseca.gov/digitalprivacy
[5] As of writing, these can be found online at https://www.sanjoseca.gov/digitalprivacy

a. DUP Webpage: If applicable, an electronic copy of the DUP is added to the Digital Privacy webpage.
b. Algorithm Register: The approved project proposal is added to a publicly viewable online register of the algorithmic systems deployed by the City. [6] The AIA Form and AI FactSheet are made publicly available online. The CPO regularly updates the algorithm register as new algorithmic systems are adopted and archives old systems as they are phased out of use.
c. Training: Users of the approved technology are given training to properly use the technology. Training is often provided by the vendor or other third party.

7. Ongoing Monitoring: Departments report annual metrics defined in the DUP. Reports usually require metrics on data usage and project effectiveness. Public can comment on data usage and annual updates online at sanjoseca.gov/digitalprivacy.

Below is a summary of the steps in the algorithmic review process.

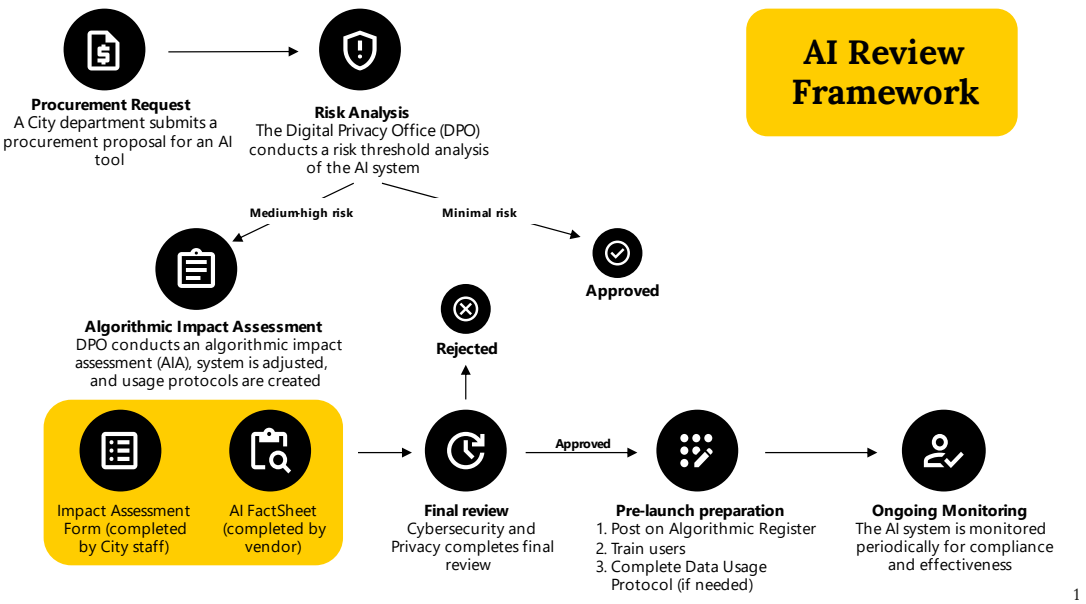

Figure 3: AI Review Framework.

Algorithmic Review Process: Step by Step

The previous seven steps that comprise the algorithmic review protocol are expanded in greater detail below.

[6] https://www.sanjoseca.gov/your-government/departments-offices/information-technology/digital-privacy/ai-reviews-algorithm-register

Step 1: Proposal

The algorithmic review process is triggered when a City department submits a procurement request for a technology involving an algorithmic system.

The formal review process can be initiated through the City's helpdesk site (https://csjhelpdesk.sjcity.net/) by going to the Request tab. A review will be trigged either when a department requests a procurement or fills out the AI review form.

For a consultation on potential projects, to initiate an initial "threshold analysis", or to ask any questions, you can contact the Digital Privacy Office directly at digitalprivacy@sanjoseca.gov.

Step 2: Risk Analysis

The algorithmic risk of the proposal is evaluated in Step 2 of the review, otherwise known as the Algorithmic Threshold Analysis. Algorithmic risk is evaluated based on two key components: the ability of data subjects and/or end-users to opt-out of the use of the algorithmic system and the intensity of the potential harm of the algorithmic system.

The figure below provides a summary of algorithmic risk, with further details below. Algorithmic risk is generally classified into one of three levels: low, medium, and high. Each factor contributing to algorithmic risk can also be defined at a low, medium, or high risk level.

1. **Low algorithmic risk** involves an **opt-in** approach to users being subjected to the AI system. The AI system generates **predictions** but does not automate decision-making. The AI system is subject to a **high level of human oversight**. The AI system **does not impact human livelihood** and is used in areas like mundane business functions (e.g., text autocomplete to help write emails). Consequences are short term and easily reversible.

2. **Medium algorithmic risk** involves an **opt-out** approach to users being subjected to the AI system. The AI system generates **recommendations** but does not automate decision-making. The AI system is subject to **periodic human oversight**. The AI system may **impact non-critical areas of livelihood** like recreation. Consequences are not long term and can be reversible.

3. **High algorithmic risk** involves users that are **unable to opt-out** to being subject to the AI systems. The AI system **automates decision-making**. The AI system is subject to **minimal or no human oversight.** The AI system **may impact highly sensitive areas of livelihood** like employment, healthcare, or criminal justice. Consequences are long-term and difficult to reverse.

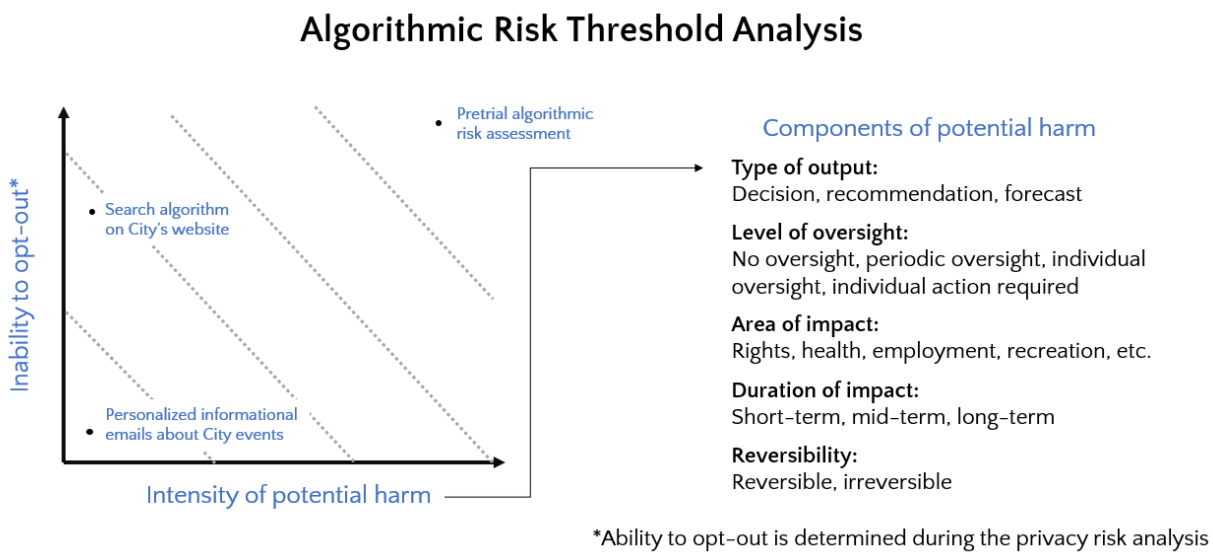

Figure 4: The risk of an algorithmic system can be estimated by identifying impacted individuals' ability to opt-out of the use of the algorithmic system and the intensity of potential harm generated by the system.

The components of potential harm consist of the type of output, the level of oversight, and the area of impact. In Figure 4, the risk level of each component of potential harm decreases from left to right. For example, for type of output, "decisions" are higher risk than "forecasts"; for level of oversight, "no oversight" is higher risk than "individual action required"; for area of impact, "impacts on rights" are higher risk than "recreational impacts".

Components of Algorithmic Risk

Algorithmic risk is defined by two main components: ability to opt-out and intensity of potential harm.

1. **Ability to opt-out:** risk is measured by an individual's ability to control being subject to a given AI system. Ability to opt-out is determined during the privacy risk threshold analysis.
    a. **Low risk ability to opt-out** involves a default opt-in approach. Individuals must actively opt-in to being subjected to the AI system.
    b. **Mid risk ability to opt-out** involves a default opt-out approach. Individuals must actively opt-out if they do not wish to be subjected to the AI system.
    c. **High risk ability to opt-out** involves individuals being unable to opt-out of the AI system. Individuals are required to be subject to the AI system.
2. **Intensity of potential harm:** risk is measured by five sub-components of potential harm: type of output, level of human oversight, area of impact, duration of impact, and reversibility.
    a. **Low risk potential harm** is associated with an AI system that generates predictions, is subject to a high level of human oversight, does not impact any areas of human livelihood, has a short-term impact, and is easily reversible.

b. **Mid risk potential harm** is associated with an AI system that generates recommendations but does not automate decision-making, is subject to periodic human oversight, impacts non-critical areas of livelihood like recreation, has a mid-term impact, and is moderately easy to reverse.
c. **High risk potential harm** is associated with an AI system that automates decision-making, is not subject to human oversight, impacts critical areas of livelihood like employment, healthcare, or criminal justice, has a long-term impact, and is difficult to reverse or not reversible entirely.

Step 3: Assessment

During the assessment stage, the department(s) fills out the required algorithmic review form for the CPO and the vendor completes the AI FactSheet. The CPO provides assessment, approval/denial, and/or recommendations. Higher-risk projects require a Data Usage Protocol to guide how the project complies with the City's Digital Privacy Policy. Lower-risk projects only require an abbreviated review.

Algorithmic Impact Assessment Form

The AIA Form is completed by City staff from the department procuring the system. The AIA Form is intended to capture information including, but not limited to:

- Project objective:
  - Purpose of the AI system
  - Justification for automating a system (if applicable)
- Vendor details:
  - Vendor involvement in deployment of the AI system
  - How the City can test the vendor's AI system before use
- Transparency:
  - Third-party auditing
  - Process to appeal incorrect results
- Equity:
  - Impact on rights or freedoms, economic status, health, etc.
- Human oversight
  - Level of human oversight over the AI system
  - Training for personnel to properly operate the AI system

AI FactSheet

The Vendor AI FactSheet is completed by the vendor of the AI system and captures basic facts about the AI system.[7] The AI FactSheet enables the CPO to better understand the technical details of the AI system and ultimately assess the risks and benefits it presents. The AI FactSheet is intended to capture information including, but not limited to:

- Training data
- Testing data

[7] The AI FactSheet template is heavily inspired by the IBM Research AI FactSheets 360 project.

- Input and outputs
- Performance metrics
- Optimal conditions
- Poor conditions
- Bias

The CPO will work with the vendor as needed to obtain necessary technical details about the algorithmic system.

Data Usage Protocols

Permissible data usage for a proposal is defined in its relevant Data Usage Protocol (DUP). The DUP is typically 3-5 pages and covers a type of data usage (e.g., video traffic monitoring). The DUP is typically composed of six key elements:

1. Project summary
2. Authorized and prohibited uses of data
3. Practices for data collection, storage, notice, retention, sharing, access, and corrections
4. Summary of security practices and approval from the City's Cybersecurity Office
5. Required training for personnel using systems and technologies (if any)
6. Oversight and annual compliance expectations, written in an Annual Data Usage Report

The Annual Data Usage Report (item 6 above) is typically 1-2 pages, drafted by the applicable departments and details:

1. Project summary
2. Required performance metrics as defined in the DUP (e.g., accuracy, effectiveness, cost)
3. Plans for the data initiative (e.g., expansion, shift in usage)[8]

Once a DUP is drafted, it will be made available to the public. Projects with the highest risk require public notification through public forums, such as City Council meetings and in-person outreach to specific impacted communities. The public can also comment on active DUPs online, by contacting the CPO directly at digitalprivacy@sanjoseca.gov, or through other public meetings on privacy-related issues.

Step 4: Public Engagement

Public engagement occurs in three forms: online, in-person, and in the built environment. More information on the City's procedures for Public Engagement can be found in the City's Privacy Manual.

[8] This approach was adapted from best practices in privacy programs, including key collaboration with Santa Clara County's Privacy Office.

Step 5: Review
After the necessary documentation has been completed, the CPO and Cybersecurity Office will review the proposal and approve or reject the proposal. Depending on the level of risk presented by the proposal, this step may involve gaining approval from the CMO or from City Council. The review may require input from the City Attorney's Office or other relevant departments on a case-by-case basis. Based on the CPO or CMO/Council review, in some instances, the proposal may need to be revised before being approved.

Step 6: Pre-Launch Preparation
Following approval of the proposal, relevant documentation will be published on the digital privacy webpage:

- Data Usage Protocol: An electronic copy of the DUP is added to the digital privacy webpage.
- Algorithm Register: If the project features an algorithmic system, the approved project proposal is added to a publicly viewable online register of the algorithmic systems deployed by the City.[9] The AIA Form and AI FactSheet are also made published online. The CPO regularly updates the algorithm register as new algorithmic systems are adopted and archives old systems as they are phased out of use.

Prior to implementation, the City will train all relevant parties on how to correctly use the approved technology.

Step 7: Ongoing Monitoring
The DUP for a given technology proposal requires an Annual Data Usage Report. The report is typically 1-2 pages, drafted by the applicable departments and details:

1. Project summary
2. Required performance metrics as defined in the DUP (e.g., accuracy, effectiveness, cost)
3. Plans for the data initiative (e.g., expansion, shift in usage)

Examples of past Annual Usage Reports can be found here.

Request for Proposals (RFP) Algorithmic Review Protocol
The algorithmic review process should be initiated prior to releasing a Request for Proposals (RFP) if the department is conducting an RFP or similar process. Departments initiate a review by contacting the CPO directly at digitalprivacy@sanjoseca.gov, filing a procurement request, or contacting their departments' privacy and AI representative. When creating an RFP, the CPO will work with the RFP team to include AI FactSheet and/or AI-specific questions in the RFP that mimic the AI FactSheet.

[9] https://www.sanjoseca.gov/your-government/departments-offices/information-technology/digital-privacy/ai-reviews-algorithm-register

Below is an illustrative example of RFP questions and how to evaluate them for an AI system. Recommended point values out of 115 are also provided.

1. Overview - Brief summary of the AI system.
    a. 0 points. Used to understand the context of the system
2. Purpose - What function does the AI system perform, and for what purpose?
    a. 3 points. Pass/Fail does the AI system's purpose fit the need of the department?
3. Intended Domain – What domain is the AI system intended to be applied in?
    a. 3 points. Pass/Fail is the AI system meant to be applied to this domain? For example, an AI meant to identify motorcycles should not be used to identify cars, unless it was built to identify both.
4. Training Data - How was the AI system trained? What data was used? How often is data added to the training set?
    a. 5 points. Should provide a brief explanation for how the data was trained. They should explain that the model has been trained on a sufficiently large data set for the use case that is updated with new data at a frequency suitable for the use case. For example, an AI meant to translate language may need to update at least annually since language evolves quickly.
5. Test Data - What data was used to test system performance? Under what conditions has the system been tested?
    a. 5 points. The test data and the conditions it was tested in should match the conditions we intend to use the system.
6. Model Information - Provide a general description of the model(s) used (e.g., large language model, transformer, deep learning, supervised learning, built on an existing open source model, computer vision)
    a. 3 points. Pass/Fail do they provide a general explanation of the models used.
7. Update procedure - In general, how often are the models updated for users? Will the user have a choice in moving to the updated model or staying on the current model?
    a. 5 points. We want to have a choice in having the model we use updated, or at least the choice to opt-out of automatic updates.
8. Inputs and Outputs - What are the inputs to the AI system? What are its outputs?
    a. 3 points. Pass/Fail do they share what information goes into the model and what goes out. The outputs should be something tangible, like a recommendation, decision, or content.
9. Performance Metrics - How was the accuracy and effectiveness of the system measured? What metrics were used, and why? What is the range of accuracy of the AI system and how does it vary depending on the data? What is the system optimizing for and under what constraints?
    a. 20 points. Clearly explains how they measure accuracy and effectiveness. Justifies metrics used for measurement. Do the metrics make sense to you, and do they meet the needs of your use case? How do the performance metrics compare to other vendors?
10. Bias - What biases does the tool exhibit and how does it handle that bias? This can include but is not limited to biases on human factors such as gender, race, socioeconomic status, disability, culture, age, or other protected classes, or biases on general factors such as a sampling bias, survivorship bias, detection bias, or observer bias.
    a. 20 points. Does the vendor report bias or justify why no bias would be present.

11. Robustness - How does the AI system handle outliers? Do overwritten decisions feed back into the system to help calibrate it in the future?
    a. 5 points. Vendor explains how it handles outlier data. Vendor provides method to overwrite AI outputs and feed those outputs back into the AI system? For example, if the AI system calls a bicycle a tricycle, can you correct it and will that correction update the model?
12. Optimal Conditions - What conditions does the model perform best under?
    a. 5 points. Does the vendor explain in what conditions the model performs best? Do those conditions match the typical conditions for your use case?
13. Poor Conditions - What conditions does the model perform poorly under? What are the limitations of the AI system? What kinds of errors can it make?
    a. 5 points. Does the vendor explain in what conditions the model performs poorly? Do those conditions *not* match the typical conditions of your use case?
14. Explanation - How does the AI system explain its predictions? Are the outcomes of the AI system understandable by subject matter experts, users, impacted individuals, and others?
    a. 5 points. Vendor demonstrates how the AI system can explain its predictions to subject matter experts and/or to the general public, depending on the use case.
15. Identifying problems - How is the AI tool monitored to identify any problems in usage? Can outputs (recommendations, predictions, etc.) be overwritten by a human, and do overwritten outputs help calibrate the system in the future?
    a. 5 points. Vendor explains 1) how the system is monitored, 2) how your agency can monitor its effectiveness in the field, 3) how outputs can be overwritten, and 4) how overwritten outputs can update the model.
16. Studies of bias and accuracy - Have the vendors or an independent party conducted a study on the bias, accuracy, or disparate impact of the system? If yes, can the City review the study? Include methodology and results.
    a. 5 points. Vendor provides a study, ideally by an independent party, on the bias, accuracy, and impact of the system. If the study is done by the vendor, vendor explains why the study is valid.
17. Representation - Is the data used to the train the system representative of the communities it covers?
    a. 5 points if applicable. If the model involves data on people, vendor explains how the people data used to train the system includes people that represent the diversity of your community.
18. Flagging inaccuracies - How can the City and its partners flag issues related to bias, discrimination, or poor performance of the AI system?
    a. 5 points. Vendor provides an easy method for flagging issues within the system around outputs that appear biased, inaccurate, or otherwise perform poorly.
19. Accessibility - How is the AI tool made accessible to people with disabilities? Has it been assessed against any usability standards, and if so what was the result?
    a. 5 points. Vendor explains how the system as a whole is accessible for users, such as the interface is compatible with screen-readers, and it can be translated into the necessary languages.
20. Usability - What other human factors, if any, were considered for usability and accessibility of the system?
    a. 3 points. Pass/Fail does the vendor explain other considerations for usability and accessibility that were built into the system.

Use-case specific questions

You may want to include additional questions based on the specific use case for the AI system. Refer to use-case specific RFP questions in the appendix "RFP questions for AI Use-Cases".

Use Case #1: Translation-Based AI Systems

- Please provide a list of all languages your solution supports for live speech translation, beyond the mandatory languages specified in Attachment A. Additionally, describe how often you introduce new languages to your platform and outline the process for these additions.
- Does your Solution offer text-to-speech functionality or other methods to accommodate American Sign Language (ASL) speakers in both in-person and virtual (Zoom) meetings? If so, please describe the features and functionalities that enable this accommodation, including any limitations or requirements for optimal performance.
- How do you measure the performance of your Solution in terms of translation, speech-to-text, and text-to-speech for English, Spanish, Tagalog, Mandarin, and Vietnamese? Please specify the metrics used (e.g., BLEU score, human ratings, etc.) and the conditions under which these measurements were taken. Based on these metrics, what is the performance of your Solution for the specified languages?
- Please provide/describe any third-party evaluations or benchmarks that have been conducted on your Solution's translation capabilities. Include details on the evaluation process, criteria, results, and any subsequent improvements made to the Solution based on these evaluations.
- What is your Solution's average time delay between speech input and translation output?
- How does the Solution handle rapid speech or overlapping conversations?
- How can the Solution adapt to idiomatic expressions, cultural references, or local slang?

Use Case #2: Large-Language Models

- What is your Solution's average time delay between text input and output?
- Is the user's input or output data used to the train your Solution? If yes, will this data train the model for any other users of your Solution?

Use Case #3: Computer Vision

- How well does your Solution adapt to blurring, obstruction, poor lighting or any conditions that may lead to misclassification?

AI GOVERNANCE

Governance Structure

The governance of algorithmic systems in the City involves several actors, policies, and practices that work in coordination to ensure that the City uses AI tools in a responsible manner. The

diagram below explains the roles and responsibilities of actors in the City who frequently participate in AI governance activities.

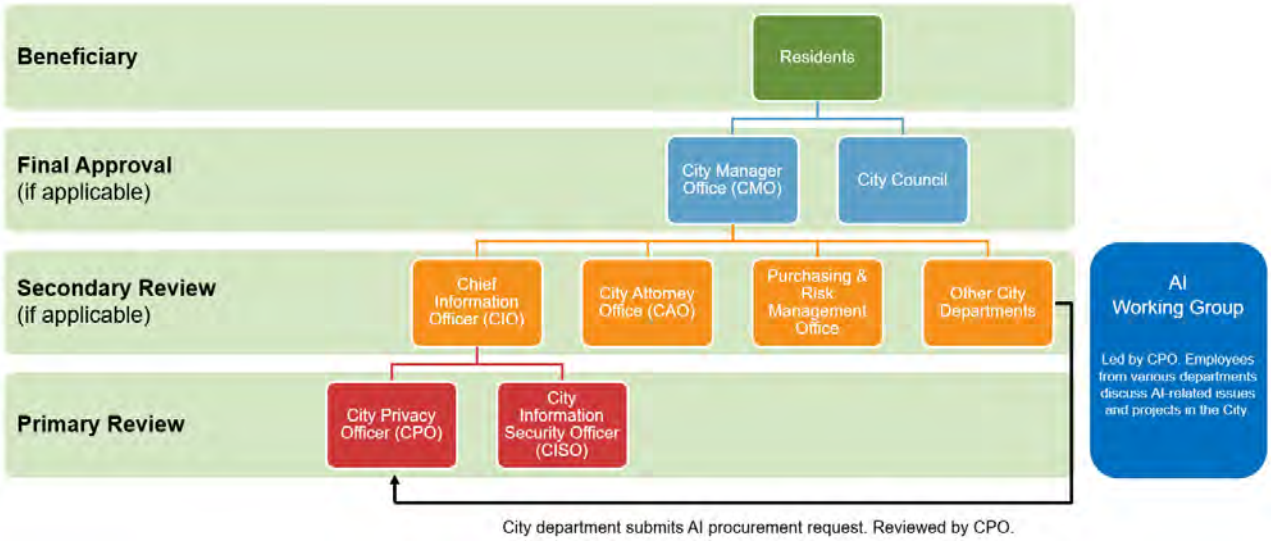

Figure 5: The governance structure of algorithmic systems in the City.

AI Roles & Responsibilities

The section below explains the roles and responsibilities of each City AI steward in more depth.

AI Beneficiaries

- All City employees that sit under the CMO and City Council serve the **residents** of San José.

Final Approvers

- The CMO generally has final approval of AI-related policies for the City.
- In some instances, final approval may come from City Council if a policy or an AI procurement has high visibility to the public or at the request of Council.

Secondary Reviewers

- The CIO approves AI-related policies set forth by the CPO and, if applicable, sends them to CMO for final approval.
- The CAO reviews AI-related policies from a legal perspective.
- The Purchasing & Risk Management Office reviews procurement requests that involve AI alongside the CPO.
- Any City department may submit a procurement request for an AI system.

Primary Reviewers

- The CPO is the main actor in AI governance activities and responsible for creating AI-related policies and guidance for the City. The CPO reviews all procurement requests that involve an AI system.
- The CISO reviews technology procurement requests from a cybersecurity perspective.

City AI Working Group (AIWG)

- Led by CPO, employees from various departments in the AIWG discuss AI-related issues and projects in the City.

AI Incident Response

Introduction

The AI Incident Response Plan (IRP) serves as the first line of defense for the City of San José (CSJ) in case of an AI incident. This incident response document has been created based on NIST Special Publication 800-61 Computer Security Incident Handling Guide.

Incident response occurs in sequential phases, each one building upon the next. The following phases provide a foundation for an Incident Response (IR) team to respond to and recover from an AI incident: Preparation, Identification, Containment, Eradication, Recovery, Lessons Learned.

Purpose

The purpose of this document is to prepare and gain fundamental understanding of the processes involved, the responsibilities, and the actions required to mitigate an AI incident. It is critical to identify and resolve incidents quickly before they escalate into a major incident requiring disaster recovery or business continuity procedures.

Scope

This IRP applies to all AI systems implemented by City Staff, contractors, and any entity operating on behalf of the City, residents. The AI IRP addresses continuity and recovery procedures to appropriately mitigate AI incidents.

Approach

The key points in development of the AI IRP:

- Obtain senior management support.
- Keep the plan simple. A well-organized, systematic, and up-to-date AI IRP that is readily available will help teams get through most situations.
- Communicate regularly on the incident status. Provide the relevant facts as they are available, disseminate them quickly, follow up regularly, keep relevant parties informed and resolve incorrect information.
- Review and test. The AI IRP must be reviewed and analyzed to ensure the documented procedures make sense and that the team is equipped to respond accordingly.
- Be flexible. The AI IRP should exhibit flexibility to meet a wide variety of situations, including team membership and access to appropriate resources.

Roles & Responsibilities

AI Incident Response Team

An AI Incident Response Team is established prior to any incidents and provides a quick, effective, and orderly response to AI incidents. The IR Team's mission is to prevent a serious loss of profits or public confidence assets by providing an immediate, effective, and skillful response to any unexpected event involving City AI systems.

The AI IR Team is authorized to take appropriate steps deemed necessary to contain, mitigate, or resolve an AI incident. The AI IR Team is responsible for investigating any malfunctioning components of City AI systems in a timely, cost-effective manner and reporting findings to management and the appropriate authorities as necessary. The CPO will coordinate these investigations.

Other Teams as needed

Other teams and departments shall contact the CPO with any information relating to a suspected AI incident.

Activation Criteria

The City Privacy Officer will determine whether the reported incident is serious enough to warrant an AI Incident Response. The following events require reporting to the CPO and may trigger an AI Incident Response:

- Declining accuracy rates; includes false positives, false negatives, true positives, and true negatives
- Findings or suspicions of algorithmic bias
- Failed or broken human oversight protections
- Failure of an AI system to provide its expected outcome (i.e., system has stopped working)
- Suspected or demonstrated harm to human livelihood
- Discovery of City confidential data used to train any public AI model, especially in large language models or other generative AI services

Some of these events may be connected to a broader incident that also involves cybersecurity or privacy. When unclear, contact both the CPO and the CISO.

Response Level

Once an incident has been identified, the next step is to determine the level of response required based on its assessed risk. Determining the level of response is critical due to the involvement of different layers of the organization as well as other external entities such as insurers, law enforcement, news media, and others. Each response level includes the issue's:

- Scope: An overview defining what each corresponding risk level entails.
- Management Team: The departments, individuals, and stakeholders responsible for managing the resolution of the incident.
- Initial Bridge Convened: The initial communication channel(s) used to connect involved parties.
- Triggers for Escalation to the Next Level: The activation requirements to raise the risk level of an incident.

For all levels of risk, City Staff, contractors, any entity operating on behalf of the City, residents, and external organizations may report AI systems through email. The Incident Management Team may use Zoom, Microsoft Teams, and email to resolve reports.

Level 1: Low Risk

The scope of this type of incident is relatively low, usually involving minor systems errors with limited risk to people. Examples include reporting an AI system that has a high accuracy rate but has

started to output incorrect recommendations sporadically or an AI system that no longer provides a clear value to the City. A low risk incident does not impact any areas of human livelihood.

- Incident Management Team: CPO, AI system owner (if applicable)
- Notification to: CIO, CISO, Department AI representative (if applicable)
- Initial Bridge Convened: These are routine or easily solvable incidents that do not require a bridge.
- Triggers for Escalation to the Next Level: If the impacted system impacts human livelihood, becomes increasingly inaccurate or indicates a need for sunsetting.

Level 2: Medium Risk
The scope of this type of incident is moderate, usually involving periodic gaps in human oversight or frequent system errors. Examples include an AI system that is consistently inaccurate some of the time or sporadically does not allow a human to override its output. The issue usually impacts non-critical areas of livelihood like recreation.

- Incident Management Team: CPO, CIO
- Notification to: CISO, Department AI representative (if applicable)
- Initial Bridge Convened: The CPO sends a Zoom invite to all parties involved.
- Triggers for Escalation to the Next Level: If the impacted system fails to work or impacts critical areas of human livelihood.

Level 3: High Risk
The scope of this type of incident is high, usually involving failures in human oversight or major system errors. Examples include privacy violations, algorithmic bias and recommendations that cause harm. There is usually clear evidence of suspected or demonstrated harm to critical areas of human livelihood like employment, healthcare, or criminal justice.

- Incident Management Team: CMO, CIO, CISO, CPO, OER, HR, Public Relations
- Initial Bridge Convened: The CPO sends a Zoom invite to all parties involved.

Phased Approach

Preparation
The preparation phase takes place before an incident occurs. Putting more effort into preparation can help reduce the duration and difficulty of recovering from an incident. Planning to respond to incidents involves all stakeholders with responsibilities to maintain the information system.

AI IR team members should not have to spend time locating and assembling needed tools or supplies when an incident occurs. Supplies to assist the team in the event of an incident are sometimes referred to as a jump bag, and should include (at a minimum):

- An empty notebook and writing instruments (In the event that technological systems are compromised, thorough documentation should be taken throughout an incident.)
- Contact information sheet

Having contact information available and current is essential. It should also be in hard copy form in case electronic systems are affected during the incident. Contact information should include:

- All members of IR team
- All contacts listed in notification
- Personnel that might assist in handling an incident

In the event that critical systems relying on the implementation of AI become compromised, management team members are responsible for ensuring there is an alternative solution or backup system while the incident is being resolved.

Key activities during preparation include:

- Ensure incident response efforts are unified and coordinated.
- Implement regular AI maintenance procedures to reduce the likelihood, severity, and duration of AI incidents.
- Assess risk and disaster resilience to reduce the duration of AI incidents.
- Identify the potential harms of AI systems; incorporate this into the preparation processes.
- Ensure critical infrastructure remains operational during incident response activities.
- Train responders to handle potential incidents should they arise. Assemble required tools and ensure responders know how to use them.

Detection & Analysis

Awareness that an AI incident has occurred can originate from different sources such as vendors, City Staff, or even residents. **An AI incident shall be defined by satisfying at least one of the conditions outlined in the section "Activation Criteria".**

The primary outcome of the identification phase is to determine whether an event constitutes an AI incident, activate the IR plan, and begin first level notification.

Best practices suggest declaring that an incident has occurred when privacy officers' sense that an adverse risk exists and then assemble the AI IR team to implement the IR plan. It is also suggested to early on have multiple people involved, to save all key records and start detailed documentation as soon as possible.

Key activities during this phase include:

- Identify, assess, and prioritize risks.
- Ensure the capacity for timely communications in support of situational awareness and operations during an AI incident.
- Provide all decision makers with decision-relevant information regarding the nature and extent of the AI incident, any cascading effects, and the status of the response.

As soon as the AI incident response team suspects that an incident has occurred, it is important to immediately start gathering all the relevant data. The repository for all AI incident data is called Artificial Intelligence Incident Report System (AIIRS) and it is located in the Privacy Program SharePoint site with access privilege only to the AI IR Team. Each incident is carefully documented on AIIRS, and all related artifacts are kept for future reference.

Containment

Limit damage from the incident and isolate the affected components of the AI systems to prevent further damage. Depending on the type of incident, the overall strategy for containment may vary. Factors that help determine the containment strategy include:

- Potential damage to City services
- Need for evidence preservation
- Service Availability
- Time and resources needed to implement the strategy
- Effectiveness of the strategy (e.g., partially contains the incident, fully contains the incident)
- Duration of the solution (e.g., emergency workaround to be removed in four hours, temporary workaround to be removed in two weeks, permanent solution)

Evidence handling must be considered when resolving an incident. This will help in legal proceedings. In such cases, it is important to clearly document how all evidence has been preserved. In addition, evidence must be accounted at all times; whenever evidence is transferred from person to person, chain of custody documentation should detail the transaction and include each party's signature. A detailed log should be kept for all evidence including the following:

- Identifying information (location, serial number, model number, hostname, media access control (MAC) address, and IP address of a computer)
- Name, title, phone number of each individual who collected or handled the evidence during the investigation
- Time and date of each occurrence of evidence handling
- Locations where evidence was stored

Eradication

Find the AI incident's cause and pause the usage of affected systems. Once the threat has been contained and initial cause determined, second level notification can take place.

Key activities during this phase include:

- Prioritize the stabilization of critical infrastructure functions.
- Document everything.
- Implement any necessary safeguards to prevent the same kind of AI incident from occurring again.

Recovery

Part of recovery is performing detailed forensic analysis to determine the exact root cause of the incident. AI systems are restored according to the configurations outlined in the AI FactSheet.

Key activities during this phase include:

- Allow affected AI systems back into use and ensure no problem remains.

Lessons Learned

Document the incident and analyze how it happened so staff can learn from it and improve future response efforts.

Some of the items to review in this phase include:

- Consider whether an additional policy could have prevented the intrusion.
- Consider whether a procedure or policy was not followed, and then consider what could be changed to ensure that the procedure or policy is followed in the future.
- Was the incident response appropriate? How could it be improved?
- Was every appropriate party informed in a timely manner?
- Were the incident-response procedures detailed and did they cover the entire situation? How can they be improved?
- Have changes been made to prevent a new and similar incident?
- Should any AI policies be updated?
- What lessons have been learned from this experience?

AI Education

As part of the City's governance of algorithmic systems, the CPO provides education about AI systems to City Staff to ensure that AI is being utilized responsibly, equitably and effectively by those who operate them on behalf of the City. All City staff are provided guidance on how to identify AI, how the City procures new AI systems, how to mitigate risk, how the City currently uses AI systems and how City Staff may receive support as questions arise.

Those who interact more closely with City AI systems will receive in-depth tactical training tailored to the specific AI system they are responsible for operating. While this varies from system to system, City Staff utilizing AI systems are trained primarily by vendors. However, they may request additional support from the CPO. The training conducted by vendors is evaluated and determined during the purchasing process and in follow-up negotiations.

PUBLIC SUBMISSION

As of: March 22, 2024
Tracking No. lpt-9eql-t2nt
Comments Due: December 05, 2023

Docket: OMB-2023-0020
Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Comment On: OMB-2023-0020-0001
Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Document: OMB-2023-0020-0183

General Comment

I am a private citizen and an open-source artificial intelligence research collaborator with an interest in AI policy – while I have done reading on the use of AI in governments as well as legal issues related to AI, I come from a mostly technical perspective, aiming to increase the depth of the current regulatory response to AI.
As an individual interested in the potential of this technology, I believe the Office of Management & Budget's (OMB) plan is a great first step toward incorporating AI in the federal government – however, the devil lies in the details. My concerns are fourfold:
(a) how to build up AI expertise and coordination in the government to meet the ambition of these proposals as well as the proposed laid out in Biden's recent executive order,
(b) the lack of adequate coverage on the topic of cybersecurity throughout the document,
(c) the lack of technical, specific guardrails for risk management, and
(d) miscellaneous related investments and initiatives that I believe would support the intent behind the OMB Draft Memorandum.

To that, I propose:
(1) A coordinated, centralized AI governance body – especially around expert advice. These AI governance bodies should ideally be modeled after successful public-private collaborations, comprising a mix of technical experts, policy makers, and diverse stakeholder representatives.
(2) Stronger investments in federal cybersecurity and critical infrastructure security are made, given the reliance of agencies on AI and digital services post-implementation.
(3) Rigorous evaluations for risk management with regard to algorithms in use by the federal government.
(4) Investments in AI ethics & safety
(5) Regular communication with peer governments on implementation of AI in analogous agencies/ministries in other countries

I'm not too confident in these proposals, but these represent my perspectives in the present moment. I hope you find these helpful, and I'd be happy to play a role in the future with regard to AI uptake in the federal government.

OMB Draft Memorandum Comment (2)

I am an open-source artificial intelligence research collaborator with an interest in AI policy – while I have done reading on the use of AI in governments as well as legal issues related to AI, I come from a mostly technical perspective, aiming to increase the depth of the current regulatory response to AI.

As an individual interested in the potential of this technology, I believe the Office of Management & Budget's (OMB) plan is a great first step toward incorporating AI in the federal government – however, the devil lies in the details. My concerns are fourfold:

(a) how to build up AI expertise and coordination in the government to meet the ambition of these proposals as well as the proposed laid out in Biden's recent executive order,

(b) the lack of adequate coverage on the topic of cybersecurity throughout the document,

(c) the lack of technical, specific guardrails for risk management, and

(d) miscellaneous related investments and initiatives that I believe would support the intent behind the OMB Draft Memorandum.

AI Coordination Mechanisms & Governance Body

This section addresses questions (2) and (7). Currently, the proposal aims to convene an independent AI governance body for each CFO Act agency. I propose that either in replacement of or in addition to agency bodies, that there be a large, centralized, overarching AI governance body for the federal government, where experts can convene and advise the federal government on safety and risk management-related issues. I observe that:

a) Technical expertise in AI is lacking in government. First, it seems like current agencies often lack technical expertise – and updating the scope of existing groups may not be effective, especially given the difficulty of expanding mandates and the necessity to hire or

consult external technical experts. Second, the current AI governance bodies within each agency also seem to convene senior leadership to discuss AI issues, without necessarily taking into account the importance of AI expertise in accurately evaluating the scope of such proposals. Third, hiring AI experts or consultants can be expensive, as many artificial intelligence experts tend to be drawn by higher pay in Silicon Valley companies. These three-fold issues may hold back the implementation of AI systems within government agencies.

b) There are significant advantages to a coordinated, centralized AI governance body – especially around expert advice. These AI governance bodies should ideally be modeled after successful public-private collaborations, comprising a mix of technical experts, policy makers, and diverse stakeholder representatives. Coordination from a centralized AI governance body minimizes doubled technical effort and enables knowledge sharing. Furthermore, it is far easier for experts to advise a centralized AI governance body. Inviting key AI figures from academic and industry is crucial to ensuring adequate risk management – including key leaders in safety, alignment, and risk management (such as Dan Hendrycks, Stuart Russell, Yoshua Bengio, and Dario Amodei) as well as researchers focused on democratic values, bias concerns, and civil rights protections in AI systems (such as Yejin Choi and Timnit Gebru). Centralized governance would also make it easier for thinktanks to propose general recommendations to a single body that can relay these to agencies, as opposed to dealing with many different agency-specific AI officers.

Lack of Adequate Focus on Cybersecurity

This section addresses questions (5) and (7). The OMB Draft Memorandum does not do enough to address threats in the intersection of artificial intelligence and cyberspace.

a) Include cyberspace as a safety-impacting purpose. Coding is the primary purpose and advantage of many large language model-focused AI systems, and Biden's recent AI Executive Order mentions cybersecurity risks as a key dual-use foundation model risk under Section (4). In the near future, it is likely that the intersection of frontier AI systems with cybercapabilities will need to be regulated.

b) Cybersecurity was rarely mentioned. The most significant for cybersecurity in the OMB Draft Memorandum directs agencies to "update, as necessary, cybersecurity authorization processes to better address the needs of AI applications." The agencies of the federal government, after implementing these processes to incorporate AI into its processes, would likely have a significant reliance on digital services and AI to run its operations. Given the risks of coupling the services of the federal government with the digital world, it is vital that stronger investments in federal cybersecurity and critical infrastructure security are made. I believe that agencies like the Cybersecurity and Infrastructure Security Agency (CISA) under the Department of Homeland Security must create new data protection and cybersecurity standards for U.S. government agencies, to ensure Americans' information and access to government services are protected.

Rigorous Evaluations for Risk Management

This section addresses questions (6) and (8). I believe the OMB's distinction between safety-impacting and rights-impacting AI is excellent. However, I raise concern with the implementation – namely, the Draft Memorandum mentions that there should be "ongoing monitoring and establish thresholds for periodic human review. In addition to pre-deployment testing, agencies must institute ongoing procedures to monitor degradation to the AI's functionality and to detect changes in the AI's impact on rights or safety. Part of this monitoring process must include periodic human reviews to determine whether the existing implementation of the minimum practices in this section adequately mitigates any new risk."

I believe these implementation measures are far too vague, and advocate for potentially high-risk or rights-impacting AI uses to undergo rigorous adversarial testing. In the AI community, this is called "red-teaming" or "adversarial prompting" – the act of testing various prompts or inputs to test edge-case scenarios. Red-teaming has been conducted on a wide range of AI models, including small simple models that are used for credit scoring to uncover bias, to large language models to ensure they do not produce undesirable outputs.

Evaluations was heavily emphasized in the recent Executive Order. To conduct rigorous evaluations, one can have shifting sets of red-teaming evaluations for certain key algorithms to ensure fairness and security – and agencies can then use these evaluations to issue transparent regular public reports on the state of fairness and discrimination in AI systems in the government. While this would require significant technical expertise, the government also has the ability to outsource expertise – e.g. opening up algorithms for red-teaming by academics and cooperating with academic experts to undergo such projects.

Other Important Points Not Brought Up in the OMB Draft Memorandum

a) The U.S. government should explicitly invest more in safety and ethics, through mechanisms like NSF grants. Right now, U.S. federal government agencies is relying on AI models and techniques are standard in industry – however, as a large investor in AI, the U.S. federal government can drive the direction in which industry develops. The Office of Management & Budget can coordinate with grantmakers across the government to differentially preference research grants focused on privacy, security, and ethics-focused technology development – including improved evaluations on security and fairness, as well as ensuring these AI models can be deployed in high-risk applications.

This would ensure that the U.S. government could directly implement AI technologies from such research, allowing the U.S. government to drive the development of the AI systems it would be using. There are also a variety of positive knock-on effects, which include encoding positive values within technology, empowering U.S. innovation in reliable and robust AI systems, and ensuring that civil rights are protected by default (even across corporate and private use). By differentially pushing technologies that focus on safety, trust, and ethics, the U.S. federal government can – in the long term – encode liberal and democratic values into American AI technology development by design.

b) The U.S. federal government agencies should communicate with its peers in other countries, such as the United Kingdom and European Union, to understand how they are incorporating AI into their processes and share knowledge.

Re: FR Doc. 2023–24269 Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Ms. Martorana,

The National Coalition on Black Civic Participation and the Black Women's Roundtable submit these comments in response to the request referenced above. We commend federal regulators for seeking input on this issue that has a significant impact on the lives and wellbeing of Black and marginalized communities throughout the nation.

The National Coalition on Black Civic Participation ("NCBCP") is dedicated to empowering Black communities and advancing the overall goals of equity and justice. Then NCBCP's mission is to promote Black civic engagement and racial, economic, and social justice through values-driven coalitions centered on women and youth empowerment, leadership development, health and wellness, education, and global empowerment. The Black Women's Roundtable ("BWR") is the women's empowerment arm of the NCBCP. The BWR is an intergenerational civic engagement network that advocates for just and equitable public policy that promotes the health and wellness, economic security, education, and global empowerment of Black women.

Black and marginalized communities that are served by agencies across the federal government are most at risk of AI systems that are biased or result in disparate impact. These groups are also more likely to be harmed by AI systems and often lack the resources to respond to the harms that result. Thus, we appreciate the Office of Management and Budget ("OMB") for centering civil rights and equity in the implementation of agencies' requirements for the use and innovation of AI systems.

We commend the OMB's efforts to establish agency requirements in AI governance, innovation, and risk management through the draft AI memorandum. We provide the following recommendations to help inform regulators in the establishment of innovative requirements for federal agencies in the use of AI systems.

Question 3. How can OMB best advance responsible AI innovation?

Fully resource and fund an agency governance structure that includes the establishment of Civil Rights Offices to address AI challenges

While OMB has taken critical steps in AI accountability by providing guidance to agencies to appoint Chief AI Officers and create agency AI Governance Boards, more should be done to ensure that agencies have the resources and authority needed to fully implement the requirements of the AI Executive Order[1] and the OMB's draft guidance on AI. To establish a robust agency AI governance structure, the OMB should include fully resourced and funded Civil Rights Offices to address the challenges identified in its AI guidance to agencies.

Development requirements for federal agencies using AI in public benefits and service programs administered by the States

Algorithmic systems used in the determination of public benefits and services can cause harm by making determinations with no explanations, discriminatory data, or a lack of transparency. Risk management of AI systems used in public benefit determinations will address these concerns.

The OMB's draft memorandum clearly states that public benefits are a rights-impacting use and must meet risk mitigation requirements. Because most determinations for federally funded public benefits and services are made at the state and local level, the OMB should require federal agencies to provide guidance to the states on the use of AI systems for the federally funded public benefits and services that they oversee.

[1] Executive Order No. 14110 (2023), 88 FR 75191, Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence, https://www.federalregister.gov/documents/2023/11/01/2023-24283/safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence

Establish a consistent public engagement process

It is critical that agencies are required to establish programs to proactively engage and seek community input from civil rights, civil society, and public interest groups, and people who use public benefits and services about the impact of agencies' use of AI systems. The public should also have a dedicated space to comment on and flag risks resulting from current and new use cases.

Regularly review and update policies

New developments in AI technology and applications are constantly emerging. Thus, guidelines and policies can become outdated and ineffective at addressing new AI system challenges. It is critically important for the OMB to regularly review and update its guidelines and policies to ensure that they remain current and effective in addressing AI challenges. This is of particular importance for AI systems that are safety or rights impacting.

Provide more clarity on how agencies determine if an AI system matches the definition of a safety-impacting or rights-impacting system

The OMB should provide more clarity on how agencies determine whether an AI system matches the definition of a safety-impacting or rights-impacting system. Public notice of these determinations should be provided.

Establish factors for issuing exemptions and waivers

The OMB's memorandum should include the following requirements to agencies when determining whether waivers and exemptions are granted for AI systems:

- An agency must demonstrate that it considered alternatives that are less rights-impacting before granting a waiver or exception
- Establish a time that the waiver or exception will expire
- Reevaluate the AI system before and after the waiver or exception expires to determine if the waiver or exception is still needed
- Provide public notice of waivers or exceptions that are granted

Provide training for agency staff who are tasked with the implementation of the guidance provided in OMB's memorandum.

Conclusion

We appreciate this opportunity to comment on OMB's draft memorandum, which provides an actionable approach to mitigating the harms of AI systems before they are implemented. This memorandum marks a significant step toward achieving equity and advancing civil rights in the use of AI systems.

For OMB's guidance to be successful, agencies must consider the benefits and risks of AI systems throughout the development and implementation processes. It is also critically important for agencies to understand the intended uses of AI systems and well as recognize the potential harms that could stem from misuses.

If you have any questions regarding these comments please contact Joycelyn Tate, Senior Technology Policy Advisor at the NCBCP and BWR, at bwrtech@ncbcp.org.

Respectfully submitted,

/s/ Melanie L. Campbell
President & CEO, National Coalition on Black Civic Participation

MHcomments_OMB 2023-0020 draft

Section 5.b.ii (p12)– Purposes That are Presumed to Be Rights-Impacting

"…if it is used to control or meaningfully influence the outcomes of any of the following activities or decisions…"

While "meaningfully influence" is specified, it may be worth also specifying that the influence considered may not necessarily be a direct result but that downstream outcomes should also be considered.

Section 5(c) (page 13) "To fill potential risk management gaps, agencies are encouraged(!) to promote and to incorporate, as appropriate, additional best practices for AI risk management, such as from the NIST AI Risk Management Framework…"

NIST has established a framework and a blueprint for an AI risk management framework, which to some degree should be required for agencies that have (or plan to have) a high degree of dependence on AI models and/or are determined to carry the responsibility of potential high degree of impacts on rights and safety. In these cases, government agencies should lead by example in the risk management of AI models and make portions of the AI RMF required.

Section 5(c)(iv)(B) (page 16) "Testing conditions should mirror as closely as possible the conditions in which the AI will be deployed."

Consider changing this to a "range of conditions", in order to obtain a better understanding of potential model limitations as well as the range of outcomes and model performance.

Section 5(c)(iv)(C) (page 16)"…this documentation must include the completed impact assessment and results from testing AI performance in a real-world context…"

*Consider changing this to "…testing AI performance in a **range** of real-world contexts…" in order to achieve a more thorough understanding of performance.*

Section 5(c)(iv)(D) (page 17)

The minimum requirement here is that human review must be conducted at least annually. If agencies choose to only meet the minimum required frequency (annually) then this type of review will occur too seldom to detect emerging risks, and harm could have occurred undetected for up to a year. Suggest that AI systems should be ranked and identified as low, medium or high risk, and that those identified as high or moderate risk should be monitored/reviewed more

frequently. Potentially, you could also split this into two types of monitoring: (1) monitoring to detect adverse or disparate impacts to rights or safety and (2) monitoring to detect performance degradation of the system. Then, the recommended frequency of monitoring could depend also on monitoring type.

Section 5(c)(iv)(E) (page 17) "Where the AI's risks to rights or safety exceed an acceptable level…agencies must stop using the affected AI…"

An "acceptable level" of impact to rights and safety should be transparently defined.

Section 5(c)(v)(A)(3) (page 19)

Using representative data – This should not only occur before initiating use, but also on some kind of ongoing basis. Over time, the affected communities may change, so while the data may be representative at development or onset, changes over time could happen gradually resulting in bias.

****

Presented Questions:

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Agencies determined to have moderate or high impacts to safety/rights should establish governance and control mechanisms, as well as policies and procedures. Minimum requirements for policies and procedures should be established, but each agency could establish customized policies and procedures suitable to their function.

Governance and control mechanisms should exist, such as independent oversight. A general, independent, oversight board could add the ability to ensure appropriate implementation of

policies across agencies. For example, one agency might exert strict criteria over a system that may have high potential impacts within that agency, but a general oversight board will have a broader view and able to identify that the particular system might have relatively low potential impacts compared to another agency that might be applying more lenient criteria. The general oversight board could ensure that the complexity of controls and policies adopted by agencies will vary appropriately across the spectrum.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Recognizing that all agencies are not equal and the potential for impacting rights & safety are not equal across all agencies, minimum requirements should vary based on a set of criteria that depends on attributes such as potential for impact to rights and safety, and usage/dependence on AI systems. Agencies with the highest potential for impact to rights and safety via AI systems should be held to a higher minimum requirement.

V. Conclusion **8**

I. Introduction

New America's Open Technology Institute (OTI) files these comments in response to the Office of Management and Budget's (OMB) Draft Memorandum On Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. OTI generally welcomes the substance of the guidance, which establishes important guardrails for federal agencies' development and use of artificial intelligence (AI). We submit these comments both to support important aspects of the Memorandum and to note areas that would benefit from clarification, amendment, or further development.

OTI works at the intersection of technology and policy to ensure that every community has equitable access to digital technology and its benefits. OTI advocates for the development and oversight of algorithmic and artificial intelligence models that are fair, equitable, and benefit all communities. Protecting equity, civil rights, and civil liberties are central to these objectives. While OTI believes strong rules for federal agencies' use of AI are essential, we continue to call for decisive action from all stakeholders, including the U.S. Congress, in regulating the creation, deployment, and use of artificial intelligence in ways that serve all of society.

OTI's comments are structured as follows. First, we reference our previous writings and filings on related issues, including as part of a coalition to make clear our institutional position and perspective on AI governance and government use of AI. Second, we highlight the memo's approach to catalyzing federal innovation and protecting rights, its detailed focus on enumerating how agencies protect rights, and the helpful suggestion that the Intelligence Community also follow the draft guidance. We then provide analysis and five recommendations on strengthening the memo's accountability framework, including its provisions on public transparency, its grants of discretion to Chief Artificial Intelligence Officers, the scope of exemptions, and remedies for adversely affected individuals.

II. OTI's prior work on Artificial Intelligence and Algorithmic Accountability

In June 2023, OTI joined a coalition of civil rights, technology, policy, and research organizations in sending a letter to the Directors of the White House Domestic Policy Council, the White House Office of Science and Technology Policy, and the Office of Management and Budget. The letter "commend[ed] the Biden-Harris administration on its recent efforts to center equity and civil rights in technology policy" and urged the administration to advance a "whole-of-government approach to addressing the impact of artificial intelligence (AI) on people's rights and opportunities." Specifically, the letter urged the administration to:

1. Make the Blueprint for an AI Bill of Rights binding administration policy through OMB guidance;

2. Ensure coordinated follow-through by federal agencies in light of Executive Order 14091 and the AI Bill of Rights, including actions outlined in the October 2022 fact sheet and needed additional efforts; and
3. Launch sustained public engagement with diverse stakeholders to raise awareness of AI harms and support meaningful public and private sector efforts to combat algorithmic discrimination.

Executive Order 14110 and the draft OMB Memorandum ("OMB guidance" or "OMB memo") demonstrate meaningful progress in each of these areas. OTI has long focused on the importance of promoting accountability for algorithmic use, and has recommended that government and commercial use of algorithms be accompanied by guardrails that center civil rights and equity. In comments submitted to the National Telecommunications and Information Administration's (NTIA) Request for Comments on Privacy, Equity, and Civil Rights, we underlined harms, especially involving disparate impacts in education, employment, and housing discrimination, and proposed paths forward including via industry and government action. Only through a substantial and deliberate set of guardrails that elevate the potential impacts on civil rights, along with important legislation (including comprehensive federal privacy rules), can the use of artificial intelligence truly serve the public interest.

III. Support for Key Aspects of the Memorandum

The OMB guidance focuses on three distinct but interrelated areas: Strengthening AI Governance, Advancing AI Innovation, and Managing the Risks from the Use of AI. Each area sets thorough and actionable requirements and guidance, including specific minimum practices. OTI is supportive of the memorandum's overall approach. In particular, we commend OMB for a balanced focus on innovation and risk-management, the combination of both a rights- and safety-focused approach, the enumeration of the contexts that can implicate rights, the centering of rights through additional minimum practices and, finally, the memo's encouragement for the intelligence community to also follow these practices.

Balancing Innovation & Risk Management

We commend OMB's efforts to balance streamlining for innovation, the need to manage risks, and the creation of governance structures to be able to do both at the level of each agency. As the memo and the accompanying Executive Order on AI make clear, leveraging the immense potential of artificial intelligence across the federal government could improve agencies' ability to perform their mission and deliver significant benefits to the public. However, deploying AI systems without a thorough understanding of attendant risks and impacts on rights, would imperil Americans. The memo rightly incorporates both perspectives by establishing clear guidance on how to remove barriers to innovation via a public enterprise strategy that includes a

plan for building and maintaining capacity to address risks from AI. The risk-management section of the memo defines the ways in which AI can pose risks to safety or rights, and requires that agencies stop using AI that is non-compliant. The equal focus on practices to promote innovation and those that promote rights and safety gives federal agencies a concrete framework for developing and deploying "responsible AI."

The Safety- and Rights-Impacting Framework

The OMB guidance and E.O. 14110 blend the rights-focused perspective of the Blueprint for the AI Bill of Rights with the risk-based approach in the National Institute for Standards and Technology (NIST) Artificial Intelligence Risk Management Framework. The nature of the vast U.S. federal bureaucracy ensures that different agencies and groups will issue rules and guidance on overlapping aspects of artificial intelligence governance. The OMB memo wisely incorporates key aspects of these two benchmark documents in its attempt to harmonize an approach to AI governance across federal agencies.

OTI welcomes the memo's enumeration of rights-implicating purposes of AI. Recognizing that certain purposes fundamentally implicate rights, no matter the details of the technology or its implementation, provides an important signal both to federal agencies and private actors. Even more, the lists provided in the memo are explicitly billed as non-exhaustive, and the agencies are encouraged to build and share with OMB their own agency-specific list of purposes that could categorize AI systems, applications or components as rights- or risk-impacting. The list provided in the memo has a wide range of purposes, including health care, immigration, policing, housing, credit and lending, education, and hiring (all discussed in either our coalition letter or in OTI's comments to the NTIA), as well as child welfare, surveillance, government benefits and emotion detection.

We are also pleased to see the importance that the memo places on the mitigations related to rights-impacting AI. These additional minimum required practices include: taking steps to ensure that the AI will advance equity, dignity, and fairness; consulting and incorporating feedback from affected groups; ongoing monitoring and mitigation for AI-enabled discrimination; notice, redress and, maintaining human consideration; and allowing for opt-out. The enumeration of rights-implicating purposes and accompanying minimum practices thus make some aspects of the Blueprint for an AI Bill of Rights binding on federal agencies.

Application to the Intelligence Community context

Finally, OTI welcomes the memo's encouragement that Intelligence Community elements, which are not bound by the memo, should also consider following the minimum practices laid out in the memo. While AI innovation and risk for national security systems is governed through other mechanisms, including Executive Order 14110, the OMB memo establishes important processes for protecting rights that are applicable and valuable to the national security contexts.

IV. Areas for Clarification/Amendment

Some areas in the memo would benefit from further clarification or development: the interaction between this guidance and the Government Accountability Office's previous similar guidance, the lack of public reporting or accountability mechanisms for parts of the memo, lack of a clear definition of "meaningfully influence," and the need for further detail on the remedy process. Our recommendations below address these areas.

Recommendation 1: Clarify how the OMB guidance interacts with the Government Accountability Office's June 2021 guidance

The memo incorporates elements from other guidance frameworks including the Blueprint for an AI Bill of Rights and NIST's Artificial Intelligence Risk Management Framework. It lays out the groundwork for AI governance at a high level, and while it does draw several pathways for agencies, it does not reference the Accountability Framework for Federal Agencies on Artificial Intelligence published by the Government Accountability Office (GAO) in June 2021. The GAO framework is built around four interrelated principles that address governance, data, performance, and monitoring, and provides in-depth guidance on practices for each of these principles. OMB should consider incorporating a reference to the GAO framework, which appears to complement OMB's aims, or otherwise clarify the relationship between the draft memorandum and the GAO's governance framework.

Recommendation 2: Strengthen Section 5's Public Disclosure and Documentation Requirements

While the sections of the memo that address governance and innovation include requirements for public disclosure of agency practices, Section 5 (on managing risks) establishes none. Given the need for transparency about how the government has identified and addressed risks from AI, this omission is consequential. We recommend that wherever agencies are directed in Sections 5(b) and 5(c) to notify OMB, they also should be required to make public disclosures otherwise consistent with law and government-wide guidance. Relatedly, Section 5(a) directs agencies to stop using AI that is not compliant with minimum practices by August 2024, but includes no requirement to internally document the AI applications or systems that agencies have stopped using. Ensuring that agencies maintain lists of deprecated AI systems and the rationales for decisions to deprecate their use is essential for accountability and auditability.

Recommendation 3: Limit the scope of exemptions and strengthen oversight of CAIO decisions in Section 5

Risks to accountability go beyond the need for public disclosure. Section 5 grants CAIOs and agencies overbroad latitude to conduct self-assessments. The memo designates the Chief AI Officer (CAIO) as the official empowered to make important decisions about AI for the agency but provides for minimal oversight of a CAIO's most consequential decisions. Section 5(b)

permits a CAIO to determine independently or with limited consultation within an agency that an AI application or component is not safety- or rights-impacting, and therefore "not subject to the minimum practices." Determinations or reversals require documentation and a risk assessment that must be reported to OMB, but the memo does not specify a process by which OMB could challenge a CAIO's determination.

In addition, Section 5(c)(iii) permits a CAIO to grant their own agency waivers of minimum practices. The memo details specific elements of the decision-making process for the waiver, but it does not provide for an oversight mechanism whereby disagreement can be documented or the CAIO's decision overruled, including by OMB. The CAIO role is not designed in the mold of an independent officer like an Inspector General, and is instead charged with promoting innovative agency uses of AI and managing risks. That design may be appropriate, but must be accompanied by appropriate internal checks and external oversight. OTI recommends that the OMB memo address both the internal processes within agencies and the external oversight mechanism(s) that will ensure that agency self-assessments are appropriately scrutinized.

Recommendation 4: Clarify the definition of "meaningfully influence" in the context of notifications to negatively affected individuals in Section 5(c).

The phrase "meaningfully influence" appears throughout the draft guidance. Arguably the most significant usage is Section 5(c)(v)(D)'s requirement that "agencies must notify individuals when AI meaningfully influences the outcome of decisions specifically concerning them, such as the denial of benefits." Section 5(c)(v)(D) helpfully instructs agencies on how to provide useful notices and encourages them to provide explanations for AI decisions. But we recommend that OMB further clarify that agencies should construe "meaningfully influence" broadly enough to prevent widespread determinations that significant inputs from AI on decision making are not "meaningful" enough to warrant notification. OMB also should consider amending the language in 5(c)(v)(D) to "require" rather than merely "encourage," agencies to provide explanations for such decisions. Such explanations provide a meaningful basis for affected individuals to understand, even in general terms, how an AI system was used to make decisions about them.

Recommendation 5: Clarify the boundaries of the remedy process

Section 5(c)(v)(E) requires that "[a]gencies must provide [...] potential remedy to the use of the AI by a fallback and escalation system in the event that an impacted individual would like to appeal or contest the AI's negative impacts on them." The inclusion of an appeals process for impacted individuals is welcome, but as drafted the language does not seem to provide for a process by which an individual erroneously *not* notified of a negative outcome could escalate a complaint for review based on the belief that an adverse decision against them was shaped by an AI system listed in an agency's public AI inventory. OTI recommends that OMB clarify the

boundaries of the potential remedy mechanism to address possible agency error and establish guardrails against bad-faith uses of a remedy or complaints process.

V. Conclusion

The OMB guidance blends a call to greater innovation with a focus on guarding rights and safety as they relate to government purchasing, deployment and use of AI. The memo rightly focuses on how AI can impact rights and encourages the broad adoption of its standards by Intelligence Community elements not bound by the guidance. OTI's five recommendations ask for a clarification on how the OMB Guidance interacts with the GAO's June 2021 guidance on government use of AI; for strengthening the public disclosure and documentation requirements of Section 5; for a limit on the scope of exemptions as well as CAIO discretion also in Section 5; for a clarification of the definition of meaningfully influence in the context of notifications within Section 5; and finally for clarification of the scope of the remedy process in Section 5.

AI priorities for the country

AI priorities for the country

Generative AI Commons (outreach team)

(Ofer Hermoni, Oita Coleman, Raghavan Muthuregunathan)

Link to this document: link

Who is Generative AI Commons?

The LF AI & Data Generative AI Commons is dedicated to fostering the democratization, advancement and adoption of efficient, secure, reliable, and ethical Generative AI open source innovations through neutral governance, open and transparent collaboration and education.

Our recommendation:

The potential of AI is vast, but it must be built carefully to expand opportunities broadly.
For instance, a new intelligent AI scheduling tool at a hospital aims to optimize staff shifts and operating room bookings. Without proper precautions, it risks prioritizing some departments over others, which may negatively impact patients needing more critical care. We recommend the following priorities to ensure a responsible and sustainable development of AI.

Equal Economic Opportunity: The scheduling tool should ensure equal opportunities for advancement by equitably distributing shifts across departments based on need and staffing levels.

Safeguard Information: Patient data used for demand forecasting must be anonymized and secured. Code reviews of the AI system should verify privacy protections before deployment.

Promote Fairness and Inclusion: When assigning prime surgery times, the tool should be tested to prevent preferential treatment for certain specialties. More limited historical data for some departments could skew results unfairly.

Provide Transparency: If the tool denies a doctor's operating room request, the hospital must explain why, with an appeals process. This enables correcting potential bias in the system.

Oversee Usage: Hospital administrators must govern the use of the tool responsibly, monitoring for unfair impacts on staff in any department. They remain **accountable** for remedying issues discovered over time.

Similarly, **an AI writing assistant risks harm** if not developed carefully. Testing and reviews must ensure they represent all groups respectfully, provide attribution for sources, and avoid generating biased, false, or **plagiarized content.**

However, generative AI cannot guarantee to be 100% unbiased, hallucination. Independent rating agencies, similar to that of moody's delloite that rates the credit rating of countries should be established to rate the reliability of LLMs or AI solutions built by corporations.

Responsible oversight and adaptation are crucial for users to trust these emerging technologies as tools to aid their advancement and productivity. With conscientious governance grounded in ethical principles, innovators can enable AI to expand opportunities broadly.

Public outreach and AI education

As AI will impact everyone in some way, it becomes essential to prioritize AI education for everyone. Below are some initiatives that Generative AI Commons is planning to accomplish. We recommend the government to adopt similar initiatives.

- **Launch public awareness campaign** to educate citizens on real versus "fake" open source AI, emphasizing the importance of available science and transparency with AI systems.
- **Develop open-source generative AI educational materials** to make this technology more accessible for developers, researchers, and the general public. This includes building tutorials, documentation, frameworks, and other resources. Prioritize practical skills development. This is important for pre-eminence in this space.
- **Build a comprehensive taxonomy and glossary of terms** relating to generative AI and responsible/ethical AI practices. Having consistent vocabulary and definitions is essential for public discourse

Importance of Open Source and why it should be the bedrock:

Open source is about free software. Free here is not free-of-cost but **Free Speech,** quoting Richard Stallman. The government should incentivize large organizations to participate in contributing to open source. Engineers of large corporations believe that open source will win in the long run compared to themselves. Neither Google Nor Open AI has the MOAT. [1][3]

Open-source software should be the foundation of the government's AI development priorities, just as free speech principles are vital for democratic societies. There is a strong parallel between these concepts when it comes to AI:

1. **Transparency** - Open source code enables transparency in how AI systems are designed and function. This is critical for identifying bias, errors, and potential harms - just as freedom of speech enables critique and truth-telling about institutions of power. **Opacity** leads to the possibility of **covert, unethical uses** of AI.

2. **Accountability** - When open-source researchers and developers must publish code openly, it imposes accountability for that code to stand up to scrutiny. Closed sources evade accountability. Openness facilitates both innovation and responsibility.

3. **Accessibility** - Proprietary AI concentrates knowledge and capabilities among **elite institutions** that can afford licensing and computer resources. Open-source AI democratizes access to anyone interested in utilizing or studying these rapidly evolving technologies. Free speech principles strive to make information available to all citizens, **not just select groups**.

4. **Oversight** - The ability of a range of stakeholders to inspect AI source code enables better oversight to ensure systems align with public interests and values. Infringing on free speech removes voices from public discourse that could raise essential concerns. Openness furthers both effective oversight and productive public debate.

In essence, opaque and closed AI creates concentrations of unaccountable technological power. Enshrining open source as a priority counteracts this tendency, **as enshrining free speech fosters an informed and empowered populace.** The principles are mutually reinforcing for AI development in the public interest.

Conclusion

To summarize, we request the government to prioritize enforcing the principles of

- equal opportunity,
- information safety,
- promote fairness,
- enforce transparency and
- accountability

when anyone builds an AI product.

We believe in incentivizing and educating the population to be aware of and contribute to Open Source Software, which will automatically guarantee the same.

FOUNDATION FOR AMERICAN INNOVATION

Dec 6, 2023

Re: OMB-2023-0020-0001 - Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

Thank you for the opportunity to respond to the Office of Management and Budget's request for comment on the draft memorandum titled Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI).[1] My name is Samuel Hammond, senior economist for the Foundation for American Innovation. FAI is a group of technologists and policy experts focused on developing technology, talent and ideas to support a freer and more abundant future.[2]

My research at FAI focuses on the second order effects of technologies like Artificial Intelligence on our institutions. By second order, I mean not only what an AI system can do on its own, but what is likely to result as AI capabilities diffuse throughout the economy. These second order effects are all important, as the history of transformative technologies – from the printing press to the industrial revolution to the internet – is also a history of equally transformative changes to government.

I call the tendency to neglect the second order effects from technology the Horseless Carriage Fallacy, as if the advent of the automobile merely replaced horse drawn carriages while holding everything else constant. In reality, the automobile changed virtually everything, radically reshaping American institutions and economic geography.

Artificial Intelligence will do the same. The question is whether governments will keep up and adapt, or be stuck riding horses while society whizzes by in the digital equivalent of a race car. The risks from adopting AI in government must therefore be balanced against the greater risks associated with not adopting AI proactively enough – a theme I explore in my essay series, *AI and Leviathan*.[3]

---

Avoiding duplication, fragmentation, and anachronism

It's within this context that I applaud the White House's steps to promote the use of AI in government through the Executive Order on "Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence." It does this in a variety of ways, including through the formation of an interagency council at OMB to coordinate the use and development of AI in concert with new Chief AI Officers at each agency.

It is difficult in the abstract to know whether this framework will accelerate AI adoption in government or whether new layers of oversight will simply slow things down. As OMB begins implementing the Executive Order through this draft memorandum, it is thus imperative to retain the EO's spirit of advancing AI in government by periodically evaluating whether the framework is proving effective in practice, and to create a process to adjust, revisit or amend the framework overtime.

Consider the establishment of Artificial Intelligence Governance Boards with oversight over AI issues at each agency. On the one hand, the Boards could expedite the adoption of AI by enabling a degree of central coordination. On the other hand, insofar as AI is increasingly embedded in every form of software, it is often hard to distinguish an AI system from ordinary information technology (IT). For example, techniques rooted in generative AI are increasingly used as an alternative method of data compression, enabling ultra low-bandwidth video conferencing.[4] In the limit, some AI researchers are even exploring the use of generative AI as a general-purpose computing paradigm to replace conventional operating systems.[5] Thus, as the line between AI systems and traditional IT systems blurs, the official definitions used to delineate "AI" from "non-AI" circa 2023 could become anachronistic in short order.[6]

Whether the framework is successful will depend on whether the Boards and AI Officers are primarily incentivized to accelerate the adoption of advanced AI systems or to police

[6] See related discussion of this point in my comments on AI and Accountability for the NTIA: "NTIA Comment on AI Accountability Policy." Samuel Hammond. Foundation for American Innovation. (2023, June 12). https://www.thefai.org/posts/ntia-comment-on-ai-accountability-policy

phantom risks, like bias or discrimination, that aren't unique to AI. As it stands, OMB was already two years late and well past its statutory deadline to issue AI guidance to agencies as required by the AI in Government Act of 2020. Before entrenching an additional layer of process, OMB should assess the factors that inhibited this timely issuance of guidance in its recent past, and use the enactment of this draft memorandum as an opportunity to correct or otherwise streamline those factors going forward.

The dangers from entrenching slow or duplicative approval processes is hard to overstate. FedRAMP, for instance, was created to overcome this problem in the procurement of cloud services. As a government-wide compliance program, agencies can transact with FedRAMP-approved providers knowing that they meet a standardized level of security. The most common AI services should follow the same model and be evaluated and authorized for use government-wide, letting Chief AI Officers and Governance Boards focus on overseeing bespoke or ad hoc AI systems for specific agency needs. This could be achieved by integrating NIST's AI RMF into the FedRAMP approval process, as is already the case with NIST's standards on security and privacy (SP 800-53). Insofar as many AI systems are and will continue to be accessed via the cloud, piggybacking on FedRAMP is only logical.

Winning the institutional arms race

The case for aggressive adoption of AI in government comes down to the arms race between AI and our institutions. This is most obvious in the arena of cybersecurity. As AI lets hackers and other bad actors level-up their capabilities, our cyber defenses will need to level-up at least as fast. And yet these dynamics extend far beyond cases of explicit AI misuse. Democratized access to AI lawyers could quickly overwhelm the court system, for instance, just as expert AI tax accountants could soon democratize the ability for individuals and businesses to minimize or complexify their tax liability.

These vectors of attack don't constitute misuses of AI at all, but rather appropriate use at an unprecedented scale. In the near future, for instance, AI agents will likely fully automate the process of filing and appealing a FOIA request. Any information that can be requested will be, necessitating the adoption of e-discovery systems to allow AI agents to automatically review and fulfill the request on the government's end. The final equilibrium could make for a far more transparent and efficient government, but in the interim, having many more requests for information than an agency has capacity to fulfill could cause a de

facto Denial of Service attack. Similar such "attacks" are likely possible across any number of public venues or services, from AI generated regulatory comments, to the potential illegibility of the sheer volume of economic activity unlocked by AGI.

Even the most productive uses of AI will increase the throughput demand on our administrative agencies by orders of magnitude. Just last week, Google DeepMind published an AI model that discovered 2.2 million new crystals and 380,000 new stable materials that could power future technologies.[7] This represents nearly 800 years' worth of new material science knowledge, achieved virtually overnight. Imagine what will happen when this same pace of discovery comes to medicine, as it almost surely will. In a typical year, the FDA approves around 50 new molecular entities for novel drugs. Could the FDA handle increasing this approval rate to 500, 5,000 or even 50,000 new molecules per year, unlocking centuries of progress in personalized medicine? The answer is clearly no, at least without adopting AI symmetrically.

The need for (and risks of) scalable governance

In every case, managing these growing throughput demands will require the federal government to not only adopt AI aggressively, but should force a rethink of the configuration of our administrative and regulatory agencies from the ground up. From broken procurement policies to the bureaucratic sclerosis engendered by slow and outdated administrative procedures, incremental reform is unlikely to suffice. We must modernize government at the firmware-level, or risk ubiquitous system failure and government becoming *the* primary bottleneck to AI's enormous potential upside.[8]

In short, as throughput demands on government increase, we will need to adopt AI-native governance models that *scale*. One highly scalable approach is the idea of Government as a Platform, drawing an analogy to multi-sided platform companies like Uber or AirBnB. Such platforms use reputation mechanisms, search and matching algorithms, and automatic dispute resolution systems to provide quasi-regulatory forms of market governance with unprecedented scale. Given progress in AI, similar platform-based approaches could be extended to other areas of regulatory oversight.

[7] "Millions of new materials discovered with deep learning." Amil Merchant and Ekin Dogus Cubuk, Deepmind. (2023, November 29). https://deepmind.google/discover/blog/millions-of-new-materials-discovered-with-deep-learning/
[8] "Heretical thoughts on AI" Eli Dourado. (2023, January 19). https://www.elidourado.com/p/heretical-thoughts-on-ai

Consider the recent advances in the visual understanding exhibited by Large Multi-modal Models (LMMs) such as GPT4-Vision. Such models can be prompted to describe and interpret what they "see" in any given image or video scene. As these models continue to improve and overcome their current limitations (such as vulnerability to prompt injection), LMMs could thus unlock new, highly scalable forms of regulatory oversight. For example, imagine a near future where, instead of the USDA or OSHA sending agents to inspect commercial farms or work sites in-person, cameras were required to be installed on-site with LMMs fine-tuned to continuously monitor for food or workplace safety violations.

As the above hypothetical makes clear, the power of AI to scale regulatory compliance also scales potential forms of government surveillance. To preserve Americans' right to privacy and strengthen public trust, any AI system that has surveillance as a dual-use must have privacy and civil liberty protection engineered into the technology itself.

A lesser appreciated risk with AI-enabled regulatory oversight is simply the extent to which all laws and regulations are implicitly calibrated to the expectation of imperfect information and an "acceptable" degree of non-enforcement. Consider the data showing that most drivers make "rolling stops" at stop signs the majority of the time – a practice that is technically illegal but which goes largely unenforced. Indeed, such laws were written *with the expectation* of deeply imperfect enforcement. If a car's on-board computer used AI to automatically detect and report a driver every time they made a rolling stop, went 10 MPH over the speed limit, and so on, the de facto stringency of basic traffic laws would suddenly become oppressive indeed. Thus, to the extent AI dramatically reduces asymmetric information within a particular agency's regulatory domain, regulators must be on guard that they are not strengthening the de facto stringency of existing laws or regulations in an analogously dramatic fashion. Nor is this risk hypothetical, as shown by the federal decision to prevent Tesla's self-driving system from making rolling stops.[9]

Reducing waste, expanding capacity

Earlier this year, researchers at OpenAI published a paper assessing the likely labor market impact of Large Language Models. They found 80% of the U.S. workforce could

[9] "Feds Make Tesla Remove 'Rolling Stops.' It's A Terrible Decision." Brad Templeton. Forbes. (2022, February 1). https://www.forbes.com/sites/bradtempleton/2022/02/01/feds-make-tesla-remove-rolling-stops-its-a-terrible-decision/?sh=65a0454b2111

have at least 10% of their work tasks affected by the introduction of LLMs, with jobs like Accountants, Auditors, and Legal Secretaries facing an exposure rate of 100%.[10] Many large companies have already begun downsizing or have plans to downsize, in anticipation of the enormous efficiency gains unlocked by emerging AI tools and agents.

Much of the work performed in government bureaucracies is especially low-hanging fruit for AI.[11] OMB should thus undertake an analogous survey to discover which federal jobs are most exposed to AI, and to what extent legislation is needed to expedite new, AI-enabled models of governance. The goal should not be to downsize the federal bureaucracy per se, but rather to augment employee productivity and free up human resources for higher value uses, reducing waste and enhancing capacity simultaneously.

Take the FTC's health care division, which employs around 30 attorneys to police competition across the entire U.S. health care industry. A day in the life of these attorneys looks like manually reading through tens of thousands emails subpoenaed from a pharma CEO as part of discovery. Yet today, with the right prompt engineering, one could feed those emails into a Large Language Model and simply ask it to find the most egregious examples of misconduct. This wouldn't replace the attorney's role in verifying what the AI discovers, but even with the imperfections of current models, it would nonetheless drive massive productivity gains – gains that we can be sure are being exploited by the private law firms on the other side.

At the same time, the same tools that can be used to enhance federal capacity can be further used to strengthen Congressional oversight. Most of the work and communications performed in any given agency is now machine readable. As agencies embrace AI internally, managers will be able to easily track and query the performance of their staff, automatically generating reports and work summaries from common document repositories. These same techniques could be used to expedite reports to Congress, and even enable near real-time monitoring of an agency's activities. Call it Inspector General-GPT.

[10] GPTs are GPTs: An Early Look at the Labor Market Impact Potential of Large Language Models." Eloundou, Tyna et al. OpenAI. (2023, March 17) https://arxiv.org/abs/2303.10130
[11] "Disrupting Bureaucracy" Samuel Hammond. PlainText. (2015, September 24). https://readplaintext.com/disrupting-bureaucracy-fa611d04f956

Innovating within government should mean more than plugging AI into an existing, outdated process and calling it a day. It will take true inventiveness and ambition. With appropriate urgency and coordination between the White House, OMB and Congress, we can forestall system failure by co-evolving our institutions with AI, enhancing public trust and saving taxpayers' dollars in the process.

Thank you,

Samuel Hammond

2023-12-05 OMB Comment

Thank you for the opportunity to comment on the proposed OMB memorandum for the heads of executive departments and agencies.

I would like to note several major concerns and one minor one, and offer related suggestions for improvement.

1. Covered AI must include downstream replications or promulgations of AI-reliant/AI-implementing systems

First, in Section 2.b., the memorandum defines "covered AI" to include "system functionality that implements or is reliant on AI, rather than to the entirety of an information system that incorporates AI." Though this is an important distinction, it is not nuanced enough. Where system functionality is reliant on AI, it is not only that specific system functionality that should be assessed. Rather, any other downstream information systems that may be affected by AI outputs should be assessed.

To take a simple example, if a particular system incorporates AI language translation and the AI translation output includes a mistranslation or auto-correction of a word or phrase that ends up being replicated across many other documents or systems that relied on the initial faulty translation/auto-correction output, the cumulative impact and reach of all of those systems would need to be taken into account when performing an assessment of the AI, not just the system that was "closest" to the AI.

2. The regime must include and support error correction, particularly in "too big to fail" software platforms

To take another version of this example, let's say that a widespread operating system (say, Microsoft Windows) or browser (say, Google Chrome or Microsoft Edge), incorporated a language translation or autocorrection function that returned faulty outputs. The government agencies using such operating systems or browsers that incorporate embedded AI systems should have some way of petitioning the companies who make those systems to fix the errors in the systems, wall them off from use, or otherwise have a reliable way of identifying the flaws and having users work around them.

Otherwise, the memorandum admonitions regarding risk assessment, etc., will not be of much practical use because some software is "too big." The government is not going to be able to completely scrap the Microsoft Windows

operating system or the Microsoft Office applications suite, so there must be a way of mitigating risk and correcting errors within all of the major ubiquitous software platforms.

3. AI promotion and adoption decisions should not be assumed.

Third, in several areas, the memorandum implicitly assumes that all agencies require the use of AI and "AI maturity," and that there will be some benefits to the use and innovation of AI that will outweigh the risks across the board in every agency. However, this is inconsistent with a true scientific assessment of risks that does assume a positive outcome.

It is quite premature to assume that AI use will be a net positive that needs to be promoted across all agencies. It is equally possible and plausible that a given agency, department, or government office finds that most of the risks outweigh the benefits of AI innovation in its sphere. These entities should be free to make a rigorous assessment and determination and should not receive any negative treatment whatsoever if they determine that incorporating AI systems does not benefit the agency on balance.

The role of the CAIO should be revised to reflect this reality. In particular, sections 3.b.ii(G) - (I), concerning the promotion of AI innovation, should be revised to reflect the possibility that AI promotion may not be in either the public's or the agency's best interests, and the CAIO might find that the CAIO will best serve the agency and the public by holding off on implementing AI systems until they are more robust, safe, and transparent.

This approach would be more consistent with the President's prior Executive Orders, which always qualified language regarding the promotion of AI with additional caveats regarding risk assessment regarding the Nation's values, laws, public rights, and safety.

4. The memorandum should insist on transparency in AI foundation models.

Fourth, the memorandum should take notice of the current trend toward a lack of transparency in AI foundation models, and therefore employ stronger language when empowering agencies to reverse this trend. Section 5.d.ii currently states, "Agencies should take steps to ensure transparency and

adequate performance for their procured AI," the OMB, the memorandum should add that every agency should take particularly special care as to the transparency of any foundation model as a prerequisite of use.

As a group of eight leading AI researchers recently noted, "While the societal impact of these models is rising, transparency is on the decline. If this trend continues, foundation models could become just as opaque as social media platforms and other previous technologies, replicating their failure modes." See Stanford University's Center for Research on Foundation Models (CRFM) and Institute on Human-Centered Artificial Intelligence (HAI), MIT Media Lab, and Princeton University Center for Information Technology Policy 2023 Foundation Model Transparency Index, available at https://crfm.stanford.edu/fmti/. Given this industry-wide trend toward less transparency, rather than more, the government should take a stronger position regarding insisting on foundation model transparency as part of any procurement process.

5. Limit R&D exclusions that would provide windfalls to commercial AI offerings.

Fifth, the memorandum has too large a carve-out for research and development in section 5.c.1 and opportunities for exploitation of government data for improvement of commercial AI. This exclusion is particularly problematic when viewed in combination with section 5.d.4, where agencies are only asked to "consider contracting provisions that protect Federal information used by vendors in the development and operation of AI products and services for the Federal Government so that such data is protected from unauthorized disclosure and use and cannot be subsequently used to train or improve the functionality of commercial AI offerings ..." Elements of the intelligence community are also excluded from even these modest requirements. This appears to mean that all government R&D activities regarding AI, as well as intelligence activities, may be used to enhance commercial AI without much scrutiny. These loopholes seem like a glaring and unnecessary risks for abuse and they should be eliminated or greatly narrowed.

6. Address labor-force risks in the memorandum.

Sixth, I do not see adequate attention being paid in this memorandum to the statements in president's October 30, 2023 executive order that "In the workplace itself, AI should not be deployed in ways that undermine rights, worsen job quality, encourage undue worker surveillance, lessen market competition, introduce new health and safety risks, or cause harmful labor-force

disruptions." The risk of labor-force disruptions is not mentioned in the current draft memorandum, which is a mistake. CAIOs and agencies (particularly the Department of Labor) must coordinate to assess and address the labor disruption and job quality risks of AI-reliant systems.

Finally, a more minor point of clarification. In section 5(b)(ii), Purposes That Are Presumed to Be Rights-Impacting, section G should include not only "time-on-task tracking," but "task tracking" more broadly. The phrase "electronic workplace surveillance and management systems" could be interpreted to include task management systems, but it is not completely clear that they do. All surveillance, management, and oversight of workplace tasks should be presumed to be rights-impacting.

Deepti Kannapan OMB-2023-20 letter

Artificial intelligence is an emerging technology with enormous potential for both positive and negative impact, so I applaud the Biden-Harris administration for taking this step toward setting the direction of its future development. Preventing harm to the rights and safety of individuals is an important priority.

This executive order encourages agencies to implement AI only when doing so has benefits that outweigh the risks, and to manage the risks that occur from its use.

As an engineer with professional experience in automating physical systems, I have two comments on the role of non-AI automation (which the executive order describes as "systems whose behavior is defined only by human-defined rules"), alongside AI.

1. Need to incentivize other forms of automation over AI when it is better fit for purpose
Automation has considerable potential in improving the effectiveness of agencies. Agencies are instructed to assess the potential benefits of using AI automation. This assessment should not evaluate AI solutions in isolation, or only against legacy systems. AI solutions must be evaluated relative to non-AI automation solutions, which can provide many of the same benefits of increasing effectiveness and efficiency.

When a non-AI auotomation system provides comparable benefit to an AI system, agencies should be incentivized to use the non-AI automation system if it can be more rigorously tested, validated, and explained. Mature engineering and mathematical techniques exist for guaranteeing safety of non-AI automated systems.

AI systems are harder to validate for all conditions, since their ability to learn may cause them to depart from their test conditions. They also frequently lack explainability, which can hinder rigorous analyses.

I support the development of AI expertise by agencies and evaluating of automation solutions, but the evaluation of systems should include the full range of automation types, including non-AI, to find the most suitable solution.

2. Safety-impacting AI must have non-AI fail-safes
The executive order acknowledges the possibility of erroneous or harmful results from a rights-impacting AI system, and hence requires periodic human review and the provision of escalation mechanisms. For safety-impacting AI, especially those controlling physical systems, harmful AI actions may require a response too rapid for a human escalation system.

Fail-safes (such as limits on system variables like as the amount of kinetic force delivered) must be implemented. These fail-safes must be able to be rigorously analyzed and validated, and troubleshot in case of emergencies. Non-AI automation may suit this purpose because it is explainable.

In general, fail-safe mechanisms are a teaming of AI, humans, and non-AI automation. I urge the Biden-Harris administration to require the use of automated and human fail-safes for safety-impacting AI.
Thank you,
- Deepti Kannapan

Citizen and Technology Lab's Submission to OMB Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Office of Management and Budget
Regulations.gov Docket Number OMB–2023–0020

The Citizens and Technology Lab (CAT Lab) of Cornell University is pleased to provide input in response to the request for comment (RFC) on OMB's draft memorandum on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence.* These comments respond to questions 2, 3, 5, and 8 of the RFC, and provide additional feedback. In this document we:

- Encourage the OMB to acknowledge and support the role of community/participatory science in the oversight of AI tools.
- Urge the OMB to develop guidelines for soliciting and supporting participation in AI innovation and governance from underrepresented groups who have been historically excluded from AI research and development - and who face disproportionate risks from AI systems.
- Advise the OMB to account for the labor, rights, and mental health consequences for volunteer and professional communities whose work is used to train AI systems and manage AI safety.

About the Citizens and Technology Lab

The Citizens and Technology Lab (CAT Lab) at Cornell University works alongside the public to discover effective community ideas for change in ways that advance scientific knowledge. CAT Lab has worked with communities of tens of millions of people on reddit, Wikipedia, and Twitter to study socio-technical safety and reliability questions, including online safety and discrimination.

CAT Lab is led by Dr. J. Nathan Matias, Assistant Professor at Cornell in the departments of Communication and Information Science. In 2010, he developed one of the first socio-technical testing systems for a generative language model in his capacity at one of the earliest neural network predictive text software companies (SwiftKey).

CAT Lab's position with respect to testing, forecasting, and preventing harms from collective AI and human behavior

CAT Lab has particular expertise with AI systems that are built on adaptive algorithms-systems that train on their outputs such as systems for ranking and sorting, resource allocation, logistics management, and generative AI. As Dr. Matias has outlined in a recent article in *Nature*,[1] the creators of these systems cannot currently make reliable assurances about the performance and safety of systems that adapt to their human environments. He outlines the needed scientific work of testing, forecasting, and preventing harms from this kind of collective AI and human behavior, including the essential role of community/citizen science. When AI systems adapt to widely different contexts, attempts at AI transparency, accountability, and regulation will grossly fail the most vulnerable in society without significant support for community/participatory science on AI and its social impacts**.**

Coordination mechanisms and OMB's role advancing responsible AI innovation *(questions 2, 3, 8)*

OMB should direct agency heads to establish a task force to build community/participatory science-based review of AI tools.

Citizen/community science offers an important mechanism to overcome severe safety and inclusion risks of science and industry. When Dr. Safiya Noble wrote "Algorithms of Oppression," documenting the gross misrepresentation of Black girls with images of pornography on Google, she was drawing attention to a system problem in AI systems that went largely undetected by AI creators in academia and industry for over a decade. As one of the only Black women in information science, she was partly able to observe this problem because it affected her and her communities. Over a decade later, US Information Science as a field has not increased the rate of Black women PhDs. Given the severe under-representation of minorities in computing, work on AI safety and reliability cannot wait for academia to change in order for communities to be safe.[2] Citizen/community science can fill these knowledge gaps and transform the diversity of the scientific and industry workforce by broadening who participants in research and by creating pathways for opportunity.

The EPA's program in Participatory Science for Environmental Protection is one such model, as documented in the 2022 report "Using Participatory Science at EPA: Vision and Principles (PDF)." In establishing this task force, OMB should seek agency input on funding needs for universities, civil society, state/regional/local governments, and Tribal communities to pursue scientific inquiry along

[1] Matias, J.N. (2023) Humans and algorithms work together — so study them together. *Nature* **617**, 248-251 (2023). *https://doi.org/10.1038/d41586-023-01521-z*

[2] Matias, J.N., Lewis, N.A. & Hope, E.C. US universities are not succeeding in diversifying faculty. *Nat Hum Behav* **6**, 1606–1608 (2022). https://doi.org/10.1038/s41562-022-01495-4

community designs. It is critical to begin now to build the scientific and engineering practice to understand collective patterns of human-algorithm behavior.

OMB should include indicators in any system it develops to inventory AI use cases (pursuant to section 7225 of the Advancing American AI Act) to seek clarity from Federal agencies on the diversity of analysis in safety-impacting and rights-impacting AI.

As Dr. Matias noted in a response to *RFC NTIA Docket No. 230407-0093*,[3] the contextual dependence of AI systems perpetuates harms over long periods of time, in particular where harms occur for people underrepresented in computing. Advancing responsible AI innovation will require a coordination mechanism that reflects this context.

To engage the public in responsible AI innovation, federal agencies should consider the roles of access to data, ethics, and volunteer labor that make up the governance systems of digital decision-making.

CAT Lab notes that federal policies need to work in tandem with algorithm transparency to enable communities to produce high quality research in the public interest, and that researchers need protection from private-sector retaliation for research and documentation of harms. We have documented some of the opportunities to enable independent research in a recent Tech Policy Press article, Enabling Independent Research Without Unleashing Ethics Disasters.[4]

CAT Lab recommends that the OMB reflect on how federal agencies can approach AI governance with the role of semi-professional moderators in mind, and designate a person to lead in advancing our understanding of the role of volunteer moderators in advancing responsible AI innovation.

Though trust and safety professionals are part of the bulwark of protection against AI harms, much of the day-to-day activity of protecting online spaces and mitigating algorithmic harm is done by volunteer moderators of online communities, whose conversations have become so-called "ground truth" for the training of AI systems. Community moderators who safeguard platforms, including Wikipedia and reddit, have already experienced overwhelming amounts of information from generative AI bots escalating the amount of spam they deal with to maintain online community spaces.[5] Scholars have begun to document the disruptions from AI-generated content in these

[3] Matias, J.N. (2023). *AI Policy Will Fail Society Without Community Science.* NTIA Docket No. 230407-0093*, also available at* https://citizensandtech.org/2023/06/ntia-submission-06-2023/

[4] Lukito, Josephine, Matias, J., Gilbert, S (2023 May 10). *Enabling Independent Research Without Unleashing Ethics Disasters.* Tech Policy Press. https://www.techpolicy.press/enabling-independent-research-without-unleashing-ethics-disasters/.

[5] Clarke, Laurie (2023 April 11). *Reddit Moderators Brace for a ChatGPT Spam Apocalypse.* Vice. https://www.vice.com/en/article/jg5qy8/reddit-moderators-brace-for-a-chatgpt-spam-apocalypse.

communities; the downstream effects on generative AI systems from this potential information pollution are still poorly understood.[6]

Similarly, the software systems that help enable volunteer moderation are often built and maintained by volunteer open-source engineers. We encourage the OMB to include the governance of volunteer and open-source sociotechnical systems as part of its safety-impacting and rights-impacting AI framework. OMB should also incentivize basic research and the development of open-source software and standards focused on the mitigation of algorithmic harm.

OMB should direct agency leads to support the work of developing best standards and practices for mitigating the mental health and secondary trauma of trust and safety teams and moderators working with AI systems.

When policymakers discuss the safety and rights implications of AI, they often consider end-users of AI, but AI development also involves managing the safety and rights of the workers who train AI systems and monitor their safety. This work, as documented by Siddharth Suri and Mary Gray in "Ghost Work", Alexa Koenig and Andrea Lampros in “Graphic: Trauma and Meaning in Our Online Lives”, and by Sarah T. Roberts in "Beyond the Screen," can expose workers to severe secondary trauma and mental health risks that psychologists have still not discovered how to reliably mitigate. There is much more research to be supported in this developing field of AI mitigation, such as emerging research around AI’s ability to render style-transfer filters to mitigate impact.[7] At Cornell, we have a team currently working on compiling a systematic review of these secondary trauma issues, how to measure the psychological harms from training AI systems to be safe, and how to introduce workplace protections that safeguard the health of the people behind the screen of AI.

Use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised *(question 5)*

Harms from human-algorithm interaction in AI systems should be considered to develop and change both in their harms and benefits over time. OMB should consider expanding the list of safety and rights impacting AI to specify arenas where the initial effect may not yet be easily observed, but where research has shown initial effects, specifically:

1. The chilling effect on freedom of speech that emerges from the use of AI to establish automated law enforcement to deter behavior. This includes systems of legal action in which

a computer is responsible for unsupervised decision-making, which distributes or outsources surveillance and enforcement to parties that are not governments.

2. The potential for such automated law enforcement tools to be deployed in requirements to watermark generative AI content. Early research has shown that receiving takedown notices from copyright enforcement bots drives down individuals' rate of posting, on average, regardless of whether the takedown notice was legitimate or not.[8]

General Comment

Attached are comments from CAP, Public Citizen, Public Knowledge, and numerous other organizations in response to the Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum.

Throughout 2023, numerous civil, technology, and human rights groups called for the Executive Branch to take immediate executive action on artificial intelligence (AI)i and to center the White House Blueprint for an AI Bill of Rights. The President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (AI EO) represents a strong start on the guidance needed to ensure the development of safe and effective AI.iv The accompanying draft OMB guidance, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence," represents essential and needed guidance for federal agencies, contractors, and grantees that are already using AI systems.

We believe it is essential to meaningfully center civil rights and equity in the implementation of these executive actions. Most centrally, that means building on the AI Bill of Rights and requiring that AI systems be shown to be effective, safe, and nondiscriminatory before use; further enumerating rights-impacting and safety-impacting uses that inherently pose the greatest risk; ensuring a broad scope by strengthening procurement language and increasing specificity around waivers and exemptions; ensuring adequate resourcing for implementation; and publishing guidance prior to using generative AI. Agencies should also consider alternative solutions when evaluating AI systems and continue to inventory their AI regulatory authority. Attached, we provide brief comments on each of these elements.

Re: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum; FR Doc. 2023-24269, 23 Nov. 2023.

Dear Ms. Martorana,

Attached are comments from CAP, Public Citizen, Public Knowledge, and numerous other organizations in response to the Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum.

Throughout 2023, numerous civil, technology, and human rights groups called for the Executive Branch to take immediate executive action on artificial intelligence (AI)[1] and to center the White House Blueprint for an AI Bill of Rights[2]. The President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence[3] (AI EO) represents a strong start on the guidance needed to ensure the development of safe and effective AI.[4] The accompanying draft OMB guidance, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence," represents essential and needed guidance for federal agencies, contractors, and grantees that are already using AI systems.

We believe it is essential to meaningfully center civil rights and equity in the implementation of these executive actions. Most centrally, that means building on the AI Bill of Rights and requiring that AI systems be shown to be effective, safe, and nondiscriminatory before use; further enumerating rights-impacting and safety-impacting uses that inherently pose the greatest risk; ensuring a broad scope by strengthening procurement language and increasing specificity around waivers and exemptions; ensuring adequate resourcing for implementation; and publishing guidance prior to using generative AI. Agencies should also consider alternative solutions when evaluating AI systems and continue to inventory their AI regulatory authority. Below, we provide brief comments on each of these elements.

Please feel free to reach out with any questions to Adam Conner (aconner@americanprogress.org) or Megan Shahi (mshahi@americanprogress.org).

Thank you for your hard work outlining the ways in which the federal government can assume the mantle of leadership on AI and implement equitable innovation.

The undersigned,

Center for American Progress

Service Employees International Union
The Tech Oversight Project

Only AI that is proven to be equitable should be developed, acquired, or used. Elements of the draft OMB AI guidance have recognized calls from the civil, technology, and human rights communities to ensure that federal government and contractor use of AI should only be allowed if those AI systems are effective, safe, and nondiscriminatory.[5]

Agency implementation of the memo's requirements must continue to build on the AI Bill of Rights and prior Executive Orders. We applaud that the draft OMB AI guidance builds on the AI EO's integration of the AI Bill of Rights and earlier Executive Orders on Racial Equity and Support for Underserved Communities.[6] There are important requirements in the minimum practices for Safety-Impacting and Rights-Impacting AI to implement the AI Bill of Rights principles of safe and effective systems, algorithmic discrimination protections, and human alternatives, consideration, and fallback. These minimum practices should be expanded to include the other two principles from the AI Bill of Rights, with requirements for Notice and Explanation[7] to those using or affected by government AI systems and to address the issue of Data Privacy[8] for agencies using AI systems.

Fully resourced agency governance structures are needed. The appointment of Chief AI Officers (CAIO) in federal agencies and the creation of Agency AI Governance Boards represent important steps in determining responsibility of and coordination for AI within agencies. More must be done to ensure that these agency CAIOs have the needed power, budget, and accountability for implementing the requirements in AI EO and the draft OMB AI guidance. CAIOs must be required to solicit and include labor and workforce input on their AI plan and they must be represented on the Agency AI governance boards. Consultation on AI in the workforce must occur pre-decisionally, as well as before, during, and after AI implementation. The draft guidance should also clarify as in the CAIO responsibilities their role in ensuring the proper control and labeling of any government product outputted by generative AI as noted in Section 10.1(c) of the AI EO.[9] The agency AI governance structures must be adequately resourced, including the need for Civil Rights Offices (or their inclusion), to meet the challenges identified in the draft OMB AI guidance.

Recognizing rights-impacting and safety-impacting uses of AI is a necessary and fundamental action. The detailed and specific outlining of purposes that are presumed to be Safety-Impacting or Rights-Impacting are an enormous and essential contribution to the broader development of responsible AI. These lists include the heart of those areas most at risk from AI including critical infrastructure, law enforcement and surveillance, employment, and medical issues among many others. These are the areas that are most at risk from AI systems and we applaud the draft OMB guidance for highlighting in detail these critical purposes. To that end, the Rights-Impacting purposes should further include workforce protections and the disability community. In Section 5.b.ii, we recommend the addition of “collective bargaining, workplace organizing, union membership, or concerted activity” to part G to ensure the further protection of workers from AI systems and to continue the Biden-Harris administration's historic support for organized labor and the working people of America. Additionally, we recommend a new part be added to Section 5.b.ii that specifically calls out the needs of the disability community, who are uniquely vulnerable to AI in any number of existing categories but deserve their own consideration. Finally, OMB should consider outlining the process by which new Safety-Impacting or Rights-Impacting purposes could be added to the AI guidance, including through public input, as technology and its usage evolves.

OMB should provide more clarity on the parameters for issuing exemptions and waivers. Clarity is needed on how AI can be determined to not match the definition of Safety-Impacting AI or Rights-Impacting AI and in issuing waivers for minimum practices. In both cases, maximum transparency is needed and such determinations by agencies should be made public on the agency’s website and AI.gov.

AI Procurement recommendations must be strengthened. “The Managing Risks in Federal Procurement of Artificial Intelligence” section should make clearer that “Aligning to National Values and Law” means that the federal government should not purchase automated surveillance, algorithmic management, and other artificial intelligence products that harms workers and must consult with and reach an agreement with workers and their exclusive representatives before purchase and deployment. Additionally, OMB should require AI labor standards in procurement contracts in this or future AI procurement guidance.

Use of alternative solutions should be considered as part of the evaluation of AI systems. The procurement section discusses the procurement of AI systems from vendors, or adoption of commercial AI offerings. But where there are barriers to robustly satisfying the Minimum Practices (i.e. they are satisfied but there are limitations to some of the reporting and transparency, for example) those AI systems should be explicitly disincentivized in favor of alternative vendor or public sector-developed options.

Guidance is needed prior to the use of generative AI. The procurement section also discusses generative AI as a future procurement. Given that Generative AI is likely to be made available as a feature in the office productivity software that every federal agency has already procured, OMB should require federal guidance before enabling widespread deployment of generative AI in existing office productivity software. OMB should task the Office of the Federal Chief Information Officer and the CIO Council to craft such guidance in coordination with the new interagency council of agency CAIOs.

Previous AI EO and OMB guidance ordered agencies to inventory their AI regulatory authorities should be retained and strengthened. While regulation is not the focus of this draft OMB AI guidance, the proposed document provides an opportunity to elevate and prioritize one strong aspect of the previous EO and OMB guidance[10] that required agencies to submit to OMB an agency plan that "must identify any statutory authorities specifically governing agency regulation of AI applications, as well as collections of AI-related information from regulated entities." The Department of Health and Human Services was the only one to publicly release their memo on AI authorities.[11] This inventory of agency regulatory authorities for AI is a strong exercise for agencies to undergo to better understand their authorities in relation to AI and of immense interest to Congress, civil society, and the public as we work to understand if new AI laws are needed or if existing AI authorities are sufficient. In order to aid all agencies in achieving the goals in the AI EO the new draft OMB AI guidance should resurface the requirement, require that documents of agency authorities be submitted to OMB and the new White House AI Council, and the document of such agency regulatory authorities should also be made public.

Who is Generative AI Commons?

The LF AI & Data Generative AI Commons is dedicated to fostering the democratization, advancement and adoption of efficient, secure, reliable, and ethical Generative AI open source innovations through neutral governance, open and transparent collaboration and education.

Our recommendation:

The potential of AI is vast, but it must be built carefully to expand opportunities broadly.
For instance, a new intelligent AI scheduling tool at a hospital aims to optimize staff shifts and operating room bookings. Without proper precautions, it risks prioritizing some departments over others, which may negatively impact patients needing more critical care. We recommend the following priorities to ensure a responsible and sustainable development of AI.

Equal Economic Opportunity: The scheduling tool should ensure equal opportunities for advancement by equitably distributing shifts across departments based on need and staffing levels.

Safeguard Information: Patient data used for demand forecasting must be anonymized and secured. Code reviews of the AI system should verify privacy protections before deployment.

Promote Fairness and Inclusion: When assigning prime surgery times, the tool should be tested to prevent preferential treatment for certain specialties. More limited historical data for some departments could skew results unfairly.

Provide Transparency: If the tool denies a doctor's operating room request, the hospital must explain why, with an appeals process. This enables correcting potential bias in the system.

Oversee Usage: Hospital administrators must govern the use of the tool responsibly, monitoring for unfair impacts on staff in any department. They remain **accountable** for remedying issues discovered over time.

Similarly, **an AI writing assistant risks harm** if not developed carefully. Testing and reviews must ensure they represent all groups respectfully, provide attribution for sources, and avoid generating biased, false, or **plagiarized content.**

However, generative AI cannot guarantee to be 100% unbiased, hallucination. Independent rating agencies, similar to that of moody's delloite that rates the credit rating of countries should be established to rate the reliability of LLMs or AI solutions built by corporations.

Responsible oversight and adaptation are crucial for users to trust these emerging technologies as tools to aid their advancement and productivity. With conscientious governance grounded in ethical principles, innovators can enable AI to expand opportunities broadly.

Public outreach and AI education

As AI will impact everyone in some way, it becomes essential to prioritize AI education for everyone. Below are some initiatives that Generative AI Commons is planning to accomplish. We recommend the government to adopt similar initiatives.

- **Launch public awareness campaign** to educate citizens on real versus "fake" open source AI, emphasizing the importance of available science and transparency with AI systems.
- **Develop open-source generative AI educational materials** to make this technology more accessible for developers, researchers, and the general public. This includes building tutorials, documentation, frameworks, and other resources. Prioritize practical skills development. This is important for pre-eminence in this space.
- **Build a comprehensive taxonomy and glossary of terms** relating to generative AI and responsible/ethical AI practices. Having consistent vocabulary and definitions is essential for public discourse

Importance of Open Source and why it should be the bedrock:

Open source is about free software. Free here is not free-of-cost but **Free Speech,** quoting Richard Stallman. The government should incentivize large organizations to participate in contributing to open source. Engineers of large corporations believe that open source will win in the long run compared to themselves. Neither Google Nor Open AI has the MOAT. [1][3]

Open-source software should be the foundation of the government's AI development priorities, just as free speech principles are vital for democratic societies. There is a strong parallel between these concepts when it comes to AI:

1. **Transparency** - Open source code enables transparency in how AI systems are designed and function. This is critical for identifying bias, errors, and potential harms - just as freedom of speech enables critique and truth-telling about institutions of power. **Opacity** leads to the possibility of **covert, unethical uses** of AI.

2. **Accountability** - When open-source researchers and developers must publish code openly, it imposes accountability for that code to stand up to scrutiny. Closed sources evade accountability. Openness facilitates both innovation and responsibility.

3. **Accessibility** - Proprietary AI concentrates knowledge and capabilities among **elite institutions** that can afford licensing and computer resources. Open-source AI democratizes access to anyone interested in utilizing or studying these rapidly evolving technologies. Free speech principles strive to make information available to all citizens, **not just select groups**.

4. **Oversight** - The ability of a range of stakeholders to inspect AI source code enables better oversight to ensure systems align with public interests and values. Infringing on free speech removes voices from public discourse that could raise essential concerns. Openness furthers both effective oversight and productive public debate.

In essence, opaque and closed AI creates concentrations of unaccountable technological power. Enshrining open source as a priority counteracts this tendency, **as enshrining free speech fosters an informed and empowered populace.** The principles are mutually reinforcing for AI development in the public interest.

Conclusion

To summarize, we request the government to prioritize enforcing the principles of

- equal opportunity,
- information safety,
- promote fairness,
- enforce transparency and
- accountability

when anyone builds an AI product.

We believe in incentivizing and educating the population to be aware of and contribute to Open Source Software, which will automatically guarantee the same.

AAPD OMB Memo Comments

December 5, 2023

Shalanda Young, Director
Executive Office of the President
Office of Management and Budget
725 17th Street, N.W.
Washington, D.C. 20503

RE: **ADVANCING GOVERNANCE, INNOVATION, AND RISK MANAGEMENT FOR AGENCY USE OF ARTIFICIAL INTELLIGENCE**

Dear Director Young,

The American Association of People with Disabilities (AAPD) is grateful for the opportunity to provide feedback on the Proposed Memorandum for the Heads of Executive Departments and Agencies on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence.

AAPD works to increase the political and economic power of people with disabilities. As a national disability-led and cross-disability rights organization, AAPD advocates for full civil rights for more than 60 million Americans with disabilities. We do this by promoting equal opportunity, economic power, independent living, and political participation. Since 1995, AAPD has worked tirelessly alongside disability advocates, government agencies, and corporate and nonprofit partners to advance the goals of the Americans with Disabilities Act (ADA) and to ensure that all Americans can benefit equally from the transformative power of technology.

AAPD applauds OMB's efforts to ensure that all federal agencies utilizing Artificial Intelligence (AI) do so in a way that complies with all relevant federal nondiscrimination and civil rights law. While AI has the potential to be a great tool for improving the way government agencies serve the public, it is critical that steps are taken to prevent the introduction of discriminatory prejudices and biases into AI platforms that then inform government hiring, procurement, and program administration.

AAPD firmly believes that efforts to utilize, manage, and govern the use of AI within the federal government should complement existing efforts for the federal government to be a model employer of people with disabilities and to advance diversity, equity, inclusion, and accessibility. It is in this spirit that AAPD strongly recommends that efforts to promote further innovation, governance and management of AI not only focus on minimizing harm and bias but strive to promote greater equity. Truly the most innovative technology is technology that improves processes and makes systems more efficient and accessible while also creating opportunities and expanding what is possible for all Americans. People with disabilities have first-hand experience with technology that has the potential to promote equity. Remote work, more widely available captioning, and accessible design of the physical and virtual environments have all greatly expanded what's possible within education, employment, and community integration for disabled people. The same can be true for AI, especially if the federal government uses this pivotal moment not only to ensure these tools do not increase disparities where such disparities already exist but also use AI innovation, management, and governance to address long-standing inequities within federal agencies and government program administration.

With this goal in mind, AAPD strongly recommends that agencies and their CAIOs should hire or engage the expertise of disabled people with significant knowledge in disability rights and civil rights. A CAIO, and accompanying team, with an appreciation of the importance of the need for rights-based protections will enable the agency to identify how different AI systems impact disabled people. Further, disabled people most negatively impacted by AI systems are multiply-marginalized and have identities that often include other protected characteristics, for example disabled people of color and disabled women. Therefore, it is essential that staff working on innovation, governance, management, and assessment of AI tools understand the ways in which civil rights protections, and the very discrimination they seek to protect against, overlap and support one another. According to data from the National Science Foundation, people with disabilities are underrepresented in science, technology, engineering, and mathematics (STEM) fields. An explicit emphasis on disabled talent within efforts to build the federal government's AI workforce could not only begin to shift this broader employment trend, it could also catalyze the development of more inclusive and accessible STEM education within postsecondary and secondary schools. Given the rapidly evolving landscape of artificial intelligence, the federal government should use the tools already at its disposal to fill critical positions. This includes using the existing Schedule A hiring authority to hire qualified candidates and pulling job candidates from databases like the Workforce Recruitment Program.

In addition to advancing equity in hiring, the federal government must use this opportunity to promote the development of accessible technology. Recent research from WebAIM revealed that only about 3% of the top million webpages were fully compliant with the web content accessibility guidelines 2.0. It is essential that the accessibility of AI tools be a part of the values frameworks that define risk mitigation, governance, and innovation. Even with the most rigorous governance and bias mitigation strategies in place, risks and potential rights violations will persist from the very start if the tool is inaccessible.

In addition to this broad feedback, AAPD is pleased to offer feedback to OMB on the following questions:

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

While federal agencies' structures and resources vary greatly, all agencies have obligations to comply with Section 508 of the Rehabilitation Act (508) and make their electronic information and technology accessible to people with disabilities. Agencies of a range of sizes and a diversity of missions have 508 Coordinators otherwise known as IT Accessibility Program Managers. The work done to promote 508 compliance could serve as a roadmap for the ways agencies approach AI governance. The General Services Administration has developed a host of resources and technical assistance offerings that agencies can use when setting up or enhancing their 508 program, and a similar model could be used here. AAPD recommends that GSA staff with expertise in 508 coordination as well as leading 508 coordinators be consulted by entities like OMB and the White House as they work to provide guidance on AI governance.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establish a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

AAPD recommends that agencies integrate AI governance into the scope of existing agency bodies focused on privacy, IT, data, and specifically IT accessibility. As referenced previously, Building on this agency knowledge of 508 implementation and coordination, when it exists, should be leveraged by the CAIO to understand the critical role accessibility plays in making certain AI tools can be used effectively by all disabled people. The establishment of a new body to enhance AI governance may also have benefits. Agency advisory committees comprised of external partners can be formed to support and complement the work done by federal agencies. These committees could be used to bring in expert perspective when such perspectives are limited within the federal government. Similarly, advisory committees of external partners can be formed to focus explicitly on specific topics, such as AI innovation in accessible transportation, while agency staff manage broader AI use and governance. When federal advisory committees are formed, careful consideration should be given to including disability rights expertise alongside other civil rights experts asked to serve in such a role.

3. How can OMB best advance responsible AI innovation?

Given the limitations of existing data sets and their reflection of the historic exclusion, segregation, and institutionalization experienced by people with disabilities, disabled people are often not accurately accounted for in data sets.. Without appropriate representation of disabled people in these data, AI tools can not be trusted to make accurate predictions about this population. Even when people with disabilities are included in data sets, users of AI tools must be mindful of how deeply rooted ableism is in our society today. Further, disabled people most negatively impacted by AI systems are multiply-marginalized and have identities that often include other protected characteristics, for example, disabled people of color and disabled women and are even less represented in data sets than people with disabilities generally.

An additional complication comes from the heterogeneity of disability. There are currently at least 61 million disabled people in the United States, and this number grows daily. This group is comprised of people with developmental disabilities, intellectual disabilities, mobility disabilities, sensory disabilities, chronic health conditions, psychiatric disabilities. Even people with similar disability types have vastly different experiences and needs making a truly representative and informed data set difficult to attain. Many disabling conditions, such as rare diseases, occur small in number, making it even more difficult for AI systems to reflect the experiences of these people accurately. Often, different populations of disabled people do not have shared characteristics but are still bound together by the common experience of discrimination. For the OMB to best advance responsible AI innovation, it should require

agencies to develop disability inclusion strategies with particular attention paid to including data on individuals with multiple marginalized identities to improve how AI tools perform.

The OMB guidance does a good job of requiring agencies to identify and discontinue using AI systems known to discriminate against populations with protected characteristics. Still, the government must improve the quality of the data it uses to harness the potential of these data-driven tools. Without taking affirmative steps to address the lack of representation in the data, the discrimination caused by these tools will continue to go unchecked, and disability and other groups under-represented in the data will continue to be left behind as the use of AI tools grows at a rapid pace.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

5(b)ii includes those areas where AI systems are known to compromise the rights of those in our society who have experienced a history of discrimination, which manifests in some of the AI tools federal agencies use. OMB is right to require agencies to stop using or revise these systems. Additionally, AAPD recommends that clarity be added to item i. B. of the safety impacting purposes to include human movements spurred by AI (such as a prompt generated by an AI tool) that may be broader than human robot teaming. AAPD also recommends noise emittance or sonic waves be added as a safety impacting purpose. This could be included in item i. C. or as a standalone item within the list. AAPD strongly suggests that the assessment of the accessibility of tools, services, designs for both physical and virtual environments, and communications be included in the list of purposes that are both safety and rights-impacting.

Within the list of purposes that are presumed to be rights-impacting, AAPD recommends the following changes and additions:

- Add to ii. D. intelligence and competency
- Add to ii G. workplace accommodations and supports as well as professional development
- Add a new item to address Decisions regarding institutionalization or placement into restrictive settings this could also be incorporated into point ii H, however decisions surrounding institutionalization are not limited to healthcare settings.

- Add a new item address Recommendations or decisions about adult welfare, whether an adult needs to be under a guardianship or conservatorship, whether an adult can continue living independently in their home, or assessments of abuse and neglect

This list should be periodically updated as the development and deployment of AI tools grow, and we must remain vigilant in monitoring the impact on disabled people, as it is inherently difficult for these data-driven tools to make accurate predictions about their needs and experiences in this heterogeneous population.

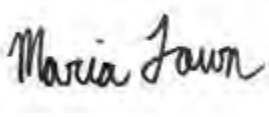
8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Agencies should provide public information about the AI tools they are using to support internal agency functions as well as administer external agency programs. In addition to a public disclosure of these tools, an explanation of the design steps taken to ensure the accessibility of the AI system should be provided to the public. This must include people who use a visual language like ASL to communicate. Public notice should be provided to all users so they know how to report problems with the accessibility of the AI system or concerns regarding the bias of the AI system.

Agencies must also provide a readily accessible way for members of the public to register concern about the agency's use of AI and request alternative tactics or tools be used.

Thank you again for the opportunity to provide comment on OMB's proposed memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. If you have any questions about these comments, please contact Michael Lewis, Vice President of Policy at (540)447-9438 or mlewis@aapd.com or AAPD President and CEO Maria Town at mtown@aapd.com.

Sincerely,



Michael Lewis
Vice President of Policy

General Comment

This brief comment is to emphasize worker, workforce, and organization-relevant implications of the Office of Management and Budget (OMB) draft memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)." In particular, AI and machine learning in all their various forms:

* will likely accelerate in their abilities (a) to create opportunities for new jobs and entire occupations, (b) to alter required job skills for existing jobs fundamentally, and (c) to replace certain jobs or essential job tasks (Selenko et al., 2022);

* require a continuous re-examination of the knowledge, skills, abilities, and other essential worker requirements across occupations (National Center for O*NET Development, 2023), with wide-ranging implications for both workers and the workforce;

* carry major implications for both technical and socio-technical aspects of AI-specific education and workforce training (NAIAC, 2023), as well as the reskilling of existing worker skills that have been fundamentally altered by AI tools and systems;

* alter the nature of organizational systems of recruiting, hiring, training, and promoting, and the manner in which these functions will be conducted.

OMB guidance will stand to benefit from considering all these interrelated points above and how they can lead to tangible actions for assessing, forecasting, intervening, and improving the AI workforce across federal agencies. The end goal is to improve AI infrastructure within federal agencies and in their relationships with one another. This not only means increasing workers' AI-related capabilities and capacities in terms of their own functioning; it also means equipping workers with the ability to assess the nature and balance of AI benefits and risks adequately, taking into account the broader sociotechnical work environment in which AI and machine learning systems operate.

In closing, please note that I am a member of the National Artificial Intelligence Advisory Committee

(NAIAC), but I speak here in my own personal capacity.

Best regards,
Fred Oswald

OMB AI Comment Submission

To: Office of Management and Budget
Re: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

I am writing regarding the request for comment to the Office of Management and Budget draft guidance on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence. Broadly speaking, I believe that the OMB and other federal agencies must use all of their powers and resources to ensure that the harmful effects of AI are limited when developed, procured, or used by the federal government—and that the government provides meaningful transparency and publicly available information about the ways our government uses AI so that we have more power to regulate, push back on harmful uses, and limit AI use in the future. In every use case, protecting civil rights must be the top priority.

There are some strong pieces of the OMB guidance that I urge you not to rollback as this process moves forward. The requirement that agencies meet minimum practices for rights-impacting and safety-impacting AI is important in addressing concerns around bias and discrimination in AI, and I urge you to keep these minimum requirements and, if anything, expand them.

There are a number of areas where this guidance, and future AI policy documents, must be improved:

- The Executive Order on AI did not do enough to address law enforcement agencies and the use of AI on immigrant communities, which are some of the spaces where AI has already been shown to have serious negative impacts. I was glad to see that the OMB guidance did include law enforcement under the covered agencies, and strongly urge you not to change this or allow these agencies special exceptions. We must establish strong policies to address law enforcement use of AI, and to limit use to mitigate harms.

- Some AI is too dangerous to be used, and any possible benefits are outweighed by known harms. Facial recognition is an AI-enabled biometric technology that infringes on the right to privacy to such a degree that it should not be used at all by the government, and this guidance should ban its use by government agencies.

- The guidance does not establish enough data privacy protections. Because AI is reliant on data the opportunity for data abuses is high, and ensuring strong privacy protections must be a top priority. While there is a need for Congress to pass comprehensive data privacy protections, the OMB should use this guidance to establish data privacy policies when government agencies develop, procure, or use AI.

- The minimum practices for safety-impacting and rights-impacting AI require agencies to stop using an AI when the “risks to rights or safety exceed an acceptable level,” but the guidance both gives agencies an option to skip determining an AI system’s risk, and also doesn’t specify what an “acceptable level” is. In these safety- and rights-impacting cases the consequences of

the use of AI are so high that the OMB must set a very limited acceptable level of risk and ensure that all agencies using AI comply with this requirement.

- The minimum practices should also apply in cases where federal funds are used to purchase AI systems, including government grants. This would better protect civil rights in even more situations, including at the state and local levels.

- All information reported by agencies in their annual use case inventory should be made publicly available, to allow for as much public scrutiny and transparency as possible. This is critical for ensuring that the public, and experts in civil rights, have the opportunity to critically assess the use of AI by the government.

While there may be uses of AI that can benefit the federal government, I call on the OMB to focus on protecting against the harms of AI your top priority in this guidance.

Signed,
