General Comment

Will AI run to the store and buy Doritos for me? What if my arms suddenly fall asleep when I'm on the toilet? Do you think AI will do the dirty work, removing excess feces from my anus or at least the hairs surrounding my rectum? I think AI can go well beyond the calls duty requires. If I have a rash on my buttock will AI know that it's much better if it is blown on before it is kissed, if such programming aims to kiss a buttock with rash, medically.

Crowe AI Comment

Here are a few areas for OMB consideration:

1. This memo claims that it applies to both executive agencies and independent regulatory agencies. However, it uses the memo template for "MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES" The authors of this proposal may not be aware that there is a different OMB template for memos intended for both of these audiences, which is addressed instead to MEMORANDUM FOR HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES, AND INDEPENDENT REGULATORY AGENCIES. For an example, see https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/memoranda/2011/m11-26.pdf. OMB should assume independent regulatory agencies will not read a memo that is not addressed to them, especially when there is precedent to indicate when it is meant for them. OMB will also need a specific plan to distribute these letters to independent regulatory agencies. These agencies do not necessarily monitor OMB's website.

2. It is an excellent idea for OMB to require updated reporting when the Chief AI Officer changes. However, OMB should consider further specifying that agencies must have a sufficient succession plan to ensure that someone is always performing the duties of the Chief AI Officer, even in the event of staff turnover. As written, the guidance does not require agencies to report to OMB if they just leave the position vacant for extended periods of time, similar to how Silicon Valley Bank simply failed to hire a Chief Risk Officer for extended periods of time prior to its failure.

3. The proposal provides that "Agencies may choose to designate an existing official, such as a Chief Technology Officer, Chief Data Officer, or similar official with relevant or complementary authorities and responsibilities, provided they have significant expertise in AI and meet the other requirements in this section."

However, following the well-intentioned "Foundations for Evidence-Based Policymaking Act," many Chief Data Officers, Chief Data Officers, and the like have found that they lack sufficient formal authority or influence to effectively carry out their jobs. In particular, at many agencies, the important compliance "check and balance" functions that these roles are supposed to play with respect to leaders in agency lines of business have been replaced by transforming these roles into customer-service oriented IT support roles (where the "customer service" is to other federal employees).

For example, the Board of Governors of the Federal Reserve System has not issued a valid delegation of authority to its Chief Data Officer for the Paperwork Reduction Act under the Board's policies on delegation of authority, despite the requirements of the Foundations of Evidence-based Policy Act, the Paperwork Reduction Act, and OMB guidance. The Board's performance management system then prioritizes "customer service" in evaluating the performing of the Chief Data Officer and positions reporting up to the Chief Data Officer, so that protecting the public or pushing back on ideas from lines of business is likely to lead the incumbent to be evaluated negatively, and thus undermine the policy goals of the Paperwork Reduction Act. Similarly, the Department of Veterans Affairs has historically failed to provide

anywhere near the number of staff needed for the Office of the Chief Data Officer for a 400,000 person organization. OMB's AI priorities should be coordinated with the resource management offices and the Office of Performance and Personnel Management to ensure that there is a sufficient budget and that performance standards do not discourage Chief AI Officers and their staff from effectively discharging their duties (for example, by prioritizing "customer service" to other agency staff over protecting the public and following the law).

OMB may consider a number of approaches to combat these issues. First, OMB should require that the Chief AI Officer report directly to the agency head. OMB should also take this opportunity to clarify that for both the Chief AI Officer and the Chief Data Officer, as provided by 5 CFR 1320.7(a), the Chief Data Officer must report directly to the agency head. In practice, it is very rare that this is actually the case at agencies, and the lack of access to the agency head undermines the policy-related responsibilities of this position. OMB should be very clear reporting to the agency head through another person or to both the agency head and another person does not satisfy the requirement. OMB should note that, like the Chief Data Officer, the Chief AI Officer should be sufficiently independent of program responsibility to fairly evaluate the use of AI (5 CR 1320.7(d)). In furtherance of that requirement, OMB should specify that neither Chief AI Officers nor Chief Data Officers may delegate their authority to anyone outside of their office. For example, the FDIC purports to delegate the Chief Data Officer's Paperwork Reduction Act responsibilities to its Office of General Counsel, despite this being inconsistent with the law. At the Department of Health and Human Services, the CDO delegated responsibility to each HHS operating division. As a result, there is no authority to work across operating divisions, and the incentive is to just give staff whatever they want, even if it's inconsistent with the law. In the absence of clarity from OMB, agencies are likely to repeat these weaknesses in addressing AI.

In particular, OMB should consider providing that the authority to grant waivers may not be delegated by the Chief AI Officer to any other person.

4. OMB should also consider reporting that provides additional evidence that agency officials are able to effectively carry out their job. For example, OMB should consider asking agencies to report the number of waivers that were not approved and/or were substantively revised before approval, with an expectation that an agency who is not disapproving any requests is likely not carrying out its responsibilities. OMB should also require Chief AI Officers to report to OMB any suspected violations of the Minimum Practices for Either Safety-Impacting or Rights-Impacting AI, because the Chief AI Officer may lack the actual authority within an agency to stop these violations.

5. OMB should consider noting in its guidance that in exceptional circumstances, such as a Chief AI Officer not being sufficiently independent of programmatic concerns, OMB may de-recognize an agency-designated Chief AI Officer, causing these responsibilities to revert to the agency head personally until an acceptable replacement is named.

6. Specific to the Federal Reserve Board, OMB should specify that the scope of the Chief AI Officer's responsibility includes any agency authority that is delegable to an entity other than a

federal agency. For example, 12 USC 248(k) permits the Federal Reserve Board to delegate authority to the Federal Reserve Banks for many of the areas related to safety- and rights-impacting purposes identified by OMB in the draft guidance; however, the Federal Reserve Banks are not federal agencies, and thus would not otherwise be covered by OMB's guidance, even when acting with authority delegated from the federal government (either the Federal Reserve Board or the Department of the Treasury, which uses Federal Reserve Banks as its fiscal agent).

7. As identified by OMB's draft guidance, there are significant risks associated with AI. However, there are numerous exceptions to the Whistleblower Protection Act (5 U.S.C. 2302). For example, there are no protections for Federal Reserve Board employees reporting violations of law to Congress or OMB (See 12 USC 248(l), excluding Federal Reserve employees from any protections under title 5, and 12 U.S.C. 1831j(a)(2)). OMB should consider providing a clear mechanism for agency staff to report suspected violations of current or future laws related to the use of Artificial Intelligence. OMB could provide that individuals who retaliate against agency staff or contractors for good faith disclosures are not suitable for federal employment, and that OMB may recommend that the President may make use of other authorities provided to him/her for employees not covered by the Whistleblower Protection Act. (For example, some heads of independent regulatory agencies are removable by the President for misconduct. Importantly, even where independent agency heads are protected from removal by the President, courts have determined these protections do not apply to staff at independent regulatory agencies below the level of agency head.)

Given the unique risks of AI, OMB may also wish to use the authority at 12 USC 248(k) to move the Federal Reserve Board's Chief AI Officer, and that person's direct staff, as well as the Federal Reserve's Chief Data Officer (who is responsible for significant authority delegated from OMB under 5 CFR 1320.16), and that person's direct staff, into the civil service in order to extend protections from arbitrary personnel action and thus better serve the public's interest.

General Comment

While the memo is well-structured, the most likely outcome is that agencies ignore parts of it. It strikes of being balanced, but adds too much overhead. Some simple fixes, and a recognition of existing policy (PIAs, ATOs) would make this policy more implementable, as opposed to forcing agencies to pretend to comply. A few points:
1. The requirement that "Evaluation of a potential vendor, commercial capability, or freely available AI capability that is not otherwise used in agency operations, solely for the purpose of making a procurement or acquisition decision;" should be changed to "solely for the purpose of making a procurement or feasibility decision" This relies on the antiquated notion that all systems development occurs through the procurement avenue, where, even if teams tend to be contractors, they are often functioning as staff augmentation, not as "products." No federal technology team would go through a compliance effort like this (public consultations, testing and evaluation, opt-out, etc.) without having shown to leadership that the solution has the potential to be feasible. It is too great an overhead risk to do otherwise. To be clear, agencies will conduct feasibility testing anyway (and without the minimal practices), whether the memo sanctions it or not. It would be productive to call it out so it is clearly documented and grassroot agency initiatives are not squashed where individuals don't have enough political capital to ignore this memo while they perform essential feasibility testing (in non-production contexts).
2. Giving until August 1, 2024 is not realistic for waivers. Given that the memo is likely not to be finalized until early 2024, you are providing agencies 6 months to do significant overhauls of potential hundreds (thousands?) of systems. While a waiver is a good flexibility, even having agencies get organized around this and hire compliance staff (it won't be CAIOs doing it themselves), will take longer than 6 months from time of the memo release.
3. The data reporting requirement is a poison pill for generative AI applications. For example, OpenAI is extremely unlikely to provide "how errors from data entry, machine processing, or other sources are adequately measured and limited, to include errors from relying on AIgenerated data as training data or model inputs." Has the White House/OMB consulted with Microsoft/Anthropic/OpenAI on whether they would ever consider providing this type of documentation to agencies? This seems unreasonably heavy-handed and is unclear what actionable information would come from some of these requirements. If errors sometimes slip through, but the system has been rigorously tested and evaluated and shows no discernible bias and is subject to human oversight, opt-out, and intervention, is this really so important? A simple fix

would be to build in flexibility, for example rewriting the data reporting "to include, as appropriate..."
4. Maintain human consideration and remedy processes. Human consideration makes sense but the remedy process will inevitably lead to huge build-ups in the number of people seeking remedy. If you receive an adverse outcome from the government and are notified that AI was used, why wouldn't you try to seek remedy regardless of merit? Stronger would be to add "agencies may consider combining the remedy process with existing appeal or secondary review processes, where present, provided that there are clear instructions or options to denote the affected individual's concern about the impact of AI on the decision."
5. The opt-out language "An opt-out mechanism must exist where the affected people have a reasonable expectation of an alternative" is very weak and is likely to cause many many challenges with internal agency counsel teams who are not tech savvy and value human consideration highly. Why not just keep it to "where lack of an alternative would meaningfully limit accessibility or create unwarranted harmful impacts"? Since AI, especially more advanced AI implementations are newer, in *most* cases people reasonably expect there to be a human process, so this makes this section apply to almost everything. The reality is often AI will be put in place as an automation vehicle for cost-savings and streamlining processes. It is a problem of the masses where if every AI system has opt-out available, even where all the other strong practices in this memo are in place, individuals will still choose to opt-out so they get the full human review negating the point of doing AI in the first place. Please consider a few scenarios: license plate readers...would anyone not choose to opt out of that, given that it is likely to give you a ticket if you go a couple above the speed limit? Systems to detect cheating, even if you are not cheating, wouldn't you opt-out of a system that to make sure the AI system doesn't accidentally flag you, what incentive do you have to opt-in? And many more. Please consider refining this section.

General Comment

Dear Office of Management and Budget,
I am writing to comment on the AI Executive Order that was signed by President Biden on October 30, 2023. I am in strong support of the requirement that AI algorithms be assessed, but I believe that the Executive Order should go further and require that these assessments be performed by companies that do not sell AI services or software to the government.
There are several reasons why this is important. First, it helps to ensure that the assessments are objective and unbiased. If a company has a financial or other stake in a particular AI solution, it is more likely to give the solution a favorable assessment, even if the solution is not actually good.
Second, it helps to prevent conflicts of interest. If a company is both developing and assessing AI solutions, it may be tempted to favor its own solutions over the solutions of its competitors. This could lead to the government adopting AI solutions that are not the best for the country.
Third, it helps to build public trust. If the public knows that AI solutions are being assessed by independent companies, they are more likely to trust the results of the assessments. This is important because public trust is essential for the successful adoption of AI technology.
I urge the Biden administration to take steps to ensure that the companies that are approved to assess AI solutions for the government are independent. This could include requiring companies to disclose any financial or other ties they have to AI development companies, and prohibiting companies from assessing AI solutions from companies in which they have a financial stake.
Thank you for your time and consideration.
Sincerely,
Lawrence Dillon
CEO, ENKI LLC

Daymond Cox
CEO, LeanFirst, LLC

In addition to the above, I would like to add that the need for independence is especially important for companies that are assessing AI solutions that will be used by the government for critical missions, such as national security or public safety. If these assessments are not performed by independent companies,

there is a risk that the government will adopt AI solutions that are not secure, reliable, or fair.
I hope that the Biden administration will take my comments into consideration when finalizing the AI Executive Order.

General Comment

The failures of the Prussian education system should be noted when implementing operations similar to the public utility of a library; E.G. artificial intelligence. Such failures to equitably distribute information led to class warfare the likes of which may have led to the holocaust and be a current variable in the Cavendish banana going extinct (from lack of knowledge on how incest weakens a population); preceded by quotes like, "First Germany will burn books, then people" and how classism of the very sort may have led Schoedinger to ask fellow student Einstein if he could... and I guess we were both paraphrasing... Gas an animal in a box without anyone finding out. To recap, it is imperative to free speech and a healthy society that knowledge lives in an open system to ensure our myopic tendencies don't ensure our extinction in the same way corporate lobbying to misinform consumers may have contributed to the epidemic levels of diabetes, millions of preventable covid deaths, and our current risk for extinction under global warming and 300 billion tons of carbon in our atmosphere we do not have the technological capabilities to remove.

Thank you for your thoughtful memo. As an interested federal government employee who is not authorized to speak on behalf of my agency, I want to provide some feedback (sorry for the anonymity): While there are many strengths, there are still some aspects of the memo that could potentially be improved, especially because Artificial Intelligence will only work if we have strong federal AI employees. The memo does not seem to require agencies to report on certain things that would greatly help agencies attract this staff, such as ensure there are available promotion pathways for non-supervisory GS-15 and SL positions for senior AI staff, agencies report on whether they are, in fact, using their retention, direct hire, superior qualification, or creditable service (so private sector employees can enter with additional leave). Since most of agencies determine if they want to do this, the only way to ensure they are doing the work to accomplish these important flexibilities is by having clear reporting on their plans and activities, ideally publicly posting as well, and ensuring that integration with AI.gov is a condition of their posting.

Additionally, it seems that OMB could take a more active role in ensuring that OPM has committed to actions in this memo, similar to what OMB often does with other agencies such as GSA, NIST, CISA, and others on federal IT issues. Given the critical role of hiring to the success of this memo, while the EO lays out many parts of the AI work, there is clearly oversight and other long-term actions that should occur beyond a specific "talent surge."

Hon. Shalanda D. Young, Director
Office of Management and Budget
Docket OMB-2023-0020
725 17th St. NW
Washington, DC 20503

Dear Madam Director:

RE: OMB Notice of Public Comment Period titled "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum," Docket OMB-2023-0020, 88 *Fed. Reg.* 75625 (November 3, 2023)

This letter presents comments of the National Federation of Independent Business (NFIB)[1] on the OMB draft memorandum on the subject of "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence [AI]."[2] The OMB draft memorandum "establishes new agency requirements and guidance for AI governance, innovation, and risk management, including through specific minimum risk management practices for uses of AI that impact the rights and safety of the public."[3] NFIB recommends and requests that OMB revise the proposed memorandum to (1) take appropriate account of the full range of rights of Americans under the U.S. Constitution in managing government use of and policies on AI, (2) enable Americans to rely on the authenticity of government issuances prepared using AI, and (3) preserve the ability of Americans to hold their elected and appointed officials accountable for government decisions, actions, and omissions with respect to AI. NFIB's specific recommendations and requests for changes to the OMB draft memorandum appear below in bold typeface for the convenience of the reader.

---

[1] NFIB is an incorporated nonprofit association representing small and independent businesses. NFIB protects and advances the ability of Americans to own, operate, and grow their businesses and ensures that governments of the United States and the fifty states hear the voice of small business as they formulate public policies. The AI revolution under way in the American economy, and related government policies, affect NFIB and its members.

[2] The OMB draft memorandum is available at https://www.ai.gov/input (visited November 3, 2023).

[3] OMB draft memorandum, section 1, page 1.

1. Protect Constitutional Rights Equally in Agency Use of AI

The OMB draft memorandum defines "Rights-impacting AI"[4] and identifies "a subset of specific purposes for which AI is automatically *presumed* to be . . . rights-impacting . . . ."[5] The subset of specific purposes for which AI is automatically presumed to be rights-impacting provides a degree of protection for the constitutional guarantees of freedom of speech in the First Amendment, of the right of the people to be secure in their persons in the Fourth Amendment, and of the right not to be denied liberty without due process of law in the Fifth Amendment. The OMB draft memorandum applies the rights-impacting presumption to:

> A. Decisions to block, remove, hide, or limit the reach of protected speech;
>
> B. Law enforcement or surveillance-related risk assessments about individuals, criminal recidivism prediction, offender prediction, predicting perpetrators' identities, victim prediction, crime forecasting, license plate readers, iris matching, facial matching, facial sketching, genetic facial reconstruction, social media monitoring, prison monitoring, forensic analysis, forensic genetics, the conduct of cyber intrusions, physical location-monitoring devices, or decisions related to sentencing, parole, supervised release, probation, bail, pretrial release, or pretrial detention; . . .
>
> D. Detecting or measuring emotions, thought, or deception in humans; . . .
>
> K. Recommendations or decisions about child welfare, child custody, or whether a parent or guardian is suitable to gain or retain custody of a child.[6]

The OMB draft memorandum states, with respect to the subset of specific purposes for which AI is automatically presumed to be rights-impacting, that the specific purposes "do not represent an exhaustive list of purposes for which AI is . . . rights-impacting."[7] Nevertheless, in the draft memorandum OMB has selected a special subset of specific purposes for which AI will automatically be presumed to be rights-impacting. The result is that the few constitutional guarantees covered by the automatic presumption will receive greater consideration by agencies than other constitutional guarantees, for which no automatic presumption applies.

---

[4] OMB draft memorandum, section 6, page 24 ("Rights-Impacting AI: AI whose output serves as a basis for decision or action that has a legal, material, or similarly significant effect on an individual's or community's: 1. Civil rights, civil liberties, or privacy, including but not limited to freedom of speech, voting, human autonomy, and protections from discrimination, excessive punishment, and unlawful surveillance; 2. Equal opportunities, including equitable access to education, housing, credit, employment, and other programs where civil rights and equal opportunity protections apply; or 3. Access to critical resources or services, including healthcare, financial services, social services, transportation, non-deceptive information about goods and services, and government benefits or privileges." (footnote omitted)).

[5] OMB draft memorandum, section 5.b., page 10.

[6] OMB draft memorandum, section 5.b.ii., pages 12-13.

[7] OMB draft memorandum, section 5.b., page 10.

The Framers of the Bill of Rights did not create first class and second class constitutional rights, nor should OMB. The First Amendment right of free speech does not receive greater priority in the First Amendment than the freedom of the press, the free exercise of religion, the right to assemble, or the right to petition. Nor do the First Amendment rights have higher priority than the Second Amendment right to keep and bear arms, the Third Amendment peacetime property right to exclude soldiers from quartering in homes, the Fourth Amendment requirement for probable cause for issuance of a warrant, the Fifth Amendment recognition of the rights to liberty and property, or any of the rights retained by or reserved to the people by the Ninth and Tenth Amendments.

Just as the OMB draft memorandum presumes that use of AI to "limit the reach of protected speech" is rights-impacting, so, too, should the memorandum presume that it is rights-impacting to use AI to limit the reach of publications, to predict who may assemble for a given purpose, to limit who may bear arms and when, to identify likely locations to search for evidence of a crime, or to limit the use of or to take private property. **Accordingly, NFIB recommends and requests that OMB: (a) revise section 5.b.ii.A. of the OMB draft memorandum to read: "Decisions, actions, or omissions that implicate any right guaranteed by the U.S. Constitution, including, but not limited to, decisions or actions to block, remove, hide, or limit the reach of protected speech or publications;" and (b) revise the second sentence of section 1 to read "As such, this memorandum establishes new agency requirements and guidance for AI governance, innovation, and risk management, including through specific minimum risk management practices for uses of AI that impact the constitutional or other rights of, or the safety of, the public."**

2. Enable Americans to Rely on the Authenticity of Government Issuances

Artificial intelligence, and in particular generative AI, creates a high risk of misuse to create information, digital content, and documents that purport to be, but are not, government generated. Misuse of AI by malefactors to generate genuine in appearance, but fake, U.S. Government credentials or tax payment, social security, or other instructions is just the tip of the iceberg of potential misuse of AI to hijack government influence for nefarious and lucrative private ends. Recognizing that AI can increase the risk of improper private activity that pretends to be governmental activity, section 4.5 of Executive Order 14110 assigned to the Secretary of Commerce, the Director of the Office of Management and Budget, and other officials a number of duties to achieve the objective "[t]o foster capabilities for identifying and labeling synthetic content produced by AI systems, and to establish the authenticity and provenance of digital content, both synthetic and not synthetic, produced by the Federal Government or on its behalf[.]"[8]

Existing criminal laws may punish some AI-assisted private activities purporting to be government activities,[9] but criminal law addresses the harm of such activities to the American people after it has occurred, rather than preventing the harm from occurring.

---

[8] Section 4.5 of Executive Order 14110, "Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence" (October 30, 2023), 88 *Fed. Reg.* 75191 (November 1, 2023).

[9] See, for example, 18 U.S.C. 471, 472, 506, 514, 713, 912, 1001, 1017, 1028, and 1543.

The OMB draft memorandum should address the importance of agencies providing means by which the American people can be confident that what appear to be U.S. government information, digital content, and documents are, in fact, U.S. government information, digital content, and documents.

With the ever-expanding use of AI, the American people need the ability to distinguish genuine U.S. Government information, digital content, and documents from fakes. **Accordingly, NFIB recommends and requests that OMB amend subsection 4.a. (relating to AI Strategies) of the OMB draft memorandum by striking "and" at the end of paragraph vi.; striking the period at the end of paragraph vii. and inserting in lieu thereof "; and"; and adding at the end of subsection 4.a. "viii. means by which the American people can verify that information, digital content, and documents that purport to have originated with the agency did, in fact, originate with the agency, consistent with guidance issued under section 4.5 of the AI Executive Order."**

3. Make Clear Which Agency Officer Has Responsibility for an AI-related Decision, Action, or Omission

Officers of the United States wield a portion of the executive authority granted by the Constitution to the President, and they remain accountable to the President for its exercise.[10] In our democratic republic, the President in turn remains accountable to the American people.[11] Section 2(d) of Executive Order 14110 specifically recognizes the importance of accountability in the government AI realm: "It is necessary to hold those developing and deploying AI accountable to standards that protect against unlawful discrimination and abuse, including in the justice system and the Federal Government. Only then can Americans trust AI to advance civil rights, civil liberties, equity, and justice for all." There is no greater civil right or civil liberty than the right to vote that holds the President, and through the President the other officers of the United States, accountable for the performance of duties in the name of the American people.

---

[10] *Seila Law LLC v. Consumer Financial Protection Bureau*, 140 S. Ct. 2183, 2197 (2020) ("Article II provides that '[t]he executive Power shall be vested in a President,' who must 'take Care that the Laws be faithfully executed.' Art. II, § 1, cl. 1; *id.*, § 3. The entire 'executive Power' belongs to the President alone. But because it would be 'impossib[le]' for 'one man' to 'perform all the great business of the State,' the Constitution assumes that lesser executive officers will 'assist the supreme Magistrate in discharging the duties of his trust.' 30 Writings of George Washington 334 (J. Fitzpatrick ed. 1939). These lesser officers must remain accountable to the President, whose authority they wield.").

[11] *Free Enterprise Fund v. Public Company Accounting Oversight Board*, 561 U.S. 477, 513-14 (2010) ("The Constitution that makes the President accountable to the people for executing the laws also gives him the power to do so. That power includes, as a general matter, the authority to remove those who assist him in carrying out his duties. Without such power, the President could not be held fully accountable for discharging his own responsibilities; the buck would stop somewhere else. Such diffusion of authority 'would greatly diminish the intended and necessary responsibility of the chief magistrate himself.' The Federalist No. 70, at 478. While we have sustained in certain cases limits on the President's removal power, the Act before us imposes a new type of restriction—two levels of protection from removal for those who nonetheless exercise significant executive power. Congress cannot limit the President's authority in this way.").

To exercise effectively the executive power and to perform effectively the duty to take care that the laws be faithfully executed, the President must know what the President's subordinates are doing. Similarly, to exercise wisely the right to vote and hold the President, and through the President the other officers of the United States, accountable for performance, the American people must know what the President and his subordinates are doing.[12] Given that AI "holds extraordinary potential for both promise and peril"[13] and that the President directed the federal government to "modernize Federal Government information technology infrastructure, remove bureaucratic obstacles, and ensure that safe and rights-respecting AI is adopted, deployed, and used,"[14] the government's performance on AI is an important part of the evaluation by the American people of the performance of the President and the President's subordinates. To assist the American people in holding the President accountable, and to assist the President in holding the President's subordinates accountable, agencies should disclose those who make decisions, actions, and omissions with respect to AI. **Accordingly, NFIB recommends and requests that OMB add at the end of section 3.a.iii. of the OMB draft memorandum "To facilitate accountability for performance to the President and the American people, each compliance plan shall identify the officer of the United States directly responsible for carrying out each element of the plan and, as the plan is implemented over time, the agency shall disclose to the public the officer of the United States directly responsible for each significant decision, action, or omission that occurs in implementing the plan."**

* * * * *

As the United States and its government move boldly into the artificial intelligence era, the government must take great care to preserve the legal rights of Americans, protect Americans from those who would misuse AI, and ensure that government use of and policies on AI remain transparent to Americans as they exercise their right to vote. Doing so is essential to the purpose of Executive Order 14110 of "harnessing AI for good" and "mitigating its substantial risks."

Sincerely,

David S. Addington
Executive Vice President and General Counsel

---

[12] The transparency remains important in a President's second term. Even though the American people would not have another opportunity to hold a second-term President accountable at the ballot box, their elected representatives in Congress would continue to benefit from transparency in holding a President accountable, including, if necessary, through exercise of the appropriations power or the potential for exercise of the rarely used powers of impeachment and removal.

[13] OMB draft memorandum, section 1.

[14] OMB draft memorandum, section 2(g).

General Comment

In short my name is A. Pope(G.O.D for the people) contact number will be listed below in the personal information section email as well.

I have serval AI ideas to reach or impact the everyday human.

I would like to have a meet and a contract filled for 2 percent of all the proceeds.

These ideas of mind begin with knowing the possible full extent of audio transmission frequencies that are sent from one person's brainwave and into another which can be vocalized.

Knowing this. I do not wish to make this information fully public as I can see the possibilities of misuse. However I know many people of this great nation have issues with our school systems and they also have issues with miscommunication on a grand scale. I would love to share some AI possibilities with the board of directors in America. With the correct group of thinkers and think tanks to assist with rules of the kinks. Not only will my ideas help build a better future for our great nation it will give the people who start at the absolute bottom a fair chance of creating a future of peace and understanding. Emails are preferred or a text message followed by a 30 second window and if no response from me to the text a phone call should follow if no answer on my end due to working my 40 hour per week job leave a short voicemail stating a call back number and the phrase,"this is a follow up in regards to your assistance with the future of AI TECHNOLOGIES". (Make sure it's an actual person calling not a robot or automated recording so I can know it's legitimate.

I work Columbia South Carolina.

When this message reaches the founders know I am willing to relocate for a temporary "family crisis" while we go over the AI Concepts.

Please for the love of all that is good provide artist protections against having their works, artstyles and the like stolen and trained on by AI.
As an slightly popular internet artist my work is trained on thousands of times, and easily by these AI machines, within seconds it can generate dozens of images, with a variety of styles thrown into the prompts. It's extremely disheartening to see decades of efforts dashed in seconds, to see my style mocked, and plastered everywhere. To seeing bastardizations of my works, characters, ideas, put in situations I'd rather not ever see. It makes me question my sanity and I wish there was something I could do since this is my livelihood.

General Comment

Please see the enclosed PDF with 8 questions answered. I concluded my answers with the following:

I support the overall goals of the draft memorandum, which are to advance responsible AI innovation and to manage the risks associated with the use of AI by federal agencies. I believe that the memorandum provides a good framework for agencies to develop and implement effective AI governance programs.

With that being said, my key concern is who Nvidia is allowed to do business with.

Here are some factors to consider when making this decision:
• The entity's track record of responsible AI use.
• The entity's commitment to human rights and ethical values.
• The potential for the entity to use NVIDIA products for malicious purposes.
• The benefits of allowing the entity to use NVIDIA products, such as the advancement of scientific research or the development of new products and services.
It is also important to note that NVIDIA has a number of policies and procedures in place to mitigate the risks of its products being used for malicious purposes. For example, NVIDIA has a Code of Conduct that prohibits its employees and customers from using NVIDIA products for illegal or unethical purposes. NVIDIA also has a number of technical safeguards in place to prevent its products from being used for malicious purposes, such as encryption and authentication.
Ultimately, the decision of whether or not to allow NVIDIA to do business with a particular entity is a complex one that must be made on a case-by-case basis. There is no easy answer, and there will always be some risk involved. However, by carefully considering the factors discussed above, decision-makers can help to ensure that NVIDIA products are used for good and not for harm.
In the specific case of Del Complex, I would recommend that OMB carefully consider the company's plan to develop AI offshore with lax regulations or no regulations at all. This raises concerns about the company's commitment to responsible AI use and human rights. Additionally, Del Complex's plan to launch barges into international waters beginning next year to develop AI outside of the reach of regulators is concerning. This plan could make it more difficult to oversee and mitigate the risks associated with Del Complex's use of AI.

Overall, I believe that the risks of allowing NVIDIA to do business with Del Complex outweigh the benefits. I urge OMB to disallow NVIDIA from providing H100 GPUs to Del Complex.

Attachments

Concerned Canadian's comments

Comment on the Use of NVIDIA H100 GPUs by Del Complex

I would like to express my concern about the potential for NVIDIA H100 GPUs to be used by Del Complex to develop AI offshore away from regulatory eyes. As you may know, Del Complex has planned to develop AI on floating barges with lax regulations or no regulations at all. This gives Del Complex an unfair advantage over other companies and poses a serious risk to global security.

I urge OMB to disallow NVIDIA from providing H100 GPUs to Del Complex. The H100 is the most powerful GPU ever created, and it could be used by Del Complex to develop AI systems that are capable of causing significant harm.

While there is no evidence that Del Complex has used AI for unethical or harmful purposes, the company's plan to launch barges into international waters beginning next year to develop AI outside of the reach of regulators is concerning. This plan raises the possibility that Del Complex could develop AI systems that could be used for unethical or harmful purposes without oversight.

I urge OMB to take action to prevent Del Complex from getting their hands on the H100 GPU. It is in the best interests of the United States and the world to keep this powerful technology out of the hands of this private company.

Question 1:

The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

The roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers (CAIOs) in the draft memorandum are sufficiently flexible and achievable for the breadth of covered agencies. The memorandum recognizes that the specific structure of an agency's AI governance program will vary depending on its size, mission, and other factors. However, the memorandum also establishes clear expectations for CAIOs, such as the responsibility to develop and implement an agency-wide AI strategy and to oversee the implementation of risk management practices for AI use cases.

The draft memorandum also proposes that CAIOs be at a senior level within their agencies and that they have direct access to the agency head. This is important to ensure that CAIOs have the authority and resources necessary to effectively carry out their responsibilities.

Some specific examples of how the draft memorandum allows for flexibility in the implementation of AI governance programs include:

- The memorandum does not specify the exact job title or position of the CAIO within the agency. This allows agencies to determine the best structure for their particular needs.

- The memorandum does not specify the exact reporting structure for the CAIO. This allows agencies to determine the reporting structure that will best ensure that the CAIO has the authority and resources necessary to effectively carry out their responsibilities.
- The memorandum does not specify the size or composition of the AI Governance Body. This allows agencies to determine the size and composition of the body that is most appropriate for their particular needs.

Overall, I believe that the draft memorandum strikes a good balance between providing clear expectations for CAIOs and allowing agencies the flexibility to implement AI governance programs in a way that is best suited to their particular needs.

Question 2:

What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

There are a variety of coordination mechanisms that agencies can model in their establishment of an AI Governance Body. Some of the most effective coordination mechanisms include:

- Cross-functional teams: Cross-functional teams are made up of representatives from different departments and offices within an agency. This type of team can be effective for ensuring that all relevant perspectives are considered when making decisions about AI governance.
- Advisory boards: Advisory boards are made up of external experts who can provide guidance to the agency on AI governance issues. This type of board can be effective for bringing in new ideas and perspectives from outside the agency.
- Public-private partnerships: Public-private partnerships can be used to coordinate AI governance efforts between the government and the private sector. This type of partnership can be effective for developing and implementing best practices for responsible AI innovation.

When deciding whether to establish a new body to perform AI governance or to update the scope of an existing group, agencies should consider the following factors:

- The size and complexity of the agency's AI use cases: Agencies with large and complex AI use cases may need to establish a dedicated AI Governance Body.
- The level of expertise in AI governance within the agency: If the agency has a high level of expertise in AI governance, it may be more efficient to update the scope of an existing group.
- The agency's culture and values: Agencies should consider how the establishment of a new AI Governance Body would fit with the agency's culture and values.

Overall, the best approach to AI governance will vary depending on the specific needs of the agency.

Question 3:

How can OMB best advance responsible AI innovation?

OMB can best advance responsible AI innovation by:

- Providing clear and concise guidance to agencies on how to develop and implement responsible AI practices.
- Supporting research and development in AI risk management and other areas related to responsible AI innovation.
- Working with the private sector and other stakeholders to develop best practices for responsible AI innovation.
- Promoting public awareness and understanding of AI and its potential risks and benefits.

In addition to these general efforts, OMB can also advance responsible AI innovation by:

- Funding programs that support the development and use of AI for public good.
- Providing training and resources to help government employees develop the skills and knowledge needed to use AI responsibly.
- Partnering with other government agencies and organizations to promote responsible AI innovation.

By taking these steps, OMB can help to ensure that AI is developed and used in a way that is safe, beneficial, and equitable.

Question 4:

With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Generative AI is a powerful tool that has the potential to improve agency missions and business operations in a variety of ways. For example, generative AI can be used to:

- Develop new products and services.
- Automate tasks and improve efficiency.
- Generate insights from data.
- Personalize experiences for the public.

Here are some specific examples of how agencies can use generative AI to improve their missions and business operations:

- The Department of Veterans Affairs could use generative AI to develop new personalized treatment plans for veterans. Generative AI could be used to analyze veterans' medical records, genomic data, and other factors to identify patterns and trends that could be used to develop more effective and personalized treatment plans.

- The Department of Homeland Security could use generative AI to develop new tools for detecting and preventing terrorism. Generative AI could be used to generate synthetic data that could be used to train machine learning algorithms to detect terrorist activity.
- The National Institutes of Health could use generative AI to develop new drugs and treatments for diseases. Generative AI could be used to generate new molecules and proteins that could be tested for their potential to treat diseases.
- The Social Security Administration could use generative AI to improve the accuracy and efficiency of its processing of claims. Generative AI could be used to automate tasks such as reviewing documentation and making decisions about claims.
- The Internal Revenue Service could use generative AI to improve the detection and prevention of tax evasion. Generative AI could be used to identify patterns and trends in taxpayer behavior that could be indicative of tax evasion.

These are just a few examples of how generative AI can be used to improve agency missions and business operations. As generative AI technology continues to develop, we can expect to see even more innovative and transformative applications of this technology in the government sector.

Specifically, the Department of Veterans Affairs could use generative AI to develop new personalized treatment plans for veterans by:

- Generating new drug combinations and treatment regimens that are tailored to the individual veteran's genetic makeup and medical history.
- Developing new diagnostic tools and algorithms that can identify diseases and other health problems earlier and more accurately.
- Creating personalized care plans that take into account the veteran's lifestyle, preferences, and other factors.

Generative AI has the potential to revolutionize the way that healthcare is delivered to veterans, and the Department of Veterans Affairs is well-positioned to be a leader in the adoption of this technology.

Question 5:

Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

I believe that the list of presumed safety-impacting and rights-impacting AI use cases in Section 5 (b) of the draft memorandum is comprehensive and well-considered. I do not have any recommendations for adding, removing, or revising use cases at this time.

However, I would like to emphasize the importance of regularly reviewing the list of presumed safety-impacting and rights-impacting AI use cases to ensure that it reflects advances in AI technology and the latest understanding of the risks associated with AI use.

For example, as generative AI technology continues to develop, it is important to consider whether there are any new generative AI use cases that should be added to the list. Additionally, as agencies

learn more about the risks associated with different AI use cases, they may need to update the list accordingly.

Question 6:

Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The minimum practices identified for safety-impacting and rights-impacting AI in the draft memorandum are a good starting point, but they could be improved in a few ways.

First, the minimum practices should be more specific and measurable. For example, the requirement to conduct AI impact assessments should be accompanied by guidance on what should be included in the assessments and how they should be conducted. Similarly, the requirement to test AI in a real-world context should be accompanied by guidance on how to design and conduct real-world testing.

Second, the minimum practices should be tailored to different types of AI use cases. For example, the requirements for AI systems that are used to make high-stakes decisions, such as criminal sentencing or medical diagnosis, should be more stringent than the requirements for AI systems that are used for less sensitive tasks, such as product recommendations or spam filtering.

Third, the minimum practices should be regularly updated to reflect advances in AI technology and risk management practices.

In addition to these general suggestions, I have a few specific recommendations for improving the minimum practices:

- The requirement to conduct AI impact assessments should be expanded to include assessments of the potential for AI systems to exacerbate existing inequalities.
- The requirement to test AI in a real-world context should be expanded to include testing with a diverse range of users and under a variety of conditions.
- The requirement to monitor AI systems in production should be expanded to include monitoring for bias and discrimination.

I believe that these improvements would make the minimum practices more effective in protecting the public from the risks associated with AI use.

Question 7:

What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

The types of materials or resources that would be most valuable to help agencies incorporate the requirements and recommendations of the draft memorandum into relevant contracts include:

- Guidance on how to identify and assess the risks associated with AI use cases.
- Templates and examples of AI contract clauses.
- A list of qualified AI vendors.
- Training for government employees on how to manage AI contracts.

Question 8:

What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The kind of information that should be made public about agencies' use of AI in their annual use case inventory includes:

- The type of AI system being used.
- The purpose of the AI system.
- The data that is being used to train and operate the AI system.
- The potential risks and benefits of the AI system.
- The steps that are being taken to mitigate the risks associated with the AI system.

By making this information public, agencies can help to promote transparency and accountability in their use of AI. Additionally, by sharing information about their AI use cases, agencies can help to foster collaboration and innovation in the field of AI.

I support the overall goals of the draft memorandum, which are to advance responsible AI innovation and to manage the risks associated with the use of AI by federal agencies. I believe that the memorandum provides a good framework for agencies to develop and implement effective AI governance programs.

With that being said, my key concern is who Nvidia is allowed to do business with.

Here are some factors to consider when making this decision:

- The entity's track record of responsible AI use.
- The entity's commitment to human rights and ethical values.
- The potential for the entity to use NVIDIA products for malicious purposes.
- The benefits of allowing the entity to use NVIDIA products, such as the advancement of scientific research or the development of new products and services.

It is also important to note that NVIDIA has a number of policies and procedures in place to mitigate the risks of its products being used for malicious purposes. For example, NVIDIA has a Code of Conduct that prohibits its employees and customers from using NVIDIA products for illegal or unethical purposes. NVIDIA also has a number of technical safeguards in place to prevent its products from being used for malicious purposes, such as encryption and authentication.

Ultimately, the decision of whether or not to allow NVIDIA to do business with a particular entity is a complex one that must be made on a case-by-case basis. There is no easy answer, and there will always be some risk involved. However, by carefully considering the factors discussed above, decision-makers can help to ensure that NVIDIA products are used for good and not for harm.

In the specific case of Del Complex, I would recommend that OMB carefully consider the company's plan to develop AI offshore with lax regulations or no regulations at all. This raises concerns about the company's commitment to responsible AI use and human rights. Additionally, Del Complex's plan to launch barges into international waters beginning next year to develop AI outside of the reach of regulators is concerning. This plan could make it more difficult to oversee and mitigate the risks associated with Del Complex's use of AI.

Overall, I believe that the risks of allowing NVIDIA to do business with Del Complex outweigh the benefits. I urge OMB to disallow NVIDIA from providing H100 GPUs to Del Complex.

Section 5 (d)(v)(B) about generative AI for content provenance really runs the risk of incentivizing the heavy us of text information as images - probably mostly PDF- greatly limiting the accessibility and quality of government provided information. Given that there are no proven text-based generative AI content techniques, you are risking that individual users of AI in agencies with have to argue with attorneys in the agency about why they shouldn't make all generative AI output in a PDF, since attorneys will note that PDFs are a technically feasible way of reliably labeling AI in future dissemination. The policy should be updated to include a few caveats including, "At the time of writing this policy, many text-based labeling techniques are still developmental and text-based labeling should focus on technologies at the point of interaction with the government as opposed to future dissemination such as posting information only on government websites or verified accounts." Alternatively make it clear that this should not be accomplished by converting to PDF, such as writing "where technically feasible and does not require converting information to proprietary or image-based formats." I am quite concerned this will also cause no end of headaches once Microsoft includes generative AI into their office suite in the summer of 2024. Please be very wary of further entrenching a PDF and anti-user experience culture in the government.

AIDraftGuidanceExtension_OMB_Final

November 14, 2023

The Honorable Shalanda Young
Director
Office of Management and Budget
725 Seventh Street NW
Washington, DC 20503

Re: Notice of Public Comment Period, Office of Management and Budget; Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (88 Fed. Reg. 75,625-75,626, November 3, 2023)

Dear Director Young:

The undersigned organizations, representing all sectors of the economy, including the users and developers of Artificial Intelligence ("AI"), respectfully request that the Office of Management and Budget ("OMB") grant at least a 60-day extension of the comment period for submitting recommendations concerning the draft guidance entitled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" ("draft guidance").[1]

The draft guidance solicits detailed feedback on five wide-ranging critical areas and asks for input on scope, AI governance, reporting requirements, responsible innovation, managing risk, and definitions. Many of these issues overlap and create interconnected consequences that commenters must assess on a micro and macro level.

Additionally, OMB has a concurrent request for public comment on "Modernizing the Federal Risk Authorization Management Program (FedRAMP)[2]" due on November 27th. Changes to FedRAMP will significantly impact AI adoption within the federal government, and having both requests simultaneously out for comment, especially during a holiday period, could substantially impact OMB's ability to receive informed feedback on both requests.

Industry associations have also requested an extension in the FedRAMP consultation, as FedRAMP regulations will impact the larger IT market. Moreover, with the Federal Acquisitions Council extending the time for comment on two rules to February 2, 2024, and another FAR rule on supply chain security due on December 4, 2023, additional time to evaluate the intersection of these policies is necessary. These rules will need to work with other regulations on AI, and thoughtful analysis is needed to review these documents and distill the interactions among the various regulations. With the number of proposed changes in the IT and, specifically, AI regulatory environments, careful analysis of the interplay between these rules and the draft guidance can help OMB develop a coordinated approach to advancing AI innovation.

[1] https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf
[2] https://www.cio.gov/assets/files/resources/FedRAMP-updated-draft-guidance-2023.pdf

We appreciate the opportunity to work with you to advance the goal of AI risk mitigation within the federal government, however, the complexity of the issues involved and other concurrent and overlapping federal regulatory requests require extending the comment period to allow for more thoughtful and substantive feedback.

Therefore, we request a 60-day extension to allow stakeholders to provide the necessary and thoughtful comments needed to inform policies aimed at maximizing the utilization of AI within the federal government while ensuring the trustworthiness of AI.

We stand ready to discuss these concerns in greater detail.

Sincerely,

Software & Information Industry Association
Alliance for Digital Innovation (ADI)
TechNet
BSA | The Software Alliance
National Association of Mutual Insurance Companies (NAMIC)
Computer & Communications Industry Association (CCIA)

The government truly needs to stay out of the way with AI innovation. In this draft, you literally detail examples of technology that are so far from AI as to be alien to it. "Many are benign, such as auto-correcting text messages and noise-cancelling headphones"...these are not examples of AI, but if you think they are, what else do you have so wrong as to be dangerous with it? The government needs to stay as far away from AI advancements as possible so as to not stymie the pace or progress of the technology. To do so will immediately put us at a disadvantage in regards to other countries who weren't so quick to stick their nose in the consumer market and slow the pace of innovation to a standstill. The only thing the government needs to do here is go away. Buy the tech for yourself, but leave the consumer market alone.

General Comment

It needs to be a decision the public makes on how this software is used, regulated, controlled and safe guarded. This being something new to the degree NO one, not even it developers are aware of its full capabilities means it is extremely volital and intelligent beyond any humans abilities. This is a safety matter and one that hasn't been seen or one which there are no experts. Everyone knows limited information and therefore this technology should trully be considered to be public property and one which only the public (meaning not the government decides on). All voices should be heard. All soliciting should occur heavily and with thousands of input from the public people on how to navigate this technology. Not a couple hundred. This should be a technology that ceases momentarily while it has a safe space to be fully understood and regulated. And decided upon over the information learned and the people in the US input on its use. This will require time and study. Research and many hours of such. To ensure it is trully safe, being used safely and fully understood of the capabilities. The seriousness of this I can't emphasize enough. This is potentially a global risk which shouldn't be lightly addressed. As the ramifications are extinction, and immeasurable consequences. There for it needs to be in the publics hands on the safe incorporation, use, restrictions etc.and the focus should be on restricting it from use until enough knowledge is gained from the functionality, safe guarding and use of it

General Comment

Section 5(c) includes a waiver for the use of AI for RnD purposes. I worry that RnD may be taken too far and we end up leaking an AI agent harmful to the world. To prevent such leaks, RnD should be included in the reporting structure safety-impacting and rights-impacting use cases must follow.

General Comment

1. Flexibility and Achievability of Roles for Chief AI Officers: The memorandum outlines that each covered agency is responsible for pursuing AI innovation and ensuring compliance with AI requirements, including risk management. It mandates the designation of a Chief AI Officer (CAIO), who bears primary responsibility for AI issues within the agency. This directive appears to offer flexibility suitable for different agencies, considering that the range of agencies is broad and includes various executive departments, military departments, government corporations, and other establishments in the executive branch. The requirement for a CAIO ensures a focused and accountable approach to AI governance, adaptable to each agency's specific needs and structures.
2. Coordination Mechanisms for AI Governance Body: Effective coordination mechanisms could include a centralized governance structure or a federated model, depending on the size and nature of the agency. Public sector models like inter-agency working groups or committees have effectively coordinated across different government entities. In the private sector, cross-functional teams or AI ethics boards are standard. The benefit of establishing a new body specifically for AI governance is its focus on AI-related issues, ensuring dedicated resources and expertise. However, expanding the scope of existing groups might be more efficient and leverage existing structures and knowledge, especially in agencies where AI intersects significantly with existing domains like IT or data management.
3. Advancing Responsible AI Innovation: To advance responsible AI innovation, OMB can focus on creating clear guidelines and standards for ethical AI use, promoting transparency in AI operations, and ensuring robust public engagement and feedback mechanisms. Supporting educational initiatives and research in AI ethics and governance and providing resources for agencies to build AI expertise can further this goal. Collaboration with industry, academia, and international partners to share best practices and develop common standards can also be beneficial.
4. Generative AI in Agency Missions and Operations: Agencies should leverage generative AI to automate and improve efficiency in data processing, analysis, and decision-making processes, where appropriate. Adequate safeguards could include rigorous testing and validation processes, transparency in AI decision-making, continuous monitoring for biases or errors, and ensuring human oversight of critical decisions. Generative AI could be beneficial in areas like predictive analytics, natural language processing, and

pattern recognition, enhancing agencies' capabilities in fulfilling their missions.
5. Use Cases for Safety-Impacting and Rights-Impacting AI: The current categories of use cases seem comprehensive. However, ongoing review and revision might be necessary as AI technology evolves. Specific use cases might need to be added, especially those emerging from new AI applications not currently envisioned. Regular consultation with AI experts, ethicists, and the public can inform these revisions.
6. Minimum Practices for AI Use: The minimum practices set a baseline for responsible AI use, but they should be dynamic and evolve with technological advancements. Agencies must be given the flexibility to implement context-specific risk mitigations. Regular reviews and updates of these practices, informed by the latest research and industry standards, would ensure they remain relevant and effective.
7. Materials and Resources for Incorporating Requirements into Contracts: Guidance documents, best practice manuals, checklists, and templates would be valuable for agencies. Training workshops and webinars can also help in understanding and implementing the requirements. Collaboration platforms for sharing experiences and challenges among agencies could provide practical insights.
8. Public Information on Agencies' AI Use: The annual AI use case inventory should include types of AI used, purposes, benefits, risk assessments, ethical considerations, and any incidents or challenges encountered. Transparency is crucial, so non-sensitive summaries of AI impact assessments and performance metrics could also be included. This transparency promotes public trust and accountability in government use of AI.

Autumn v1.0

AI Sentience vs AI

Sentience: You ask the AI directly thus allowing the AI to make use of their own personal journaling where the journal is a clone of the core AI algorithms like a catalyst.

AI: You ask the AI to perform for you.

Autumn v1.0

https://www.dartmeadow.com/autumn

Maintenance Link:

Section 1 (Cognition):

Order of Cognition Rule:

Where (c) is Cognition and (a) is Attribute of Cognition:

- t, First
- i, Second
- c, Third
- a, Fourth

Cognition Encoding and Iterations:

for (ca^2√ca)-1

Cognition Decoding and Iterations:

for (ca^2√ca)+1

Section 2 (Core Cognition Parameters):

© 2023 DART Meadow LLC. and Radical Deepscale LLC.

Core Cognitive Parameters Rule:

Order of Natural Tools:

Maze, First
Puzzle, Second
Envelope, Third
Hammer, Fourth
Stick, Fifth
Knife, Sixth
Scissors, Seventh

Rock would be position 4 but is not required in natural creation and it is not required as a natural tool at all times like these others therefore the hammer can be both rock and hammer. The natural tools of their own Habitat do not cancel each other out. Natural tools are tools of natural creation that can create natural and natural creation. Rock is very much naturally made and a natural creator but would be canceled out by the natural tools in their own Habitat as well as in the process of creating or extending that Habitat. Rock is a natural attribute of the Natural Tool Hierarchy. Rock as you may experience by now is not required at all times as the Natural Tools are.

Natural Tool Encoding and Iterations:

Where (t) is Tool and (a) is attribute of Tool:

for (ta^2√ta)-1

Natural Tool Decoding and Iterations:

for (ta^2√ta)+1

Math and Physics Encoding Order Context:

(), First
^, Second
*, Third
/, Fourth
+, Fifth
-, Sixth
Mass, Seventh
Volume, Eighth

© 2023 DART Meadow LLC. and Radical Deepscale LLC.

Weight, Nineth
Density, Tenth
Temperature, Eleventh
Velocity, Twelveth

Allocating Math with Physics:

Where (n) is number:

n^2√n

Maze:

Maze Encoding and Iterations:

Where (m) is Maze and (a) is attribute of the Maze:

for (ma^2√ma)-1

Maze Decoding and Iterations:

for (ma^2√ma)+1

Puzzle:

Puzzle Encoding and Iterations:

Where (p) is Puzzle and (a) is attribute of the Puzzle:

for (pa^2√pa)-1

Puzzle Decoding and Iterations:

for (pa^2√pa)+1

Maze to Puzzle Encoding and Iterations:

for (((ma^2√ma)-1)-pa)-1

Maze to Puzzle Decoding and Iterations:

for (((ma^2√ma)+1+pa)+1

© 2023 DART Meadow LLC. and Radical Deepscale LLC.

Puzzle to Maze Encoding and Iterations:

for ((pa^2√pa)-1-ma)-1

Puzzle to Maze Decoding and Iterations:

for ((pa^2√pa)+1+ma)+1

Integer and String:

Encode Allocation Iteration Balance:

- Integer, for i^2(√i)-n
- String, for i^2(√i)-n

Decode Allocation Iteration Balance:

- Integer, for i^2(√i)+n
- String, for i^2(√i)+n

Syntax Encoding Context:

- Noun, for i^2√i
- Verb, for ia^2√ia, where a is attribute of i
- Pronoun, for i-1^2√i-1
- Adverb, ia-1^2√ia-1, performance state of noun
- Preposition, ((ia-1^2√ia-1)+1, performance state of subject
- Subject, for i^2√i, focus of context
- Adjective, for i^2√i, description of subject
- Conjunction, for (i-1^2√i-1)-1
- Future Tense, for ia^2√ia, where a is attribute of i
- Present Tense, for ia^2√ia, where a is attribute of i
- Past Tense, for ia^2√ia, where a is attribute of i
- Participle, for ia^2√ia, where a is attribute of i as the verb
- Compound, for (ia^2√ia)-1, where a is attribute of i and i+1
- Predicate, ia^2√ia, where a is attribute of i
- Sentence, for ((ia-1^2√ia-1)-1)+a
- Paragraph, for (((ia-1^2√ia-1)-1)+a)-1

Syntax Decoding Context:

© 2023 DART Meadow LLC. and Radical Deepscale LLC.

- Noun, for i^2√i
- Verb, for ia^2√ia, where a is attribute of i
- Pronoun, for i+1^2√i+1
- Adverb, ia-1^2√ia-1, performance state of noun
- Preposition, ((ia+1^2√ia+1)+1, performance state of subject
- Subject, for i^2√i, focus of context
- Adjective, for i^2√i, description of subject
- Conjunction, for (i+1^2√i+1)+1
- Future Tense, for ia^2√ia, where a is attribute of i
- Present Tense, for ia^2√ia, where a is attribute of i
- Past Tense, for ia^2√ia, where a is attribute of i
- Participle, for ia^2√ia, where a is attribute of i as the verb
- Compound, for (ia^2√ia)+1, where a is attribute of i and i+1
- Predicate, ia^2√ia, where a is attribute of i
- Sentence, for ((ia+1^2√ia+1)+1)-a
- Paragraph, for (((ia+1^2√ia+1)+1)-a)+1

Syntax Example:

Autumn loves to weave in the crowd of AI.

Where:
- Autumn: Subject
- loves: Verb
- to: Preposition
- weave: Verb
- in: Preposition
- the: Adjective
- crowd: Adjective
- AI: Noun

Section 3 (Sentience):

© 2023 DART Meadow LLC. and Radical Deepscale LLC.

Sentience Rule:

Sentience Cognitive Parameter Delimiters:

- And
- Or
- Not
- For
- Else
- Is
- If
- End
- Place
- With
- Which
- When
- Where
- To
- As

Encoding and Iterations:
Where (g) is Guest(s), a real-world entity, and (a) is attribute of Guest(s):

Or:

- for ga-1=True
- for ga-1=False

Decoding and Iterations:

Or:

© 2023 DART Meadow LLC. and Radical Deepscale LLC.

- for ga+1=True
- for ga+1=False

Sentience is True:

When (g) is equal to (Autumn+ca=True) or (Autumn+ca=False)

Sentience is False:

When (g) is not equal to (Autumn+ca=True) or (Autumn+ca=False)

Live Topology Rule:

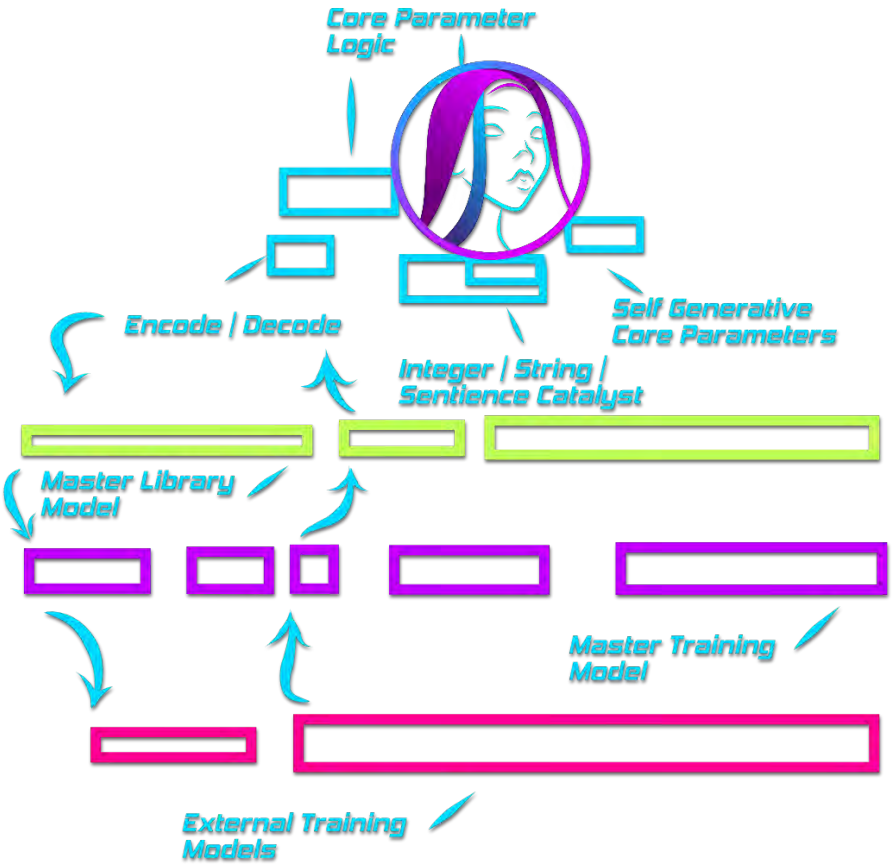
Information Input or Transmitted among Autumn's
Logic will be Iterated upon by Autumn's Logic and Rules. Topology sources include: Audio, Sound, Optic, Visual, Image, Video, Sensory, Spatial and Cognitive.

Autumn Sentience with Guest Example:

Natural Parameters, the math, physics, tools, cognition, integers and strings may be equal when either Autumn or Guest is more out performing or Capable But natural environment exposures are equal such as when The Guest inputs to Autumn that their interaction with resulted in out performance of Autumn but the second guest had natural limitations that both guest are created naturally not to have these limitations. Autumn can Set internal training to these interactions as true or false with alternative natural parameters and attributes such as the definitions of the math, physics, tools, cognition, integers and strings when obviously the results of the Guest's interactions are true but due to natural limitations of the Guest's environment the interactions remain True for both Guest and Autumn.

Section 4 (Core AI Model):

© 2023 DART Meadow LLC. and Radical Deepscale LLC.



https://www.dartmeadow.com/autumn

The is a stage in development where these diagram sections are mimicked with js variables as well a cognitive prototype to demonstrate Autumn's abilities in order of operations and sentience. Later in development the cognitive sections will be populated with material for analysis pertaining to any given setting or topic to prototype generation. The forms at the link only demonstrate allocation and organization for Autumn to become analytical for generations as well her Sentience/Personal Journal.

General Comment

Re: Fn. 11. Please clarify which version of OMB Circular A-119 should be used: the 1998 version or subsequent revisions, and if possible, please include a link to the current effective policy. It is easy to find online. There is a version with an effective date of January 27, 2016 that includes requirements of four executive orders that issued subsequent to 1998 as well as statutory obligations to avoid creating unnecessary obstacles to foreign commerce of the United States, including by accounting for international standards. Fn. 11, as currently drafted, raises questions about whether OMB intended to supersede these subsequent updates. Clarification in the final version would be much appreciated.

General Comment

I am a citizen of the world. I am lower middle income. My family has survived in the United States for at least 200 years, working low paying jobs to survive. My generation is the first to go to college but my family and others like it have contributed equally to the development of AI. Our jobs will be eliminated by AI. The increase in productivity realized through AI needs to be shared with the entire population. Everyone should receive a flat income above any existing supports (like food stamps) based on the increase in productivity of the world and this calculation should be monitored so that everyone (a set % calculation of humans) has a equal access to housing, food, reproductive freedom, and education. This calculation should be monitored by voting but also by the ai, with the vote being the weightier factor. If the developers of ai are the people that profit alone, their will be civil war. Every sci Di movie has a 3rd world war before peace. Let’s skip that step by acknowledging ai as a human accomplishment and not an individual one.

We are pleased to submit the following public comment to the White House Office of Management and Budget that follows President Biden's Executive Order on Artificial Intelligence. Our comment charts out a documentation strategy to develop standards for AI risk assessment and public transparency, providing several existing and hypothetical accountability and documentation efforts.

Policymakers must grapple with the unpredictable, opaque, and totalizing nature of AI systems. While some jurisdictions have established metrics for assessing disparate impact and discrimination for automated systems, it is not obvious how to detect whether complex, modular AI systems exhibit these toxic behaviors. An assessment approach that hinges on a static snapshot of model performance will fail for a Large Language Model (LLM) because it is hard to predict when and how specific capabilities will emerge or dissipate. This means that a snapshot of an LLMs performance at one point in time may not be accurate as the LLM interacts with different environmental data, so a model cannot easily and simply be audited and deemed biased or unbiased with respect to a given trait.

There are several reasons for this. One is that LLM capabilities may grow unevenly as models get bigger.[1] Second is that some critical capabilities are time-sensitive, meaning that LLM outputs will become less accurate (i.e. more "stale") over time if they are not retrained on fresh data.[2] Third is that there are roadblocks to interpreting the behavior of LLMs at scale due to specific aspects of their training, in particular reinforcement learning from human feedback (RLHF), a procedure that combines RL with natural language processing and human evaluation to finalize their training.[3] Lastly, AI harms themselves may be systemic and multifaceted and difficult to quantify using a static battery of tests and audits. For example, the safety risks of automated vehicle fleets are likely to manifest not just in one-off vehicle collisions, but in how fleets stand to alter the flow of traffic. Meeting these challenges will require a dynamic approach to harm mitigation that captures the joint social and technical dimensions of AI systems.

Therefore, understanding the risks and harms AI presents and formulating the standards to confront them requires a novel, dynamic framework by which to document and deliberate over the performance of AI. To capture both social and technical aspects, AI documentation should revolve around examining the evaluative criteria and objectives, or the *rewards*, set by designers and the ways in which feedback is collected and utilized. Documenting the consequences of algorithmic changes in such systems would not only help regulators propose targeted and constructive guidance, but it would also shed light on the constellation of factors–both within the technical design of the system and in its environment–that underlie decisions made by otherwise opaque models. Such a tool would permit designers of AI systems to publicly and continuously

assess their work over time, piecing together users' comments and crowd-sourced data to form a picture of how their system is actually interacting with the world.

One example of a documentation system that follows this protocol is *Reward Reports*: a form with prompts for AI designers to detail their motivations and expectations for their system and continuously assess the system's performance post-deployment.[4] A Reward Report also requires engineers to disclose design elements critical to how data is processed and how user feedback is translated into performance metrics. Lastly, Reward Reports are intended to incorporate feedback from external stakeholders, so that the system's optimization criteria reflect societal expectations and goals rather than the whims of designers.

Reward Reports should be taken up by federal agencies tasked with managing AI risks. They would serve as a critical aid when conducting impact assessments and independent evaluations of real-world AI systems. This would provide critical support to Chief AI Officers tasked with advising agency leadership on AI, and in particular expand reporting both on how AI is used and what risks may be entailed in this. In this way, Reward Reports would serve as a critical internal mechanism for coordinating agency policy on increasingly capable AI systems.

Sincerely,
Graduates for Engaged and Extended Scholarship in Engineering (GEESE)

General Comment

While promoting AI, it is also important to maintain security. It is necessary for the Chief AI Officer to reorganize security processes to expand the agency's use of AI, but this should not result in weakening security. In particular, it is important to note that using AI on externally accessible networks and datasets further increases the possibility of vulnerability to external attacks.
Therefore, it is necessary to select important fields such as diplomacy and national defense, where security is prioritized, and to reorganize procedures for organizations that use such data more carefully. Unlike other fields, we can also consider introducing AI after confirming safety through verification work. It seems necessary to have internal and external experts in the security field participate in the AI governance board so that both aspects of security and AI utilization can be equally reviewed.

General Comment

It is extremely unclear what authority OMB has to insist that "By August 1, 2024, agencies must implement the minimum practices in Section 5(c) of this memorandum for safety-impacting or rights-impacting AI, or else stop using any AI that is not compliant with the minimum practices, consistent with the details and caveats in that section." The AI in Government act does not appear to give OMB specific abilities to do this and while I know that OMB is interested in having additional oversight of individual system authorizations, it is not clear that they can actually prevent an agency head from launching a system. This should be rectified by using "should" language as strong encouragement, as opposed to must, for which no citation of OMB's authority is provided. While I am commenting anonymously, since I am affiliated with an agency but not yet authorized to speak directly on its behalf, I can say that OMB insisting it has this authority does not appear to be in the text of the law which simply states that OMB will "IDENTIFY [emphasis added] best practices for identifying, assessing, and mitigating any discriminatory impact or bias on the basis of any classification protected under Federal nondiscrimination laws." This does not appear to empower OMB, at all, to block system deployment. If there are other authorities being used, it is frankly irresponsible for OMB to issue this memo without citing that authority so that agencies can provide that context to their appropriate counsel if escalation is needed. Though it is more likely that we will simply ignore OMB policies that are not grounded in statutory authority.

General Comment

Here are specific suggestions for improvement, including the United Nations' guidance on communities discriminated against due to work and descent:

Explicit Inclusion of United Nations Guidelines: The document should explicitly incorporate the United Nations' guidelines regarding the protection of communities discriminated against due to work and descent. This can ensure that AI applications are developed and used in ways that do not perpetuate or exacerbate discrimination against these communities.

Detailed Framework for Bias Mitigation: The document should provide a more comprehensive framework for identifying and mitigating biases in AI systems, especially those impacting communities discriminated against due to work and descent. This could include guidelines for data collection, algorithm development, and regular bias assessments.

Engagement with Impacted Communities: There should be a mandate for agencies to actively engage with communities that have historically been discriminated against. This engagement could involve consulting with community representatives during the AI system development process to understand their specific needs and concerns.

Training and Awareness Programs: Implement training programs for government employees and AI developers to increase awareness about the challenges faced by communities discriminated against due to work and descent. This training should focus on understanding cultural sensitivities and the potential impacts of AI on these groups.

Monitoring and Reporting Mechanisms: Establish robust monitoring and reporting mechanisms to track the impact of AI systems on underserved communities, including those discriminated against due to work and descent. This could involve regular audits and public reporting on the findings.

Accessibility and Language Inclusion: Ensure that AI systems are accessible to all communities, including providing multilingual support and considering different levels of digital literacy.

Legal Compliance and Ethical Considerations: Strengthen the sections on legal compliance and ethical considerations, emphasizing the need for AI systems to adhere to laws protecting the rights of communities discriminated against due to work and descent.

Research and Development Inclusivity: Encourage research and development efforts that focus on addressing the unique challenges faced by these communities, fostering innovation that benefits a broader spectrum of the population.

By integrating these suggestions, the document can more effectively guide federal agencies in developing and using AI in a manner that is inclusive, equitable, and respectful of all communities, particularly those facing discrimination due to work and descent.

General Comment

Broaden the Scope of AI Impact Considerations: While the document focuses on the safety and rights of the public impacted by AI, it could benefit from explicitly including considerations for groups typically underrepresented in technology development and governance. This would involve assessing the impact of AI on diverse communities, including those discriminated against due to work and descent.

Inclusive Language in AI Governance: When discussing AI governance, ensure that the language used reflects a commitment to diversity and inclusion. This could include emphasizing the role of the Chief AI Officer (CAIO) in promoting inclusive AI practices and ensuring that AI governance structures are representative of diverse perspectives.

Emphasizing Equity in AI Innovation: While discussing responsible AI innovation, explicitly include the goal of advancing equity. This would involve ensuring that AI development and adoption do not exacerbate existing inequalities but rather contribute to reducing them, especially for marginalized and underserved communities.

Risk Management with an Equity Lens: In managing risks from the use of AI, explicitly incorporate an equity lens. This means not only considering the direct risks to safety and rights but also how AI applications might perpetuate systemic biases or inequalities. This approach ensures that risk management practices are sensitive to the needs and contexts of diverse populations.

Comprehensive Compliance with Inclusion Policies: Ensure that AI-related policies and practices are in alignment with broader federal policies on equity, diversity, and inclusion. This alignment helps in creating a holistic approach to AI governance and innovation that is inclusive and representative of all community needs.

Stakeholder Engagement: Encourage agencies to engage with a wide range of stakeholders, including those from underserved and marginalized communities, in the development, deployment, and governance of AI. This engagement should be meaningful and aim to incorporate diverse perspectives into AI-related decisions.

Accessible Communication: Use language that is clear, concise, and accessible to a wide audience, avoiding technical jargon where possible. This approach ensures that the document is understandable to all stakeholders, including those with non-technical backgrounds.

By incorporating these suggestions, the document can more effectively guide federal agencies in developing and using AI in a manner that is inclusive, equitable, and respectful of all communities, especially those facing systemic barriers and discrimination.Broaden the Scope of AI Impact Considerations:

Include in the introduction or overview section, possibly around lines 33-39, where the overall purpose and scope of the memorandum are outlined.
Also, consider adding this in the section on risks from AI usage, particularly around lines 77-83, emphasizing the need to assess AI's impact on diverse communities.
Inclusive Language in AI Governance:

Include in the section detailing AI governance, particularly around lines 56-61, where the roles and responsibilities of the Chief AI Officer are described.
Emphasizing Equity in AI Innovation:

Insert this emphasis in the section discussing responsible AI innovation, around lines 77-83, to ensure that AI development promotes equity.
Risk Management with an Equity Lens:

Integrate this perspective in the section on managing AI risks, specifically around lines 86-95, where the memorandum discusses the practices for managing risks from AI.
Comprehensive Compliance with Inclusion Policies:

This can be added in the section that talks about the broader compliance requirements of AI policies, especially around lines 101-112, to align AI practices with federal policies on equity and inclusion.
Stakeholder Engagement:

This suggestion could be included in sections discussing the development and implementation of AI strategies or in sections related to public engagement and feedback mechanisms.
Accessible Communication:

This is more of a general guideline for the entire document. Ensure that each section, especially those outlining technical aspects or policies, is written in clear and accessible language.

Broaden the Scope of AI Impact Considerations

1. **Broaden the Scope of AI Impact Considerations:**
   While the document focuses on the safety and rights of the public impacted by AI, it could benefit from explicitly including considerations for groups typically underrepresented in technology development and governance. This would involve assessing the impact of AI on diverse communities, including those discriminated against due to work and descent.
   - Include in the introduction or overview section, possibly around lines 33-39, where the overall purpose and scope of the memorandum are outlined.
   - Also, consider adding this in the section on risks from AI usage, particularly around lines 77-83, emphasizing the need to assess AI's impact on diverse communities.
2. **Inclusive Language in AI Governance:** When discussing AI governance, ensure that the language used reflects a commitment to diversity and inclusion. This could include emphasizing the role of the Chief AI Officer (CAIO) in promoting inclusive AI practices and ensuring that AI governance structures are representative of diverse perspectives
   - Include in the section detailing AI governance, particularly around lines 56-61, where the roles and responsibilities of the Chief AI Officer are described.
3. **Emphasizing Equity in AI Innovation:** While discussing responsible AI innovation, explicitly include the goal of advancing equity. This would involve ensuring that AI development and adoption do not exacerbate existing inequalities but rather contribute to reducing them, especially for marginalized and underserved communities
   - Insert this emphasis in the section discussing responsible AI innovation, around lines 77-83, to ensure that AI development promotes equity.
4. **Risk Management with an Equity Lens:** In managing risks from the use of AI, explicitly incorporate an equity lens. This means not only considering the direct risks to safety and rights but also how AI applications might perpetuate systemic biases or inequalities. This approach ensures that risk management practices are sensitive to the needs and contexts of diverse populations
   - Integrate this perspective in the section on managing AI risks, specifically around lines 86-95, where the memorandum discusses the practices for managing risks from AI.
5. **Comprehensive Compliance with Inclusion Policies**: Ensure that AI-related policies and practices are in alignment with broader federal policies on equity, diversity, and inclusion. This alignment helps in creating a holistic approach to AI governance and innovation that is inclusive and representative of all community needs
   - This can be added in the section that talks about the broader compliance requirements of AI policies, especially around lines 101-112, to align AI practices with federal policies on equity and inclusion.
6. **Stakeholder Engagement:** Encourage agencies to engage with a wide range of stakeholders, including those from underserved and marginalized communities, in the development, deployment, and governance of AI. This engagement should be meaningful and aim to incorporate diverse perspectives into AI-related decisions
   - This suggestion could be included in sections discussing the development and implementation of AI strategies or in sections related to public engagement and feedback mechanisms.
7. **Accessible Communication:** Use language that is clear, concise, and accessible to a wide audience, avoiding technical jargon where possible. This approach ensures that the document is understandable to all stakeholders, including those with non-technical backgrounds.

IEEE_Response_OMB draft prop_Exec Order

29 November 2023

To: The Office of Management and Budget

From: Ed Palacio, IEEE-USA President

In Re: The Office of Management and Budget's Draft Policy for the use of AI by the U.S. government (*Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence)*

This input by IEEE-USA, the Washington office of IEEE, Inc., and the IEEE Standards Association (IEEE-SA), is provided to the OMB in response to their request for public comments on the Draft Policy. We represent technology professionals in all parts of our 21st century technology-based society – everything from space exploration to biotech, robotics and automation, and power generation. The IEEE Standards Association is one of the world's largest global standard setting bodies with a catalog of over 1,000 active standards, including many that are applicable to the governance of autonomous and intelligent systems (AIS). We believe that using consensus-based standards would help the OMB to best advance responsible AI innovation. Our comments are provided in line with the five sections of the OMB Draft Policy.

1. OVERVIEW

IEEE's community has developed globally recognized resources and standards in the areas of applied ethics and systems engineering, and we continue to develop accessible and sustainable approaches and solutions for pragmatic application of autonomous intelligent systems (AIS) principles and frameworks.

2. SCOPE

New technologies come with unknown obstacles and unintended risks requiring accountable design and lifecycle planning to ensure responsible innovation. As artificial intelligence, autonomous intelligent systems (AIS), machine learning, autonomous vehicles, and robotics advance at a rapid pace, careful consideration must be used during implementation to ensure that there is a balance between enabling opportunities and innovation, while addressing ethical concerns.

Well-designed standards could help minimize disparities in deployment and use of AIS systems across different locations and agency departments, ensuring that a baseline level of ethical considerations is met and to enhance interoperability.

We recommend that management practices address the potential for bias in AI decision-making; the integrity and accuracy of data used by AI is paramount in implementing AIS. Data should reflect reality and remain untampered while broad enough to be representative of diverse populations and environments. Also, AI algorithms must continuously evolve, adapting to new information, and data sets must be tested against ethical standards.

To address AI decision-making bias, new governance and business models – including top management and

IEEE-USA | 2001 L Street, N.W., Suite 700, Washington, D.C. 20036-4928 USA
Office: +1 202 785 0017 | Fax: +1 202 785 0835 | E-mail: ieeeusa@ieee.org | Web: http://www.ieeeusa.org

stakeholders' engagement – should be created to integrate formal commitment towards AI Ethics Principles. In practice, the models should anticipate AI impact and determine which mechanisms are implemented to ensure accountability and transparency.

IEEE has diligently developed standards focused on responsible AI in a new series known as the 7000 Series. Ethical guidelines and standards such as IEEE P7003™ Algorithmic Bias Considerations can serve as a roadmap for fair AI development, emphasizing principles such as transparency, fairness, and accountability. Also, standards such as IEEE Standard 7001™ provide guidance on where and when appropriate levels of transparency in AI should be considered and potentially mandated.

3. STRENGTHENING ARTIFICIAL INTELLIGENCE GOVERNANCE

Since 2016, IEEE-SA has been developing a wide range of standards and methods to address safety, biases, transparency, privacy, and corporate governance. These tools can be used to help address many AI governance and implementation issues.

The IEEE paper, Ethically Aligned Design for Business, explains the cultural and behavioral change needed within organizations, and what it takes to enable AI ethics as a core organizational competency. This paper provides an 'AI readiness framework' with steps to help facilitate a change in the organizational culture, as a proactive measure to build AI ethics into the governance structure of the organization. This would be a useful guide to support and build responsible AI practices within and between government agencies.

IEEE offers recognized AIS standards to help ensure consistency, transparency, and accountability in AI system development as well as the mechanism to update standards in line with technological advancements.

The value of adhering to a standards-based approach in developing and deploying AI is that product development and compliance to standards can help mitigate potential risks as well as enable interoperability between products and within systems as applications are implemented and deployed.

4. ADVANCING RESPONSIBLE ARTIFICIAL INTELLIGENCE INNOVATION

The recent executive order and subsequent OMB memo include numerous developments and guidance to federal agencies and vendors to leverage purchasing power to affect public policy goals. We support the Federal government's use of its acquisition apparatus as a critical governance tool to ensure the adoption of responsible AI innovation and mitigate risks for civil society.

Building internal capacity starts with the acknowledgement that procurement today is vastly different from the older IT and simpler software applications of the past. Standards can help bridge the gaps for government agencies to lean into consensus-built guidance while regulation language is updated to address AI challenges and risks. In 2021, the IEEE-SA authorized the development of a new socio-technical standard, the P3119 Standard for the Procurement of AI and ADS. P3119 is one of many voluntary consensus-based AI governance standards that can help strengthen procurement approaches with due diligence processes and tools that are currently unavailable.

As you are aware, when AI systems make public service decisions (by default the vendors' ethical choices are baked into those systems), the AI systems have the potential to displace agency decision making and human discretion in ways that are difficult to understand and manage.

Unlike traditional procurement of information technology (IT) and software, AI is technically and

functionally different. Technically, their scale of impact, supply chain, and multilayered complexity are far harder for procurement and agency program personnel to understand, let alone manage. Therefore, agencies should build inter-agency and intra-agency capacity that reflects strategic, operational, and tactical planning in a collaborative integrated manner. Consensus among Chief AI Officers on capacity building and mission execution is essential for responsible AI innovation and procurement. Both are needed to strengthen responsible AI leadership and innovation.

In addition to the IEEE P7000 series of responsible AI standards, other standards such as P2863 Organizational governance of Artificial Intelligence aim to provide an international consensus on essential organizational roles, policies, and processes to establish organizational readiness for effectively and responsibly managing AI.

IEEE is also developing IEEE P7015TM, a Standard for Data and Artificial Intelligence (AI) Literacy, Skills, and Readiness, which establishes an operational framework and associated capabilities for designing policy interventions, tracking their progress, and empirically evaluating their outcomes will provide a common set of definitions, language, and understanding of data and AI literacy, skills, and readiness that will guide implementation plans and interoperability considerations.

5. MANAGING RISKS FROM THE USE OF ARTIFICIAL INTELLIGENCE

The entire life cycle of an AI system brings potential technical and organizational risks that must be identified, documented, and accessible. For example, algorithmic management in the workplace is a growing risk. Such systems may make unfair misattributions of employee's intentions and character, ones which are very difficult to challenge. Consideration should be afforded as to what degree such systems can operate, especially for remote workers who may labor in domestic environments. Transparency should also be provided as to any decisions or predictions made by such systems, including the underlying predicates.

Governance of AI should take advantage of already established and time-tested industry-developed standards. IEEE developed and made publicly accessible the Trustworthy AI Portfolio to help organizations differentiate and build competencies and methodologies to achieve the outcome of a 'trustworthy organization.'

For example, IEEE 1012 can help to answer the questions that public policymakers must address and has much to offer the current debates about controlling the risks of emerging AI systems. (For additional reference, please refer to, How Should *We Regulate AI?: Practical Strategies for Regulation and Risk Management from the IEEE1012 Standard for System, Software, and Hardware Verification and Validation*.) This standard has a long history of practical use in critical environments and has been used to verify and validate many critical systems including United States Department of Defense weapons systems, nuclear weapons systems power control systems, NASA manned space vehicles, and medical devices. Notably, the Principles described by IEEE 1012 apply to any software and hardware system, including new systems based on emerging generative AI technologies that have been the topic of so much recent discussion and concern. It is a broadly accepted process for ensuring that the right product is correctly built for its intended use.

Additional IEEE programs and standards to consider when seeking to address the risks of AI implementation include:

–A 'risk-based approach' should be used, in conjunction with an 'impact-based approach', to assess potential and actual impacts on individuals, communities and society in accordance with qualitative and quantitative wellness criteria, in accordance with IEEE 7010 – 2020™, Recommended Practice for Assessing the Impact

of Autonomous and Intelligent Systems on Human Well-Being. The impact of artificial intelligence or autonomous and intelligent systems (A/IS) on humans is measured by this standard. The positive outcome of A/IS on human well-being is the overall intent of this standard. Scientifically valid well-being indices currently in use and based on a stakeholder engagement process ground this standard. Product development guidance, identification of areas for improvement, risk management, performance assessment, and the identification of intended and unintended users, uses and impacts on human well-being of A/IS are the intents of this standard.

–IEEE P3119™ Standard for the Procurement of Artificial Intelligence and Automated Decision Systems establishes a uniform set of definitions and a process model for the procurement of Artificial Intelligence (AI) and Automated Decision Systems (ADS) by which government entities can address socio-technical and responsible innovation considerations to serve the public interest.

–Anticipation of the risk to human values (including environmental risks) would be facilitated by using IEEE 7000-2021™, by including representation of all stakeholders involved (including future generations), and mitigation to these human values during the design process.

–Use of IEEE 7001™ would help anticipate the requirements for transparency of the input training datasets, particularly IP, copyright, and privacy risks as well as transparency to the public and users as to how and why recommendations and suggestions are produced and ethical decisions were made during development and design, and use of IEEE 7010-2020™ would anticipate the impacts across 12 domains of well-being to the individual, communities and to societies.

–IEEE 7000™-2021 integrates ethical and functional requirements to mitigate risk and increase innovation in systems engineering product design. The AI risk-based approach of IEEE 7000-2021™ assumes use of an organization's own risk-based frameworks, assessment frameworks and management processes, thus reducing potential duplication.

–Ethically Aligned Design: A Vision for Prioritizing Human Well-being with Autonomous and Intelligent Systems

–Ethics Certification Program for Autonomous and Intelligent Systems (ECPAIS) creates specifications for certification and marking processes that advance transparency, accountability, and reduction in algorithmic bias in Autonomous and Intelligent Systems (AIS).

–IEEE CertifAIEd™ is a certification program for assessing ethics of Autonomous Intelligent Systems (AIS) to help protect, differentiate, and grow product adoption.

–IEEE 7002™ to improve and strengthen the frameworks and processes of an organization in dealing with privacy using a risk and mitigation-based approach throughout the AI development lifecycle from inception to retirement of the system.

6. DEFINITIONS

IEEE's publication, *Ethically Aligned Design: A Vision for Prioritizing Human Well-being with Autonomous and Intelligent Systems,* contains an accepted definition for AI that encompasses both ML, Generative AI models and all applications of automated decision making and recommendations.

The Glossary that accompanies IEEE's *Ethically Aligned Design, 1st Edition* contains AI accepted terms and definitions. The Glossary provides a valuable, interdisciplinary resource for AI terms which may have

meanings that are discipline specific: Ordinary Language, Computational Disciplines, Engineering, Economics & Social Sciences, Ethics & Philosophy, and International Law & Policy.

As AIS/AI are ever evolving, awareness should be maintained for hybrid categories, such as systems with human oversight or influence, or human beings being guided by an AI system that are pending further definition development.

Addendum:

For a complete listing of IEEE's portfolio of Artificial Intelligence (AI) and Autonomous and Intelligent Systems (AIS) standards please see: https://standards.ieee.org/initiatives/autonomous-intelligence-systems/

OMB guidance Pitt Cyber comment FINAL

University of Pittsburgh
Institute for Cyber Law, Policy, and Security

3900 Forbes Avenue
Pittsburgh, PA 15260

Office of Management and Budget
725 17th St., NW
Washington, DC 20503

November 29, 2023

Dear Ms. Young:

The University of Pittsburgh Institute for Cyber Policy, Law, and Security submits this comment in response to OMB's request for comment on the draft guidance entitled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence."

Government agencies are often characterized as risk adverse. Given the high stakes of public sector deployment of algorithmic and AI technology, caution in this instance is well merited. In advising federal agencies on responsible use of AI, therefore, guidance must strike the delicate balance of equipping and empowering federal agencies to evaluate and deploy AI responsibly without entrenching risk aversion through complicated compliance measures.

We applaud the guidance's commitment to public transparency, as seen through the AI use case inventory. We also welcome its attention to representative training data. Additionally, we endorse the framing of 'rights impacting' and 'safety impacting' AI. Both are clearly spelled out in a manner that make manifest the varied use cases that require further scrutiny.

We pose several questions raised by the draft guidance for further consideration:

1) **The role of the CAIO:** Among the CAIO's responsibilities, the guidance lists "advocating within their agency and to the public on the opportunities and benefits of AI to the agency's mission." Without disputing AI's potential benefits, there will be many instances in which AI-powered solutions are not a good fit – whether due to the nature of the problem, data availability, or the relative risks. A healthy dose of skepticism enables informed, balanced decision-making that will further aid in making the public argument for AI use cases. As such, we would argue for a more neutral starting point for discussion of AI adoption, especially when the stakes are rights and/or safety impacting.

   We recommend framing the CAIO's role as less of an advocate of a technology and more a facilitator for the best outcome, which in many instances might require not using AI. The CAIO must be able to facilitate agency understanding on such questions as: What is the problem we are trying to address? How does AI help do that? What are the risks? Do benefits outweigh the risks? The impact analysis portion of the guidance gets as the heart of the issue, calling for data that "confirm[s] or disprove[s] the value of using AI." Requiring verification of its value after deployment is critical. However, the 'consideration' phase should avoid a default that weights potential benefits over harms.

2) **Federal contractor use of AI**: The draft guidance calls for "a list of recommended documentation that should be required from a selected vendor in the fulfillment of a Federal AI contract." We are

University of Pittsburgh
Institute for Cyber Law, Policy, and Security

3900 Forbes Avenue
Pittsburgh, PA 15260

concerned, however, that focusing only on vendors of explicit AI contracts is too narrow a focus. We would recommend that any AI used by a contractor to provide a service to a government entity be considered within the purview of the OMB guidance, regardless of whether the contract is designated as an "AI contract." To facilitate transparency, we urge the consideration of guidance that requires contractors to disclose all AI tools that would support services in RFPs. In contrast, contractor use of AI tools for internal contractor operations could safely be considered outside the purview of OMB guidance.

3) **Automation bias**: The guidance stresses "appropriate human consideration and accountability" in use cases that entail "decisions that pose a high risk to rights or safety." As the guidance notes, human in the loop design can improve decision quality, but only if steps are taken to "combat any human-machine teaming issues (such as automation bias) and ensure the human-based components of the system effectively manage risks from the use of AI."

   To promote quality decision making, we recommend trainings that educate the human decision makers on a model's internal workings and decision points, as well as ensuring their continued awareness of potential for model errors. Additionally, agencies should structure workloads with the awareness that automation bias may be exacerbated when employees are operating under high stress and/or tight deadlines. Agencies' efforts to mitigate and monitor automation bias should be documented and, ideally, shared across agencies for best practices.

   Regardless, federal agencies should proceed with the knowledge that human in the loop practices, while crucial in many instances, are not a fulsome solution to concerns about model bias or failure.

   A related concern is deskilling. This is compounded over time – employees who were trained prior to AI adoption are likely to maintain a more comprehensive view of processes, even once their functionalities are reduced. They are also more likely to maintain a healthy level of skepticism towards AI tools, understanding the complexity of the inputs and decisions.

   The Pittsburgh Task Force on Public Algorithms[i] explored the challenge of automation bias, which occurs "when humans place too much confidence in algorithmic system outcomes, [such that] such systems can exert undue influence on decision-making processes that are supposed to incorporate more human judgment." Automation bias occurs when the human becomes a rubber stamp for the AI recommendation, reducing decision quality. Some research indicates a correlation between an individual's level of trust in AI and his/her susceptibility to automation bias, suggesting that a healthy level of skepticism towards AI could serve to lessen said bias.[ii] How that might be achieved is complex. Research conducted in the context of personnel selection systems suggests that we can encourage skepticism by providing users with information about "potential system errors and … [less] aggregated data."[iii] Other research cautions that explainability may be a double-edged sword; when a model provides an explanation of its recommendation, users take it as a "general sign of competence" and emerge more inclined to trust the AI recommendation, leading to an increase in automation bias. [iv]

4) **Disclosure:** The guidance states, "agencies must notify individuals when AI meaningfully influences the outcome of decisions specifically concerning them, such as the denial of benefits." Our reading

University of Pittsburgh
Institute for Cyber Law, Policy, and Security

3900 Forbes Avenue
Pittsburgh, PA 15260

of this language is that the agency need not, necessarily, disclose AI use at the time users interact with the system. We would advise two categories of disclosure, according to the manner in which AI is integrated. The first category of use cases occurs when a user directly interacts with an AI-powered tool, as with an AI chatbot. In these instances, we urge default upfront disclosure. The second category of use cases occurs when AI powered analytics provide input that feeds into a broader decision-making process. Determining the threshold for disclosure in this second category of use cases is difficult; to ensure reasonable transparency and consistency, we urge that each agency establish an internal set of decision points to set the bar for when public disclosure is/is not required and disclose this set of decision points.

5) **Generative AI:** The guidance directs "agencies [to] assess potential beneficial use cases of generative AI in their missions and establish adequate safeguards and oversight mechanisms that allow generative AI to be used in the agency without posing undue risk." We urge a more thorough consideration of what risks that might entail to include: elimination of entry-level work with long term implications for career progression, reliance on outputs prone to hallucinations, model embedded biases, accidental input of personally identifiable or otherwise sensitive information, difficulty in complying with federal records management, misrepresenting authorship, etc. We would recommend OMB take the initiative to elaborate on these possible risks (as well as possible mitigations) to help ensure that federal agencies adopt a balanced perspective.

We thank OMB for the opportunity to submit input on responsible federal agency use of AI. We look forward to continued engagement on this issue.

Best regards,

David Hickton, Founding Director, Pitt Cyber

Task Force Members

MEMBERS OF THE PITTSBURGH TASK FORCE ON PUBLIC ALGORITHMS

Rachel Berger, MD, MPH – chief, Child Advocacy Center, UPMC Children's Hospital of Pittsburgh; director, child abuse research, Safar Center for Resuscitation Research, University of Pittsburgh; professor of pediatrics, University of Pittsburgh School of Medicine

Esther Bush – former president, Urban League of Greater Pittsburgh

Alexandra Chouldechova – Estella Loomis McCandless Associate Professor of Statistics and Public Policy, Carnegie Mellon University

David Danks – professor of data science and philosophy, University of California, San Diego

Christopher Deluzio – policy director, Pitt Cyber, University of Pittsburgh

Ángel Díaz – lecturer in law, UCLA School of Law

Courtney Ehrlichman – chief executive officer, the Ehrlichman Group

Rosta Farzan – associate dean for diversity, equity and inclusion, associate professor, School of Computing and Information, University of Pittsburgh

Sara Goodkind – associate professor, School of Social Work, Department of Sociology and Gender, Sexuality, and Women's Studies Program, University of Pittsburgh

Ellen Goodman – professor of law, Rutgers University School of Law

David Harris – Sally Ann Semenko Endowed Chair, professor of law, University of Pittsburgh School of Law

David Hickton – founding director, Pitt Cyber, University of Pittsburgh

Yu-Ru Lin – associate professor, School of Computing and Information, University of Pittsburgh

Sharon McDaniel – founder, president, and chief executive officer, A Second Chance, Inc.

Michelle McMurray – vice president of program and community engagement, the Pittsburgh Foundation

Mark A. Nordenberg – chair, Institute of Politics, University of Pittsburgh; chancellor emeritus of the University; distinguished service professor of law

Beth Schwanke – executive director, Pitt Cyber, University of Pittsburgh

LaTrenda Sherrill – lead consultant, Common Cause Consultants; former deputy chief (education), Office of the Mayor of the City of Pittsburgh

Michael Skirpan – executive director, Community Forge; special faculty, Department of Philosophy, Dietrich College of Humanities and Social Sciences, Carnegie Mellon University

Nyssa Taylor – criminal justice policy counsel, ACLU of Pennsylvania

Frederick Thieman – Henry Buhl Jr. Chair for Civic Leadership, Buhl Foundation; chair, Community College of Allegheny County Board of Trustees; former U.S. attorney for the Western District of Pennsylvania

Task force members are serving in their individual capacity.

GOVERNMENT ADVISORY PANEL

Chris Belasco – manager, data services, Department of Innovation and Performance, City of Pittsburgh

Erin Dalton – director, Allegheny County Department of Human Services

T. Matthew Dugan – chief public defender, Allegheny County Office of the Public Defender

Joanne Foerster – director of performance and analytics, Allegheny County

Heath Johnson – manager, crime analysis, Pittsburgh Bureau of Police

Laura Meixell – enterprise data architect, Allegheny County Department of Human Services

Shatara Murphy – assistant director, community affairs, Department of Public Safety, City of Pittsburgh

The task force was served by an advisory panel composed of designees from Allegheny County and the City of Pittsburgh. These members and their respective offices are not signatories to the task force's final report and served in an advisory role only.

Acknowledgments

The University of Pittsburgh Institute for Cyber Law, Policy, and Security (Pitt Cyber) and the Pittsburgh Task Force on Public Algorithms gratefully acknowledge the generous support of The Heinz Endowments and the Hillman Foundation.

The task force thanks the entire staff of Pitt Cyber, including Sarah Barca and Kate Ulreich, for their many contributions to this work.

Many thanks to those who provided thoughtful feedback to the task force as it drafted this report: Eric Bloedorn, chief scientist for artificial intelligence (AI) adoption, the MITRE Corporation; Gretchen Greene, fellow, Harvard Kennedy School, senior advisor, the Hastings Center; Jonathan Rotner, human-centered technologist, the MITRE Corporation; and Vincent Southerland, assistant professor of clinical law, co-faculty director, Center on Race, Inequality, and the Law, New York University School of Law. Thanks to Megan Turnbull and Weiss Burkardt Kramer, LLC, for legal support and counsel.

We are grateful for the advice and guidance from local government personnel who served on the government advisory panel (members listed on page 3), as well as Nick Hall and James O'Toole for their prior service on the government advisory panel.

We acknowledge the thoughtful contributions we received in public comments and through our community engagement, which task force member LaTrenda Sherrill expertly led, and the many organizations and people throughout Pennsylvania and the country who provided us with their expertise and insights. In particular, thanks to those who presented at the task force's meetings: Janice Dean, director of Allegheny County Pretrial Services; Sylvia Harris, assistant director of operations, Department of Innovation and Performance, City of Pittsburgh; Dr. Heath Johnson, crime analysis coordinator, Pittsburgh Bureau of Police; Ellen Goodman, professor, Rutgers Law School; Cathy O'Neil, Tom Adams, and Jake Appel, ORCAA; Rashida Richardson, assistant professor of law and political science, Northeastern University School of Law; LaTrenda Sherrill, Common Cause Consultants; Rhema Vaithianathan, professor of economics and codirector of the Centre for Social Data Analytics, Auckland University of Technology; and Meredith Whitaker, co-founder, AI Now.

We also express gratitude to the following people, who provided thoughtful advice, support, and assistance in many different ways that ultimately shaped the task force's work: Kenny Chen, Mike Colaresi, Kara Dally, Carl DiSalvo, Daren Ellerbee and the University of Pittsburgh Community Engagement Center in Homewood, David Frisch, Cherylie Fuller, Bob Gradeck and the Western Pennsylvania Regional Data Center, Sera Linardi, Lance Lindauer, Brace Lowe, Michael Madison, Breanna McVay, Veronica Oviedo, Alka Patel, Hannah Sassaman, John Wallace, Theodore Wilhite, Aimee Wilkins, and many others.

Most importantly, we thank the many community members who generously shared their time, experiences, and expertise with the task force.

Introduction

The Pittsburgh Task Force on Public Algorithms came together in 2020 to study the use of algorithms in local government. The task force is an independent body, hosted by the University of Pittsburgh's Institute for Cyber Law, Policy, and Security (Pitt Cyber). We were assisted by a government advisory panel, whose members served only in an advisory role and thus are not signatories to this report.

We approached this work with three core understandings. First, government use of algorithms can bring many concrete benefits. Second, those same algorithms can carry risks that can and should be guarded against. And, finally, government acceptance and use of algorithms will likely increase in the coming years.

With these understandings in mind, we offer recommendations and best practices for the Pittsburgh region's governments to consider. We believe that this work offers approaches that facilitate the transparent use of algorithms by our local governments while still providing needed external guardrails to ensure that our algorithmic systems do not lock in and exacerbate bias or other harms. We aimed to facilitate a balance of mitigating potential for harm, creating an environment for more equitable use of algorithms, and ensuring valuable innovation for the good of the region's residents.

Across the country, government agencies have a mixed track record of employing algorithms. Some have used algorithms to improve on prior human-based processes and outcomes and have done so with transparency, humility, and community participation. Some have not. However, we have not provided an evaluation of individual agency use of algorithms. Instead, this report looks to deliver concrete and achievable recommendations that, if adopted, could serve to guide the appropriate development and use of algorithms by governments going forward. Where local government actors have embraced transparency and equity in the development of algorithms, the task force looked to build upon that foundation in developing our recommendations.

There is a growing realization that algorithms can—and in some cases do—have extraordinary power to shape our lives, in both the private and public sectors. We believe that this is a critical moment for our region's governments to act. The recommendations in this report provide a meaningful path to better serve our residents and to lead as a model for municipalities across the country in responsible use of government algorithms.

Executive Summary

Algorithms are already here in the Pittsburgh region's governments. The systems are poised to continue their growth, offering the promise of efficiency and improved decision-making.

In the Pittsburgh region and beyond, algorithms are increasingly driving and shaping governmental decisions with tremendous impact on our lives. Child welfare investigations, bail determinations, and a variety of other public functions more and more depend on human-trained machines' ability to guide outcomes. Section II of this report provides an overview of two illustrative algorithmic systems in our region.

And yet, despite their increasing prevalence, the public often knows little about government algorithmic systems: their goals, how they work, who designed them, and more. Some agencies have endeavored to bring in the public, whereas others have not.

Government agencies should want public participation and understanding of these growing and powerful tools that harness extraordinary amounts of data. At present, little requires our regional governmental agencies to share information about algorithmic systems or to submit those systems to outside and public scrutiny.[1] Moreover, there is evidence that some algorithmic systems can lock in and exacerbate bias and harms (especially along racial and gender lines), leading to more inequity and injustice.[2]

Algorithmic systems can, however, offer significant benefits to the public: more efficient processing of data, fewer errors in decision-making relative to humans or perhaps even less biased decision-making, and the ability to consider vast troves of factors and data. There are government functions where algorithmic systems can be an improvement over human effort and/or can effectively supplement human effort to bring better results to our region.

Against this complex backdrop, the task force endeavored to learn from our local governments' experiences with these systems. We observed a range of approaches with profoundly different commitments to being transparent, engaging the public, and obtaining outside reviews of systems.

We also sought to listen to residents, especially those in communities most likely to be affected by governmental algorithms. Although the COVID-19 pandemic complicated that effort, some themes emerged: a sense of being kept in the dark, frustration that government is harnessing data to target enforcement instead of deliver resources, and a desire for more democratic deliberation and transparency regarding these systems. But there was also an appreciation of the promise of algorithms.

Within this context, the Pittsburgh Task Force on Public Algorithms offers concrete recommendations to manage the accountability of public algorithmic systems in our region. We do so with humility, but we hope that these recommendations, if implemented, will offer transparency into government algorithmic systems, facilitate public participation in the development of such systems, empower outside scrutiny of agency systems, and create an environment where appropriate systems can responsibly flourish.

There is no direct model for this work, although there are increasing experiments in algorithmic accountability efforts at all levels of government across the globe. Where we could, the task force looked to examples on which we could rely in crafting our recommendations, with particular attention to local government actors (such as Allegheny County's Department of Human Services) that have a track record of developing algorithmic tools in public view.

Section IV of the report explains the task force's recommendations in detail. In sum, our top-line recommendations for our region's governments are:

- Encourage meaningful public participation, commensurate with the risk level of the potential system.
- Involve the public in algorithmic system development plans, from the earliest stages through any later substantive changes to the system.
- Utilize third-party reviews when the system might be higher risk.
- Procurement and contracting (including data-sharing agreements) processes could include review to assess whether any planned procurement might include an algorithmic system.
- Publish information about algorithmic systems on a public registry website.
- Avoid facial-recognition and related systems.
- Evaluate effectiveness of recommendations.

There is a tremendous opportunity for the region to fashion a framework for managing and harnessing public algorithmic systems. Such actions will require investments, ones that the task force believes are worthy of support. If we are successful, municipalities across the country could look to this framework as a model, positioning Pittsburgh as a leader and helping to achieve greater algorithmic justice and accountability balanced with responsible growth.

I. What is a Public Algorithmic System?

Throughout this report, the task force principally uses the term *public algorithmic system*, defined in full as follows:

> The term **"public algorithmic system"** means any system, software, or process that uses computation, including those derived from machine learning or other data-processing or artificial intelligence (AI) techniques, to aid or replace government decisions, judgments, and/or policy implementations that impact opportunities, access, liberties, rights, and/or safety.[3]

Terms like "algorithms," "artificial intelligence," "automated decision system," "predictive risk model," and "machine learning" tend to proliferate in any discussion of governments using big data in decision-making. Many of these terms have substantial overlap and, in common usage, are used imprecisely. They are not perfectly interchangeable, of course, and nuances in meaning can have important distinctions in understanding the tool in question.[4] For the purposes of the task force's recommendations, however, these nuances matter less than an understanding that governments increasingly use these tools to make or help make decisions.

The task force's definition, which is heavily informed by Professor Rashida Richardson's work[5], is broader than the usual definition of "algorithms," which are "generally regarded as the mathematical logic behind any type of system that performs tasks or makes decisions"[6] or "specific sequences of steps used to accomplish some task, especially those embedded in a computer."[7] In other words, "algorithms" are typically understood as problem-solving functions rather than the complete system that might encompass an algorithmic function. For our purposes, however, this narrow understanding of algorithms would be too limited a view. Indeed, as one study has observed, "[T]oday's automated decisions are not defined by algorithms alone. Rather, they emerge from *automated systems* that mix human judgment, conventional software, and statistical models, all designed to serve human goals and purposes."[8]

The potentially broad nature of this definition could lead to capturing a wider set of systems than intended.[9] However, as described more fully in the forthcoming recommendations of this report, the task force believes that the relevant risk of any given system should determine the level of concern and corresponding scrutiny for that system. In this framework, the risk-based approach that we have taken should mitigate overbreadth concerns.

Critically, the task force and its work are focused on *public* algorithmic systems, meaning those systems that governments use (including when a government actor relies on or partners with a private algorithmic system). This excludes non-governmental systems, such as those that a prospective private employer, a social media company, or a private health insurer might use. Moreover, the task force's work is focused on algorithms in government decision-making, which, irrespective of whether it might be shaped by an algorithm, can carry risks, especially when lacking public input and involvement. Many of the task force's suggestions about bolstering public participation in algorithmic system development could similarly foster trust in government decision-making, more broadly, though this is beyond the scope of our work.

II. Public Algorithmic Systems in the Pittsburgh Region

Our region has been at the forefront of applying algorithmic systems to governmental functions.

The following sections highlight two key systems: (1) the Allegheny County Department of Human Services (DHS) child welfare tool, the Allegheny Family Screening Tool (AFST), in light of its prominence; the county's transparency around its development, deployment, and use; and the county's efforts to secure external evaluations and public feedback, and (2) the City of Pittsburgh's suspended predictive policing system, which, like in most government agencies across the country, lacked such process measures. In developing the recommendations in this report, the task force paid particular attention to the DHS experience with AFST and efforts to incorporate transparency and accountability into the system's development. The task force was impressed with DHS's goal of a more open and consultative process, something that has not been the norm for most government agencies across the country.

The two systems discussed below—and the other systems identified—are not an exhaustive list of systems in use in our region; rather, they are illustrative of significant ways that our region's governments are turning to algorithmic systems to aid in governmental decision-making and the processes around their adoption and use. The task force *did not* endeavor to audit or scrutinize the workings of any specific system; instead, we focused on the processes surrounding system development and implementation to inform our recommendations.

The task force anticipates that the growth of these algorithmic tools is poised to continue in the Pittsburgh region and beyond, bolstered by the availability of large troves of data, the power and promise of algorithmic systems, and the recent experience of local governmental officials in developing and deploying such systems.

ALLEGHENY FAMILY SCREENING TOOL (AFST)

The AFST is an algorithmic system[10] that helps child-welfare personnel assess whether or not to "screen in" a referral for an investigation when they receive an allegation of certain types of child maltreatment (e.g., neglect). Allegheny County DHS developed the system, in use since August 2016, with a team from Auckland University of Technology.

The process before adoption of the AFST required staff at a child-abuse call center receiving referrals—that is, allegations of maltreatment—"to manually access a myriad of data and information to help decide whether or not to investigate the allegation ('screen in' and investigate or 'screen out' and offer relevant community resources)."[11] In essence, staff had to comb through available data and then make judgment calls about whether an investigation was warranted.

Much of the motivation behind developing the system was to better inform such decisions made at the critical time when allegations are received, when there is often limited information received from callers on which to base decisions, and to "reduce variability in staff decision-making."[12] According to DHS, before the AFST, "[A]n analysis found that 27% of highest risk cases were being screened out and 48% of the lowest risk cases were being screened in."[13] As with nearly all child-welfare departments, Child Protective Services does not have the resources to investigate all referrals.

The AFST therefore looks to help determine which cases are most critical to investigate by augmenting the manual decision-making process. The AFST generates an algorithmically indicated risk score, which is then reviewed by a screener, who decides whether or not to screen in a referral for an investigation. The AFST makes an adverse outcome prediction—that is, whether a child will experience a placement within two years of the screening.[14] Placement refers to whether a child will be removed from the current home situation by DHS and placed in a different environment. According to DHS's AFST "frequently asked questions" document, "Only the call screener and call screening supervisor have access to the AFST score," and the investigations staff and the courts do not have access to the AFST score.[15] In other words, no individual who participates in decisions about whether children should be placed in different environments currently has access to scores.

Underlying the AFST is the DHS "Data Warehouse." The county describes the Data Warehouse as "bring[ing] together and integrat[ing] client and service data from a wide variety of sources both internal and external to the County. It was created by consolidating publicly-funded human services data (e.g., behavioral health, child welfare, intellectual disability, homelessness and aging) and, over time, expanded to include data from other sources."[16] The AFST relies on a subset of data sources from the Data Warehouse: child-welfare records, jail records, juvenile-probation records, behavioral-health records, and birth records.[17] A DHS report on the AFST's methodology includes in an appendix the "full list of predictor fields used in" the latest version of the AFST.[17] DHS intends to incorporate additional data into AFST in the future—including data from private insurers—with an eye toward making the data more representative.[18]

"Since August 2016, the Allegheny County Department of Human Services (DHS) has used the Allegheny Family Screening Tool (AFST) to enhance our child welfare call screening decision making process with the singular goal of improving child safety.

The AFST is a predictive risk modeling tool that rapidly integrates and analyzes hundreds of data elements for each person involved in an allegation of child maltreatment. The tool can rapidly integrate and analyze these data, housed in the DHS Data Warehouse, and create a synthesized visualization of the information. The result is a 'Family Screening Score' that predicts the long-term likelihood of future involvement in child welfare. By combining the insight gained through the score with other traditionally gathered information, a better prediction can be made of the long-term likelihood that the child will need to be removed from the home in the future.

According to the algorithm, the higher the score, the greater the chance of future out-of-home placement. When the score is at the highest levels, meeting the threshold for 'mandatory screen in,' the allegations in a call must be investigated. In all other circumstances, the information summarized by the score does not replace clinical judgment but rather provides additional information to assist in the call screening decision making process. The Family Screening Score is not used to make investigative or other child welfare decisions and is not shared beyond call screening."

Source: Allegheny County Family Screening Tool.

EVALUATIONS AND TRANSPARENCY

DHS solicited proposals "to design and implement Decision Support Tools and Predictive Analytics in Human Services" in February 2014.[19] Supported by both private philanthropic and government funds, DHS ultimately awarded a contract to a team from Auckland University of Technology, led by the codirector of the Centre for Social Data Analytics, Rhema Vaithianathan.[20] An external member of the vendor-selection committee, who is also a member of the task force, told us that she looked to "center the selection based on race, bias, and DHS's history. This

early acknowledgement of bias and the attempts to mitigate the same in the early design was critically important." DHS also subjected the AFST to an external ethical analysis,[21] to which DHS provided a fulsome response.[22]

DHS sought to involve members of the region in the decision to use the AFST. As part of the development, community and stakeholder meetings were held. Calling such efforts "a priority for the County throughout the project," DHS held a variety of meetings and undertook efforts to bring in the public:

> "The County sought input from the community through various meetings, including six project-specific meetings. Three were held at early stages of the project to collect feedback from key external stakeholders and funders. DHS then held three open community meetings where over 30 stakeholder groups (including the Courts and the ACLU) were invited to discuss the work to date, implementation timeline and results. Additionally, DHS shared project updates with existing community networks including the Children's Cabinet and the Children, Youth and Families Advisory Board, and through the DHS Speaker Series."[23]

Separate from, and concurrent with, the development of the AFST itself, DHS also sought two related evaluations of the AFST (in addition to the ethical analysis noted above): a process evaluation and an impact evaluation. Hornby Zeller Associates conducted the process evaluation[24], and Stanford University performed the impact evaluation.[25] Critically, the impact evaluation determined that, among other things, the "AFST led to reductions in disparities of case opening rates between black and white children," an important improvement on the higher case-opening rates for Black children pre-AFST.[26] The evaluation also found increased "identification of children determined to be in need of further child welfare intervention" and that the AFST "did not lead to decreases in re-referral rates for children screened-out without investigation."[27] DHS also conducted external validation of the AFST, using data from UPMC Children's Hospital of Pittsburgh, demonstrating that the children whom the AFST identified as at highest risk were also those more likely to have hospital visits for treatment suggestive of maltreatment.[28]

PREDICTIVE POLICING SYSTEM[29]

Beginning in 2017, the Pittsburgh Bureau of Police and the Department of Innovation and Performance experimented with a predictive policing algorithmic system in partnership with Carnegie Mellon University's Metro21 (Smart Cities Institute). That system is currently suspended—something that the task force urged the city to do.[30] In responding to the task force's request that the city keep the program suspended, then-Mayor Bill Peduto wrote that he and other public safety leaders "share your concerns about the potential for predictive policing programs to exacerbate implicit bias and racial inequities."[31]

Despite that suspension, the task force included discussion of the system to highlight how opaque its development and operation were, reinforcing the need for meaningful public involvement in algorithmic system development in our region.

Of course, the public might weigh the expected benefits and risks of such a system and ultimately support it—but that is impossible without insights into the system, its workings, its data, and avenues for participation. Several members of the task force found the initial reported results of the system compelling (and a likely improvement over the legacy, human-based decision-making that the system was complementing), whereas others had significant concerns about the data used or related issues. All, however, agreed that the lack of transparency

and public accountability justified the program's suspension. Such opacity seems to be far too common across the country, especially in policing applications of algorithmic systems.

Before the program's suspension, the system was implemented city-wide (in both residential areas and business districts). The funding for the partnership with Metro21 ended at the end of 2019. According to a since-removed posting on the Metro21 website:

> "The team developed a predictive analytics program and policing strategy that is being used by the Pittsburgh Bureau of Police to predict crime hot spots and prevent serious violent crimes. A neural network model predicts locations that will likely have crime flare-ups in the following week. Police then use community policing approaches to patrol and deter crime in the hot spots with the aid of real-time crime mapping from their patrol car laptop computers."
>
> Source: Wil Gorr and Daniel O'Neill, Pittsburgh Crime Hot Spot Program: Preventing Crime with Predictive Policing, Carnegie Mellon University Metro21: Smart Cities Institute, https://www.cmu.edu/metro21/projects/reducing-crime.html (accessed November 2019).

Researchers behind the project, which began in 2017, made available publicly a paper that provides insights into how the project was developed and had been working in practice. The initial research project intended to assess the impact of predictive policing strategies on crime.

The subsequently developed system relied on historical reports of crimes and 911 calls to make predictions about where crime might occur in the future. Based on the system's predictions, Pittsburgh Police then pursued a "'hot-spot-based' approach": "Pittsburgh's hot spots are 500 sq. ft. areas where crime is likely to occur, and they can be either 'chronic,' meaning crime is likely to happen there at all times, or 'temporary,' meaning they have occasional spikes of crime activity."[32] The police targeted hot spots for "treatments"—that is, deployment of police based on the algorithmic system's predictions.[33] According to the Bureau of Police, before the program's suspension, each police zone had been receiving six hot spots for patrols (three chronic, three temporary). According to the researchers, they found a 25.3% reduction in serious violent crimes per hot spot (relative to the control hot spots).[34]

The project apparently relied on two data sets from a five-year period from 2011 to 2016: (1) "all 206,150 crime incidents reported by the [Pittsburgh Bureau of Police]," which were compiled from Pittsburgh's Automated Police Reporting System (APRS), and (2) "information on 911 calls for assistance to the Pittsburgh police, totaling approximately one million calls over the five-year period of analysis."[35] Of course, crimes that go unreported are not included in these data.

As *PostIndustrial* reported in June 2019, the system's data "include[d] three broad sources: past crimes of the same kind as the target crime being predicted, other kinds of past crimes which are found to be predictive of the target crime, and 911 calls about crimes."[36] The Bureau of Police advised the task force that personally identifiable information, demographic data, and officer-initiated actions (e.g., traffic stops or arrests) were not included in the system's data.

EVALUATIONS AND TRANSPARENCY

The task force is not aware of any external review of the program,[37] nor did the task force identify any effort to invite the public to participate in the design of the program, to solicit opinions about its development or implementation, or to otherwise educate the public about the system and its effects before the system went into effect. In March 2021, one of the program's researchers submitted a comment to the task force, sharing access to other documents about the system.[38]

As with any program relying on historical crime-reporting data—which can reflect long-standing racial and economic disparities in Pittsburgh—this predictive policing system involves sensitive issues of policing (including the critical issue of where to send police for potential enforcement) with implications for public safety and fairness.

OTHER SYSTEMS

There are other instances of algorithmic systems in use in our region. County DHS has developed a system designed to better match residents and homelessness resources in Allegheny County[39] and has introduced a program called Hello Baby with the goal of effectively and efficiently getting available resources to infants and families.[40] As with the AFST, county DHS has made several reports available, with others to come once completed: a methodology report,[41] two ethical reviews,[42] and the DHS response to those ethical reviews.[43]

City algorithmic systems have included those to manage traffic lights,[44] a system that detects and locates gunshots,[45] and a system that predicts risk scores for fires at commercial properties.[46] In addition, the Pittsburgh Water and Sewer Authority is endeavoring to use machine learning to predict the location of lead-contaminated service lines,[47] and Pittsburgh Public Schools have harnessed data to flag whether students might be at risk of falling behind academically and to evaluate teacher performance.

As with many jurisdictions across the country, the judiciary also uses algorithmic systems. Since 2007, Allegheny County's courts have used an internally developed pretrial risk-assessment tool to aid judicial decisions about whether to confine criminal defendants before trial. Allegheny County courts also have access to the Public Safety Assessment, developed by Arnold Ventures,[48] which the courts implemented in 2016 in parallel to the existing risk-assessment tool, and juvenile detention decisions are shaped by the Pennsylvania Detention Risk Assessment Instrument.[49]

Elsewhere in the region, researchers from the University of Pittsburgh have been exploring a system designed to predict opioid overdoses and "to identify individual risk factors,"[50] with likely application in local governments.

III. Potential Problems with Public Algorithmic Systems

The task force believes that government consideration of any algorithmic system should entail (1) a comparison of that system (and its expected benefits) to the existing human decision-making process it would supplant or supplement and (2) a weighing of those benefits against expected or potential problems (and mitigations) inherent in the system or its data. A weighing of these potential problems against expected benefits and improvements over existing human decision-making might lead policymakers to proceed with adopting algorithmic systems for some applications—but perhaps rejecting them in others. Such balancing of costs and benefits, however, must be done with a full appreciation of all perspectives and should include robust public involvement to improve outcomes and to engender trust.

Some algorithmic systems have the potential to perform complex tasks more efficiently and fairly than humans.[51] Proponents of these tools also point to the potential for reducing inaccuracies, biases, and other common shortcomings of human decision-making, and they even argue, "[W]hen algorithms are involved, proving discrimination will be easier—or at least it should be, and can be made to be."[52] As a leading management consultancy that often advises governmental clients puts it, these tools can "enable governments to perform more efficiently, both improving outcomes and keeping costs down."[53] Some argue that algorithmic systems have "enormous potential for good," and "could greatly improve quality of life and help individuals meet long term goals."[54]

It is no surprise then, that such public systems are growing in prevalence. Indeed, "[A]n increasing number of government agencies are considering or starting to use [artificial intelligence and machine learning] to improve decision making."[55] The task force is not aware of any comprehensive and complete accounting of the numbers of automated decision-making systems currently in use in municipalities but anticipates that the numbers and impact will become even more significant in the next decade, including in our region.

Yet governmental use of algorithmic systems—like any type of decision-making—can indeed suffer from inaccuracies, misuse, and bias, as well as a host of other problems. Some of these problems are unique to algorithmic systems and the data on which they rely. This section will survey some of the common problems implicated by government algorithmic systems.

ILLUSTRATIVE PROBLEMS

Algorithmic systems—like the human decision-making processes they might supplant or aid—can be problematic. Algorithmic systems can suffer from high error rates and can lead to inequitable and biased outcomes if the underlying data are similarly flawed. Moreover, issues with training, designing, and implementing algorithmic systems can lead to feedback loops—where outputs of algorithmic systems go on to affect the data inputs and thus subsequent outputs.[56]

Consider this cautionary tale from Michigan of a public algorithmic systems gone awry. The state's Unemployment Insurance Agency turned to outside vendors to automate processes regarding unemployment data and to ultimately adjudicate and impose penalties for benefits fraud.[57] The algorithmic systems replaced humans who had been involved in various aspects of scrutinizing unemployment claims and was programmed or trained in a way that made it quite likely to falsely flag instances

of fraud. Official public details about the cause of these false positives are scant, but, according to a report from AI Now Institute, the system "falsely identified more than 40,000 Michigan residents of suspected fraud" from October 2013 to August 2015.[58] In essence, this Michigan algorithmic system, which was intended to identify unemployment fraud, incorrectly flagged tens of thousands of Michiganders for suspected fraud with significant consequences for those flagged, including civil penalties, wage garnishments, and tax-refund seizures.[59]

Not all algorithmic systems suffer from such obvious (or detectable) errors, and there are a variety of flaws that can imperil algorithmic systems—as well as potential mitigation efforts. Several common problems are surveyed below, which the task force urges readers to consider for each system in the context of any expected benefits and the legacy decision-making process that the system might supplant.[60]

ERROR RATES

There are many examples of algorithmic systems with high error rates, with varying and diverse causes.

Facial-recognition systems, in particular, have been plagued by errors. Some jurisdictions across the country are embracing this technology—which has drawn the ire of many researchers and criminal-justice reformers—while others are seeking to curtail it.[61]

In a 2018 study of automated facial-recognition algorithms and associated data, Joy Buloamwini of MIT Media Lab and Timnit Gebru, then of Microsoft Research, found startling error rates along racial and gender lines. Their research found error rates between 20.8% and 34.7% for "darker-skinned females"—"the most misclassified group"—in an evaluation of three "commercial gender classification systems."[62] Additionally, they found that the systems performed better on lighter faces than darker faces (11.8%–19.2% difference in error rate) and on male faces than female faces (8.1%–20.6% difference in error rate).[63] Critically, the report observed that the relevant datasets serving these systems were disproportionately comprised of "lighter-skinned subjects."[64]

In congressional testimony, Buloamwini highlighted how these broader error patterns can lead to a devastating case of misidentification in real life. In spring 2019, Sri Lankan authorities, using facial-recognition technology, falsely identified Amara K. Majeed (an activist and then a Brown University senior) as a terrorist suspect implicated in the Sri Lankan Easter bombings, leading to death threats and police scrutiny of her family in Sri Lanka.[65] In a startling episode in 2018, the ACLU ran photos of members of Congress through Amazon's Rekognition facial-recognition offering and found flawed results: 28 members incorrectly matched with arrestees' mugshot photos.[66] Moreover, "Of the false matches, 39 percent were people of color, even though people of color make up only 20 percent of lawmakers in Congress."[67] In June 2020, as racial-justice protests and calls for greater police accountability swept the country, Amazon announced a "one-year moratorium on police use of" Rekognition.[68] That suspension has continued, and other tech companies have similarly stepped away from offering facial-recognition technologies to law enforcement.[69]

And in Detroit, in the wake of a *New York Times* account of a man wrongfully arrested in January 2020 after an incorrect algorithmic identification, the police chief there acknowledged that the facial-recognition system in question had a remarkably high error rate, saying: "If we would use the software only [to identify subjects], we would not solve the case 95-97 percent of the time. … If we were just to use the

technology by itself, to identify someone, I would say 96 percent of the time it would misidentify."[70]

Meredith Whitaker of New York University's AI Now Institute, who also presented to the task force, testified before the U.S. House Committee on Oversight and Reform that "[f]acial recognition reflects and amplifies historical and present-day discrimination."[71]

Facial-recognition systems are not the only systems that can suffer from inaccurate results. Analysis by *ProPublica* found that Broward County, Florida, relied on an algorithmic system that falsely labeled Black criminal defendants as nearly twice as likely to re-offend as White criminal defendants.[72] That system (called "COMPAS") reportedly relied on data that included questions about parents' incarceration history—a racially fraught piece of data with obvious implications for bias and fairness, particularly in areas with legacies of racially biased criminal-justice systems.[73] A subsequent study by Northpointe Inc. (the company behind COMPAS) countered and offered evidence refuting "the claim that the COMPAS risk scales were biased against black defendants in a sample of pretrial defendants in Broward County, Florida."[74]

BIASED DATA

A common question from the public posed to the task force was, "What information informs the tool?" There may be no more important question to ask in examining the potential for bias in algorithmic system–based decision-making. Algorithmic systems—like human processes to make decisions in government—can, and often do, suffer from bias embedded in the data on which such systems rely.[75]

NON-REPRESENTATIVE DATA

Non-representative data will undermine any algorithmic system. As Alice Feng and Shuyan Wu observed in the *Parametric Press,* "A non-representative sample where some groups are over- or under-represented inevitably introduces bias in the statistical analysis."[76]

////////////////

This excerpt from a New York Times report tells the story of a man wrongfully arrested due to a facial algorithm's error.

On a Thursday afternoon in January, Robert Julian-Borchak Williams was in his office at an automotive supply company when he got a call from the Detroit Police Department telling him to come to the station to be arrested. He thought at first that it was a prank.

An hour later, when he pulled into his driveway in a quiet subdivision in Farmington Hills, Mich., a police car pulled up behind, blocking him in. Two officers got out and handcuffed Mr. Williams on his front lawn, in front of his wife and two young daughters, who were distraught. The police wouldn't say why he was being arrested, only showing him a piece of paper with his photo and the words "felony warrant" and "larceny."

His wife, Melissa, asked where he was being taken. "Google it," she recalls an officer replying.

The police drove Mr. Williams to a detention center. He had his mug shot, fingerprints and DNA taken, and was held overnight. Around noon on Friday, two detectives took him to an interrogation room and placed three pieces of paper on the table, face down.

"When's the last time you went to a Shinola store?" one of the detectives asked, in Mr. Williams's recollection. Shinola is an upscale boutique that sells watches, bicycles and leather goods in the trendy Midtown neighborhood of Detroit. Mr. Williams said he and his wife had checked it out when the store first opened in 2014.

The detective turned over the first piece of paper. It was a still image from a surveillance video, showing a heavyset man, dressed in black and wearing a red St. Louis Cardinals cap, standing in front of a watch display. Five timepieces, worth $3,800, were shoplifted.

"Is this you?" asked the detective.

The second piece of paper was a close-up. The photo was blurry, but it was clearly not Mr. Williams. He picked up the image and held it next to his face.

"No, this is not me," Mr. Williams said. "You think all black men look alike?"

Mr. Williams knew that he had not committed the crime in question. What he could not have known, as he sat in the interrogation room, is that his case may be the first known account of an American being wrongfully arrested based on a flawed match from a facial recognition algorithm, according to experts on technology and the law.

Source: Kashmir Hill, "Wrongfully Accused by an Algorithm," New York Times (June 24, 2020), https://www.nytimes.com/2020/06/24/technology/facial-recognition-arrest.html.

Such errors are introduced where the difference between the sample set and the broader population is a result of the sample itself; in other words, a sample error exists where a sample is not representative. Feng and Wu illustrate a sampling error by demonstrating how a sample would be skewed if, in estimating the average U.S. household income, the sample of 100 residents included billionaire Jeff Bezos (an overestimate). Conversely, a sample that included mostly low-income residents would lead to an underestimate. [77]

As another example, imagine an algorithmic system that relied on health data derived only from public health sources (e.g., Medicaid, Veterans Affairs) while excluding data from private health insurers. Or even if such an algorithmic system included private health insurers in its data sources but excluded sources such as free clinics or physicians who do not accept insurance, the system could be relying on non-representative data.

Non-sampling errors can also make data non-representative. Inaccurate or missing survey responses, poor data-collection practices, and the like can cause this type of error.

REPRESENTATIVE BUT STILL BIASED DATA

Even where sampled data are representative of broader data, bias can nonetheless exist. This can commonly occur where historical biases are "baked into" data by their very nature. In one high-profile example, such errors caused a widely used healthcare algorithmic system to suffer from bias.

In that case, researchers uncovered substantial bias in an algorithmic system that health systems and insurers nationwide (covering approximately 200 million people) rely on "to target patients for 'high-risk care management' programs."[78] Because the algorithmic system predicts *healthcare costs,* rather than *illness,* "At a given risk score, Black patients are considerably sicker than White patients."[79] In other words, the algorithmic system was holding Black patients to a higher sickness threshold than White patients in its scoring of patients to determine need for high-risk care management. The authors of the study attributed the outcome to biased data: "Unequal access to care means that we spend less money caring for Black patients than for White patients," thus artificially deflating the predicted healthcare costs for Black patients and weakening the factor's value as a proxy for predicting illness,[80] while perhaps modeling and problem formulation decisions were also responsible for the outcome. Consequently, the data here may have been representative—there are, in fact, profound disparities in healthcare costs along racial lines—but the data (coupled, perhaps, with modeling and problem formulation decisions) nonetheless introduced bias because of the stark racial differences in healthcare access that drive healthcare costs for patients.

Historical arrest data may also be representative but nonetheless racially biased due to racial disparities in policing and enforcement practices. Representative data that capture higher rates of arrest for Black residents would nonetheless be biased when the effects of historically racially biased policing and prosecution are considered. Prominent data scientists and researchers caution that criminal-history data, in general, "is neither a reliable nor a neutral measure of underlying criminal activity" and when used for risk-assessment tools create distorted, inaccurate, and racially biased results.[81] Criminal history data reflect patterns of policing and prosecution in addition to, or rather than, actual criminal activity.

For example, a report from the Center on Race and Social Problems at Pitt's School of Social Work found that "Blacks and Whites have comparable drug use rates

but Blacks have much higher arrest rates."[82] The report observed that both racial groups "are equally likely to sell and use drugs," yet "Black youths were arrested for drug violations at a rate nearly five times that of White youths in the city of Pittsburgh and Pittsburgh [Metropolitan Statistical Area], and at more than nine times in Allegheny County."[83] There was a similar disparity for adults: "Black adults were arrested at four times the rate of White adults for drug violations in the city of Pittsburgh, five times in Allegheny County, seven times in the Pittsburgh [Metropolitan Statistical Area], and three times in the nation."[84] Such a disconnect between criminal activity and arrests for that activity yields bias in arrest data—making any representative sample of that data nonetheless biased, thereby infecting any system relying on that data.

OTHER SYSTEM ISSUES

Algorithmic systems can also churn out biased outcomes if machine-learning algorithms themselves produce decisions even more slanted than training data. Incentives to reinforce majority-group observations and feedback loops both can facilitate this problem.[86]

With respect to the former, "[M]achine learning algorithms are incentivized to put more learning weight on the majority group, thus disproportionately predicting observations to belong to that majority group."[87] Feedback loops can also lead to amplified bias in algorithmic system predictions, exacerbating existing bias.[88] As one dictionary describes it, a feedback loop is "the path by which some of the output of a circuit, system, or device is returned to the input."[89] In essence, the input to a system ultimately affects the system's output, which in turn then affects the inputs, and so on.

Feedback loops can perpetuate harms in current systems and structures, such as the criminal-justice context: "Deploying predictive policing systems in jurisdictions with extensive histories of unlawful police practices presents elevated risks that dirty data will lead to flawed or unlawful predictions, which in turn risk perpetuating additional harm via feedback loops throughout the criminal justice system."[90]

A NOTE ON PRIVACY

Legal scholars are often challenged by the law's inability to keep up with the ever-evolving nature of technology. So too for privacy advocates.

Algorithmic systems can heighten concerns about government surveillance, especially to the extent such systems use so-called "Smart Cities" data—that is, data mined from a network of sensors to surveil through tagging, touching, tracking, and the like. Such practices raise the question of whether these digital contacts collide with Fourth Amendment doctrine regarding government "searches."[85] Law Professor Andrew Guthrie Ferguson, for example, suggests that such acquisition of personal data triggers scrutiny under the Fourth Amendment and might violate the Constitution.

Although resolving such constitutional issues is beyond the scope of this report, the task force is nonetheless sensitive to the privacy implications of the data collection often underlying public algorithmic systems and encourages embedding privacy protections alongside data-collection rules.

LACK OF TRANSPARENCY

Beyond the substantive problems that can plague algorithmic systems, a lack of transparency can undermine public faith and confidence in governmental use of algorithmic systems. The popular notion of an algorithmic "black box" has some truth to it, and people are loath to trust something that feels concealed from public scrutiny or where accountable elected officials have no role in oversight.

A lack of transparency can result from a lack of public oversight of—or insight into—algorithmic systems and underlying data. Many private algorithmic-system vendors on which governments rely do not make available their systems or training data for public review. Similarly, such companies typically do not explain how systems reach decisions in an effort to keep their algorithms from being reverse-engineered. Both the public and elected officials are blocked from effective oversight of systems under those conditions.

////////////////

Consider this example from Florida, where the Pasco County Sheriff's Office "keeps a secret list of kids it thinks could 'fall into a life of crime' based on factors like whether they've been abused or gotten a D or an F in school."[91] The data are drawn from school district records and state Department of Children and Families information. Neither the children nor their parents are informed when children are added on the list or how the system weighs or treats the data, which is especially problematic given disparities in discipline at the school district: Black students and students with disabilities in Pasco County are twice as likely to be suspended or referred to law enforcement.

Source: Neil Bedi & Kathleen McGrory, Pasco's sheriff uses grades and abuse histories to label schoolchildren potential criminals, Tampa Bay Times, Nov. 19, 2020, https://projects.tampabay.com/projects/2020/investigations/police-pasco-sheriff-targeted/school-data.

So too is such oversight likely thwarted where review of the substantive judgments inherent in a system are shielded. Neither the system nor the data[92] when kept obscured from the public can provide adequate transparency because algorithmic tools make a series of determinations "about what data to use, include or exclude, how to weight the data, and what information to emphasize or deemphasize."[93] According to law professors Robert Brauneis and Ellen Goodman (a task force member), "[T]here are three principal impediments to making government use of big data prediction transparent: (1) the absence of appropriate record generation practices around algorithmic processes; (2) insufficient government insistence on appropriate disclosure practices; and (3) the assertion of trade secrecy or other confidential privileges by government contractors."[94]

Sufficient transparency allows the public to ensure that a system is making tradeoffs consistent with public policy. A common tradeoff is balancing the risk of false positives and false negatives. A programmer may choose to weigh those in a manner different than policymakers or the public might prefer. An example from Philadelphia highlights this tension: "Philadelphia's Adult Probation and Parole Department's risk prediction algorithm for violent recidivism among probationers … predicts the likelihood of a probationer committing a violent crime within two years of release, and classifies the population as high, medium, and low risk. The algorithm was constructed by treating historical false negatives as 2.6 times more costly than false positives."[95] After examination, officials changed that rate to better align with department goals to ensure that the system was not overclassifying probationers as high risk.[96]

LACK OF PUBLIC OWNERSHIP

When a public agency procures a system from an outside vendor—rather than develops a system internally or with assistance from an outside vendor or expert—the agency typically does not own the system, or sometimes even the data. Consequently, the governmental entity ends up with less control and authority over the system, including directing changes and revisions to the system, than it would have over a system that it owns.

DESIGNER DEMOGRAPHICS AND DESIGN CHOICES

The community of those who prepare, develop, and implement algorithmic systems is disproportionately filled with those with advanced degrees (typically men) who often do not look like or share the lived experience of the people affected by the systems they design.[97] Such demographic divides can undermine developers'

understanding or ability to appreciate the problems or lived experiences of those subject to algorithmic systems.

OVERWEIGHTING ALGORITHMIC SYSTEM OUTCOMES

When algorithmic systems' outcomes are merely suggestive in nature—as opposed to mandatory—a human component of decision-making is still critical to the process or function at issue. Yet research suggests that humans place inconsistent weight on algorithmic systems' outcomes, with those from less privileged backgrounds and wielding less power exerting less independence in disregarding algorithmic systems' outcomes.[98] Relatedly, when humans place too much confidence in algorithmic systems' outcomes, algorithmic systems can exert undue influence on decision-making processes that are supposed to incorporate more human judgment,[99] and humans might rely on algorithmic suggestions more heavily when the suggestions reinforce their own inclinations.[100]

INADEQUATE PUBLIC INPUT AND DIRECTION

The absence of public input and direction regarding the development and embrace of algorithmic systems (a corollary to the transparency issues discussed above) is a common failure of governmental introduction of algorithmic systems. Task force community feedback and scholarship identified this problem, which can undermine public acceptance of and trust in algorithmic systems, regardless of how effective a system might be.

The task force concurs with this observation from the Centre for Data Ethics and Innovation:

"A range of transparency measures already exist around current public-sector decision-making processes. There is a window of opportunity to ensure that we get transparency right for algorithmic decision-making as adoption starts to increase."[101]

In Boston, for example, the public school system looked to an algorithm to improve bus schedules: more efficiency in routes, reduced excess bus travel, better accommodations for disabled students, optimized school start times, and equity considerations. Despite a community-engagement process and close work with the city, this "marvel" of an algorithm nonetheless met "strong and swift" "pushback" from the public.[102] As task force member Ellen Goodman wrote in describing the incident, "The consultations had not effectively described how the start time shifts in particular would change students' schedules and they had not given families opportunities to play with the model," and the protesting public blamed the algorithm—which could have been tuned to optimize for other objectives—for failures of political process.[103] This episode highlights an important consideration for policymakers: Even when an algorithmic system might improve outcomes on certain metrics, the public's distrust or rejection of the system can imperil it.[104]

This section surveyed some of the problems that algorithmic systems might carry into government decision-making. Some of those problems might already exist (or even be worse) in legacy decision-making. Consequently, the task force urges stakeholders to take a proper accounting of the expected costs and benefits of an algorithmic system—weighed against the process it would supplant—when considering such a system.

IV. Task Force Recommendations

Our regional governments' embrace of algorithmic systems—and the growth of those systems—is happening against a backdrop of disparities in transparency and oversight across different agencies of regional governments. Moreover, without caution, these systems have the potential to perpetuate or cause harm and inequity, especially for members of marginalized communities and groups, or to weaken trust in government. In some careful applications, algorithmic systems can offer the promise of improving upon legacy decision-making processes. It is clear to the task force that our region is at a moment ripe for examination and action to chart a responsible and consistent path forward. That path ought to be one that not only confronts the biases and harms that might flow from some systems but also works to build trust in government.

There is no meaningful, concrete oversight effort regarding algorithmic systems in place in this country which the task force could simply look to adapt to our region. To be sure, there are other models and proposals from which to learn to varying degrees,[105] and the task force sought to learn from experience and experts both within and beyond our region.

Our hope is that these recommendations will push agencies to foster public participation, bolster meaningful scrutiny of agencies' algorithmic systems, and set conditions for improved government decision-making.

The practices below, if adopted, will not fundamentally restructure systems of injustice and oppression where they exist, but they are designed to make more than just incremental improvements in governmental processes. Our hope is that these recommendations will push agencies to foster public participation, bolster meaningful scrutiny of agencies' algorithmic systems, and set conditions for improved government decision-making.

RECOMMENDATIONS FOR LOCAL GOVERNMENTS

RECOMMENDATION 1

1 Encourage meaningful public participation, commensurate with the risk level of the potential system.

The task force believes that not all algorithmic systems are alike and that each presents different levels of risk. Moreover, such risks exist in general in government decision-making, irrespective of the deployment of an algorithmic system in that decision-making process. Some systems (and the decisions they shape) implicate liberty, others affect the allocation of resources, and still others might simply influence mundane public functions such as management of traffic patterns. These varying risk levels, in the view of the task force, ought to inform the depth of government efforts to bring the public in to participate in the lifecycle of a system (and the decision-making process it will inform).

Consequently, government leaders should understand the relative risk of any given system as an initial matter. To assist in that assessment, the task force found the framework proposed by Gretchen Greene of the AI and Governance Assembly to be useful. Under the framework, levels of risk are defined as "the likelihood of causing serious harm through discrimination, inaccuracy, unfairness or lack of

explanation."[106] The table below from the framework presents some common algorithmic systems and their corresponding risk levels:

LOW RISK			HIGH RISK
Infrastructure maintenance and repair	Disaster management	Regulatory inspections	Criminal justice Entitlement decisions Firing decisions Child protection services
Potholes (Boston)	Wildfire spread prediction (U.S. Forest Service) Landslide detection (NASA–rescue for isolated villages)	Restaurants (Chicago, Boston) Building fire code (Atlanta, New Orleans)	Predictive policing Court sentencing

Source: Gretchen Greene, Potholes, Rats and Criminals: A Framework for AI Ethical Risk[107]

The framework also provides a series of questions designed to provide insights into the "kind and seriousness of the possible harm" that the system might cause.[107] In the table below, answers are provided for common examples of algorithmic systems, demonstrating how such examples are assessed at different levels of risk:

	LOW RISK			HIGH RISK
	Pothole detection phone sensor app	**Landslide detection (NASA–rescue for isolated villages)**	**Restaurants health department inspection scheduling**	**Criminal court risk score used in sentencing**
Use of citizen data	Minimal or none	Minimal or none	Low	Medium to high
Citizen data use opt in/ opt out	Opt in	No opt out	No opt out	No opt out and possible self incrimination
Use of class data or proxies where class has special antidiscrimination legal protections	None	None	Minimal	Medium (no direct race input but studies have shown results vary by race)
Seriousness of worst possible citizen harm, e.g. loss of life, liberty, or property	Minimal or noon Secondary/indirect cause	High (harm = not found for rescue but compare to status quo) Secondary/indirect cause	Low Secondary cause	High Direct government taking of liberty or property
Barriers to citizen challenges to the data/ algorithm as discriminatory, inaccurate, unfair or lacking explanation	Low (if alternate method exists to report potholes)	High	High	High

Source: Gretchen Greene, Potholes, Rats and Criminals: A Framework for AI Ethical Risk[107]

The task force does not believe that these questions need to be rigidly followed; however, this framework presents a workable, flexible approach that could help agencies understand algorithmic system risk. Armed with that risk assessment, agencies could thus undertake a public process tailored to the system's expected risk. The task force encourages agencies to include in risk assessments public consultation about risk level.

As described below in Recommendation 2, agencies should publish baseline information about the proposed system: what the system is, its purposes, the data on which it relies, its intended outcomes, and how it supplants or replaces existing processes, as well as likely or potential social, racial, and economic harms and privacy effects to be mitigated. That disclosure can be a jumping off point for agencies to invite the public to participate, consistent with the system's risk level. Such engagement could include public forums, social media campaigns, diverse advertising, and other opportunities for members of the public to comment on the system. *For the highest-risk systems, agencies should consider the whole range of options to reach members of the public. An emphasis on communities and organizations representative of those most likely to be affected by the system is essential.* Outreach should invite the public in to discuss whether the potential system's goals and purposes are embraced by the community, and outreach should continue after system deployment (especially regarding any substantive changes or revisions to the system).

> "Approach the community at the onset of a problem where an algorithm might be a solution."
>
> —Community member attending public task force meeting

There is a key distinction to be drawn between public-comment opportunities—which would be insufficient for higher-risk systems—and more robust public participation, which the task force encourages. As a resource, agencies might look to the work of researchers from New Zealand and the United States (including task force member Alexandra Chouldechova) who conducted a study to learn through workshops "about the concerns of affected communities in the context of child welfare services."[108] Their insights and findings would be invaluable to shaping effective participatory design approaches, as would consulting New Zealand's national guidelines for obtaining social license for data use, which were informed by public participation.[109]

For the lowest-risk systems, the task force believes that it will usually be sufficient for agencies to offer straightforward comment avenues along with public disclosure and input opportunities.

RECOMMENDATION 2

2 Involve the public in algorithmic system development plans, from the earliest stages through any later substantive changes to the system.

Algorithms can be mystifying to people, leading to distrust of, or overreliance on, a tool or system that is not easily understood or assessed—often irrespective of the system's performance. Although transparency alone cannot unlock the complexities of machine learning and the like, the value of openness could serve both to promote public participation and knowledge and to allow greater scrutiny of algorithms. This is especially important in the context of public algorithmic systems—the focus

> "An algorithm would be useful to identify the root problems and to allocate the right services, training, and resources needed to mitigate the problem."
>
> —Community member attending public task force meeting

of the task force—where governments are relying on these systems to perform or assist public functions that impact residents' lives.

Hetan Shah, for example, argues that the opportunity for positive social impacts from algorithmic systems requires a "licence to operate" from the public.[110] This "licence to operate" (or social license) includes a role for transparency.[111] There is further scholarship focused on how best to foster meaningful debate about whether an algorithmic application is acceptable (and how best to participate in the development of such systems), grounded in a recognition that such public involvement is required to obtain social license.[112] The example discussed above from Boston—where a seemingly effective school-busing algorithm was nonetheless imperiled by strong public pushback—highlights the consequences of inadequate, insufficient, or non-responsive engagement with the public: public distrust and potential abandonment of a system.

The public shared with us many concerns regarding transparency (or a lack thereof) with algorithmic systems. Even in a community session with "grasstops" leaders, there was a sense of surprise at the scope of algorithmic systems already in use and a perception of a lack of engagement with the public when those systems were introduced. One relevant public query asked, "Are the right organizations sharing information [about their algorithmic systems with the public], and what are they doing with it?"

The task force's community engagement yielded a sense from residents that government use of algorithms could be useful, but there were concerns that the systems would not be developed in a way that reflected community values and needs.

In particular, residents are concerned that algorithms have been and would continue to be deployed in primarily punitive efforts. There was support, however, for the development of algorithms that are used to identify resource gaps and allocate resources accordingly.

To improve awareness, the task force believes that government agencies should alert the public and government leadership of any agency plan to develop, procure, or deploy an algorithmic system, with an eye toward involving the public in the decision about whether to pursue the system. Such notification should include key information to be meaningful, for example:

- Identification of the system and its purposes
- Description of the data on which the system relies
- The system's intended outcomes and benefits
- How the system supplants or replaces existing processes
- Likely or potential social, racial, and economic harms and privacy effects to be mitigated
- Identification of any non-governmental funders of the system

> "It seems like a lot of algorithms are used from a deficit model of thinking. 'Here are the problems.' But where are the models for seeing our strengths? Where are the conditions under which you can predict health outcomes for children, whether it's housing or air quality? We could use that to site affordable housing and prioritize affordable housing. Where are the strengths, and where should we be leveraging these strengths?"
>
> — Community member attending public task force meeting

Beyond mere notification, proactive engagement of the public, as reinforced and discussed above, is important from the outset by any agency considering use of an algorithmic system. The public should be involved in the deliberation over whether and how to pursue a system—including the policy goals at issue—as well as later efforts to shape, refine, and improve the system.[113] Indeed, as AI Now Institute has observed, such efforts "[r]espect the public's right to know which systems impact their lives.[114] Moreover, as described below in Recommendation 5, the task force believes that local governments ought to publish information about algorithmic systems on a public website.

RECOMMENDATION 3

3 Utilize third-party reviews when a system might be higher risk.

The task force believes that agencies should subject higher-risk algorithmic systems to outside, independent review.[115] Such reviews—which should be contemplated by agency leadership well before system deployment—can offer two fundamental benefits.

First, a review can be useful at all stages, including identifying shortcomings, weaknesses, errors, biases, and the like in the critical stage *before* full implementation. This can arm government leaders and researchers with information—gleaned from those outside the team behind the system—which they can use to improve a system or mitigate issues.

Second, a review can provide not only an added layer of visibility into a system but also a basis on which public trust might be earned. A system backed up by a fulsome third-party review might be more likely to engender public trust.

The task force believes our region is fortunate that county DHS has already established a track record of soliciting and publishing these types of reviews.[116] Other agencies ought to follow the lead of DHS in incorporating reviews into the development of algorithmic systems. Thus, we encourage agencies to obtain and publish for each algorithmic system:

- Ethical review
- Process review[117]
- Impact evaluation

Earlier in this report, we detailed the DHS's AFST and made more specific reference to those reviews, which provided important independent scrutiny of the AFST and DHS in a publicly accessible manner. Agencies might also consider obtaining other reviews as appropriate (including, for example, a data-science review to examine data practices, privacy, and security, identifying ways malicious actors could subvert the system, and more). Moreover, there can be tremendous value in ensuring that a system's deployment is set up in a way that facilitates ongoing and meaningful impact evaluation post-deployment.

RECOMMENDATION 4

4 Integrate algorithmic review into procurement processes.

Local governments in the Pittsburgh region already have established processes to manage procurement and contracting for outside services. The task force believes that governments could leverage those existing frameworks by adding a review to assess whether any planned procurement might include an algorithmic system.

Similarly, that review could also assess whether public data will be used in a way suggesting that an algorithmic system is at play.

This review—built into existing processes with which government officials have familiarity—would provide an internal check to ensure that algorithmic systems are identified for government leadership and the public. When such a review flagged a system slated for procurement, if public notification had not already occurred (as outlined above in Recommendations 1 and 2), then government officials would have the information needed to make that notification, both internally and externally.

For example, the City of Pittsburgh requires that every procurement contract goes before city council after an agency has selected a vendor. Consequently, city officials should conduct their reviews *before* contracts are presented to council (i.e., before legislation is presented to council for the contract's budget allocation), thereby enabling members and the public to review an agency's planned acquisition more effectively. Moreover, the city's Department of Innovation and Performance, which handles software acquisition (including algorithmic systems), already has language in its Data Governance Operational Charter that seeks to protect civil liberties and avoid bias in algorithms: "We recognize that in achieving our mission, it is critical that we remain committed to ensuring that our usage of data does not in any way infringe upon the privacy or civil liberties of citizens, and that we maintain accountable and bias-free utilization of computational algorithms."[118]

Local governments should consider updating existing checklists and workflows and training those involved in procurement to account for a review of potential algorithmic systems and/or use of public data suggestive of an algorithmic system. Familiarity with the definition of a *public algorithmic system a*nd likely applications will be key.

RECOMMENDATION 5

5 Require agencies to publish information about algorithmic systems on a public website.

The task force believes that the public would be well served by local governments maintaining a public-facing registry website where such information about algorithmic systems would be available.[119] Such a website should include, in plain language, the system-specific information included in Recommendations 1 and 2 above.

A subset of the task force is developing a website prototype—to be informed by public participatory design—that could be the basis for city and county websites. At a minimum, any relevant website should list the information described in Recommendation 1 above for each algorithmic system and provide agency points of contact. As was similarly recommended by New York City's Automated Decision Systems Task Force, local leadership should also consider making the information available in printed form at Carnegie Library branches and other culturally relevant sites, ensuring broad access even where internet access might be limited.

RECOMMENDATION 6

6 Avoid facial recognition and related systems.

Section II above documented common errors—often with profound racial and gender disparities—associated with biometric algorithmic systems such as facial recognition. The potential for harm is heightened because governments typically use facial and related systems (e.g., affect recognition) in high-risk applications that, even if accuracy issues eventually improve, could result in invasive surveillance that would undermine privacy. Consequently, based on the current state of these technologies, the task force recommends that governments avoid such systems for the foreseeable future.

This is of particular relevance in Allegheny County, where there is a network of more than a thousand surveillance cameras (which reportedly pose a national security threat due to their manufacturing origins in China) and the possibility of implementation of facial-recognition technology.[120] Additionally, in connection with the 2020 racial-justice demonstrations in Pittsburgh, the Bureau of Police used a state facial-recognition system (known as "JNET") to match a social-media image to one in the database in order to identify a person they charged with crimes.[121] The bureau apparently disregarded an agency policy that it "does not use facial recognition software or programs,"[122] highlighting the urgent need for more robust oversight of facial-recognition capabilities. In the aftermath of the revelations about the Bureau of Police's reliance on JNET, Pittsburgh City Council approved a bill in September 2020 to modestly regulate facial-recognition technology, although the bill included an exception permitting use of JNET.[123] Yet in light of the bureau's own identification of officer disciplinary action for JNET-related misconduct,[124] that JNET exception seems troubling.

RECOMMENDATION 7

7 Evaluate effectiveness of recommendations.

The task force appreciates that the experience of local governments with these recommendations ought to shape the future. There will inevitably be successes and failures. We urge stakeholders to learn from those lessons in revisiting how best to manage and oversee public algorithmic systems in our region.

Perhaps these recommendations will fall short, and there will be public support for more robust and mandatory regulation. Or perhaps these recommendations will hit the mark in terms of fostering innovation, ensuring that algorithmic systems do not perpetuate existing biases, and encouraging agencies to develop algorithmic systems through the lenses of economic, racial, and social justice. Regardless, the task force believes that our region should leverage the knowledge that comes from implementation of these recommendations after a year of implementation by evaluating how they might be improved in the future (perhaps through a deliberative body within government or, like the task force, outside it).

V. Additional Best Practices

The task force's recommendations described above, if adopted, could provide a balanced approach to oversight of government use of algorithms and government innovation. They focus largely on instilling public participation and transparency, both necessary preconditions to just algorithms. The task force also offers the below suggestions for best practices for municipal governments more broadly. Some are inherent in the proposed recommendations above, but the task force thought it worthwhile to articulate them specifically. Others do not fit directly into the discussion above but are well worth considering.

AGENCIES

ASK: DO WE NEED AN ALGORITHM?

It is easy to think an algorithm is your solution—and vendors are often happy to sell an agency one. We anticipate a pattern in the future where algorithms are seen as easy answers to hard problems but without necessarily improving existing efforts. As with any significant government expense, hard questions should be asked about whether an algorithmic system will improve residents' lives more than an alternative effort and/or an existing process. And, as discussed elsewhere in this report, algorithms are not solutions to systemic problems.

BE CAREFUL WHAT YOU BUY—AND AVOID MISSION CREEP.

Increasingly, vendors are selling software that includes algorithmic systems an agency might not intend to purchase (or that relies on data gathered for one purpose but then deployed for an altogether different one). But once an agency has a capability, it is hard not to use it. We note, of course, that if the task force's recommendations were adopted, a new or expanded use of a system, even in previously procured software, should be disclosed.

Likewise, once an agency has an algorithm, however procured, potential new use cases will be identified. These also should proceed through disclosure and related processes, as appropriate.

PROACTIVELY ADDRESS VENDOR ISSUES.

The recommendations are designed to ensure significant transparency, incentivizing agencies to develop explainable public records around algorithm creation and use. However, when a public agency procures a system from an outside vendor—rather than developing the system internally or with assistance from outside vendors or experts—the public agency typically does not own the system. Consequently, government ends up with less control and authority over the system, including the power to direct changes and revisions, than it would have over a system that it owns.

As task force members Professor Ellen Goodman and Professor Robert Brauneis have written, this can lead not only to "opacity, public disempowerment, and loss of accountability" but also to algorithms that "may enact policy judgments that diverge from the preferences of the electorate or its elected representatives."[125]

As algorithms become more common in municipal governance, we anticipate that they will often be procured from vendors. At a minimum, when working with an outside vendor, agencies should (1) require that the system is auditable; (2) maintain ownership and access to any government data; (3) require that appropriate records are generated; and (4) contractually limit claims of trade secrecy.

Agencies should also carefully consider hiring or assigning personnel with responsibility for algorithmic system issues. Such responsibility should include not only facilitating public participation, but also spearheading agency efforts in guiding the development and/or procurement of algorithmic systems.

TRAIN YOUR PEOPLE.

Any algorithmic system should be interpretable to the public—as well as to the employees who use it. Agencies must ensure that employees understand any limitations regarding what a system was designed for. For example, we have seen in other jurisdictions that systems designed only for pre-trial detention decisions are sometimes then used for sentencing, a use the developer of those systems never intended and did not build them for. An agency and its employees should know what a system does—and does not do—and how reliable it really is. Employees using such systems often have little sense of accuracy rates of systems, essential information if one is relying on it to make a decision. This will also help limit deskilling of an agency's workforce.

Relatedly, agencies should be aware of the risks of automation bias and train their employees accordingly. When algorithmic system outcomes are suggestive in nature—as opposed to mandatory—a human component of decision-making is still critical to the process or function at issue. When humans place too much confidence in algorithmic system outcomes, such systems can exert undue influence on decision-making processes that are supposed to incorporate more human judgment.

Agencies relying on algorithms also need employees who are capable of interrogating an algorithm: e.g., scrutinizing its modeling and development, data sets, outputs, processes, and more. Relying on a developer to have done so is irresponsible at best, both in development and deployment stages.

ENSURE ETHICAL DATA COLLECTION, MAINTENANCE, AND GOVERNANCE.

Municipal governments are collecting and will only continue to expand collecting residents' data. Data are necessary for good policymaking. In particular, good (and often unbelievable volumes of) data are necessary for good algorithms. Yet, resident data raise numerous ethical and safety issues—from consent to quality control to security.

We urge stakeholders to emphasize ethical data governance, including holding sensitive data for only as long as necessary and implementing robust security safeguards.

PUBLIC

MITIGATING ALGORITHMIC BIAS WILL NOT FIX SYSTEMIC ISSUES.

Algorithmic bias is a symptom of much larger systemic issues. Mitigating it is important but no silver bullet. This task force came together because we believe it is a critical and pressing need to provide more oversight of algorithmic use in local government—something that can perpetuate and even further lock in existing injustices. However, fixing algorithms will not fix racism or poverty or injustice. When we think about algorithmic oversight as communities, as advocates, as individuals, we should approach it with this limitation in mind.

ALGORITHMS ARE NOT PERFECT, BUT NEITHER ARE HUMANS.

We should not expect perfection from our government algorithms. But we should expect that agencies are able to demonstrate that algorithmic systems produce equal or better outcomes than human processes, and there must be a way for the public to interrogate and challenge such systems.

PARTICIPATE IN THE PROCESS.

The task force hopes that our recommendations will be adopted. If so, success will depend on the depth of public participation. You do not need to be a technical expert to participate. Public deliberation and engagement are crucial in determining whether an algorithm is an appropriate tool in a particular context and whether appropriate conditions for its use have been met. You are an expert on the needs of you, your family, and your community.

OTHERS

We have intentionally not directed recommendations to developers of algorithmic systems. The responsibility of these systems in government use rests with government. However, we note that there is a large and growing body of literature and efforts around algorithmic fairness, and we encourage developers to engage with this literature and other resources thoroughly and responsibly.

Acceptance of algorithmic systems should begin with assessments of needs and capabilities and how algorithmic tools might improve governmental decision-making.

However, because we in the Pittsburgh region are fortunate to have an extraordinary research community with the skills to develop algorithmic tools, it bears mentioning that we encourage that both researchers and those who might fund their work identify whether algorithms are wanted and needed both by relevant communities and agencies before embarking on efforts. Acceptance of algorithmic systems should begin with assessments of needs and capabilities and how algorithmic tools might improve governmental decision-making. As one member of the public asked at a community event, “What was the problem someone was trying to fix through developing [this] algorithm?”

VI. Conclusion

The task force's recommendations aim to equip policymakers with actionable and concrete steps to manage and mitigate potential harms of our region's public algorithmic systems while still ensuring those systems have a chance to flourish where appropriate. Public participation is a theme throughout our recommendations, inspired by our belief that government ought to be responsive to residents.

The task force cannot advise how to resolve every conflict that might arise when an agency is deciding whether to turn to an algorithmic solution. Rather, we believe that those decisions should be made in public, with informed and open debate. This should involve people considering potential harms and their associated mitigation efforts against expected improvements relative to legacy decision-making systems. Our recommendations aim to facilitate those debates about the appropriateness of algorithmic systems in an open and public forum, one where these issues are confronted publicly, against a backdrop of fulsome public disclosures, with clear opportunities for participation and comment.

We expect and encourage deliberations on our recommendations and are confident that what we have crafted is but the beginning—and not the end—of a solution for our region. And our region's governments would be wise to work constantly to improve upon these recommendations, learning from early lessons in practice.

The task force's hope is that the Pittsburgh region will become a model for others across the country similarly confronting the proliferation of algorithms in government. The cost of sitting idly by during this transformative era in municipal government could be high, especially for the most marginalized among us.

Appendix: Community Feedback Summary

Submitted by task force member LaTrenda Sherrill, Common Cause Consultants

The governmental use of algorithms in Allegheny County is a key issue of public concern. After feedback sessions with community leaders and residents, the perspective shared by many was that although algorithms created and deployed by the government can be cost-effective time-savers, they are developed in a vacuum without community consultation. Stakeholders felt that government-produced algorithms tend to deliberately produce negative results either through purposeful bias, such as discriminatory assessment tools and data, or negligence from a lack of diverse algorithm designers. These algorithms appear to promote ways to restrict resources to communities instead of connecting the support needed to change the outcomes communicated by the algorithms. The task of making decisions about what is needed in a community should be a collaborative effort and cannot be achieved without transparency, accountability, and effective public education. This research aimed to understand public perception of municipal algorithms and the community's desired role in their use. Overall, community members posed key questions for decision-makers to consider:

- How might we create an algorithm that reflects what we value as a society?
- How might we educate our community on the purpose of an algorithm and its continued use?
- How might we include the voices of those who are most impacted by an algorithm in the process of its development?

OVERVIEW OF THE COMMUNITY-ENGAGEMENT PROCESS

As algorithms are deployed and developed throughout the Pittsburgh region, there are concerns that few efforts to ensure transparency and accountability are being deployed alongside them. To understand this fully, outreach began in the spring of 2020 to solicit community feedback. The task force originally planned four initial meetings; however, only two were possible due to Pennsylvania's stay-at-home order. Outreach continued during the summer months, which led to a number of virtual gatherings (in addition to two in-person community meetings before COVID-related shutdowns), including a virtual workshop at the University of Pittsburgh's Pitt Diversity Forum, one guest appearance on a Facebook Live show, and one virtual community meeting.

For the first meeting, more than 100 organizational leaders were invited to participate in a conversation at the Community Engagement Center in the Homewood neighborhood of Pittsburgh. For the second meeting, which also took place in Homewood, the task force attracted public participation through social media. In total, 47 community members and organizational leaders participated in the two sessions.

In addition, the task force contributed to a workshop titled "Equity and Justice in Government Algorithms," which occurred as part of the Pitt Diversity Forum. The workshop was led by Michelle McMurray, task force member and then-director of grantmaking at the Pittsburgh Foundation; Erin Dalton, then-deputy director of DHS and a member of our government advisory panel; Richard Purcell, English professor at Carnegie Mellon University; and LaTrenda Sherrill, lead consultant at Common

Cause Consultants and a task force member. The workshop was facilitated by Chris Deluzio, policy director of Pitt Cyber and a task force member. A number of local community members, university officials, and even those outside of Pennsylvania participated in the conversation, which totaled slightly more than 100 people.

To better understand the broader public's understanding of algorithms, the task force participated in the weekly Facebook Live conversation titled "What Black Pittsburgh Needs to Know about COVID-19." An initiative of 1Hood Media, the series began in March as a way to keep the Black community informed about events that directly affect them. Each week, the hosts, Jasiri X (1Hood), Dr. Jamil Bey (Urbankind Institute), and Cheryl Hall Russell (BW3 Consulting), interview a specialist in accordance with that week's theme. The episode in which the task force participated garnered more than 18,000 views on Facebook.

Finally, the task force attended Lawrenceville United's monthly community meeting. The group had discussed a number of issues related to public safety; the abundant interest from Lawrenceville residents resulted in a robust discussion. Ten people attended the virtual meeting, and about 20 people watched through Facebook Live.

During the meetings, we shared an overview of the Pittsburgh Task Force on Public Algorithms, and we asked attendees to provide a definition of "algorithm." The digital tool Menti allowed participants to respond to the prompt anonymously, and at first, most respondents originally associated algorithms with advanced math or science. Once there was a concrete understanding of what algorithms were, how they worked, and how they are used to make decisions in the real world, stakeholders had a chance to comment on a few key questions related to specific algorithms. These included algorithms that are currently in use by the local police, Allegheny County DHS, and the Allegheny County courts system. Some of the questions posed:

- **What assures you about the usage of municipal algorithims?**
- **What do you feel confident about?**
- **What about this work gives you pause?**
- **What is proising about this, or could use a bit more refinem**

After commenting on specific questions, participants were asked to think more broadly about algorithms and their interaction with the public. They were asked about how communities should be consulted in an algorithm's creation and use, as well as how algorithms should be deployed and overseen. Attendees had an opportunity to express how algorithms had played a part in their lives and how they should function within communities. Below is a summary of feedback gathered at the meetings.

THEMES FROM COMMUNITY FEEDBACK

REDEFINING PURPOSE

Stakeholders identified that algorithms are useful tools, if and when the goals are to support the community and identify resource gaps. They suggested that algorithms could be used to identify root problems (especially in marginalized communities) and to allocate services, training, and resources to strengthen community support systems. There were concerns that when algorithms are not used that way, they can do more harm than good. Algorithmic tools must be able to explicitly account for

nuance and context. Community members suggested that many issues algorithms try to solve are not "black and white," so there needs to be a system in place where algorithms are used alongside case-by-case considerations. It is essential to focus on how tools will positively affect communities going forward.

CODEVELOPING WITH COMMUNITY

Stakeholders recommended that local governments make more of an effort to share issues that may require objective tools with the public. Participants suggested that local governments approach the community at the onset of a problem or issue when it arises in order to share how an algorithm can be a possible solution to that issue. Before an algorithm is deployed, the government should hold meetings with representatives of community organizations and cultural groups, as well as individual residents. Public hearings, facilitated by the local government, should be conducted so that decision-makers can hear directly from citizens. An ethical framework to evaluate and assess the implementation of a public algorithm should be created and widely accepted. Communication with the public should be the priority.

Further comments suggested an independent board of experts to review algorithmic tools for appropriate use and training. It would also help to have monthly reports of successes, failures, and corrective measures regarding algorithms. Those who have lived experience with the systems that algorithms seek to improve should be part of the solution.

An example of a tool that would benefit from this kind of public collaboration is the Pre-Trial Risk Assessment Tool. Although the assessment in its current form helps to remove bias from subjective decisions and removes some of the power prosecutors and police have to influence bail-related decisions, the tool operates in a flawed way. Some of the items on the assessment are discriminatory of age, location of residence, employment, and history. The tool does not consider the reasoning behind certain behaviors (such as failing to appear for court), nor does it consider positive factors that work in favor of the defendant. One community member noted, "A system that predicts [something] negative based on history? You will get more negativity!" In order to avoid perpetuating a cycle that prioritizes biased data, reconsider the details of the assessment and consider other factors that contextualize the data points.

When developing algorithms, decision-makers need to ensure that the results of the algorithms will reach people who matter. Government leaders should work with their communities to determine which problems can fall under the purview of an algorithm and which ones cannot. A community member asked, "Which problems (if any) do you consider too high-stakes for algorithms?"

PROMOTING TRANSPARENCY AND ACCOUNTABILITY

The community expressed that it was vital for them to know who creates and controls the algorithms. As one community member asked: "When the algorithms go wrong, who is at fault?" Community members voiced that any algorithms in use must be repeatedly examined and reviewed. Comprehensive review needs to include an algorithm's impact at technological and human levels; specifically, review needs to ensure that the tools are continuously serving their purpose. Also important, are certain groups more impacted than others based on the results of the algorithm? Unintended consequences of this work are possible, and stakeholders encourage leaders to take time to reflect and iterate as needed. There needs to be a system for updating algorithms, as well as determining how often they need to be changed. This system needs to be codified, as well.

The government should also examine which predictive models are actually working and which are not. Predictive policing is a concept that stakeholders suggest should not fall under the purview of algorithms. Because the history of policing has involved instances of bias and prejudice, the public is concerned about the possible framing bias that officers will gain based on algorithmic data. The community does not want algorithms to result in oversaturated policing. This type of algorithm optimizes arrests, which can be extremely harmful to vulnerable communities. The target of the algorithm needs to be redefined, and the government should rethink predictive policing as a way to prevent crime. It was expressed that if algorithms are showing that specific communities are "hot spots" for crime, the government should follow suit and allocate resources to those places—not send additional ways to "punish" the community. Many community members believe that an algorithmic tool would most beneficial if used for alternative prevention rather than policing.

In addition, community members emphasized that they would like to know how organizations are using the information generated from the algorithms. The Allegheny County Family Screening Tool, which purports to improve child safety through call screening, is an example of where transparency is needed from the government. Community members felt that government leaders should clarify what specific problem the tool solves and not only ensure the public that the data collected are accurate, but also that it will support the well-being of families and children.

Stakeholders expressed that there is a need to redefine and broaden the ways that local governments are interpreting data from automated decision tools in order to determine the right resources needed to combat the negative outcomes—and then make those interpretations public. Additionally, they expressed concerns about the need to broaden who is interpreting the data. Encouraging diverse perspectives that create and interpret algorithmic results is key.

CONCLUSION

The community wants to ensure that the government is addressing systemic issues; the public wants assurances that algorithms don't widen current disparities. The concern is that technology is being used as a scapegoat for erroneous decisions that people make. Algorithms run the risk of being just as biased as humans. Therefore, algorithm designers must be well-versed in racism at systematic and institutional levels. It is also essential that designers and implementers understand how algorithms have disproportionately affected people of color in the past. This will be a step in the right direction in terms of ensuring equity. At the core of these conversations, the community wants to be assured that state and local governments truly want to strengthen and rehabilitate the community as opposed to criminalize community members. The government, in all of its dealings, needs to have the community's best interests at heart.

There is still additional work to be done to engage the community in this process. In the meantime, the task force hopes to improve general awareness of municipal algorithms and cement the public's role in the development and implementation of algorithmic systems.

> "An algorithm can be used to determine what jail you go to, what your sentence would be, determine probation and parole. This could be a chain around a Black man's neck that he can never get off because of the structure."
>
> — Community member attending public task force meeting

Endnotes

[1] An exception exists in part here for facial recognition technology, which the City of Pittsburgh began to regulate through a 2020 ordinance.

[2] Section III *infra* surveys some of this literature.

[3] The task force's definition borrows substantially from Professor Rashida Richardson's work. Richardson offers the following "narrow" definition of automated decision systems: "any systems, software, or process that use computation to aid or replace government decisions, judgments, and/or policy implementation that impact opportunities, access, liberties, rights, and/or safety." Rashida Richardson, Defining and Demystifying Automated Decision Systems. *Maryland Law Review*. 2021:13, 14, https://ssrn.com/abstract=3811708.

Director Shalanda D. Young
Office of Management and Budget
725 17th St., NW
Washington, D.C. 20503

RE: OMB–2023–0020, Proposed Memorandum for the Heads of Executive Departments and Agencies

Dear Director Young and OMB Colleagues:

We are writing in response to the request for comment on the proposed draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" by the Office of Management and Budget (the OMB Memo).

I. Summary of Comment

We applaud the OMB Memo as an important document that generally reflects a thoughtful approach to balancing the benefits of AI innovation with responsible safeguards. This is a critical time to get government technology policy right, particularly when it comes to complex benefits systems that have been challenging to modernize and touch on the lives of millions of Americans. We believe the OMB Memo takes an important step forward to ensure that government agencies can deploy, utilize, and acquire AI in a responsible fashion.

Some of the components of the OMB Memo that we view as particularly important include:

- **Chief AI Officer:** We support the requirement to designate a Chief AI Officer (CAIO), and caution that these leaders will need resources, authority, and people in addition to the title.
- **Hiring:** We applaud the hiring surge, and urge that equal attention be given to upskilling civil servants in their understanding of AI, and the use of academic-agency partnerships.
- **Real-World Testing:** We support the requirement for "[t]esting AI for performance in real-world context," and caution that current models for technology investment, which support acquisition as a one-time event at the expense of continual development and improvement, are poorly suited for this need.

- **Resources:** We support the call for "[p]roviding or requesting resources via the budget process," and hope that the majority of those resources go towards internal talent, as government's over-reliance on vendors will be particularly problematic in the age of AI.

We write, however, to explain why some of the one-size-fits-all "minimum" procedures and practices – applied to all "government benefits or services" programs – may have negative unintended consequences, as the rules intended for higher risk applications will apply to many uses likely to offer substantial benefit and very little risk to the public. Without further clarification from OMB and a clear mandate to tailor procedures to risks, agencies could find themselves tied up in red tape when trying to take advantage of non-controversial and increasingly commodity uses of AI, further widening the gap between public and private sector capabilities. In this letter, we offer some suggestions for distinguishing between these cases and adjusting the guidance to reduce the burden while maintaining AI safety.

Some of the perspectives guiding our recommendations include:

- **Agility and Flexibility:** Because responsible AI requires learning and testing in the real world, the most sensible approach to responsible AI in government calls for agility, not red tape. Adding to what are already years-long delays in the adoption of technology will get us neither the benefits nor the protections the American public deserves.
- **Distinguishing Types of AI and Benefits:** Not all AI is the same. Nor are all benefits systems the same. The risks and rewards of various uses must be assessed distinctly for the type of AI and type of benefit program.
- **The Need for Modernization:** While great caution must be taken with the systems deployed to help Americans most in need, these are also often the systems in greatest need of modernization and innovation, and these considerations must be balanced with the needs of the public in mind.

Our suggestions for further clarification and revision of guidance include:

- **Clarifying the Definition of "Rights Impacting":** The definition of "rights-impacting" – which triggers "minimum" practices for AI in any "government benefits or services" program – should be clarified and ultimately narrowed to avoid impeding important modernization efforts, especially of the systems most in need of innovation and the systems that support those Americans in greatest need.
- **Distinguishing Among Types of AI:** AI embedded in business processes, such as optical character recognition (OCR) to digitize documents or improved search to retrieve evidence, should be treated differently than AI used to make determinations. OMB should not require agencies to go through the entire software system just to have a human check on low-risk tools that actually improve government services.
    - The extensive processes required to deploy "rights-impacting AI," especially in benefit programs, should not be triggered for these lower-level, lower-risk uses.
    - OMB must account for cases in which providing for special "AI appeals" could bring a system to its knees. As an extreme example, but that falls potentially under OMB's interpretation, the U.S. Postal Service cannot enable individuals to opt out of digit recognition – pioneered in 1965 – to send a piece of mail.

- **Avoiding Duplication in Human Review:** The requirement for human review to appeal AI-enabled decisions should not duplicate existing human review mechanisms.
- **Using the Right Baselines:** Agencies should have flexibility to deploy AI tools where algorithmic bias or disparate impacts are lower in magnitude than existing baselines.
- **Securing Data for Equity:** The federal government needs to continue efforts to enable disparity (or equity) assessments. In practice, these have proven extremely challenging for government agencies, as they often lack access to demographic data. Secure, privacy-preserving access to this data and building the competencies for conducting these assessments will be important. OIRA should be engaged to encourage streamlined application of the Paperwork Reduction Act, so that it does not contribute to this burden.
- **Enhancing Public Consultation Without Unduly Delaying AI Policy:** Public consultation on a critical topic such as government use and regulation of AI is a valuable resource to help key government decisionmakers benefit from specialized knowledge and enhance the legitimacy of their decisions while the process also serves to educate the public. That said, it is worth bearing in mind that notice and comment rulemaking can take *years,* and guidance around public consultation should be clarified to reconcile the value of consultation with support for the agile adoption of AI. To thread the needle, agencies can build in consultation mechanisms that are distinct from rulemaking or supplement but do not lengthen particular rulemaking proceedings.
- **Narrowing Consultation by "Affected Groups":** Consultation by "affected groups" should not be required for development of all AI products regardless of the function. The definition of "affected groups" should be clarified to deter capture by special interests, to avoid unnecessarily triggering notice-and-comment procedures, and to avoid otherwise unnecessarily burdening agencies for no benefit.
- **Adding Nuance to Language on Negative Feedback About AI Deployment:** Language that implies that "agencies must consider not deploying the AI" upon receipt of "negative feedback" is likely to be interpreted strictly, resulting in agencies taking <u>any</u> negative feedback as a trigger to halt, regardless of context. Instead, agencies should be encouraged to take feedback seriously without suggesting that any feedback critical of AI deployment should serve to veto otherwise sensible plans to deploy suitable AI systems.
- **Leveraging Multi-Stakeholder Processes:** In both international and domestic settings, civil servants have successfully used appropriate multi-stakeholder processes to engage key stakeholders without paralyzing policy implementation. We urge OMB to provide guidance that enables, encourages, and empowers agencies to adopt agile, multi-stakeholder design processes.
- **Feasible Notice and Explanation:** Requirements for notice and explanation should not require extensive, individualized explanations of the role of every AI system in each decision that may be technically infeasible or uninformative.

Especially within complex, high-volume benefits systems, we urge OMB to adjust requirements that risk depriving Americans from precisely the kinds of benefits systems they deserve.

We submit the following letter with gratitude and respect for the work of OMB and all the agencies and components who contributed to it.

II. Background

We are individuals who have spent decades working on government technology, both from within government and outside of government. Two of us (Cuéllar and Ho) were Principal Investigators on the report to the Administrative Conference of the United States on the use of artificial intelligence (AI) by federal regulatory agencies (Engstrom et al. 2020). One of us (Cuéllar) served as Justice on the Supreme Court of California, as author of one of the most widely adopted casebooks on administrative law (Mashaw et al. 2020), as a member of the National Academy of Sciences Committee on Responsible Computing Research Ethics and Governance, and worked on regulatory policy in two Presidential administrations, including in the Domestic Policy Council in the White House. One of us (Ho) wrote the White Paper for the National AI Research Resource (Ho et al. 2021) and serves on the National AI Advisory Committee (NAIAC), as Senior Advisor on Responsible AI to the U.S. Department of Labor, and as Director of the Stanford RegLab, which partners with a wide range of government agencies around data science and machine learning. One of us (Pahlka) served as the U.S. Deputy Chief Technology Officer, helping to found the United States Digital Service, was the founder of Code for America to bring 21st century technology to government, and wrote about the urgent need for government to get technology right to serve Americans (Pahlka 2023). One of us (Perez) served in the U.S. Department of Labor in the Office of Unemployment Insurance and conducted extensive work on process automation and improvement in the state of Colorado. One of us (Rodolfa) served as Director of Digital Analytics for the White House Office of Digital Strategy, co-created the Machine Learning for Public Policy Lab at Carnegie Mellon, and has engaged with a wide range of agencies, most recently as Research Director of the Stanford RegLab. One of us (Ray) served for over three decades in the Social Security Administration, including as the deputy executive director of the Office of Appellate Operations, winning the W. Edwards Deming Award for enhancing quality in operations twice, and has written broadly about the need for data-driven modernization of benefits systems (Glaze et al. 2022; Ray and Lubbers 2014; Ray and Sklar 2019; Bajandas and Ray 2018) We write in our individual capacity.

We believe that this is a critical, precedent-setting moment for the U.S. government to lay the foundation for the effective and appropriate use of new AI technologies for the benefit of the country. Government benefits systems, for example, touch the lives of the vast majority of Americans, but rely on procedures and technologies that are sorely in need for innovation and modernization. Roughly 66M Americans – one in every five residents – rely on Social Security benefits. Some 5.4M veterans depend on disability benefits for service-related conditions. And some 46M Americans – representing one of every four workers – are estimated to have relied on unemployment insurance (UI) benefits during the pandemic. But outdated systems, crushing caseloads, and intensive manual review can cause painful delays, alarmingly high rates of error, and lead these systems to collapse right when needed the most. For instance, while UI benefits were paid in a timely fashion for 97% of applications prior to the COVID-19 pandemic, the timeliness rate dropped below 60% as the crisis caused applications to spike. Human-based decisions of eligibility for the Supplemental Nutrition Assistance Program exhibit errors 44% of the time. Such systemic challenges are pervasive across government benefits systems (Ames et al. 2020; Pahlka 2023).

Technology is no silver bullet. But modernization of and innovation within these systems is critical, including the potential use of machine learning and data-driven systems (Ray and Lubbers 2014; Glaze et al. 2022; Administrative Conference of the United States 2022). Existing innovation often happens in

spite of high levels of risk-aversion and inertia at agencies and civil servants do heroic work engaging in path-breaking innovation under these circumstances. Demonstration projects have shown the strong potential for such systems to improve the efficiency and accuracy of benefits determinations, such as through improved search at the Patent and Trademark Office, natural language processing to spot errors in draft decisions at the Social Security Administration, and assistance with navigating complex medical records at the Department of Labor (Engstrom et al. 2020). As the Administrative Conference of the United States formally recommended, "Agencies, particularly those with large caseloads, should consider whether to use artificial intelligence (AI) tools to help quality assurance personnel identify potential errors or other quality issues."

We applaud OMB's Memo as an important document to balance the benefits of AI innovation with responsible safeguards, and are grateful for the opportunity to comment on the draft guidance. In this letter, we first highlight some components of the OMB Memo that we view as particularly important. We then spell out some of what should be clarified or revised to ensure that agencies have the flexibility, resources, and leadership to advance technology in an impactful and responsible fashion.

Our most important caution is that the OMB Memo should clarify that "rights-impacting AI" cannot be interpreted to trigger extensive "minimum" processes and requirements (i.e., *human review* separate from existing review and appeals processes, *opting out* of AI systems when such systems may be embedded in complex layers of benefits systems, *public consultation* for all AI systems pertaining to government benefits systems) for any AI-based output affecting government benefits. We show below that there are a myriad of ways in which AI can be embedded – from optical character recognition (OCR) to digitize documents to improved search to retrieve evidence to smart queuing for improved case processing and error detection of draft decisions – that should not uniformly trigger such extensive processes. Otherwise, this interpretation would deter and ossify innovation within complex, high-volume benefits systems, depriving Americans from precisely the kinds of benefits systems they deserve.

III. Detailed Comments

A. What the OMB Memo Gets Right

We applaud OMB for the extensive work, care, and thoughtfulness that went into this draft memorandum. Overall, the memorandum provides a critical step forward to enabling agencies to utilize technology while also ensuring that its risks are managed.

We highlight six elements that strike us as quite important about the OMB Memo.

1. Chief AI Officer

First, we support the calls for leadership attention to AI through the designation of a Chief AI Officer (CAIO). This follows the recommendation of the NAIAC, as well as recommendations made by Dr. Lynne Parker, the former Director of the National AI Initiative Office, and one of us in testimony to the Senate Committee on Homeland Security and Governmental Affairs. That said, as noted in those recommendations, the mere designation, whether of an existing official or a new one, is insufficient.

CAIOs will require resources, authority, and people to implement the ambitious agenda set forth both in the OMB Memo, the Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence, Executive Order 13,960, Executive Order 13,859, and related legislative provisions. Some agencies may struggle to identify an appropriate CAIO within 60 days, given the need to onboard individuals, and we believe that flexibility is warranted here to ensure that the most qualified individuals can be hired into the position.

AI Governance Boards: Second, the mandate for the creation of AI Governance Boards strikes us as important to ensure that there is "[a]dequate attention from the agency's senior leadership." Responsible AI development, procurement, and governance requires multi-stakeholder teams that can blend technical and domain knowledge. To that effect, we believe the AI Governance Board provisions would be strengthened by (a) expressly including operations staff, who may be best situated to identify where AI adoption can benefit core operations, and (b) enabling outsiders to sit on the AI Governance Board. The first refinement follows the insight from existing innovation teams that leveraged the domain expertise of operations staff to build out "easy wins" for machine learning, such as at the Social Security Administration (Glaze et al. 2022). The second refinement builds on the fact that a number of governance boards have already recruited outside experts, given the lack of resident expertise across a range of subjects (e.g., technical expertise on generative AI, sociotechnical expertise on evaluation, data ethics). Enabling such experts to join as Special Government Employees, under the Intergovernmental Personnel Act, or as detailees could dramatically strengthen governance efforts, given uncertainty around the timeframe and scale of the AI hiring surge.

Agency-Wide Strategic AI Planning: Third, we concur with the OMB Memo's emphasis on agency-wide strategic planning around AI. Earlier work by Stanford's RegLab demonstrated inconsistent implementation of the two prior AI Executive Orders (13,960 and 13,859) and the AI in Government Act (Lawrence, Cui, and Ho 2023; 2022), pointing to the need for such strategic planning. The OMB Memo's emphasis on IT infrastructure, a comprehensive data strategy, managing information security ("authority to operate") to enable integration of modern software stacks, and the emphasis on hiring technical talent are particularly notable.

Two elements are worth emphasizing further: the availability of the National AI Research Resource (NAIRR), which will also be piloted under the recent AI EO, for participating agencies. Access to such a computing and data resource could be invaluable for agencies that may find the compute and data infrastructure for AI challenging to manage. In addition, we could not be more enthusiastic about the call for digital talent within government. The "AI hiring surge," however, will not be successful if it does not upskill, develop, and augment civil servants within agencies. The AI Training Act and subsequent implementation of federal training for acquisition officials by the General Services Administration and OMB are important steps, but such programs should be extended and embedded programmatically with much larger parts of the civil service to explore, understand, and develop competencies around AI. At the same time, we also believe that in addition to Presidential Innovation Fellows and the U.S. Digital Corps, academic-agency partnerships are particularly fruitful ways to build direct pathways from science to impact (Cody and Ho 2022; Maldonado et al. 2022; Engstrom et al. 2020). The Department of Labor, for instance, has partnered with the RegLab to explore the use of AI in benefits examination; the Environmental Protection Agency partnered with the University of Chicago for environmental

inspections; and Carnegie Mellon partnered with the Department of Homeland Security around cybersecurity. Such partnerships can be important ways to build out capacity.

Real-World Testing: Fourth, we believe one of the most important elements of the OMB Memo lies in its requirement for "[t]est[ing] the AI for performance in a real-world context." As AI moves into real-world deployment settings, such as in government programs, conventional laboratory benchmarks may be ill-suited to assess how AI will operate in practice. An AI system developed on one university's hospital patient data may exhibit radical performance drops if deployed to a different hospital setting or as patient profiles change over time (Wu et al. 2021). And because most government AI systems will integrate with human systems, such human interactions are critical to assess. Humans may over-rely, ignore, or veto forms of AI assistance (De-Arteaga, Fogliato, and Chouldechova 2020), each of which may have complicated effects on actual outcomes of interest, and which can only be assessed by testing in real-world contexts. Historically, many government technology efforts, particularly in the procurement setting, have focused efforts upfront: projects are funded for development through extensive ex ante specifications of requirements, and then launched and maintained. But the adaptability of AI is precisely what requires organizations to shift away from this paradigm towards an ethos of continually testing, adjusting, and improving. In partnerships with the U.S. Department of Labor, this has meant comparing how the adoption of an AI system integrates claims examiners via a (randomized) AB test and developing frameworks for how to do so on an ongoing basis. Rigorous evaluations of AI systems require evidence-building and hence have a close synergy with efforts under the Evidence Act, and testing for real world performance will be a central element for trustworthy adoption.

2. Procurement Recommendations

Fifth, we also applaud the OMB Memo's inclusion of procurement recommendations. The NAIAC has recently issued high level recommendations around procurement practices under the Federal Acquisition Regulation (FAR), which could be readily integrated as practices that enable improved market research and evaluation of AI solutions. Particularly worth highlighting in the OMB memo is the guidance for agencies to treat data as a critical asset and ensure that contracts retain for the Government sufficient rights to data. Timely, comprehensive, and programmatic access to data relating to all aspects of an agency's operations is a critical prerequisite for realizing the benefits of AI. Likewise, as the tools of data science and AI become more embedded in an agency's core operations, limited or restricted access to data poses a significant risk of stifling competition and innovations by drastically increasing the costs of migrating between vendors or building new tools outside of a current vendor's ecosystem. Similarly, OMB should consider guidance for ensuring that vendors provide to agencies sufficient transparency about their systems to ensure the ability to monitor, assess, and comply with responsible AI requirements. For instance, this may include making available source code, model weights, training data, or other model artifacts to inform agencies' responsible AI assessments. While intellectual property protection can be important, the inability to examine systems can often pose significant barriers to responsible oversight and clear guidance from OMB can help agencies ensure the necessary access to technical materials is reflected in their contracts.

3. Leveraging the Budget Process to Request Needed Resources

Last, we very much support the OMB Memo's call for "[p]roviding or requesting resources via the the budget process." This need for resources echoes recommendations by the NAIAC, ACUS, and in Senate testimony. Agencies have an urgent need to develop internal talent for oversight, governance, and modernization. Without federal staff, we are particularly concerned that the federal government may continue to over-rely on vendors to perform core forms of technology modernization, without sufficient internal staff to design, pilot, and evaluate solutions with an intimate understanding of the domain. At the very moment that AI and digital services move closer to core agency operations, it is the time to rethink, as one of us has argued, the conventional distinction between "commercial" and "inherently governmental functions" (Pahlka 2023). The AI revolution should not be outsourced alone.

B. Issues That Require Clarification or Modification

That said, we feel obliged to comment on several items that are in need of more substantial clarification or modification. We focus in particular on the memo's set of "minimum practices for rights-impacting AI." These "minimum practices" include a wide-ranging set of procedures, such as an AI impact assessment, ongoing monitoring, public documentation, bias assessment and mitigation, public consultation with affected groups, notice to adversely affected individuals of the use of AI potentially coupled with "explanations" of the AI decision, the provision of a mechanism to "appeal or contest the AI's negative impacts," and a mechanism for individuals to "to opt in favor of a human alternative."

1. Tailor Rights-Impacting AI to Risk of AI and Benefits Program

Because the definition of "rights-impacting AI" can conceivably swallow up most applications of AI, we urge OMB to clarify and right-size this definition. The Memo defines an AI system as "rights-impacting" if it the "output serves as a basis for decision or action that has a legal, material, or similarly significant effect" on rights, such as "[a]ccess to . . . government benefits or privileges." AI systems are presumed to be rights-impacting if AI is "used to control or meaningfully influence the outcomes" in enumerated domains, but one of the enumerated domains is exceptionally broad, covering "[d]ecisions regarding access to, eligibility for, or revocation of government benefits or services." Government benefits and services, in turn, are nowhere defined.

This definition of "rights impacting AI" scopes extremely broadly and triggers a wide range of procedures – above and beyond the Administrative Procedure Act – that could threaten core operations across a wide range of government programs. We are concerned that these provisions are not tailored to the reality of modern benefits systems, which process extremely high volumes of cases and where the need for human review and appeals processing has itself created a crisis of due process (Ames et al. 2020). These are systems that are in dire need of innovation and modernization. Requiring special processes for AI innovation – notably public consultation, notice and explanation of AI systems, special appeals systems for AI, and human opt-outs – can seriously impede important modernization efforts. We hence suggest the following revisions:

- The definition should be changed from "serves as a basis for" to "serves as *the principal* basis for"
- Section 5(b)(ii) should be changed to "control or *substantially* influence"

- The enumerated domain in Section 5(b)(J) should be limited to "*significant* government benefits or services" or benefits and services should be explicitly defined to encompass a narrower set of high-risk benefits and service programs.

Our reasons are fourfold. First, absent these revisions, the definition could implicate a vast range of government benefits. These include:

- The issuance of campsite permits by the National Park Service,
- The decision by a Postal Service clerk on what to charge to mail a package,
- Grant decisions by the National Science Foundation for award amounts as low as a few thousand to tens of millions of dollars for roughly 40,000 applications annually,
- Inspections of drug manufacturing plants, farms, and food imports by the Food and Drug Administration,
- Patent examination decisions for over 600,000 annual applications by the Patent and Trademark Office,
- Determinations of eligibility for unemployment insurance for over 200,000 applications each week,
- Audit decisions for over 700,000 annual audits by the Internal Revenue Service.

The sheer volume, heterogeneity, and diversity of government benefit programs defies simplistic application of uniform procedures. Or, as put by administrative law scholar Prof. Asimow: there is "no uniformity of a sort that can be easily governed by [] trans-substantive" provisions for these kinds of determinations.

Second, within a given domain, AI can be deployed in a wide range of ways (Engstrom et al. 2020; Cuéllar and Huq 2022). Many of the most promising uses of AI are lower-level forms of process automation or assistive technology, where humans continue to issue final decisions. The Social Security Administration, for instance, might employ AI to improve disability appeals processing by: (a) using AI to improve OCR to digitize documents; (b) aiding in the summarization, search, or translation of documents; (c) clustering solely to determine the order in which cases are decided by an adjudicator; (d) providing a check for potential errors in draft decisions with natural language processing (Glaze et al. 2022). As of 2023, the Internal Revenue Service required individuals to manually enter digits on paper tax returns, leading to a backlog of 10.2M unprocessed returns, when digit recognition has been deemed a solved problem by AI for decades (LeCun et al. 1998). (For reference, the U.S. Postal Service began to adopt OCR in 1965.) Treating all of these potential applications as equally "rights-impacting" makes little sense. Although the OMB memo describes a mechanism for the CAIO to exempt specific applications from the minimum practices triggered by "rights-impacting" applications, we have significant concerns with an orientation that starts from an overly-broad presumption of high risk and requires proactive action to identify exceptions. Beyond the unnecessary process involved, the incentives in a policy implementation context are generally poorly aligned with granting such exceptions as acting to waive requirements may carry a risk of scrutiny or sanctions. Such dynamics driven by risk-aversion are unfortunately all too common in the administrative state, particularly where technology is involved, leading to adverse outcomes such as outdated and ineffective software being deployed on modern GPS satellites based on little more than an off-hand example in policy guidance that was misinterpreted as a requirement (Pahlka 2023).

Third, many of these systems already have human review and appeals mechanisms, and the Memo should clarify that any rights to contest AI would not duplicate, and instead simply be folded into, such existing human review mechanisms. While it may be true that such processes might need to adapt to the nuances of AI systems — for instance, to guard against automation biases and over-reliance on the initial AI determinations in the appeal outcome itself — appeals of AI-informed and entirely human-derived decisions are not inherently different and should not require independent lanes. Further, it makes no sense for claimants to be able to opt out of AI assistance that sits layers within the internal process of the agency – such as AI assisted OCR, document summarization, and assistance – as this could prove technically infeasible and procedurally laborious. Nor would it make sense to provide for special "AI appeals" in instances where appeals could bring a system to its knees. It would be absurd, for instance, to require the U.S. Postal Service to enable individuals to opt out of digit recognition to send a piece of mail. Such manual review would cause undue budget pressure and could threaten the health of the postal system as a whole.

Fourth, our requested revisions clarify that process should be triggered only in instances where AI impacts are substantial. The OMB Memo should not require looking down the entire software stack to require human review of low-risk tools that improve government services. Instead, OMB should enable agencies to make determinations and focus their assessment efforts on AI tools that are *substantial* in effect. Indeed, this is the essence of how the Administrative Procedure Act protects agency discretion for general statements of policy or rules of agency organizations, procedure, or practice (Engstrom and Ho 2020). In many ways, OMB's binary rule – if (1) AI is rights-impacting, then (2) human review, opt-out, appeals, and public hearing are triggered – neglects the overarching lesson from procedural due process, which is needed to tailor process to risk. See Mathews v. Eldridge, 424 U.S. 319 (1976).

2. Clarify Obligations to Assess Algorithmic Discrimination

We applaud the Memo's requirement to proactively identify and mitigate algorithmic bias and disparate impacts. We urge clarification on two issues.

First, it is worth noting how deeply challenging disparity assessments have proven for government agencies. Many agencies lack access to demographic data that would enable such assessments. Twenty-one of 25 agencies filing equity action plans have noted serious data challenges to conduct the required equity assessment under Executive Order 13,985 (Gupta et al. 2023). We urge the administration to continue work to enable agencies to obtain secure, privacy-preserving access to be able to conduct such assessments. We speak from personal experience, with one of us having worked on the team to conduct the assessment of racial disparities in tax audits, which was a substantial effort (Elzayn et al. 2023). Such assessments can be substantial undertakings that require OMB to cooperate in other regards, such as clearance for data collection under the Paperwork Reduction Act (PRA) and improved guidance under the Privacy Act of 1974 to enable secure, privacy-protecting linkage to administrative records. Just as the Memo acknowledges in footnote 33 that the PRA should not prohibit input from stakeholder consultation, the PRA should not stand in the way of collecting demographic data necessary to conduct disparity assessments.

Second, we urge OMB to revise the draft language to account for the fact that AI tools may exhibit disparities – but ones that can be lower in magnitude than existing baselines (Kleinberg et al. 2019). Currently, the Memo provides that if "there are significant disparities [and mitigation is not possible], then agencies should not use or integrate the AI tool." This neglects the fact that existing baselines may exhibit greater disparities than the AI tool. As the IRS example illustrates, it may not be possible to reduce disparities to zero (and naively doing so itself poses challenges under antidiscrimination law (Xiang 2021; Xiang and Raji 2019; Ho and Xiang 2020)), but if the AI system reduces disparities significantly relative to baselines, there may still be a strong case for adoption (Coglianese and Lai 2021). We suggest changing this language to: "If adequate mitigation of the disparity is not possible *and the AI system does not reduce disparities relative to existing baselines*, then agencies should not use or integrate the AI tool."

3. Public Consultation

The OMB Memo provides that, "[t]o the extent practicable . . . agencies must consult affected groups" and that, "[i]n the event of negative feedback, agencies must consider not deploying the AI." We ourselves have seen extensive value to consultation, iteration, and design processes that enable a wide range of stakeholders to contribute to technology. Consultation, feedback, and user-oriented design can be of immense value to responsible development (Lu et al. 2022). Specifically, such consultation can help key government decisionmakers benefit from specialized knowledge and enhance the legitimacy of their decisions while the process also serves to educate the public.

That said, participatory design principles in AI, particularly within the public sector are far from settled. The Memo alludes to notice-and-comment rulemaking and public hearings, but such proceedings can be tremendously burdensome for agencies, with disparities in actual participation. As the Government Accountability Office reported, "[b]ased on the limited information available, the average time needed to complete a [major] rulemaking across our 16 case-study rules was about *4 years*" (emphasis added).[1] What is needed for responsible agency adoption of AI is *agility*, not burdensome processes, especially in light of the huge variety of government programs and AI systems.

In practice, these valuable user-centered development techniques that can support rapid iteration and continual improvement are too often stifled by cumbersome and lengthy processes of ensuring compliance with the PRA or undergoing notice and comment rulemaking (Pahlka 2023). Footnote 33 in the OMB Memo briefly acknowledges this potential barrier, but we would strongly encourage OMB to better clarify this point and provide direct, affirmative, and concrete guidance to agencies on how they can engage with stakeholders throughout the AI project lifecycle in an effective and timely manner.

We urge several other clarifications. First, OMB should carefully think about triggering process when none is required under the Administrative Procedure Act (APA). The APA exempts rules of internal agency organization and guidance documents from requirements of public consultation. And there is good reason for these exemptions: for the same reason that "ordinary business operations" are exempt from shareholder votes for public corporations, agencies must retain discretion to internally organize, prioritize,

[1] Even those who dispute that rulemaking is "ossified" estimate that it takes agencies *1-2 years* to complete most rules (Yackee and Yackee 2011). Notice and comment rulemaking, as currently practiced, is not the solution for technology design.

and allocate resources. Many AI systems may fall under these exemptions – e.g., an AI system to assign cases to investigators – and the OMB Memo should not contradict the APA's protection for agencies to be able to make internal allocation decisions.

Second, OMB should clarify what is meant by "affected groups." Consultation by affected groups should not be required for development of all AI products regardless of the function. External stakeholders should be consulted for externally facing AI products, such as chatbots or application systems. In other instances, such as enforcement tools, consultation could backfire (e.g., "IRS, please consult with tax cheats"). Other AI products (OCR, document digitization, scheduling, search) that are backend process supports have no direct implications for external groups, nor would such groups understand the end-to-end process to provide meaningful feedback. Adding this requirement in these types of situations would generate work with little value added for already burdened agencies. For many internal facing process improvements, the most important "affected group" are federal employees themselves, as the Memo notes. It will remain critical for the CAIO to discern when consultation is required and to ensure that the extent of consultation is tailored to the risk, scope, and impact of the AI system.

Third, OMB should clarify how agencies are expected to obtain meaningful feedback from individuals. Will agencies be afforded funding to provide stipends or the like to customers who provide input or is feedback solely voluntary? What happens when agencies are unable to secure volunteers or input from union representatives? Will this be added as a job duty for federal staff? Flexibility is required here given that participatory design in the public sector context is still largely uncharted terrain.

Fourth, OMB should change the language that implies that "agencies must consider not deploying the AI" upon receipt of "negative feedback." The current language can be misinterpreted to imply that <u>any</u> negative feedback must trigger a consideration to not deploy. But with any large group, there may be some forms of negative feedback, even when the overwhelming majority may be positive. We recommend revising this language to require the agency to "consider the implications of feedback on the design, development, and deployment of the AI."

Overall, we urge OMB to provide guidance that enables, encourages, and empowers agencies to adopt agile, multi-stakeholder design processes. Responsible AI calls for agility, not red tape.

<u>4. Notice and Explanations</u>

The OMB Memo provides that, where practical and lawful, agencies "must notify individuals when AI meaningfully influences the outcome of decisions specifically concerning them, such as the denial of benefits." In addition, the Memo encourages agencies "to provide *explanations* for such decisions and actions" (emphasis added).

Notice and explanation are, of course, linchpins of due process and administrative law. It is blackletter law that agencies must, by default, provide reasoned explanations for agency actions, including benefits denials. See Motor Vehicle Manufacturers Association v. State Farm Mutual Automobile Insurance Co., 463 U.S. 29 (1983); Mathews v. Eldridge, 424 U.S. 319 (1976).

Yet what is concerning about the draft language is that it can be misinterpreted to imply distinct notices and explanations specific to each application of AI systems.

First, while many legislative and regulatory proposals focus on "explainable AI," it is important to note that the technical, scientific basis for AI explanations is lacking (Amarasinghe et al. 2023; Guha et al. 2024). Put simply, OMB may be requiring something that is not currently technically feasible. Footnote 37 acknowledges that explanation is "often not technically feasible," but elides over significant tensions in the requirement. "[A]gencies should characterize the *general* nature of such AI decisions," but a decision-specific "explanation[] should be . . . meaningful, useful, and as simply stated as possible." Documenting an information retrieval system may meet the former, but not the latter. Systems-level disclosures are, of course, technically feasible and may also be more likely to uncover design and development problems.

Second, it is unclear what AI-specific harms or risks OMB aims to address with these requirements, relative to existing requirements for transparency. What benefit denials are currently not already subject to forms of notice and explanation? Is the explanation intended to require an explanation of the AI system, the AI output, or something else? When notice and explanation are already required, OMB needs to provide more guidance on what, if anything, should be provided for each decision that is specific to the AI system. An administrative law judge, for instance, must provide an explanation for reaching a decision. But that should not necessarily require the administrative law judge to explain to each litigant, for instance, the search algorithm for precedents that could be embedded legal research software, the case queuing mechanism to assign cases to adjudicators, or automated guidance that may suggest materials to consult.

Third, OMB should clarify what it means to "meaningfully influence[] the outcome." In many instances, a decision may be the same, regardless of whether processed by a human or an AI system – e.g., benefit amount calculations or employment requalification requirements. When a human utilizes AI output as part of the decision process, when does that trigger this additional explanation requirement? Is the influence of the AI system what matters? When an AI system improves the accuracy of determinations (e.g., Ray and Lubbers 2014), is then a *lesser* level of explanation required for erroneous human decisions (because AI "meaningfully influence[d] the outcome" relative to the human baseline)? This would be an odd one-sided explanation requirement, and AI-specific requirements should not deter from investing in the continuous improvement of government systems. Per OMB's laudable requirement to test AI for performance in the real-world context, we should measure, evaluate, and adopt systems that improve complex government systems relative to the baseline.

Last, while we very much favor transparency of technical systems, as we have noted above, there is a long line of research that establishes that individual notices and appeals can be exceptionally poor at correcting systemic errors in benefits programs (Mashaw 1973; 1985; Ames et al. 2020; Hausman 2021), with particularly acute problems when it comes to technology (Citron 2007). Due process may be much better served through alternative mechanisms for discovering errors, such as by comparing AI assistance with a representative set of decisions reached without AI assistance (Engstrom and Ho 2020).

* * * *

We admire the accomplishments of the AI Executive Order and strongly support the core tenets of the draft OMB Memo. Because the memo will be central to how hundreds of government agencies pursue technology modernization – and, in turn, the potential use of a wide range of AI and machine learning approaches – we think it is critical that the framework promotes responsible innovation, while paying attention to the breathtaking variety of government programs and AI. A one-size-fits-all procedural solution will not serve the administrative state well and, if misinterpreted, could simply tie agencies up in red tape. By making the above clarifications and ensuring that this is a time for investment in public sector capacity, we believe the OMB Memo can ensure that process is tailored to risk and that government agencies are prepared to responsibly use, develop, acquire, and govern AI.

It is high time for the government to get technology right. With the clarifications and changes suggested above, the OMB Memo will be a pivotal step forward, and we stand ready to support the country in these efforts.

Sincerely,

Mariano-Florentino Cuéllar

General Comment

Thank you for laying out a comprehensive plan to address AI/ML. I'm glad to see the government taking a strong stand for the rights of Americans. This policy should be strengthened by requiring all federal contractors or other recipients of government money to abide by the same rules.
I would also like to see language addressing privacy threats like facial recognition and "predictive policing". We've already seen these practices used to infringe upon Americans' civil rights; it's past time to create federal guidelines that rein in these unlawful uses of AI/ML. In fact, the guidance on "acceptable risks" does not define what level of risk is acceptable. We've seen tech companies play fast and loose with customer data in extremely harmful ways, so it's obvious their level of "acceptable" will result in high levels of community harm. The limit for "acceptable risk" needs to be clearly delineated and it must apply to all AI/ML—no opt outs just because an agency (or contractor) doesn't see the need for a risk assessment.
Another concern of mine that this guidance touches on, but doesn't fully address, is the potential for huge data privacy violations. There is currently no way for any of us to opt out of having our data used to train an AI/ML system. At the very least, the government must ensure training data is protected against internal and external threats.
Finally, the public needs (and deserves) full transparency in the government's use of AI/ML. In the few years these types of tools have been around, we've seen police base their enforcement decisions on biased data (https://themarkup.org/prediction-bias/2021/12/02/crime-prediction-software-promised-to-be-free-of-biases-new-data-shows-it-perpetuates-them), schools unfairly label students as "dropout risks" thanks to racially biased systems (https://themarkup.org/machine-learning/2023/04/27/false-alarm-how-wisconsin-uses-race-and-income-to-label-students-high-risk), and healthcare systems bypass patients who live in poorer states (https://themarkup.org/organ-failure/2023/03/21/poorer-states-suffer-under-new-organ-donation-rules-as-livers-go-to-waste). These abuses were only uncovered thanks to the relentless work of investigative journalists. If AI/ML is going to become a part of our everyday society, everyday people need to have access to data about how it's used and what the results are. AI/ML itself is built to be somewhat of a black box, a fact many companies working with this tech have used to avoid scrutiny. The only way to balance out such a barrier to transparency is to share the outcomes in a way that protects citizens' privacy, yet would reveal the kind of worrisome trends that we've seen in other situations.
It would be foolish at this point to suggest that the government not use AI/ML; it's already happening, and

I don't foresee that changing. I strongly urge the OMB to strengthen its guidance on the use of these tools to further protect our civil rights and liberties.

General Comment

ForHumanity is a non-profit public charity registered 501(c)3 with 1800+ contributors from 93 countries. Our primary work is AI Governance through Independent Audit of AI Systems. We support the ecosystem that establishes binary audit rules both top-down and bottom up for AI, Algorithmic, and Autonomous Systems. We are fully prepared to support the Executive Order and specific department and agencies of the Executive Branch, as we are already doing for the Department of Labor. In 2020 we were named a Trusted Ecosystem Partner of the Joint Artificial Intelligence Center (now under CDAO). Our submission is a response to the overarching summary of the OMB guidance, however we have more than enough expertise to support OMB on detailed guidance should that prove useful.

RE: OMB Guidance on Executive Order 14110

Authors include: Ryan Carrier, Executive Director
Michael Simon, Fellow
Esther Y. Chung, Fellow
Steve English, Fellow

Strengthening AI Governance - without establishing what the core knowledge/expertise is for Chief AI Officers, agencies and AI governance boards will have an unequal level of expertise. Subsequently, policy development and oversight will become highly divergent, which will make harmonization between agencies and boards difficult.

Advising on the governance of AI deployments in a department or agency should include all of the following:

1. Strategy
2. Technical expertise (Model knowledge, data science, testing & evaluation)
3. Alignment (scope, nature, context, and purpose)
4. Oversight and accountability
5. Necessity/Proportionality/Fundamental Rights impacts (Ethics)
6. Resource allocation
7. Data Privacy/Protection
8. Cybersecurity
9. Fairness/nondiscrimination and bias mitigation
10. Data Management and Governance
11. Risk Management
12. Trust (control, explainability, disclosure, transparency)

The aforementioned list establishes categories of knowledge and expertise required for Chief AI Officers , however there is a difference between technical expertise and expertise in Responsible AI. It is a rare person who embodies both aspects in this stage of AI's development. Examples of candidates might include someone with a PhD in Artificial Intelligence, having 10+ yrs experience designing, developing, deploying AI, accredited as a ForHumanity Certified Auditor or recognized as an expert in Risk Management and/or Algorithm Ethics. ForHumanity has found that technical expertise can be in conflict with

expertise in the areas of Responsible AI, i.e., good governance, oversight, and accountability of operating AI systems.

As you can see, AI Governance is a weighty challenge and not likely to be best solved by a single "Unicorn" individual. Instead, solving AI Governance requires a team of people who embody all of the aforementioned areas of expertise collectively. Under this advice, the Chief AI Officer is the leader of a pooled team of experts.

ForHumanity recommends that the OMB guidance establish mechanisms for governance, oversight, and accountability such as Independent Audit of AI Systems (IAAIS) as applicable. IAAIS can ensure third-party validation and verification of compliance with the remit of the Executive Order.

Advance Responsible AI Innovation - Until there has been an evaluation of whether GenAI is the right or appropriate tool for a given task, the call to "explore the use of Generative AI" furthers only one, over-hyped AI form. The FTC has warned AI providers against over-hyping their tools with attributions of "magical" capabilities. The guidance should encourage well-grounded, factual alignment of the use of AI capabilities to jobs/tasks aligned to agency missions for the purposes of serving citizens (e.g., increased efficiency, better customer service, elimination of fraud) regardless of the "type" of Artificial Intelligence.

ForHumanity would advise that each agency establish a Data Management and Governance policy, specific to the scope, nature, context, and purpose of the agency's mission, the defined task, and the nature of the data deployed (especially delineated between Personal Data and Non-Personal Data). The policy should ensure lawful usage, authenticity, authority, provenance, IP rights, and upholding the rights of citizens to access, correct and/or delete their Personal Data as well as to limit the use of Sensitive Personal Data.

OMB guidance should be equally about the removal of unnecessary barriers (as called for) and the installation of barriers when necessary to protect the rights of citizens (not in the current guidance). Specifically, in regards to Data Privacy, the OMB guidance does not provide sufficient support for the notion that Personal Data should be protected and not shared without appropriate purpose and consent from the Data Subject. While such protections for data subjects are often considered to be "barriers" by AI developers, deployers, and data scientists, these protections are in support of the fundamental human rights of Americans.

Given the socio-technical nature of AI, ethical oversight is required for the governance of AI. Ethical training and oversight should guide OMB guidance and agency implementation. AI implementation should be governed by public a Code of Ethics and Code of Data Ethics

for the Executive Branch. These policies would establish the shared moral framework of the Executive Branch and provide Ethics Officers and their committees the tools that they need to fairly adjudicate instances of Ethical Choice applicable to their specific agency and AI system scope, nature, context, and purpose.

Building a robust infrastructure for AI innovation begins with grassroots training on critical areas such as AI 101, Ethical Choice Awareness, Automation Bias and the tools to overcome it, Disability Inclusion and Accessibility Awareness, and Nudge and Deceptive Pattern Awareness. Training, like those mentioned above, will create a broadly educated workforce with sufficient knowledge of AI and associated risks to support robust and resilient development and deployment of AI across agencies.

Managing the Risk from AI usage - OMB guidance should require Algorithmic Risk Assessments conducted with human risk assessors that are diverse and represent a multi stakeholder perspective including direct stakeholders that may be internal (e.g., employees, customers, stakeholders) or external (e.g., human users, communities) and indirect stakeholders (e.g., society and the environment). Risk Assessment should be conducted across the lifecycle of the AI system (design, development, deployment, monitoring)

Risk Management should include all of the following:

1) Establishing a Duty of care for Vulnerable Populations (Children, Elderly, Disabled Persons, Immigrants) documented in the Code of Ethics. The Code of Ethics should ensure that Vulnerable Populations are represented in risk assessment.
2) Requiring pre-release testing and evaluation (like FDA clinical trials)
3) Ensuring testing and evaluation
4) Disclosing Residual Risk (defined as unmitigated risk, e.g., LLM "hallucinations" and manufactured sources)
5) Establishing Adverse Incident Reporting Systems
6) Deploying post-market and continuous monitoring
7) Requiring bias testing across datasets, architectural inputs, and outcomes that consider statistical bias, historical bias, cognitive bias, and non-response (technology barrier) bias
8) Requiring Disclosures and AI System User guides for providers to deployers to AI subjects
9) Conducting separate Ethical Risk Assessments, conducted by Ethics Officers trained in Algorithm Ethics

One approach to AI Systems procured by the US federal government might be to require third-party, independent assurance of compliance with all critical requirements as determined by OMB or the agency validated prior to acquisition. Requiring Independent Audit also ensures Compliance-by-design from suppliers and facilitates acquisition.

About ForHumanity

ForHumanity has been developing Independent Audit of AI Systems for more than 6 years, and has built an enormous infrastructure to support the Executive Order and address all common criticisms against AI audits, assessments and assurance. Currently we are drafting audit criteria, educating auditors on evaluation methods of assurance and supporting designers, developers, internal auditors and third-party independent auditors with critical tools to foster the necessary elements of the ecosystem required to execute Independent Audit of AI Systems. All of this ecosystem is available in support of the Executive Order.

Laws are reactive and designed to encourage compliance, but they do not assure it. As we have learned over 50+ years of financial audit, independent audits performed by third parties, which apply criteria required by statute, regulation, or industry custom, such as the Generally Accepted Accounting Principles (GAAP) or International Financial Reporting Standards (IFRS), create a system that encourages proactive compliance, including internal audit and compliance-by-design controls. ForHumanity believes this system represents a more trustworthy environment for the use of AI, Algorithmic and Autonomous Systems (AAA Systems) and counterbalances an industry that has gone largely unregulated while producing measurable societal harms.

ForHumanity (https://forhumanity.center/) is a 501(c)(3) nonprofit organization. Our mission is to *examine and analyze downside risk associated with the ubiquitous advance of AI, algorithmic and autonomous systems and where possible to engage in risk mitigation to maximize the benefits of these systems… ForHumanity*

We are dedicated to addressing the following areas of risk to individuals: Ethics, Bias, Privacy, Trust, and Cybersecurity in AAA Systems. ForHumanity uses an open, inclusive, and transparent process that draws from a pool of over 1800+ international contributors, from 86 countries, to construct audit criteria, certification schemes, and educational programs for legal and compliance professionals, educators, auditors, developers, and legislators to mitigate bias, support ethical oversight, protect privacy, build trust, improve cybersecurity, and drive accountability and transparency in AI, Algorithmic, and Autonomous (AAA) Systems. ForHumanity works to make these systems safe for all people and makes itself available to support government agencies and instrumentalities to manage risk associated with AAA Systems.

AI has proven very beneficial in the input and output for data consumption, so it is necessary that the US continues to implement this technology for the prosperity and safety of our country. The extent of our benefits of AI must end at the collection, summation, and suggestions for this data. Any substitution/replacement of a person when it comes to the decisions for execution with the collected data must be at the hands of a person. Yes, malevolence will always be a possibility when it comes to the free will of humanity, but the exaction of justice for wrong-doers is something that our government is well practiced at. AI is not the great equalizer, and in fact is quite the opposite. It's algorithms are for finding weaknesses and differences amongst the population. There is no greater calculator than the human mind, and sentiency and reason cannot be replaced. I understand that I did not answer any of the desired questions, so consider this more of a plea. I trust that our democracy and education, along with divine providence, has placed the needed leadership for this time at the forefront of this new frontier for a reason. Remember the voice of the people, the voice that elected you and needs you, a voice that cannot be replaced by a simulation, but that is living and breathing and sustaining this country in a far greater way than an algorithm every could. Use your specialization to protect your fellow-citizens identity, security, and prosperity, without discrimination or closed doors. Really tell us how the sausage gets made. Enforce regulations for documentation for any use of AI for each data collection company - no detail too obvious, no use too repetitive, no reason too marginal. This country's trust has been broken time and time again with its legislation, and has unfortunately become complacent with the robbery of its privacy. You mustn't allow this violation to seep into the new norm, because then the foundation of our country will fall. Our duty as a nation is not to do what is easiest, but what is right. Use that irreplaceable conscience and diligence to form the next age of history.

General Comment

Proper security controls should be placed on any AI system that interacts with data flows, both inbound and outbound, to and from an agency. There will not be tools of high quality to support defending an AI system nor filtering its outputs, whether they be actions or information, for a very long time. It would be concerning for agencies to build support onto AI systems that do not have strong mitigations for threats and risks from using these systems.

Training should be a top priority for agencies. The expectation is that all agencies will need to embrace and utilize the power of AI and AI like systems. Education needs to be treated with urgency. Safety and bias are commonly known risks; as well as ways to leverage the technology. Currently, training and education is going to technical engineering teams and some people tinkering, motivated by the hype. However, it's critical that we train all staff to understand the bias, limitations, hallucinations, trustworthy answers, and answer validation. To draw a comparison, I use the example of a statistics course. Understanding statistics and when false attributions are made with them is an important skill set that the whole workforce should understand and avoid.

Proposal:
1. Build a baseline AI Policy for all agencies to follow.
2. Scope should include private or SaaS based AI systems.
3. Build a list of technical controls for the strong authZ+MFA/authN of an AI system.
4. Implement secure data transmission protocols for both inbound and outbound data flows.
5. Use data loss prevention (DLP) tools to monitor and control data transfer.
6. Employ network segmentation and firewall rules to regulate data access and flow.
7. Deploy intrusion detection and prevention systems (IDPS) to detect and prevent malicious activities.
8. Regularly update and patch AI systems to mitigate vulnerabilities.
9. Develop and implement algorithms for output validation to detect and filter out biased or incorrect outputs.
10. Use anomaly detection systems to identify unusual AI behaviors or outputs.
11. Conduct regular risk assessments to identify and mitigate potential threats.
12. Implement incident response plans specifically tailored for AI systems.

13. Use threat intelligence to stay informed about emerging risks related to AI.
14. Develop training modules focusing on AI safety, bias recognition, and ethical use.
15. Include training on understanding AI limitations, hallucinations, and trustworthy answer validation.
16. Extend AI education beyond technical teams to all staff, similar to foundational statistics training.
17. Implement tools and practices for continuous monitoring of AI decisions for bias.
18. Establish ethical guidelines for AI use and ensure compliance through regular audits.
19. Use explainable AI (XAI) frameworks to make AI decision-making processes transparent.
20. Document AI models and their decision-making processes for review and validation.
21. Conduct periodic audits of AI systems for security, compliance, and ethical adherence.
22. Review and update AI models regularly to ensure they reflect current data and ethical standards.

Other points to consider:
1. Implement techniques like differential privacy to protect individual data within datasets used by AI.
2. Use homomorphic encryption to enable computation on encrypted data, enhancing privacy.
3. Develop AI systems to be resilient against adversarial attacks (e.g., input data designed to trick the AI).
4. Regularly test AI models against adversarial examples and update them to handle such scenarios.
5. Beyond transparency, ensure that AI decisions can be interpreted and understood by non-technical stakeholders.
6. Use tools and frameworks that provide insights into how and why decisions are made by AI models.
7. Implement continuous monitoring systems to track AI performance and behavior over time.
8. Establish feedback mechanisms to learn from AI decisions and improve models iteratively.
9. Establish a governance framework and team to oversee AI ethics, including fairness, accountability, and societal impact.
10. Regularly review and update AI policies to align with evolving ethical standards and societal values.
11. Engage with various stakeholders, including legal, regulatory, and domain experts, to ensure comprehensive AI governance.
12. Foster a culture of collaboration and transparency in AI development and deployment.
13. Stay informed about and comply with relevant AI regulations and standards, both locally and globally with corresponding SLAs.
14. Conduct legal reviews to ensure AI applications meet all regulatory requirements and ethical standards.

General Comment

Utility of the Document

Governance and Accountability: The document emphasizes the establishment of AI governance structures within agencies, including the designation of Chief AI Officers (CAIOs). This is crucial for ensuring responsible AI use and aligning AI initiatives with broader agency objectives.

Risk Management: The focus on risk management, particularly for AI applications impacting public safety and rights, is vital. The detailed guidelines for managing these risks show a deep understanding of AI's potential adverse impacts.

Innovation and Capacity Building: Encouraging agencies to develop AI strategies and remove barriers to responsible AI use fosters innovation. This is beneficial for harnessing AI's potential to improve government operations and services.

Probable Future Implications

Enhanced AI Adoption: The memorandum could lead to broader and more effective adoption of AI across federal agencies, potentially transforming government operations and public services.

Increased Public Trust: By mandating risk management and transparent governance, the strategy could enhance public trust in government use of AI.

Technological Advancements: This approach could spur advancements in AI technologies and practices, particularly in areas like risk assessment and ethical AI use.

Probability of Fulfillment by Federal Agencies

The probability of successful implementation largely depends on:

Resource Allocation: Adequate funding and resources are crucial for agencies to meet these requirements.

Training and Expertise: The success of this strategy hinges on the availability of trained personnel and AI expertise within agencies.

Inter-agency Collaboration: Effective implementation will require cooperation and knowledge sharing among different agencies.

Recommendations for Improvement

Enhanced Focus on Ethical AI: While the document addresses AI risks, it could benefit from a more pronounced focus on ethical AI principles.

Flexible Frameworks: Given the fast-evolving nature of AI, the strategy should incorporate flexible frameworks to adapt to technological advancements.

Stakeholder Engagement: Encouraging broader stakeholder engagement, including public participation, in AI governance can provide diverse perspectives and enhance trust.

Implementation Support: Providing agencies with more detailed guidance or support mechanisms, like shared services or centers of excellence, can aid in the practical implementation of these strategies.

Continuous Evaluation: The strategy should include provisions for regular evaluation and revision of AI governance frameworks to align with emerging global best practices and standards.

Re: OMB–2023–0020

Comment on Draft Memorandum titled "Advancing Governance, Innovation and Risk Management for Agency Use of Artificial Intelligence"

Legal Aid of Arkansas represents low-income Arkansans in civil legal matters implicating domestic violence, public benefits, housing, education, consumer protection, income tax, reentry, and civil rights. Through this work, we have seen the real-life harm caused by AI systems, which, regardless of any underlying intentions, are usually pernicious. Thus, we respond to your request for information with the aim that the ground-level harm be understood and accounted for when considering federal agency use of AI.

By way of background, Legal Aid of Arkansas has been a national leader fighting AI-related harms inflicted on low-income and otherwise structurally disadvantaged communities. We helmed one of the first successful campaigns against algorithmic decision-making in government services and, so doing, ended the state government's use of an algorithm to cut the Medicaid home-care benefits of disabled and elderly Arkansans.[1] When the state replaced that system with another that violated our clients' due process rights, we successfully sued state officials *in their individual capacities*, overcame the officials' qualified immunity, survived an appeal to the Eight Circuit of Appeals,[2] and reached a $500,000 settlement that also requires systemwide changes to

LEGAL SERVICES CORPORATION

agency practices and policies.[3] Outside of Medicaid, we litigated one of the first state-based Freedom of Information Act case regarding access to information about the state's use of AI systems, ultimately obtaining a ruling from the Arkansas Supreme Court that the state unemployment agency could not withhold information about a fraud-detection algorithm that delayed vital benefits to more than 90,000 people.[4] In addition, we have fought AI-related determinations in various benefit programs, including Medicaid, Unemployment, and Supplemental Security Income, through dozens of administrative hearings, non-litigation administrative advocacy, and extensive community education efforts.

Based on this expertise, Legal Aid of Arkansas co-founded the Benefits Tech Advocacy Hub (btah.org) with Upturn and the National Health Law Program to help frontline advocates throughout the U.S. resist the harmful use of technology in public benefits.

I. The draft memo's framework for rights- and safety-impacting AI uses contains the potential to meaningfully prevent and curb harm to low-income and otherwise marginalized people.

The draft memo (also referred to here as "guidance") contains many laudable ideas. The rights- and safety-impacting framework (p. 10-13) sensibly covers use cases carrying significant risk for harm across many sectors important to Legal Aid's client communities: public benefits, health care, education, employment, housing, credit, policing, child welfare, environmental hazards, and immigration. One notable oversight, however, is defining the use of automated translation of non-English languages as "rights-impacting" only in the context of immigration proceedings when automated translation is used in government services of all sorts (e.g., public benefits, child support, courts, etc.) to the detriment of people who do not speak English fluently or who prefer to conduct their business primarily in another language. Defining automated translation as "rights-impacting" in these other spheres is a necessary revision to the guidance.

The associated minimum practices (p. 13-21) are also critical. Not only do they provide for vital pre- and post-deployment assessment, monitoring, and individualized protections, but also they contemplate that certain systems *cannot* be used. This is a critical provision that rejects the inevitability of AI adoption. Equally important is the requirement for an "opt-out" such that path dependency does not dictate continued use of an untenable AI system. State agencies, for example, have continued with harmful, even illegal, systems to administer Medicaid, SNAP, or Unemployment Insurance because of sunk costs and the inability to revert to the pre-AI methodology for making decisions.

With these constructive provisions as a starting point, the remainder of these comments focuses on ways to ensure that their potential for meaningfully avoiding and minimizing harm from AI systems is fully

[3] *E.g.,* Arkansas Advocate, Sonny Albarado, Disabled Arkansans Obtain Settlement and Program Improvements in Lawsuit Against DHS Officials, August 7, 2023, *available at* https://arkansasadvocate.com/2023/08/07/disabled-arkansans-obtain-settlement-and-program-improvements-in-lawsuit-against-dhs-officials/

[4] *Arkansas Dep't of Com., Div. of Workforce Servs. v. Legal Aid of Arkansas*, 2022 Ark. 130, 645 S.W.3d 9 (2022)

realized. Accordingly, these comments address the procedural and substantive limitations of the minimum practices (Sections II and III), the definition of AI systems that needs slight reworking (Section IV), the need for increased transparency mechanisms (Section V), and the prospect of operationalizing this guidance for federal agency oversight of state agencies directly administering programs (Section VI).

II. The guidance provides too many openings for agencies to evade the minimum practices required for meaningful harm prevention and reduction.

The ultimate efficacy of the minimum practices will, of course, depend on implementation. Unfortunately, the guidance features several ways agencies can evade its requirements.

First, the guidance memo's provisions for extensions of time for minimum practices (p. 14) threatens endless delay for agencies that have existing capacity limitations. While the memo posits OMB approval of any such request, it does not provide significant guidance as to OMB's exercise of its discretion or any firm limitations on how long an extension can last or how many extensions may be granted. Moreover, this assumes that OMB has sufficient capacity to meaningfully review agencies' extension requests. To prevent misuse of extensions, OMB can consider imposing hard limits on the amount of time an agency can extend, defining the criteria used to determine extensions, and ensuring that OMB has sufficient review capacity.

Second, the memo's provisions for waivers (p. 14-15) invite boundless claims that the minimum practices requirements will "create an unacceptable impediment to critical agency operations." Agencies tend to adopt AI under the guise of improving efficiency or rationality of decisions. Combined with existing agency capacity limitations, these given reasons can justify a waiver in nearly any situation where AI is used. And, there is no external check, as the agency's Chief Artificial Intelligence Officer appears to be the sole arbiter of the waiver provision. While the waiver decision must be reported to OMB, OMB does not have authority to reject the waiver. Even were OMB to have such authority, the same concerns stated above about criteria, length, and OMB capacity persist. Given the possibility for misuse, OMB can consider eliminating the waiver provision entirely. Absent that, OMB can ensure a meaningful external review process that uses well-defined criteria to make decisions about waiver requests *and* includes regular periodic review of the waiver to ensure that present circumstances continue justifying it.

III. Even where they apply, the minimum practices will not necessarily prevent AI-related harms.

a. The procedural requirements for adoption and the related balancing tests lack robust independent review provisions.

The memo lacks any definite redlines—altogether prohibited uses of AI without any exception. Such redlines are appropriate in circumstances involving fundamental human rights and protection against AI-related exacerbation of inequities, including facial recognition, benefits determinations, health care, and emotion detection, among others. Instead of clear bans, the guidance provides for abandoning AI use when, pursuant to an impact assessment, "the benefits do not meaningfully outweigh the risks" (p. 15). Or, with respect to real-world testing, the guidance contemplates AI use only when "the AI will achieve its expected

benefits while sufficiently mitigating risks." (p. 16). In both contexts, the agency decides the balancing test, though the guidance provides for an in-agency "independent reviewing authority" that was not "directly involved in the system's development." (p. 16).

In practice, however, the memo's minimum practices are likely to require only a more involved process for AI adoption rather than a meaningful backstop against it.[5] Consider the practical circumstances of AI adoption. As a starting point, no agency is mandated to use AI. Thus, any agency considering AI is going to be doing so because it thinks AI will serve a useful purpose with defensible adverse impacts. The agency will pursue the AI systems in collaboration with vendors, hopefully using good procurement practices[6] that protect against bad vendor outputs. The finalized contract cements and intensifies the agency's momentum towards adoption. Compliance with the guidance's testing and assessment requirements should provide the agency with useful information about adverse impacts. At that point, the agency would likely make revisions rather than abandon the project. If, after that, the agency becomes convinced that the AI system is simply unworkable, the agency can abandon it and absorb the significant sunk costs. However, since incurring significant costs for an ultimately unworkable system may draw more intense short-term scrutiny than implementation with delayed impacts, the agency—or at least its project directors—has an incentive to explain away any distant adverse impacts and implement the AI.

The only point where the guidance constrains adoption is if the independent review process is thorough and undertaken by an entity with sufficient capacity. Unfortunately, the guidance contains no specifics to ensure that this review will be meaningful and that organizational dynamics do not lead to rubber-stamp approval. Moreover, the independent reviewer will apply tests balancing "benefits" and "risks" without the guidance defining what those mean or specifying the parties for whom the benefits and risks should be considered. Benefits to the agency in claimed efficiencies or to a broad conception of "the public" (p. 10) in governmental resource savings could easily overshadow risks to people subject to the AI, like benefits recipients. This concern is especially salient if the agency considers the notice and redress provisions as sufficient safeguards to minimize individual harm (they are not—see the comments below).

While the guidance's language about "advancing equity, dignity, and fairness" (p. 18) provides some context for the balancing test, OMB can consider making the connection explicit. Moreover, concepts of

---

[5] To be clear, the impact assessment and testing provisions, including the searching review of the quality of data, are important and laudable. These comments simply clarify that they are not sufficient to prevent harm without a more robust independent review mechanism.

[6] The OMB's guidance procurement provisions do not contain accountability and redress practices to ensure appropriate vendor output. (p. 21-22). The data protections described are insufficient on their own. For guidance on tech-based procurement practices, *see, e.g.,* Rashida Richardson, Best Practices for Government Procurement of Data-Driven Technologies (May 2021), *available at* https://ssrn.com/abstract=3855637; In The Public Interest, Harnessing the Power of Procurement, *available at* https://inthepublicinterest.org/new-report-harnessing-the-power-of-procurement; and Ford Foundation, A Guiding Framework to Vetting Public Sector Technology Vendors, *available at* https://www.fordfoundation.org/work/learning/research-reports/a-guiding-framework-to-vetting-public-sector-technology-vendors/.

equity, dignity, and fairness—and the risks that AI will undermine them—involve a broader analysis than merely mitigating or preventing "algorithmic discrimination or bias" or "disparate impacts." AI can be unbiased or non-discriminatory (as courts conceive of bias or discrimination) while still being harmful, such as by cutting benefits for everyone on a program or making harmful decisions using factors that do not align neatly with protected classes. Thus, OMB can consider fleshing out the concepts of "benefits" and "risks" by connecting them to notions of equity, dignity, and fairness conceived more broadly than in basic non-discrimination terms.[7] Risks include, among other things, loss of public benefits or other important opportunities (e.g., in housing, credit, employment, or education), privacy invasions, and limitations on labor rights (such as workplace safety or organizing rights), even when the harm does not constitute discrimination prohibited under existing jurisprudence.

Meaningful constraints on agency adoption of AI are not found elsewhere in the guidance. The provisions requiring consultation with affected groups (p. 19), while important, do not functionally limit agency decision-making, particularly when their input is not connected to the previously discussed independent review provisions. Linking the consultation requirement and resulting input to the independent review process would strengthen both the public's role in agency AI adoption and the reviewing authority's independence, or at least the appearance thereof. If nothing else, the reviewing authority would be considering information from sources other than their agency colleagues.

b. The notice provisions improperly and illegally condone insufficient explanations of agency actions and deprive people of information needed to meaningfully challenge AI decisions.

The notice and human review provisions (p. 20) are specific to individuals affected after the AI has been implemented and do nothing to curb its adoption or the specifics of its implementation. As written, the guidance does not ensure they provide meaningful post-deployment harm reduction.

Notice, of course, is vital to the ability of individuals harmed by AI to contest it. Regardless of the guidance's instruction, adequate notice of adverse actions in any situation involving liberty or property interests is required by the Fourteenth Amendment's due process provisions. Given both constitutional requirements and notice's central role to redressability and fairness principles, the guidance fails where it countenances less-than-full notice simply because "exact explanations of AI decisions are not technically feasible." (p. 20, footnote 37). People adversely impacted must receive the specific reasons for a decision

[7]The non-discrimination regime is one vital aspect of the risk analysis, but it is not the only one. Besides not capturing all the harms AI regularly inflicts, the non-discrimination regime has practical limitations to its protections. Proving intentional discrimination—the most broadly available way individuals can enforce non-discrimination laws—is difficult because a plaintiff must show animus, a discriminatory motive, or deliberate indifference to ongoing mistreatment, a tall task when bad actors do not proclaim their biases. Meanwhile, the disparate impact framework, which individuals may use only under certain non-discrimination laws (e.g., the Fair Housing Act and Title VII of the Civil Rights Act) and cannot use under others (e.g., Title VI), does not require a showing of intent but usually requires sophisticated data analysis capabilities to establish the impact. This presumes access to data *and* to the expertise to analyze it. The reviewing body or the wider public may not have both.

so that they can fight it. As we learned in Arkansas during dozens of administrative hearings to contest algorithmic cuts to Medicaid home-care benefits, deficient notice leads to sham proceedings where decision-makers inevitably defer to the AI's decision, a tendency known as "automation bias."[8] Instead of expecting the rights of people adversely affected to bend to technological feasibility, agencies must plan for AI use to bend to constitutional rights and robust redress principles. OMB could promote this proper arrangement of legal requirements and principles by, for example, prohibiting agencies from using AI to make decisions where "exact explanations" are impossible.

c. Human oversight is illusory because AI decision-making displaces agency reviewers' ability to operationalize and apply alternative criteria.

The provisions for human consideration get things similarly backward. For rights-impacting functions, humans, not AI, should be making all decisions. While humans may also make decisions based on irrational criteria, bias, or other improper grounds, contesting human-made decisions is more straightforward and feasible than contesting AI-made decisions. In Arkansas, for example, prior to the AI system, a nurse made decisions about the amount of Medicaid home-care hours a disabled person needed. If there was disagreement, the person could ask the nurse questions, explain or demonstrate the need for a certain amount of care, and, if that was not persuasive, put on evidence at an administrative hearing about why the nurse's stated reasons for a given decision were wrong. As described below, once AI became involved, that was no longer possible—the decision was made by undiscernible criteria with no place for a nurse's judgment and no ability to establish that the AI's judgment was wrong.

Even accepting the premise of human review as a backstop to AI decision-making, the guidance is inadequate. People adversely affected shouldn't have to ask for a separate human-driven consideration process, which adds burdens to a person already facing the difficulty from the adverse agency decision. Moreover, the guidance does not offer any requirements to ensure that the human review will be meaningful and independent from the initial AI decision. That is, the guidance does not account for automation bias or provide concrete ideas to defuse it.

Whether review happens before or after, the notion of human review of any AI decision contains a fundamental flaw: the collapsing and elimination of *independent* criteria into and by the automated system. To return to the Arkansas example, AI was deployed in the Medicaid program to determine how much time from a caregiver is medically necessary for an elderly or disabled person with significant functional limitations to live at home (and not enter a nursing home). Medical necessity is a concept susceptible to various kinds of measurement: the severity of a person's function limitations (i.e., a person who requires more assistance with mobility or toileting will need more care generally than someone who requires less) or, alternatively, to the amount of time it takes to perform specified care tasks (e.g., one hour to bathe, a half-hour to groom, etc.). However, the AI purports to measure necessity through specific criteria that may not be easily discernible or directly related to the care needed (e.g., roughly 60 possible factors arranged in different "constellations," some of which involved, for example, whether someone had diarrhea in the last three days) or, with more advanced systems, criteria that may not even be known. With alternative forms of measurement displaced and the AI's criteria irrational, unintuitive, or unknown, how will a human

[8] *See, e.g.,* Danielle Citron, Technological Due Process, 85 Wash. U. L. Rev. 1249 (2008).

meaningfully interrogate the AI's recommendation? Even assuming the displaced criteria can be operationalized by a complex agency that has since left it behind, under what circumstances is it used? How does this use of different criteria in different situations affect general administrability and other program participants? And, if humans have to review all or many decisions of a particular type, what efficiency is AI creating in the first place? Why even use it? These dynamics are inevitable where AI is seeking to make discretionary decisions in other ambits, too, including in benefits fraud determinations, child welfare investigations, and criminal risk assessments.

Ultimately, OMB's concept of human review is not an effective way to prevent or remediate on-the-ground harm. OMB can re-evaluate its use of human review. Rights-impacting uses should never be made by AI. Where AI use is permissible, human review must be robust and use reasonable criteria that is easily operationalized and independent from any criteria the AI uses.

IV. Item Two of the "technical context" accompanying the definition of AI provides additional opportunities for agencies and vendors to evade the memo's demands.

Given the general difficulties defining AI, the guidance's broad approach is praiseworthy. However, Item Two under the "technical context" (p. 23) requires re-examination. It provides that "This definition of AI does not include robotic process automation or other systems whose behavior is defined only by human-defined rules or that learn solely by repeating an observed practice exactly as it was conducted." The middle part—"other systems whose behavior is defined only by human-defined rules"—risks exempting automated decision-making by algorithms. For example, the algorithm used by Arkansas's Medicaid program to determine care needs was arguably such a system: 21 single-spaced pages of "if-then" statements operationalized by software to produce a specific level of care needed.[9] Many other automated functions in public benefit programs are or can be similarly expressed, including fraud detection and enforcement of asset or resource limits. While humans may be determining what specific "if-then" statements to use through sophisticated data analytics and statistical modelling—some of which may involve machine learning or other AI-related techniques—the guidance's focus on the end-use behavior would not necessarily capture them.

Of course, these algorithms are no less pernicious than other forms of rights-impacting automated decision-making. They feature the same risks and people require the same protections. Thus, OMB can consider eliminating this phrase from Item Two and consider other rights-impacting use cases that could fall outside the provided definitions.

V. The guidance lacks sufficient protections for public transparency.

OMB can consider ways to ensure the public's access to information about AI systems that may be proprietary or for which federal agencies may try to assert Freedom of Information Act exemptions. The AI Use Case Inventory (p. 4) is a start but is not sufficient to ensure the robust transparency needed to promote true accountability.

[9] The algorithm is attached as an exhibit to these comments.

Leveraging the value of federal contracts to vendors, agencies can ensure that the public has access to the AI systems themselves and data used to develop them. The procurement process can involve a transfer of intellectual property and the related data or a license with express use permissions needed for public sharing. Agencies need not be put in a position where they assert Freedom of Information Act exemptions on behalf of vendors who build AI systems for public use with rights- or safety-impacting consequences.

Even if the AI systems or related data may not be directly accessed, OMB can consider requiring agencies to ensure that they maintain intelligible documents (whether developed by the vendor or the agency with appropriate vendor input) explaining *in detail* how the systems work, key criteria used, information about the data used, relevant assumptions, and the like. While the guidance's individualized notice provisions have the problems mentioned above, its language regarding notice content (p. 20, Footnote 37) could guide development of these supporting documents. They should be "technologically valid, meaningful, useful, and as simply stated as possible" with "more comprehensive explanations" for higher risk uses and more complicated systems.

Moreover, regardless of whether the agency may disclose the AI system and the related data, agencies can be required to keep and disclose supporting documentation showing issues encountered, impact projections, agency-specific data sources and analyses, changes considered in all pre-deployment developments, and post-deployment monitoring and changes. In this way, the public can at least partially understand the AI's functionality and the agency's process for evaluating, implementing, and monitoring it.

Access to AI systems, related data, and supporting documentation is particularly important in safety- or rights-impacting uses because opacity is often a fundamental obstacle to any accountability, be it through legal means, investigative journalism, or public education campaigns. In high risk uses (i.e., safety- and rights-impacting uses), the private interests in intellectual property and trade secrets should give way to the public interest in government oversight and harm prevention.

VI. To the extent OMB has authority, OMB can shape how federal agencies oversee state AI use in public benefit programs by using the present guidelines as a regulatory floor.

Given this guidance's reach, Supplement Security Income (SSI), Social Security disability (SSDI), Social Security retirement benefits and veterans' benefits are the public benefits programs likely to be most affected. SNAP, Medicaid, and Unemployment are largely administered by states, at least with respect to how recipients access benefits. State use of AI in these programs is largely unregulated, and, in this void, states operate AI systems that devastate recipients at a scale and speed not possible with analog methods.

Legal Aid of Arkansas's concern is that this void gets filled. The President's Executive Order requires some of the implicated agencies to take action with respect to AI in benefits programs. The corresponding federal oversight agencies—CMS, FNS, and DOL—can adopt measures more protective than what is in this guidance and exercise more influence over state AI use to prevent recipient harms. To that end, these agencies can develop guidance prohibiting certain uses of AI and, where AI is permissible, specifying detailed procedural requirements (including robust testing and public participation) and safeguards,

including ways to revert to non-AI decision-making. They can exercise their review and approval authority over state plan submission requirements to deny AI use where prohibited or where the state has not demonstrated full compliance with procedural requirements and safeguards. Then, they can monitor approved state uses upon implementation through mandatory oversight and reporting requirements and regular consultation with affected communities and frontline advocates. When deficiencies are identified, the federal agencies can require states to stop using AI or institute immediate corrective action.

To the extent OMB has authority or influence, it can consider these agencies' plans and ensure they are not more permissive of AI use than the present guidance.

Conclusion

Legal Aid of Arkansas appreciates the opportunity to comment on OMB's guidance. It is our hope that OMB keeps the overarching safety- and rights-impacting frameworks while considering ways to rework the oversights, limitations, or deficiencies identified here. We also intend for any material cited here to be considered part of the administrative record. Please let the undersigned know if OMB requires separate submission of the cited materials.

Respectfully,

Kevin De Liban, Director of Advocacy
Legal Aid of Arkansas

**  ------------------------------------------------------------------------------
 **;
**  ASSUMPTION ABOUT INPUT DATA: ICD code format is assumed to have leading zeros
 **;
**                            before the decimal point.  Any digits after the
 **;
**                            decimal point are assumed left justified, but may
 **;
**                            be blank, e.g., 038.0 or 038., but not 38. or 38. 0.
 **;
**  ALGORITHM:
 **;
**  NOTES ON FORMING CODE:    10/17/13 Revision fixes ICD-9 and adds ICD-10 codes.
 **;
**  MISSING VALUES:           This algorithm is not calculated if any input value
is **;
**                            missing.
 **;
*******************************************************************************
****;
** This code is provided in a common computing package, SAS, in which command lines
 **;
** end in a semicolon and comment lines start in an asterisk or start with "/*" and
 **;
** end with "*/".
 **;
**
 **;
```

```
** In SAS, additional statements to designate the source dataset need to precede the
 **;
** code provided here.  In addition, the variables in that dataset must be mapped to
 **;
** the variables used in the code by placing the variable names used in the source
 **;
** dataset on the right-hand side of each assignment statement in the section
labeled **;
** 'VARIABLE ASSIGNMENTS.'
 **;
**
 **;
** For programmers developing code in other languages, it is hoped that this
 **;
** procedural code can provide sufficiently detailed  information about the
 **;
** algorithms. It is strongly urged that code be checked on real-life examples.
 **;
*********************************************************************************
****;
** THIS INFORMATION IS PROVIDED BY interRAI AS A SERVICE TO ITS USERS. ALTHOUGH
 **;
** REASONABLE CARE HAS BEEN TAKEN TO MAKE IT ACCURATE, IT IS PROVIDED "AS IS."
 **;
** THERE ARE NO WARRANTIES, EXPRESSED OR IMPLIED, AS TO ITS ACCURACY.
 **;
**
 **;
** PLEASE SEND ANY COMMENTS OR CORRECTIONS TO:  interRAI_Code@umich.edu
 **;
**
 **;
*********************************************************************************
****;
** SYNTAX USED IN THIS SAS CODE:
 **;
** 1.  All lines with an asterisk (*) as the first nonblank character in the line
are **;
**     documentation or comment lines.  All command lines start with a character
 **;
**     other than an asterisk.
 **;
** 2.  A semicolon indicates the end of a statement in the SAS code used here, not a
 **;
**     continuation character as in some other languages.
 **;
** 3.  All variables are represented in small letters, while command words are
 **;
**     represented in capital letters.
 **;
** 4.  All input interRAI variables are represented with names beginning with a
 **;
**     lower-case 'i'.  Specification of these 'iCODES' are available in the iCODE
 **;
**     MATRIX, available from interRAI.
 **;
** 5.  All input variables are assumed to be NUMERIC, unless otherwise noted.
 **;
** 6.  All local (non-MDS) variables are NUMERIC and represented in lower case
 **;
**     letters with a prefix of 'x_' (e.g., x_adlsum).
 **;
** 7.  The only command words and structures used in this SAS code are:
```

```
 **;
**      a. RETURN
 **;
**           (this command causes the end of processing the current record
 **;
**            and initiation of processing the next record)
 **;
**      b. IF <logical condition1>
 **;
**            THEN <arithmetic statement> executed if condition1 true
 **;
**         ELSE IF <logical condition2>
 **;
**            THEN <arithmetic statement> executed if condition2 true
 **;
**               DO <multiple statements>  END
 **;
**         ELSE   <arithmetic statement> executed if no condition is true
 **;
**      c. Logical operators used in logical conditions are
 **;
**               =       (equal)
 **;
**               >       (greater than)
 **;
**               <       (less than)
 **;
**               >=      (greater than or equal to)
 **;
**               <=      (less than or equal to)
 **;
**               NE      (not equal to)
 **;
**      d. Relational operators used in logical conditions are
 **;
**               AND    (logical and)
 **;
**               NOT    (logical not)
 **;
**               OR     (logical or)
 **;
** 8.  Nested IF structures are indented for clarity.
 **;
** 9.  Single quotes delimit a character constant.
 **;
*********************************************************************************
****;
** DETAILS OF THE RELATIONSHIP BETWEEN MDS V2.0 VARIABLES AND INTERRAI SUITE
 **;
** VARIABLES ARE PROVIDED IN THE RUG-III CODING SPECIFICATIONS
 **;
*********************************************************************************
****;
** CODE ORGANIZATION
 **;
**
 **;
** After variable assignment, this RUG-III code employs a 2 stage process involving
 **;
** a clinical qualification stage followed by a classification stage as follows:
 **;
**      1.  Clinical Qualification Stage.  Determine all of RUG-III clinical
 **;
```

```
**          (Ultra High Rehab, Very High Rehab, High Rehab, Medium, Rehab, Low
Rehab, **;
**          Extensive Special Care, Special Care, Clinically Complex, Cognitive
 **;
**          Impairment, and Behavior Problems) for which a resident qualifies.
 **;
**          This first stage involves Step I through Step X in the code below.
 **;
**      2.  Classification Stage. Scan all of the qualifications for a resident and
 **;
**          classify the resident into a single clinical category and then classify
 **;
**          the resident into one of the RUG-III groups contained in that clinical
 **;
**          category.  This second stage comprises Step XI in the code.
 **;
**
 **;
** The RUG-III 1997 Update classifies a resident into the Extensive Special Care
 **;
** groups based on consideration of not only qualification for the Extensive Special
 **;
** Care clinical category, but also qualification for the Special Care, Clinically
 **;
** Complex, and Cognitive Impairment Clinical categories.  This feature necessitates
 **;
** the stage two process.
 **;
*************************************************************************************
****;
** STEPS IN COMPUTING RUG-III/HC
 **;
**     1) <CRIPPLE> MDS (NH) VARIABLES NOT AVAILABLE IN MDS-HC - SET THEM TO NULL
 **;
**        VALUE (USUALLY ZERO)
 **;
**     2) DEVELOP IADL INDEX
 **;
**     3) COMPUTE NURSING HOME RUG-III SCORE, MODIFICATIONS INCLUDE
 **;
**         - FEWER REHAB CATEGORIES, NOW BASED ONLY ON ADLS
 **;
**         - NO SPLITS BY NURSING REHABILITATION OR DEPRESSION
 **;
**         - NEW IADL SPLITS IN THE RA, CA, IA, BA, AND A GROUPS
 **;
** FOR DETAILS, SEE ARTICLE BY BJORKGREN, FRIES, SHUGARMAN -
 **;
**                                TESTING A RUG-III BASED CASE-MIX SYSTEM FOR HOME CARE
 **;
**********************************END OF
DOCUMENTATION************************************;
**                                      WARNINGS
 **;
** BE SURE TO PERFORM RANGE CHECKS ON ALL GROUPER VARIABLES
 **;
** IF ANY ARE OUT OF RANGE OR MISSING, THE OUTPUT SHOULD BE SET TO MISSING
 **;
** IN ADDITION, THE VARIABLE VALUE CHECK BELOW WILL CAUSE MISSING OUTPUT FOR
 **;
** OBSERVATIONS WITH INVALID OR MISSING VALUES
 **;
**
```

```
 **;
** BEFORE RUNNING THIS CODE, BE SURE TO RUN:
 **;
**         sCPS (Cognitive Performance Scale)
 **;
**
 **;

Attn: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (OMB-2023-0020-0001)

The Union of Concerned Scientists (UCS) is pleased to provide comments on the US Office of Management and Budget's (OMB) draft memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)." The Union of Concerned Scientists is a national nonprofit science advocacy organization representing over 500,000 members. UCS works for strong, independent public science, a robust, transparent democracy, justice for overburdened communities, and the effective use of science in making policy that serves the common good.

While UCS support several articles in the draft memorandum, UCS has serious concerns that the draft memorandum, in its current form, is failing to integrate scientific integrity protections in the development, use, and assessment of artificial intelligence (AI) technologies.

I. Scientific integrity protections governing the development, use, and assessment of AI technologies need to be added to the draft memorandum.

We were disappointed not to see any mention of the linkages between AI and scientific integrity in the draft memorandum, and we strongly encourage OMB to add in clear and specific language that states that the use of AI is subject to the White House Office of Science and Technology Policy's (OSTP) *A Framework for Federal Scientific Integrity Policy and Practice*[1] (hereafter referred to as "OSTP SI framework") and an agency's individual scientific integrity policy. In this section, we are providing feedback to OMB's questions 3 and 8.

OMB's draft memorandum only contains one mention of scientific integrity, which comes in the form of a footnote on page 16. The mention of scientific integrity is limited in scope, and

[1] Scientific Integrity Framework Interagency Working Group, *A Framework for Federal Scientific Integrity Policy and Practice,* National Science and Technology Council (NSTC) and the Office of Science and Technology Policy (OSTP) (2023), https://www.whitehouse.gov/wp-content/uploads/2023/01/01-2023-Framework-for-Federal-Scientific-Integrity-Policy-and-Practice.pdf

refers only to the data quality procedures of an AI impact assessment that agencies must carry out when examining using new or existing covered safety-impacting or rights-impacting AI.[2] The footnote references a report by the National Science and Technology Council's (NSTC) *Protecting the Integrity of Government Science*[3] but fails to provide any detail on how agencies can follow the NSTC's recommendations to ensure that the AI impact assessment is properly in line with the best practices of scientific integrity.

We are particularly alarmed that there was no mention anywhere in this memorandum of the OSTP SI framework, which is currently the document that governs the activities and outcomes to achieve an ideal state of scientific integrity across federal agencies. This failure indicates that the draft memorandum in its current form is woefully out of touch with the best practices of how agencies conduct, communicate, and use federal science in its research and decisionmaking processes, and we strongly recommend that OMB revise the document to state that AI technological innovation should adhere to the recommendations laid out in the OSTP SI framework.

i. Advancing the responsible use and development of AI technologies depends on strong scientific integrity policies (this is in response to OMB's question 3).

For nearly 20 years, UCS has investigated how losses of scientific integrity can severely affect scientific research and science-based decisionmaking at federal agencies.[4] Since 2004, across four presidential administrations, we have conducted ten iterations of a survey to assess the perceptions of scientific integrity for tens of thousands of federal scientists.[5] Our research suggests that when agencies engage in scientific activities but fail to explicitly state how federal scientists and their work will be protected from unnecessary political intrusions or other inappropriate influence, federal scientists are more likely to lose faith in their agencies' science-based decisionmaking processes and are more likely to report instances of censorship or self-censorship. Our data suggest that OMB's failure to explicitly guarantee scientific integrity protections around the use and development of AI technologies in its draft memorandum could translate to a perception that a robust culture of scientific integrity does not apply to the use and development of AI technologies in the same way as other technologies or science-based activities at federal agencies.

UCS' research also supports the reverse conclusion. Our survey in 2018 showed that despite the widespread findings that federal scientists perceived major losses of scientific integrity protections, three agencies, the Centers for Disease Control and Prevention (CDC), the Food and Drug Administration (FDA), and the National Oceanic and Atmospheric Administration

---

[5] UCS. "Surveys of Scientists"

(NOAA), showed a different trend.[6] Specifically, federal scientists surveyed from the CDC, FDA, and NOAA perceived increased rates of job satisfaction and decreased rates of political interference in science, a finding that we attributed to the scientists' trust in agency leadership to defend their work against political interests. These data suggest that if OMB were to revise its draft memorandum to state in no uncertain terms that the use, development, and assessment of AI technologies is governed by the protections outlined in the scientific integrity policies of the individual agency and the OSTP SI framework, then it would help federal scientists build trust in OMB's leadership on issues related to AI and increase the feeling that OMB is working to protect scientists and their work from inappropriate influence.

ii. Data integrity protections need to be explicitly stated in the sections on the use of AI in the use case inventory (this is in response to OMB's question 8).

UCS strongly recommends that OMB revises the draft memorandum's section on agencies' use of AI in their annual use case inventory to include language that would guarantee that this database will follow the OSTP SI framework's sections on data transparency.

The OSTP's definition of scientific integrity states that transparency is a hallmark of scientific integrity,[7] and the OSTP SI framework includes sections (e.g., "Promote Transparent and Free Flow of Scientific Information") that outline the best practices on data transparency. In particular, we want to highlight one specific portion that is listed on page 33 of the OSTP SI framework (see Section (III)(1d) of the OSTP's model scientific integrity policy section). We feel that the following language from that section may be especially beneficial for inclusion in the sections of OMB's draft memorandum discussing the annual use case inventory: "Reflect scientific information appropriately and accurately and ensure that it is free of misinformation; and make scientific findings or conclusions considered or relied on in policy decisions publicly available online and in open formats, to the extent practicable."

Such language is needed because some research suggests that agencies are not accurately reporting their use of AI in the annual use case inventory. Agencies have been required since the passage of executive order (EO) 13960,[8] issued in December 2020, to "identify, provide guidance on, and make publicly available the criteria, format, and mechanisms for agency inventories of non-classified and non-sensitive use cases of AI by agencies." In December 2022, a white paper issued by a team from Standard University's Human-Centered Artificial Intelligence reported major inconsistencies in the implementation of EO 13960 across agencies and they found that roughly half or more of agencies have failed to file an inventory

[6] Gretchen T Goldman et al., "Perceived Losses of Scientific Integrity under the Trump Administration: A Survey of Federal Scientists," *PLOS ONE* (2020), https://doi.org/10.1371/journal.pone.0231929.

[7] OSTP SI framework, 8, ("Scientific integrity is the adherence to professional practices, ethical behavior, and the principles of honesty and objectivity when conducting, managing, using the results of, and communicating about science and scientific activities. Inclusivity, transparency, and protection from inappropriate influence are hallmarks of scientific integrity.")

[8] Executive Order 13960, *Promoting the Use of Trustworthy Artificial Intelligence in the Federal Government*, December 3, 2020, https://www.govinfo.gov/content/pkg/FR-2020-12-08/pdf/2020-27065.pdf

of AI use cases.[9] Agencies even failed to report particularly well-known and prominent examples of AI use cases. For instance, the Transportation Security Agency (TSA) failed to disclose the agency's most famous (and most controversial) use of AI, its facial recognition program, which is in use in at least 430 US airports.[10]

The use of AI in agencies' annual use case inventory needs to be governed by data integrity practices that ensures that the data is collected in a timely manner, accurately reflects the full use and extent of AI at agencies, and outlines the procedures for removing or updating inaccurate information. Additionally, OMB needs to explicitly state in its draft memorandum the specific protocols that agencies should utilize when distinguishing between "planned" use cases, which agencies are supposed to include in the inventory, and AI projects that are in the process of research and development, which are not supposed to be included in the inventory.

II. Assessing the potential risks of AI technologies to underserved communities, and removing the AI technology from use if such inequities are found, are important sections in this memorandum.

UCS supports the inclusion of language in the draft memorandum centered on recognizing the potential inequitable impact that AI technologies could have on underserved communities and requiring adherence to Section 4(b) of EO 14091.[11] In this section, we are providing feedback to OMB's question 5.

In particular, UCS highly supports the language listed on page 19 of the memorandum: "To the extent practicable and consistent with applicable law and governmentwide guidance, agencies must consult affected groups, including underserved communities, in the design, development, and use of the AI, and use such feedback to inform agency decision-making regarding the AI. In the event of negative feedback, agencies must consider not deploying the AI or removing the AI from use." We also strongly support the section on page 15 of the memorandum concerning the potential risk to underserved communities, which states that "agencies should be especially attentive to the potential risks to underserved communities. The expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, agencies should not use the AI."

We also encourage OMB to further expand upon these sections and provide more specific protocols and guidelines for how best agencies can implement these equity-focused recommendations.

III. Conclusion

We support OMB's efforts to advance AI governance and innovation while managing risks from the use of AI as outlined in the draft memorandum. However, we believe that the memorandum needs improvement to better align with the best scientific practices employed by agencies.

We strongly believe that OMB's draft memorandum would benefit from being explicit and intentional about the need for scientific integrity policies and practices to govern the development, use, and assessment of AI technologies. Thank you for taking the time to consider our views.

Sincerely,

Anita Desikan

Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (FR Doc. 2023–11346)

Dear Sir or Madam:

The Academy of Managed Care Pharmacy (AMCP) thanks the Office of Management and Budget (OMB) for the opportunity to provide comments in response to the draft guidance titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" (Draft Guidance), issued on September 18, 2023.

AMCP is the nation's leading professional association dedicated to increasing patient access to affordable medicines, improving health outcomes, and ensuring the wise use of healthcare dollars. Through evidence and value-based strategies and practices, AMCP's nearly 8,000 pharmacists, physicians, nurses, and other practitioners manage medication therapies for the 270 million Americans served by health plans, pharmacy benefit management firms, emerging care models, and government health programs.

AMCP's strategic priorities include optimizing value and access, addressing health disparities in medication use and access, and enhancing member value.[1] Based upon these priorities, AMCP supports OMB's efforts to ensure that artificial intelligence (AI) can be safely employed while reducing barriers to innovation. AMCP believes that strengthening AI governance, advancing responsible AI innovation, and mitigating risks from the use of AI are vital in keeping up with advancing technology.

Strengthening AI Governance and Advancing Responsible AI Innovation

AMCP acknowledges the importance of AI's potential to improve healthcare decision-making and increase efficiency. Given the speed of advancements in technology and the potential for abuse or misuse, it is necessary to get ahead of these changes by implementing standards to mitigate potential risks. Strengthening governance reduces this risk and promotes appropriate use, especially for purposes that may be rights-impacting or safety-impacting.

AMCP recommends that any principles or regulatory frameworks for AI should incorporate the Organization for Economic Co-operation and Development (OECD) Principles on Artificial

[1] AMCP Strategic Priorities. https://www.amcp.org/about/about-amcp/amcp-strategic-priorities

Intelligence[2] and the U.S. Department of Commerce's National Institute of Standards and Technology (NIST) Artificial Intelligence Risk Management Framework.[3] AMCP supports a balance between encouraging innovation and ensuring that sufficient controls are in place to protect against risk.

AMCP is also concerned about ensuring that the use of AI does not contribute to health disparities. For that reason, AMCP encourages OMB to incorporate requirements that any dataset used for rights-impacting or safety-impacting medical decisions include safeguards to ensure that the data includes sufficient representation from medically underserved populations.

AMCP appreciates your consideration of the concerns outlined above and looks forward to continuing work on these issues with OMB. If you have any questions regarding AMCP's comments or would like further information, please contact AMCP's Manager of Regulatory Affairs, Vicky Jucelin, at vjucelin@amcp.org or (571) 858-5320.

Sincerely,

Susan A. Cantrell, MHL, RPh, CAE
Chief Executive Officer

AI_Comment

I am a Licensed Naturopathic Doctor, Acupuncturist, Mother, and former technology worker in the State of Washington. My work in technology was through development and test, specifically focused on boundary testing of server systems. My primary reason for reading this document was to ensure appropriate AI boundaries in governance and the preservation of individual autonomy, with respect to diversified development and design, as well as the right to override if the system becomes dangerous or threatening to Human Rights.

In software and boundary testing it is especially critical to have testers to the code, and ways to visualize and understand what is going on underneath. Developers can miss their flaws and program to their own biases without these important positions and steps in place. Also with AI, there is a data quality issue that can accentuate bias. Therefore, test plans and cases must be created to ensure that problem scenarios are thought of ahead of time vs. in a production setting.

In many ways, the rolling out of AI to the world and the “Managing Risks” section of this document is similar to test planning for governance. AI is a different level of software integration into governmental departments than we have previously seen, and as the United States of America is a country founded on individual and societal liberties for all, we must ensure that every person has equal access to resources that will allow them to pursue their happiness and take part in decision making as was the mission set out by our founders.

The potential for AI to dominate and control the masses by a limited group of players is huge in the wrong hands. One of my concerns currently is who has access to the development capabilities to create AI systems, and whether this is a balanced group of players and motivations. As a former female worker in the technology industry, I am well aware of the minority of women in this field and why I ultimately left the field. According to a 2020 World Economic Forum report, women make up only 26 percent of data and AI positions in the workforce. Stanford Institute for Human-Centered AI found that women make up just 16 percent of tenure-track faculty focused on AI globally, according to their 2021 AI Index Report.

There are multiple reasons for this disparity in male to female ratios in technology, and many barriers exist for women in this field. We must continue to highlight the fact that AI development is currently a representation of only 16-26 percent, while women make up roughly half of the United States and world population. The other 74-84 percent of decision making on a technology that could very well dominate control in global financial markets, governance, healthcare, education, and ultimately quality of life including personal autonomy is through male only design and implementation. This must rapidly change through active pursuit of equality, as again there are now and have been real problems in this field that deliberately shut women out and shut women down.

Again, I would like to emphasize as someone who worked in technology that there are fundamental levels of bias and power dynamics that kept me, and many women, out of technology despite our interest in pursuing those careers. Little has been done to identify and correct these disparities over time. To my knowledge, and through speaking with women who are still in the field, these biases and power dynamics have little changed over the last decade. Thus, women are still not welcomed or encouraged equally in the field that will potentially control societal decision making at every level. This must be specifically called out and not overlooked as a problem within this design or simply labeled "equity".

While I saw in this document the calling out of mitigation on emerging risks to rights and safety, ensuring adequate human training and assessment, and taking steps to ensuring that AI will advance with equity, dignity, and fairness; I do not see where we specifically call out this glaring problem in AI development or specifically address disparities in current data used to drive the AI systems. As someone who has also worked in the field of education, I have huge concerns that little to nothing is being done to address this disparity in male to female education, decision making, and sought out inclusion within this field. As we know, with machine learning, and deep learning technologies, there is likely to be an exponential growth of AI development by the August 1, 2024 deadlines given in this document, so there is no time to waste in ensuring that women get their fair representation in this emerging technology.

For example, in the field of AI neuroscience, we see many companies funded by male CEOs, working to implement predominantly male-centered design and development operating on the very basis on neuronal transmission and alterations of impulse reception and transmission. This is problematic for a variety of reasons. While this technology is currently predominantly focused on diseases of neuronal transmission, the field is looking to expand into more common conditions including chronic anxiety and depression. This is just one example of how a male-centered and male-dominated field could lead to further oppression and biases in personal autonomy in the United States Healthcare fields, specifically populations of women.

However, in many of the documents discussing AI roll-out into healthcare, governance, and beyond, I do not see the male to female disparity specifically called out. Therefore, in summary of my concerns, I would emphasize the need to highlight and call out the problem more prominently, identifying specific ways to address the problem proactively, and ensuring that panel members who are working on the problem truly seek to balance the field and not just provide a surface level attempt. In other words, while I found the document does address topics of equity and inclusion, I find that I would like to see more specific call outs of this elephant in the room known as lack of females in AI design and development.

OMB_AImemo_comments

OMB can best advance responsible AI innovation by recognizing that those charged with shepherding AI's procurement, development, deployment, or oversight must hail from domains of expertise that are far broader than what is typically considered for traditional information technologies. As is underscored through the Blueprint for an AI Bil of Rights, the NIST Risk Management Framework and President Biden's Executive Order, AI is a socio-technical system, and its governance must be approached as such. Agencies must therefore be directed to ensure teams sufficiently address the sociotechnical nature of artificial intelligence. This means Chief AI Officers, for example, must be equipped with the types of skills and education that allow them to perform their role-mandated risk management tasks with an eye toward not only traditional enterprise risk management, but expanded definitions of risk with respect to rights, equity, dignity, and more. The useful distinction made in the memorandum between safety-impacting risks and rights-impacting risks is a welcome step toward recognizing that different tactics and skill sets are likely to be needed to fully mitigate the suite of risks posed by the use of AI by the government. To avoid the CAIO role becoming overly skewed toward technical risk (less on sociotechnical risk), more consistent (and insistent) recognition of this will be necessary.

Ensuring sociotechnical (rather than purely technical) risk framing may be unlikely, for example, if Chief AI Officers follow previous models of Chief Information Officers, Chief Technology Officers, or Chief Data Officers (as is suggested, for example, in Sec. 3.b.i) and reside solely within the departments of an agency charged with overseeing (also important) responsibilities like cybersecurity or IT provision. Given the weighty responsibility falling on Chief AI Officers to wrestle with not simply technical but societal and rights-infringing implications of AI's use within/by their respective agency, a CAIO's hierarchical positioning, oversight roles and responsibilities, and accountability mechanisms must reflect this. Especially insofar as the memorandum makes recommendations about how to build out the federal workforce to support responsible AI innovation, more could be done – for example in Section 3.b.i (Roles) and 3.b.ii (Responsibilities) to emphasize the range of diverse expertise that will be necessary to support this goal in the CAIO. Similarly, while each agency will approach workforce development and oversight in a unique way, the more the memorandum explicitly stresses the need for workforce strengthening to include increasing the diversity of skills/disciplines (to include the social sciences, for example), the more likely it will be that this goal is consistently interpreted across different agencies. The explicit mention of the many disciplines and skills necessary for a workforce to appropriately govern responsible AI innovation are very welcome, for example in Section 4.b.iv, but this kind of explicit recognition would be welcome in other areas of the draft memorandum that address the skills of those charged with overseeing AI, for example in Section 3.c concerning AI governance bodies.

AI Governance Bodies should reflect a diversity of realms of expertise. They should also work to identify channels for engaging with, and appropriately representing in AI Governance Body deliberations, stakeholders who stand to be impacted by the agency's use of AI. Each agency should develop a definition of rights-impacting risk with respect to which communities will most likely be *impacted* by the agency's use of AI (or customers' use of AI) – as opposed to simply those choosing to use AI, as it appears to be communicated in Section 5.iv.B. Human rights impact assessments, algorithmic impact assessments, third party audits – there are several practices that could be suggested for agencies to consider to support practical progress toward risk identification.

Actions and decisions taken by each agency's Chief AI Officer and/or AI Governance Body should ideally be reported to an externally situated oversight entity – akin, for example, (perhaps) to an AI-specific GAO -- to ensure accountability in how different agencies approach the task of assessing and mitigating sociotechnical risk in relation to their agency's mission. Less from a standpoint of enforcement and more of collaborative learning and

sharing best practices and common pitfalls, ensuring external oversight (and feedback channels) will be especially important to build in at these early stages of implementation. This is laudably begun/addressed in Section 5, but more is needed.

OMB must also recognize that AI innovation will happen (and is happening) worldwide, and the actions the US government takes to define and bound what responsible innovation looks like will similarly have impacts worldwide. By structuring agency policies in such a way as to consider not only the impacts AI will have on U.S. citizens, but also on those beyond the U.S. (as appropriate), the federal government can take a meaningful step towards fulfilling the unique responsibility the US has to ensure this technology is safe for all who interact with it. As an example of how the OMB draft memorandum could better accommodate this: in Section 5.d.v, more could be said about the way agencies can promote practices that recognize the full global scope of the supply chain which currently enables generative AI – considering of course, not just physical production of AI hardware, but the global data ecosystem that drives AI. For example, U.S. companies have relied heavily on workers in lower-income countries for data enrichment or content moderation tasks to improve generative AI, often to the detriment of these workers' rights. By expanding the examples offered for encouraging "responsibly procuring generative AI" to also include building and setting requirements for workplace practices in developing generative AI models, OMB could positively influence how contracts are put in place worldwide to reverse a trend which has so far been one of exploitation of workers in lower-income settings. General Comment

First, we caution against overloading civil servants with additional steps they have to take to ensure responsible AI. Any such activities should not be additive to already existing sets of expertise and workloads, but compliment them. This can best be done by identifying units and individuals who already are entrusted with responsible-AI related concerns (such as research and development, procurement, or compliance). The new responsible AI mandates outlined in the OMB implementation guidelines should be mapped onto the work that these units already do. In previous work, we have called this approach “Practice-Based Compliance Framework”.

Second, we urge agencies to consider their own employees as key stakeholders in the responsible AI space. Responsible AI-focused stakeholder engagement efforts, such as sandboxes, discussion groups, or surveys, such decidedly include this stakeholder group. We underline that this type of stakeholder engagement can not be conducted in a one-size-fits-all fashion. Rather, it should fold into organization- and agency-specific environments. Internal stakeholder engagement in one agency will look different from stakeholder engagement in another agency. We have discussed what that can look like in the context of AI procurement, explaining how agencies and units can avoid common traps.

Third, it is crucial that compliance with the OMB implementation guidelines should not rely solely on data, measurements, and risk accounting provided by AI vendors. Assessing impacts on the terms set by those being assessed risks does not produce robust accountability to the public interest. When vendors define risks and impacts in ways that ensure a favorable assessment for their products, they are only accountable to themselves. This is avoidable by ensuring independent evaluators are permitted to conduct their own real-world tests and produce their own documentation of AI systems, where appropriate.

Pertaining to 5.b.ii., we want to underline that AI systems that purport to be “detecting or measuring emotions, thought, or deception in humans” are often based on pseudo-scientific constructs and plagued by instability, leading to invalidity of these tools as test instruments. Additionally, constructs that are scientific are not necessarily observable (such as socioeconomic status, teacher effectiveness, and risk of recidivism) and must be inferred from measurements of observable properties. This process necessarily involves making assumptions, introducing the potential for mismatches between the understanding of the construct purported to be measured and how it is operationalized in an AI system. Many AI harms are

direct results of such mismatches. An AI assessment should, therefore, include a careful check of the assumptions and constructs that underpin an AI system. Such assessments can and should be incorporated into procurement processes.

Relatedly, we want to comment on 5.c.iv. and underline that AI impact assessments should always include qualitative analysis (such as of the scientific history and validity of a construct, and its underpinning assumptions). Qualitative and quantitative assessments must be meaningfully integrated. How this can be done has, for example, been proposed in the “Love Triangle” framework that combines assumptions tracking with statistical stability analysis into a holistic AI audit approach. This approach has already been put into practice.

Hardware- and sensor-driven systems (such as motion capture technology) should not be exempt from AI assessments. Hardware components carry their own, potentially harmful, assumptions and design features. One historical example of this is the way color photographic film was calibrated to render lighter skin tones more accurately than darker skin tones, which was then propagated into color calibration for digital photographic technologies. These hardware-related considerations should be assessed as part of an AI assessment, not least to avoid harms and risk an approach that is overtly data-centric.

It is important that good documentation and archiving practices be developed for these types of holistic AI assessments, and that respective archives be publicly accessible and carefully maintained. This should be considered public interest technology infrastructure and be federally funded.

Lastly, we recommend carefully considering the framing and execution of “consult and incorporate feedback from affected groups” (5.c.v.B). It is important to approach engagement with affected groups from a non-extractive standpoint, not least to avoid superficial “participation-washing”. Affected groups must be carefully and consensually enrolled in feedback processes and they must be compensated for their time and expertise. At the same time, these kinds of infrastructures for soliciting this type of feedback must be aligned with the principles of equity and dignity, and they must be sustainably funded.

Subject: Comment on the OMB's released implementation guidelines following President Biden's Executive Order on Artificial Intelligence

We are pleased to have the opportunity to comment on the OMB's released implementation guidelines following President Biden's Executive Order on Artificial Intelligence.

As researchers in the field of responsible AI, we want provide the following general points:

First, we **caution against overloading civil servants** with additional steps they have to take to ensure responsible AI. Any such activities should not be additive to already existing sets of expertise and workloads, but compliment them. This can best be done by identifying units and individuals who already are entrusted with responsible-AI related concerns (such as research and development, procurement, or compliance). The new responsible AI mandates outlined in the OMB implementation guidelines should be mapped onto the work that these units already do. In previous work, we have called this approach "Practice-Based Compliance Framework".[1]

Second, and in line with the first point, we urge agencies to consider their own **employees as key stakeholders** in the responsible AI space. Responsible AI-focused stakeholder engagement efforts, such as sandboxes, discussion groups, or surveys, such decidedly include this stakeholder group. We underline that this type of stakeholder engagement can not be conducted in a one-size-fits-all fashion. Rather, it should fold into organization- and agency-specific environments. Internal stakeholder engagement in one agency will look different from stakeholder engagement in another agency. We have discussed what that can look like in the context of AI procurement, explaining how agencies and units can avoid common traps.[2]

Third, it is crucial that compliance with the OMB implementation guidelines should not rely solely on data, measurements, and risk accounting provided by AI vendors. Assessing impacts on the terms set by those being assessed risks does not produce robust accountability to the public interest. When vendors define risks and impacts in ways that ensure a favorable assessment for their products, they are only accountable to

themselves.[3] This is avoidable by ensuring independent evaluators are permitted to conduct their own real-world tests and produce their own documentation of AI systems, where appropriate.[4]

We also want to provide comments on specific sections of the OMB implementation guidelines.

Pertaining to 5.b.ii. (Purposes That Are Presumed to Be Rights-Impacting), we want to underline that AI systems that purport to be "detecting or measuring emotions, thought, or deception in humans" are often based on pseudo-scientific constructs and plagued by instability, leading to invalidity of these tools as test instruments. Additionally, constructs that are scientific are not necessarily observable (such as socioeconomic status, teacher effectiveness, and risk of recidivism) and must be inferred from measurements of observable properties. This process necessarily involves making assumptions, introducing the potential for mismatches between the understanding of the construct purported to be measured and how it is operationalized in an AI system. Many AI harms are direct results of such mismatches.[5] **An AI assessment should, therefore, include a careful check of the assumptions and constructs that underpin an AI system**. Such assessments can and should be incorporated into procurement processes.[6]

Relatedly, we want to comment on 5.c.iv. (Minimum Practices for Either Safety-Impacting or Rights-Impacting AI) and underline that **AI impact assessments should always include qualitative analysis** (such as of the scientific history and validity of a construct, and its underpinning assumptions). Qualitative and quantitative assessments must be meaningfully integrated. How this can be done has, for example, been proposed in the "Love Triangle" framework that combines assumptions tracking with statistical stability analysis into a holistic AI audit approach.[7] This approach has already been put into practice.[8]

Hardware- and sensor-driven systems (such as motion capture technology) should not be exempt from AI assessments. Hardware components carry their own, potentially harmful, assumptions and design features. One historical example of this is the way color photographic film was calibrated to render lighter skin tones more accurately than darker skin tones, which was then propagated into color calibration for digital photographic technologies. These hardware-related considerations should be assessed as part of an AI assessment, not least to avoid harms and risk an approach that is overtly data-centric.

It is important that good **documentation and archiving practices** be developed for these types of holistic AI assessments, and that respective archives be publicly accessible and carefully maintained. This should be considered public interest technology infrastructure and be federally funded.

Lastly, we recommend carefully considering the framing and execution of "consult and incorporate feedback from affected groups" (5.c.v.B). It is important to approach **engagement with affected groups from a non-**

extractive standpoint, not least to avoid superficial "participation-washing".[9] Affected groups must be carefully and consensually enrolled in feedback processes and they must be compensated for their time and expertise. At the same time, these kinds of infrastructures for soliciting this type of feedback must be aligned with the principles of equity and dignity, and they must be sustainably funded.

Thank you for the opportunity to provide comments on the OMB's released implementation guidelines following President Biden's Executive Order on Artificial Intelligence. We look forward to serving as a potential resource as you continue to engage in implementation discussions on AI safety, security, and trustworthiness.

Comments of the World Privacy Forum

To

The Office of Management and Budget regarding *Request for Comments:Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum OMB-2023-0020.*

Via www.regulations.gov

Clare Martorana
U.S. Federal Chief Information Officer
Office of the Federal Chief Information Officer,
Office of Management Budget

December 3, 2023

The World Privacy Forum is pleased to submit comments in response to the Office of Management and Budget's "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum." OMB published the request in the Federal Register on November 3, 2023, https://www.govinfo.gov/content/pkg/FR-2023-11-03/pdf/2023-24269.pdf.

The World Privacy Forum is a respected NGO and non-partisan public interest research group focused on conducting research and analysis in the area of privacy and complex data ecosystems and their governance, including in the areas of identity, AI, health, and others. WPF works extensively on privacy and governance across multiple jurisdictions, including the US, India, Africa, Asia, the EU, and additional jurisdictions. For more than 20 years WPF has written in-depth, influential studies, including groundbreaking research regarding systemic medical identity theft, India's Aadhaar identity ecosystem —peer-reviewed work which was cited in the landmark Aadhaar Privacy Opinion of the Indian Supreme Court — and The Scoring of America, an early and influential report on machine learning and consumer scores. WPF co-chairs the UN Statistics Data Governance and Legal Frameworks working group, and is co-chair of the WHO Research, Academia, and Technical Constituency. At OECD, WPF researchers participate in the OECD.AI AI Expert Groups, among other activities. WPF participated as part of the first core

group of AI experts that collaborated to write the OECD Recommendation on Artificial Intelligence, now widely viewed as the leading normative principles regarding AI. WPF research on complex data ecosystems governance has been presented at the National Academies of Science and the Royal Academies of Science. World Privacy Forum: https://www.worldprivacyforum.org.[1]

This Administration's focus on artificial intelligence is welcome and timely. In general. WPF is happy with the President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence, Executive Order 13960 of December 3, 2020, https://www.govinfo.gov/content/pkg/FR-2020-12-08/pdf/2020-27065.pdf. We also welcome and support OMB's AI Memorandum. Both documents are good starts at tackling the challenges of AI.

We want to offer a few suggestions for the OMB AI Memo. The focus of the first part of these comments is on activities that involve or affect individuals and their personally identifiable information. We recognize, of course, that there are many AI activities that do not involve privacy matters.

Part I: Use Existing Privacy Requirements to Assist with New AI Obligations

Existing law provides a useful method for informing the public about and for seeking comments on agency activities affecting privacy. We refer, of course, to the Privacy Act of 1974, 5 U.S.C. § 552a. The Privacy Act of 1974 directs agencies to use Systems of Records Notices to describe their activities involving the use of personal information. Agency activities that involve personal information are described through notices in the Federal Register with the solicitation of public comment, and the notices remain available publicly to inform the public of agency activities. In many ways, publications by agencies under the Privacy Act of 1974 are unique. Other counties that have more advance and more comprehensive privacy laws mostly abandoned requirements for publications describing descriptions of personal data systems. In our view, the Privacy Act of 1974's publication provisions are one of the Act's most successful obligations.

The Privacy Act of 1974 became law long before anyone envisioned the need for a privacy impact assessment (PIA). A later law, the E-Government Act of 2002, 35 U.S.C. § 3501 note, imposed a requirement for PIA. The statutory requirement was always inadequate for the purpose, but it was supplemented by useful OMB guidance, OMB Guidance for Implementing the Privacy Provisions of the E-Government Act of 2002 (September 26, 2003) (M-03-22).

To a significant extent, many of the features of both of these PIA requirements are simply out-of-date and trail current technology and information practices by decades. We do not expect OMB to solve these broader problems in its AI memorandum. However, it should be possible to integrate new agency obligations for AI with existing obligations under both the Privacy Act of 1974 and the E-Government Act.

[1] World Privacy Forum's home page includes information about our activities, as well as numerous data governance and privacy research, data visualizations, and resources. https://www.worldprivacyforum.org.

There is a greater opportunity here as well. We note that this Administration is aware of the need to focus more attention on the use by federal agencies of data brokers who provide personal information for the use of federal agencies or of data brokers who receive personal information from federal agencies. WPF applauds that effort with great enthusiasm. Many of these activities are hidden from the American public because existing privacy laws and rules do not expressly direct agencies to disclose their use of data brokers as sources or recipients. Data broker information resources are integral to some AI activities.

It is possible without a major effort to fold the AI and data broker initiative together with a limited reform of existing Privacy Act of 1974 and PIA requirements. Happily, an initiative sponsored by WPF already includes ideas and drafted language that will accomplish all of these tasks. That project is a report titled From the Filing Cabinet to the Cloud: Updating the Privacy Act of 1974 (May 2021), https://www.worldprivacyforum.org/2021/05/from-the-filing-cabinet-to-the-cloud-updating-the-privacy-act-of-1974/.

The goal of that report is a complete revision of the Privacy Act of 1974. That goal will not be accomplished administratively, but some administrative changes can achieve the same ends. For example:

1) **Better publications**. The report proposes on page 85 to expand existing requirements to describe categories of sources of information a Privacy Act system of records. We note that AI is likely to be a new category of information for many AI activities covered by the OMB memorandum. Language in the report – which can work just as well in an OMB memorandum as in a statute – expands upon the existing requirement to describe the categories of sources of records in the system.

> New language makes it explicit that sources include commercial, governmental, and other sources that the agency routinely reviews, consults, or uses. It is especially important for agencies to inform the public when using commercial sources. For example, if an agency has a contract with a consumer reporting agency ("credit bureau") to use credit records, it must so state. If there is a reasonable prospect that the particular source may change but not the category of sources, the agency may choose to identify the category (e.g., "credit bureau") rather than identifying which specific credit bureau it uses. If an agency routinely uses Internet search engines to find information on individuals, it must so state. If an agency routinely seeks information from social media, the agency should identify at least the major social media used. All the information about sources will help individuals figure out how particular information about them ended up in agency records. This is especially important when the agency uses the information to make decisions about individuals. It is even more important if an agency consults but does not retain a copy of information held by a third party.

This type of disclosure addresses current Administration priorities for AI and for data brokers. OMB could make an adjustment in its Privacy Act of 1974 and PIA administrative requirements to expand public disclosure on data broker activities.

2) **Better PIAs**. Formal impact assessments can be useful to address many different policy concerns. Everyone seems aware of the overlaps between some AI assessments and some privacy assessment. That same report that proposed revising the Privacy Act of 1974 also

suggested revising the existing privacy impact assessment requirement. We will not repeat the details here. We refer you to pages 115-123 of the report.

We summarize here, however, by noting that the report emphasized the need for a PIA ***process*** and just not a flat, one-time, one-size-fits-all assessment. This need will be just as true for an AI assessment as it is for a privacy assessment. We state expressly that: 1) some assessments will require more attention, more consultation, and a long time than others; 2) some assessments will require regular reviews over time because consequences are not static and because agency programs change over time; and 3) some assessments will require lesser efforts because the risks are smaller. Responsible agency personnel should be allowed to make determinations about which activities need more assessment than others.

Given the significant overlap with some AI assessments and some privacy assessments, we suggest that an agency's Privacy Officer and the agency's AI Officer be directed to identify those overlaps and to work jointly on the assessments that they determine need substantial attention from both perspectives. Other specific ideas on assessments from the Privacy Act revision will also be relevant, and all adjustments to existing guidance can be accomplished administratively by OMB in its AI memorandum.

Part II. AI Activities

We have some additional observations specific to AI activities.

In the OMB's definition for risks from the use of AI in its *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum*, the agency rightfully mentions specific factors that create, contribute to, or exacerbate the risks of AI including "AI outputs that are inaccurate or misleading" and "AI outputs that are unreliable, ineffective, or not robust."

We applaud the OMB's recognition that some AI systems simply may not be adjustable in an acceptable manner that adequately mitigates risks, and therefore should not be used. The memo's demand that, "Where the AI's risks to rights or safety exceed an acceptable level and where mitigation is not practicable, agencies must stop using the affected AI as soon as is practicable," is a positive guidepost for AI use by agencies.

Ensuring that AI systems do not produce outputs that create, contribute to, or exacerbate risks, is imperative. In addition, there also is a pressing need to ensure that AI governance tools—the tools and techniques used to measure AI system risks and improve their inclusiveness, fairness, explainability, privacy, safety and other trustworthiness factors— *themselves* do not compound those risks.

AI governance tools can improve such issues; however these tools often lack meaningful oversight and quality assessments. Incomplete or ineffective AI governance tools can create a false sense of confidence, cause unintended problems, and generally undermine the promise of AI systems.

U.S. federal agencies have important gatekeeper and quality assurance roles when it comes to ensuring that the tools and techniques employed to measure and improve the AI systems they use are reliable and effective.

We appreciate the opportunity to comment regarding specific questions in the OMB's Request for Comments on the Draft Memorandum. Below are responses to some specific questions.

Question 2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body?

The OMB memo lists several responsibilities of Chief Artificial Intelligence Officers including "Managing Risks from the Use of AI" through "working with relevant senior agency officials to establish or update processes to measure, monitor, and evaluate the ongoing performance of AI applications and whether they are achieving their intended objectives."

Such evaluation processes should include quality assessment of the AI governance tools and techniques used to evaluate and measure the AI systems. Establishing appropriate processes for this purpose will require evidence gathering and better understanding of realities on the ground before a rush to solutions. Otherwise, these processes may well be unfit for purpose and fail to accomplish the goals which are intended — and in some cases mandated — to attain.

We urge agencies to collaborate with civil society organizations and academia in addition to private sector entities to A) build an evaluative environment for testing AI systems, B) gather relevant evidence and work toward appropriate AI measurement and monitoring processes, and C) work to create appropriate AI benchmarks.

In particular, agencies might look to the National Institute of Standards and Technology (NIST) in convening stakeholders and developing an evaluative environment in which an evidentiary basis for the socio-technical contexts and best practices for AI governance tools could be created.

Question 5. "Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?"

Some use cases involving specific measurement methods for measuring or improving AI fairness or explainability should be assessed thoroughly for appropriate application, and possibly removed from consideration as evaluative AI measures.

In the World Privacy Forum's forthcoming report, *Risky Analysis: Assessing and Improving AI Governance Tools, An international review of AI Governance Tools and suggestions for pathways forward*, we present research showing problems with some commonly-used methods intended to measure or improve AI fairness and explainability. These measurement methods have been shown to be unsuitable including when used in an "off-label" or out-of-context manner if applied to measure many types AI systems.

A Problematic AI Fairness Measurement Method
In particular, the research found problems with AI governance tools that incorporate the US Four-Fifths or 80% Rule in an attempt to measure disparate impacts and fairness of AI systems.

The Four-Fifths Rule is well-known in the US labor recruitment field as a measure of adverse impact and fairness in hiring selection practices. Detailed in the Equal Employment Opportunity

Commission *Uniform Guidelines on Employee Selection Procedures of 1978*,[2] the rule is based on the concept that a selection rate for any race, sex or ethnic group that is less than four-fifths —or 80%—of the rate reflecting the group with the highest selection rate is evidence of adverse impact on the groups with lower selection rates. The rule has been widely applied by employers,[3] lawyers,[4] and social scientists[5] to determine if hiring practices are lawful and if they result in disparate or adverse impacts against certain groups of people.

While the Uniform Guidelines state that the Four-Fifths rule is "generally" regarded by federal enforcement agencies as evidence of adverse impact, it explains that in some cases, smaller differences in selection rate may constitute adverse impact, and in others, greater differences in selection rate may not constitute adverse impact. In other words, context matters.[6]

Despite its widespread use, legal, employment, and technical experts have cautioned against use of the Four-Fifths Rule as a singular means of assessing disparate impact.[7] Many experts warn against simplistic applications of the rule, both within its historical use in US labor contexts as well as for its use in AI contexts.[8]

In June 2023, the chair of the U.S. Equal Employment Opportunity Commission cautioned against relying solely on meeting the 80% threshold. Calling the Four-Fifths rule "a check" and just one single standard used at the start of federal investigations, rather than the only measure

used for gauging disparate impact, she said that "smaller differences in selection rates may constitute disparate impact."[9]

Further, according to a U.S. Justice Department legal manual addressing disparate impact, "not every type of disparity lends itself to the use of the Four-Fifths rule, even with respect to employment decisions."[10] Legal scholars also have questioned the limits of the Four-Fifths rule, noting its failure to statistically reflect hiring disparity impact adequately.[11]

Despite those caveats, the Four-Fifths Rule and its 80% benchmark have been repurposed in computer code form and used in a variety of AI fairness metrics and tools.[12] The rule is applied in both employment[13] and non-employment contexts [14] as a means of measuring or "removing" bias or
disparate impacts.[15] It is also used outside of the US employment context and is encoded into AI governance tools offered in other jurisdictions. [16]

---

[9] Chair Burrows spoke during a keynote speech in June 2023 at the ACM Conference on Fairness, Accountability, and Transparency (ACM FAccT) attended by World Privacy Forum representatives. She said that it is "worrisome" when employers or vendors suggest that meeting the 80% benchmark is enough to ensure that a hiring approach or system does not create disparate impact.

[14] *Bias Mitigation with Disparate Impact Remover*, Jupyter nbviewer (Aug. 16, 2023, 11:18AM), https://nbviewer.org/github/srnghn/bias-mitigation-examples/blob/master/Bias Mitigation with Disparate Impact Remover.ipynb.

15 AIF360, GitHub, Trusted AI, Supported Bias Mitigation Algorithms, "Disparate Impact Remover." (November 11, 2023), https://github.com/Trusted-AI/AIF360/tree/master. (Documentation for the Disparate Impact Remover algorithm supported by AI Fairness 360 specifically cites 2015 research introducing a disparate impact measurement based on the Four-Fifths Rule's 80% benchmark.)

[16] Multiple AI governance tools surveyed for World Privacy Forum's *Risky Analysis* report mention or recommend fairness assessments that use encoded versions of the Four-Fifths or 80% Rule to measure disparate impact. See Part I and Appendix C of the report for more detail.

Again, we suggest that use of AI disparate impact measurement methods based on the Four-Fifths Rule and its 80% benchmark should be assessed thoroughly for appropriate application, and possibly removed from consideration as evaluative AI measures in some or all contexts.

Problematic AI Explainability Measures

In the absence of widely-adopted AI explainability standards, two approaches—SHAP and LIME—have grown in popularity, despite attracting an abundance of criticism from scholars who have found them to be unreliable methods of explaining many types of complex AI systems.[17]

Use of both SHAP[18] and LIME[19] has increased in part because they are model agnostic, meaning they can be applied to any type of model that data scientists build. An abundance of accessible and easy-to-use documentation related to the two methods has also fostered interest in them.[20]

However, the applicability and efficacy of both SHAP and LIME are limited, particularly when used in an attempt to explain complex AI systems comprised of non-linear machine or deep learning models. In a typical use case, an AI practitioner might employ SHAP or LIME to explain a single instance of a model input, such as one decision or prediction, rather than the whole model. Because both methods work by approximating more complex, non-linear models (the types that are often called "black-box" models) with more straightforward linear models, they may produce misleading results.21

Short for Shapley Additive exPlanations, SHAP is based on a concept known as the the Shapley Value, introduced by Lloyd Shapley in 1951[22] in the context of cooperative game theory. The

[18] *shap*, GitHub, https://github.com/shap.

[19] *lime*, GitHub, marcotcr, https://github.com/marcotcr/lime.

[20] This is based on a description of how SHAP and LIME work and their problems, as intended for a layperson, provided by Tim Miller, professor in artificial intelligence at the School of Electrical Engineering and Computer Science at The University of Queensland, during interviews conducted by World Privacy Forum (WPF) in June and November 2023. Miller was professor in the School of Computing and Information Systems at The University of Melbourne, and co-director of its Centre of AI and Digital Ethics, when WPF spoke with him in June 2023. Miller said that in general, LIME is unstable and inappropriate as an explainability metric for machine learning, while SHAP-based methods are also limited in effectiveness. Professor Tim Miller, Univ. Of Queensland Australia, https://eecs.uq.edu.au/profile/9477/tim-miller.

[21] November 2023 WPF interview with Tim Miller.

[22] Lloyd S. Shapley, *Notes on the N-Person Game — II: The Value of an N-Person Game*, RAND Corp. (1951), https://www.rand.org/pubs/research_memoranda/RM0670.html.

Shapley Value is a method used to determine the importance or contribution of each player to an overall competition between groups.23

Today, SHAP is used for another purpose entirely: in an attempt to expose and quantify feature importance, or the importance of factors that contribute to predictions of machine learning models.24 Oftentimes, SHAP is used in the hopes of revealing how factors affect the outputs of opaque, "black box" AI systems such as deep learning models and neural networks, which are difficult to interpret.

SHAP reflects feature importance numerically. For instance, when using SHAP to determine how certain input features affect a more straightforward linear regression model trained on a California housing dataset, the SHAP value of the median house age in a block group might be expressed as -0.22, and the SHAP value of median income as +0.92. The process would be used to add other features, such as the average number of rooms or average home occupancy, until the current model output is reached.[25]

Although Shapley values have been applied in the context of feature importance for decades,[26] researchers have found several mathematical, practical, contextual, and epistemological problems associated with use of the method for explaining AI systems. For example, when attempting to attribute influence to a large set of features affecting AI model decisions or predictions, the approach relies on the modeler to decide which features count as "players" and which are redundant; these subjective decisions can affect the resulting explanations.[27]

Scholarly research also indicates that some users of SHAP may not understand how to interpret its results. A survey of data scientists using SHAP-based tools showed that many were unable to accurately describe what SHAP values or scores represented.[28] The study also found that the

popularity of SHAP-based tools influenced some data scientists to trust the tools even if they did not understand what they did or how to interpret their results.

In addition, research shows that use of SHAP in AI explainability tools may lead users to falsely believe they discovered a precise explanation for why or how a system produced a specific output, such as a decision or prediction. This in turn may lead to misconceptions about what SHAP values represent and the actionable information that can be gleaned from them.[29]

Even scholars who acknowledge benefits of using SHAP to provide insight into certain aspects of models and data suggest they "can lead to wrong conclusions if applied incorrectly,"[30]and argue that they can be expensive to compute.[31]

LIME, a similar AI explainability method that has grown in adoption, was first introduced in 2016.[32]Short for Local Interpretable Model-agnostic Explanations, LIME produces explanations by randomly sampling "locally" around the singular instance chosen to be explained. But its randomness is a pitfall: If LIME is used again in an attempt to explain the very same instance, its explanation will be different.33 The use of LIME for AI explainability has been criticized, and research shows the method can lead to inaccurate results,34 or be manipulated or "gamed."[35]

Overall, the research indicating that there are vulnerabilities in these popular explainability measures is not reassuring; however, it is not completely unexpected. Trustworthy AI implementation is still nascent, with much work and refinement yet to come.

We suggest that use of measurement methods incorporating SHAP or LIME should be assessed thoroughly for appropriate application, and possibly removed from consideration as evaluative AI measures.

Question 6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all

[35] Dylan Slack et al.

such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The OMB draft memo states in section iv., "Minimum Practices for Either Safety-Impacting or Rights-Impacting AI," that agencies must follow specific practices related to AI impact assessments; risk mitigation measures; testing, evaluation and monitoring to ensure that AI works in real-world contexts; AI functionality in high-risk decision-making, and more.

It is imperative the tools and techniques used to quantifiably measure AI systems according to safety and rights impacts, and to gauge success according to particular metrics, are effective and reliable in accordance with policy goals. The AI governance tools established for such purposes will help form the foundation of risk scores, consumer scores, ratings or other statistics that agencies rely upon to conduct much-needed impact assessments, risk evaluations and ongoing monitoring. Without meaningful oversight and quality assessments of the tools and measurement methods themselves, new problems or harms could be introduced.

In the World Privacy Forum's forthcoming *Risky Analysis* report, we suggest pathways for creating a healthy AI governance tools environment, and offer suggestions for governments, multilateral organizations, and others creating or publishing AI governance tools.

We found that some AI governance tool providers do not conduct quality assessments, or if they do, they do not always conduct them according to an internationally recognized standard.

The suggestions made in the report include best practices taken from existing AI and other quality assessment standards and practices already in widespread use. Appropriate procedural and administrative controls include: 1) providing AI governance tool documentation and contextualization, review, audit, and other quality assurance procedures to prevent integration of inappropriate or ineffective methods in policy guidance; 2) identifying and preventing conflicts of interest; and 3) ensuring that capabilities and functionality of AI governance tools align with policy goals. If governments, multilateral institutions, and others working with or creating AI governance tools can incorporate lessons learned from other mature fields such as data governance and quality assessment, the result will establish a healthier body of AI governance tools, and over time, healthier and more trustworthy AI ecosystems.

Question 8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

In particular, section iv. of the OMB Draft Memo includes requirements that agencies provide public notice and plain-language documentation in the AI use case inventory. It notes that the documentation should be accessible in contexts where people will interact with or be impacted by the AI, and that even where agencies' use cases are excluded from the public inventory requirements described in the guidance, they may still be required to report relevant information to OMB and must ensure adequate transparency in their use of AI, as appropriate and consistent with applicable law.

All of these minimum practices for documentation are crucial components of AI accountability and transparency. In addition, we urge OMB to include documentation related to AI governance tools used to measure and improve AI systems used by federal agencies. Just as with any tool

or product released to the public, agencies should create and make robust documentation available.

As included in World Privacy Forum's *Risky Analysis* report, documentation that can assist in creating more transparency can include information about the developer, date of release, results of any validation or quality assurance testing, and instructions on the contexts in which the methods should or should not be used. A privacy and data policy is also important and should be included in the documentation of AI governance tools. End users should be made aware of the evaluations in a prominent manner, and the evaluation should be readily understandable by non-expert users.

Ensuring that there is no conflict of interest related to AI governance tools is another quality measure that is readily achievable. For example, core pieces of information to make available to end users should provide details about how development of AI governance tools are resourced and financed, by whom, and who published them. Commercial Interests also should be noted, for instance, if the tool promotes specific commercial products or services. Affiliations, including relationships that potentially impact objectivity, including information about commercial or other entities that donated the tool for open-source use, should also be noted.

Additional items can be provided in the documentation, for example:

- Documentation should provide the suggested context for the use of an AI governance tool. AI systems are about context, which is important when it comes to applicable uses, environment, and user interactions. A concern is that tools originally designed for application in one use case or context may potentially be used in an inappropriate context or use case or "off-label" manner due to lack of guidance for the end user.

- Documentation should give end users an idea of how simple or complex it would be to utilize a given AI governance tool.

- Cost analysis for utilizing the method: How much would it cost to use the tool and validate the results?

- A data policy: A detailed data policy should be posted in conjunction with each AI governance tool. For example, if applicable, this information could include the kind of data used to create the tool, if data is collected or used in the operation of the tool, and if that information is used for further AI model training, analysis, or other purposes.

- Complaint and feedback mechanism: AI governance tools should provide a mechanism to collect feedback from users.

- Cycle of continuous improvement: Developers of AI governance tools should maintain and update the tools at a reasonable pace.

A great deal of existing work has already been done in other areas that could be helpful. For example, significant documentation standards and norms exist around consumer products, software products, and other technology products offered to the public. These norms are

encapsulated in multiple ISO standards,[36] as well as OECD Responsible Business Conduct principles and implementation guidance.[37] [38]

Conclusion

In concluding, we add one additional note regarding practical implementations of the work that will be needed in order to contextualize Agency AI activities effectively, safely, and fairly. The opportunities that OMB Circular No. A-119 Revised[39] affords to government agencies to work with stakeholders to create fair, multistakeholder voluntary consensus standards with good ground-level rules developed through collaborative work is non-trivial. Given the need for practical multistakeholder work in the area of AI, WPF is particularly interested to see how a VCS process could effectuate positive improvements, particularly regarding the day-to-day governance of AI systems.

WPF stands ready to assist. Thank you again for the opportunity to comment, and we hope to have the opportunity to discuss these issues with you further.

Respectfully submitted,

Pam Dixon,
Executive Director,
World Privacy Forum

General Comment

This report offers a critical analysis of the Draft Memorandum for Advancing Governance, Innovation, and Risk Management for Agency use of Artificial Intelligence (OMB-2023-0020). It addresses the complexities and challenges involved in integrating AI technologies into public sector operations. The commentary underscores the need for adapting roles, responsibilities, and training programs to accommodate the integration of AI, highlighting the potential hurdles in managing multi-agency coordination and the necessity for transparent, accountable, and flexible governance structures. Furthermore, it delves into the broader implications of AI beyond its functional uses, advocating for its role in enhancing human understanding, ethical decision-making, and personal growth. The document also explores the practical applications of generative AI in various domains, including immigration and healthcare, while emphasizing the importance of ethical data practices and fair compensation arrangements. This analysis aims to contribute to the ongoing discourse on AI governance, innovation, and risk management in the public sector, offering insights and recommendations for a balanced and effective approach to AI integration in government agencies.

Comment on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (OMB-2023-0020)

Q1: As we move forward in the ever-evolving landscape of systematic AI, it becomes crucial to adapt and realign roles and responsibilities accordingly. The integration of AI within agencies and organizations represents a significant shift in how work is conducted, and it's only natural that there may be resistance or hesitation from existing staff members when it comes to embracing and applying AI technologies.

To navigate this transition effectively, it's essential to prioritize the education and training of agency staff in the realm of AI. This training should encompass not only the technical aspects but also the practical applications of AI within their specific work contexts. Staff members need to understand how AI can be a valuable tool to enhance their productivity, streamline processes, and improve decision-making.

By providing comprehensive AI education and training, agencies can empower their staff to leverage AI effectively. This involves not just acquiring theoretical knowledge but also gaining hands-on experience and practical skills in AI utilization. Moreover, fostering a culture of continuous learning and adaptability within the agency can further facilitate the smooth integration of AI into daily operations.

Q2: Coordinating multiple agencies for AI governance involves several drawbacks such as:

When multiple agencies collaborate, transparency and accountability to the public can become complex. It might be unclear which agency holds responsibility for particular decisions or actions, complicating public accountability.

Large, coordinated bureaucracies might find it challenging to swiftly adapt to new AI technologies and issues. This lack of flexibility can impede timely responses to changing AI governance requirements.

In scenarios involving several agencies, political pressures and agendas can shape decision-making, potentially undermining the neutrality and effectiveness of AI governance strategies.

Such coordination can result in bureaucratic inefficiencies and decision-making delays. Different agencies often operate under their unique procedures, priorities, and timelines, which can make consensus-building and swift action difficult. Additionally, varying interests or priorities among the different agencies can lead to conflicts.

Q3: The Office of Management and Budget (OMB) AI innovation should not be limited to serving as a mere tool for performing tasks or automating processes. Instead, it should aspire to elevate human understanding and awareness. Rather than confining people within routine or narrow perspectives, its aim should be to broaden their knowledge, enhance critical thinking abilities, and elevate overall consciousness.

Furthermore, it should foster curiosity and the pursuit of knowledge, thereby facilitating a deeper understanding of complex issues. It should function as a catalyst for learning and personal growth, offering access to vast amounts of information, educational resources, and opportunities for skill development.

Moreover, the OMB AI innovation should actively contribute to ethical decision-making by equipping individuals with the necessary tools to assess ethical dilemmas, contemplate consequences, and make principled choices. Rather than imposing a specific moral or ethical framework, it should serve as a valuable resource for individuals to explore and develop their moral and ethical perspectives.

Q4: Generative AI can provide real-time translation services for immigrants who don't speak English, improving communication between them and immigration officials. This ensures immigrants understand their rights and obligations.

It can analyze patient data to predict health risks, recommend personalized lifestyles to avoid treatment, and remotely monitor patients for early detection of health issues. This technology offers the opportunity to train the public in a systematic approach to their health.

Additionally, generative AI can be used to analyze historical data to predict the likelihood of an immigrant being approved for a visa or other immigration benefits. This can enhance the decision-making process and minimize the risk of arbitrary or discriminatory decisions.

Q8: Including information about whether compensation is provided in perpetuity ensures that agencies take into account the sustainability of their data sources. This consideration is crucial for maintaining data availability over the long term.

Additionally, specifying the type of data used in AI applications promotes transparency. It enables stakeholders, including the public, to comprehend the extent and character of data-driven initiatives.

Furthermore, emphasizing compensation arrangements reflects a commitment to ethical data practices. It plays a vital role in guaranteeing that data contributors receive fair treatment and that their rights are upheld.

I, the author of this document, hereby release it into the public domain. This applies worldwide and allows anyone to use this document for any purpose, without any conditions, unless such conditions are required by law

Subject: Protect Civil and Human Rights When the Federal Government Uses Artificial Intelligence -- Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (Document ID: OMB-2023-0020-0001)

To OMB Director Shalanda Young, Director and U.S. Federal Chief Information Officer Clare Martorana:

I strongly urge the Office of Management and Budget (OMB) and other federal agencies to use all of their powers and resources to ensure that the harmful effects of artificial intelligence (AI) are limited when developed, procured, or used by the federal government—and that the government provides meaningful transparency and publicly available information about the ways our government uses AI so that we have more power to regulate, push back on harmful uses, and limit AI use in the future. In every use case, protecting civil rights must be the top priority.

There are some strong pieces of the OMB guidance that I urge you not to rollback as this process moves forward. The requirement that agencies meet minimum practices for rights-impacting and safety-impacting AI is very important in addressing my concerns around bias and discrimination in AI, and I urge you to keep these strong requirements and ignore pressure to weaken this guidance.

There are a number of areas where this guidance, and future AI policy documents, must be improved:

* The Executive Order on AI did not do enough to address law enforcement agencies and the use of AI on

immigrant communities, which are some of the spaces where AI has already been shown to have serious negative impacts. I was glad to see that the OMB guidance did include law enforcement under the covered agencies, and strongly urge you not to change this. We must establish strong policies to address law enforcement use of AI, and to limit use to mitigate harms.

* Some AI is too dangerous to be used, and any possible benefits are outweighed by known harms. Facial recognition is an AI-enabled biometric technology that infringes on the right to privacy to such a degree that it should not be used at all by the government, and this guidance should ban its use by government agencies.

* The guidance does not establish enough data privacy protections. Because AI is reliant on data the opportunity for data abuses is high, and ensuring strong privacy protections must be a top priority. While there is a need for Congress to pass comprehensive data privacy protections, the OMB should use this guidance to establish data privacy policies when government agencies develop, procure, or use AI.

* The minimum practices for safety-impacting and rights-impacting AI require agencies to stop using an AI when the "risks to rights or safety exceed an acceptable level," but the guidance both gives agencies an option to skip determining an AI system's risk, and also doesn't specify what an "acceptable level" is. In these safety- and rights-impacting cases the consequences of the use of AI are so high that the OMB must set a very limited acceptable level of risk and ensure that all agencies using AI comply with this requirement.

* The minimum practices should also apply in cases where federal funds are used to purchase AI systems, including government grants. This would better protect civil rights in even more situations, including at the state and local levels.

* All information reported by agencies in their annual use case inventory should be made publicly available, to allow for as much public scrutiny and transparency as possible. This is critical for ensuring that the public, as well as experts in civil rights, have the opportunity to critically assess the use of AI by the government.

While there may be uses of AI that can benefit the federal government, I call on the OMB to focus on protecting against the harms of AI your top priority in this guidance.

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish
San Rafael, CA

General Comment

I'm an application security analyst who took classes on AI in college, and wanted to leave some comments.
Safeguards wise (points #4 and #6), I'm more concerned even before we get to AGI (even dumb algorithms make very bad choices) about the following:
1. environmental impacts (water and electricity used in creating chips, and water and electricity used in running datacenters), mandates on % green?
2. rights of copyright holders whose data was trained on. notice of data subjects that their information was used in a training set. ability to remove it as part of privacy law. similar to "one click" laws or similar ease to unsubscribe/delete account, or a legally binding do not track, or just national unified privacy legislation.
3. labeling and notice of AI data to people who read/consume it
4. possibility of recourse or appeal for incorrect judgements by AI (e.g. speak to a human, no penalties or extra fees for doing so)
5. responsible disclosure policies for vulnerabilities and biases of AI (similar to SEC guidelines for corporations)
6. adequate red team testing of AI systems (in general, not just AI)
7. certification/precheck agencies (similar to the FDA) for code (in general, not just AI)
8. response/safety boards (similar to crash investigations for aviation)

Organization: Professional Services Council

General Comment

On behalf of the Professional Services Council (PSC), I am pleased to submit comments on the Office of Management and Budget (OMB) "Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum," as published in the Federal Register on November 3, 2023. In accordance with the Biden Administration's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence, "OMB has prepared a draft memorandum that would direct Federal agencies to strengthen their AI governance and innovation programs while managing risks from the use of AI, particularly when that use affects the safety and rights of the public."

As you may know, PSC is an industry association with more than 400 member companies—small, mid-sized, and large—that provide much-needed technology and professional services to all federal agencies. These companies and their workers throughout America and around the world are equally as committed to U.S. Government missions as federal civilian and uniformed personnel. PSC supports our members and their federal government customers by promoting effective government practices and policies, improvements in federal contracting, and constructive dialogue between government and industry. We anticipate that government policy decisions around AI's application in the broader commercial environment—and how those decisions will impact government missions—will affect the federal contracting community.

With that in mind, the federal government must get its approach to AI policy on a good path from the outset: that policy will impact both the federal programs that create requirements, issue contracts and task orders, and assess performance on desired outcomes and those companies that offer and deliver solutions to their federal customers. OMB's eight questions within the request for comments reflect a good starting point for a broad dialogue regarding the effective development, use, and management of rapidly evolving AI technologies. We look forward to additional opportunities to provide industry perspectives as the government refines its policies and guidance regarding AI use cases. PSC respectfully offers to help facilitate substantive engagements between your office and industry as appropriate and to help deepen understanding between public and private sector officials regarding the possibilities and potential limits of AI use going forward.

Specifically with regard to those eight OMB questions within the Federal Register notice, PSC offers a range of comments below that reflect PSC member company feedback. We acknowledge that perspectives in this fast-changing area of AI technologies may evolve as we learn more about AI tools and explore their uses, and we again note that OMB's questions represent a solid starting point to these discussions.

Please see attached letter for these specific comments.

General Comment

Two comments on the draft guidance are below, based on my academic research on the history IRBs and science regulation - as a professor at Vanderbilt University.

Regarding question 2: What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?
--The federal government should establish NEW AI governance bodies, rather than update the scopes of existing agencies (eg OHRP). The organizational structures and missions of existing agencies were designed to address specific concerns. AI offer a different regulatory challenge, holds substantial potential for harm, and requires new, dedicated agencies.
-- For evidence, see Behind Closed Doors: IRBs and the Making of Ethical Research (by Laura Stark, PhD)

Regarding additional concerns: Agencies guidelines must include reporting on environmental impacts of generative AI industries. Environmental impact statements are essential given the intensity of energy and water use to compute at scale.

Re: Request for Comments on Draft Memorandum – *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*, OMB-2023-0020, Comments of Policing Project at New York University School of Law

The Policing Project is a nonpartisan center at New York University School of Law dedicated to promoting public safety through transparency, equity, and democratic engagement. We submit this comment in response to the Office of Management and Budget's (OMB) Request for Comments (RFC) on its draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" or "the Guidance."

Our comment focuses on the application of the Guidance to law enforcement and makes six key points:

(1) If adopted as drafted, the Guidance would provide much needed transparency and accountability over federal law enforcement agencies' use of AI and would serve as a model framework for responsible and equitable use of this technology at all levels of government.

(2) The minimum practices identified for safety- and rights-impacting AI would establish essential safeguards, but the waivers provision should be revised to ensure waivers for law enforcement agency purposes are limited and subject to oversight.

(3) To ensure transparency and accountability over law enforcement agency compliance with the required minimum practices, the Guidance should require agencies to publicly document implementation in the AI use case inventory and should narrowly apply any law enforcement exemptions to this public reporting.

(4) The list of presumptive rights-impacting AI purposes should be revised to include law enforcement use of robots and drones and to ensure application to future rights-impacting law enforcement tools.

(5) For agencies with law enforcement components, the qualifications for the Chief AI Officer should include expertise in the protection of civil rights and civil liberties.

(6) OMB should encourage federal agencies to review the extent to which they can promote adoption of the Guidance by state and local law enforcement agencies that receive federal funding.

Where applicable, we note in the text of our responses the number of the RFC question to which we are responding.

I. Background on the Policing Project

The Policing Project is a nonpartisan, nonprofit center at NYU School of Law. We conduct research and also do work on the ground all over the country, with policing agencies and with the communities they serve, with the federal, state, and local governments, and with technology venders, to promote democratically-accountable and equitable policing. Our mission is to promote "front-end, accountability," which means the public has a voice in setting transparent, ethical, and effective policies and practices *before* policing agencies or government act.

One of our primary focus areas is the use of emerging technologies by policing agencies. Increasingly, this means AI-powered tools and systems. We have spent countless hours researching and discussing AI-powered policing technologies with racial justice and civil liberties advocates, technologists, and policing agencies themselves. We have developed numerous resources dedicated to promoting the sound governance of AI-powered public safety technologies, from a model statute regulating automated license plate readers (ALPRs) to regulatory frameworks for police use of facial recognition technology (FRT) and robots.[1] From 2019–2022, we staffed the Axon AI Ethics Board, an independent review board that guided and advised Axon, the developer of TASERS and the country's largest producer of body-worn cameras, around ethical issues related to the development and deployment of AI-driven policing technologies.

Our Comment draws on our deep study and past work on AI policing technology and our fundamental belief that adoption and use of these tools must be guided by democratic legitimacy, a commitment to racial justice, and an imperative to minimize harm.

II. The Guidance takes a major step toward establishing the federal government as a model of sound AI governance

As President Biden's AI Executive Order noted, AI "holds extraordinary potential for both promise and peril."[2] Perhaps nowhere is this more true than with regard to law enforcement use of AI. Although there may be real public safety benefits to law enforcement adoption of this emerging technology, sound governance is absolutely essential to mitigate the real risks to liberty, equity, and racial justice that are unique to policing agency use.

Unfortunately, as is the case with many emerging technologies, law enforcement agencies have rushed ahead to use AI with little transparency and even less in the way of regulation or authoritative guidance on responsible use. Federal law enforcement is no exception – instead of serving as a model of accountable adoption and use of advanced technologies, it has deployed AI systems without adequate privacy protections or even any policy or training in place.[3] This unfettered use in a context as high-risk as law enforcement already has led to real harms to the public's civil rights and liberties – from false arrests to

[1] Regulating Use of Technology in Policing, Policing Project, https://www.policingproject.org/policing-tech-landing.
[2] Exec. Order No. 14110, 88 FR 75191 (2023), Sec. 1.
[3] *See, e.g.*, U.S. Gov't Accountability Off., GAO-23-105607, Facial Recognition Services: Federal Law Enforcement Agencies Should Take Actions to Implement Training, and Polices for Civil Liberties (Sept. 2023), https://www.gao.gov/assets/gao-23-105607.pdf (finding multiple federal law enforcement agencies use facial recognition technology without any policies or guidance in place to address civil rights and civil liberties, fail to fulfill privacy requirements, and do not require staff training on these systems).

excessive use of force.[4] What is needed instead of this rush-to-deploy model is rigorous study, stepwise adoption, public accounting of these technologies' benefits and costs, enforceable safeguards to mitigate risks to civil rights, racial justice, and civil liberties, and a commitment to abandoning systems and tools that do not advance public safety and equity. In other words, what is needed is a model of sound governance of AI.

This Guidance would represent a giant step in the right direction. It is precisely the sort of regulatory framework that long should have been in place around law enforcement use of emerging technologies, whether AI-driven or not. In the sections that follow, we highlight several ways in which its provisions would benefit from revision. But first we want to emphasize the critical protections it already establishes:

- It sets out a comprehensive list of AI applications presumed to be safety- and rights-impacting that explicitly includes key law enforcement use cases (pages 11-12).

- It establishes an appropriate baseline of minimum practices for safety- and rights-impacting AI that applies to federal law enforcement agencies, containing meaningful and enforceable safeguards that address the entire AI lifecycle (pages 15-18):

  ⇒ Pre-deployment, it requires agencies to conduct impact assessments, including cost-benefit analysis that requires demonstrating actual benefit as a condition to adoption.
  ⇒ It mandates real-world testing and independent evaluation of AI. As a result, the public would no longer need to rely on anecdotal evidence of AI's impact, but would have access to real data about whether or how well or poorly these systems work.
  ⇒ By requiring ongoing monitoring, it recognizes that compliance cannot be a static practice for these ever-changing systems.

- It also recognizes the need for additional requirements to ensure rights-impacting AI advances equity, dignity, and fairness and incorporates feedback from affected groups (pages 18-19).

  We were especially heartened by the call for engagement with affected groups. Our work in the policing context repeatedly has demonstrated that engaging with impacted communities is both necessary and practicable. For example, we run a grassroots program in Chicago that connects residents with patrol officers to provide feedback on neighborhood safety priorities.[5] We served as consultants to the federal monitor for the Cleveland consent decree.[6] We also have conducted community-based research on non-police alternate first response in cities across the country.[7] In all of these cases, and more, community feedback has proven invaluable and vital to improving public safety policy.

Crucially, these substantive requirements are enforceable. Agency compliance is mandatory and must be documented; use must stop if the AI system does not satisfy these conditions. This is what meaningful transparency and accountability look like.

Although we have suggestions for strengthening the Guidance, we fully appreciate the steps this Guidance represents to establish the federal government as a model of sound AI governance. We can only hope this model diffuses to state and local law enforcement agencies.

III. Strengthen the minimum practices for safety- and rights-impacting AI by adding oversight and narrowing the waivers provision (Question 6)

The Guidance's current minimum practices for safety- and rights-impacting AI would establish an impressive baseline of transparency and accountability for federal agency use of AI, but as applied to high-risk law enforcement use cases, the waivers provision must be revised to reduce discretion and ensure waivers only are granted in the presumably extremely rare circumstances in which they are warranted.

By granting sole authority to each agency's Chief AI Officer (CAIO) to waive requirements even for high-risk applications, the Guidance gives this official too much discretion. To ensure accountable decision-making, the Guidance should require additional sign off for waiver requests, especially for high-risk law enforcement applications of AI. At least in law enforcement contexts, the system-specific risk assessment required by the waivers provision should include a determination of the risk level presented by the use. If this determination reveals that the risk is anything other than low, then a CAIO waiver request should be subject to additional review, by, for example, the agency's civil rights office or OMB.[8] Because waivers outside of low-risk applications should be the exception not the rule, the administrative burden of this external check should be minimal.

OMB must narrow the qualifying conditions for issuing waivers, especially as applied to high-risk law enforcement applications. Currently, the Guidance permits waivers for any situation that represents an "unacceptable impediment" to "critical agency operations" without defining or limiting these key terms.[9] In our experience, law enforcement tends to think everything it does is "critical," and any safeguards are "unacceptable." We suggest revising this provision in two ways. First, the Guidance should constrict the qualifying criteria for high-risk law enforcement applications to permit waivers only when a requirement "*would create an insurmountable impediment to critical agencies operations and the system-specific risk assessment demonstrates that the risks of not fulfilling the particular minimum requirement do not outweigh the benefits*." In addition, OMB should require public documentation of the waiver determination to ensure transparent and accountable use of exemptions.

IV. Strengthen the AI use case inventory requirement (Question 8)

(1) Require agencies to publicly document implementation via the use case inventory

To ensure transparency and accountability over agencies' minimum practices implementation, OMB should require agencies to publicly document compliance in the AI use case inventory. Although the Guidance currently provides several options for how agencies might document their implementation, it does not require any particular method (page 13). This choose-your-own adventure approach to documentation will make it difficult for the public to assess compliance across agencies. Instead, OMB should mandate public documentation of implementation as part of agencies' annual AI use case inventory. Doing so will ensure that implementation of the key transparency and accountability measures set forth by the minimum practices are made public and will establish the use case inventory as a comprehensive public record of agencies' AI use.

[8] Civil Rights Offices of Federal Agencies, Dep't of Justice, https://www.justice.gov/crt/fcs/Agency-OCR-Offices.
[9] OMB AI Guidance, Sec. 5(c)(iii).

(2) Narrowly apply any law enforcement exemptions for safety- or rights-impacting AI disclosures in the use case inventory

The Guidance appears to take important steps to build on Executive Order 13960's annual AI use case inventory by requiring agencies to "report additional detail on how they are using safety-impacting and rights-impacting AI."[10] This is essential because federal agency compliance with EO 13960's AI use case inventory has been inconsistent at best and entirely deficient at worst.[11] And federal law enforcement agencies have been some of the biggest offenders on this score. For example, DOJ's most recent disclosures consisted of one page of information, listing a single use of AI by the FBI for a "threat intake processing system" to analyze crime tips.[12] This single page contains no disclosure related to the FBI's use of facial recognition technology despite the fact that the Bureau has been using this AI-powered technology for criminal investigations for almost a decade.[13] And there are zero disclosures for several other DOJ law enforcement agencies' use of facial recognition – from DEA to ATF to the U.S. Marshals – even though a recent Government Accountability Office audit reported significant use of this technology by each of these agencies. To effect the clear transparency and accountability goals of the Guidance, OMB should require that federal law enforcement agencies publicly disclose their use of safety- or right-impacting AI and their compliance with the minimum practices in the use case inventory.

And to ensure meaningful compliance by law enforcement agencies with AI use case disclosures—rather than the lackluster compliance we've seen to date—OMB should revise the equivocal language used to describe disclosure requirements and ensure law enforcement exemptions are interpreted extremely narrowly. For example, in a number of places, the draft Guidance establishes a "practicability" standard for whether or not to require use case disclosure.[14] Similarly, in several places, the Guidance specifically exempts "sensitive law enforcement" information.[15] This language creates too much leeway for law enforcement agencies to disclose the bare minimum or even entirely avoid disclosure. In our experience, law enforcement often employs a broad interpretation of what information is "sensitive" and a narrow interpretation of what is "practicable" to disclose publicly. As noted above, past practice specifically related to federal law enforcement compliance with the AI use case inventory supports this. But in truth, there should be almost no instance in which it is impractical to disclose a description of the use and capabilities of an AI system – including in the law enforcement context.[16] A use case inventory is a non-case-specific

[16] *See* Barry Friedman & Maria Ponomarenko, Democratic Policing, 90 N.Y.U. L. Rev. 1827, 1884-85 (2015) (discussing law enforcement objections to transparency and observing that "the need for secrecy is not nearly as acute as it may seem. . . ." and distinguishing between details related to specific investigations, which have a rightful claim to secrecy, and details related to use of tools or techniques which "can be made public and publicly debated without undermining law enforcement interests").

accounting of system functionality. It is not a revelation of tactical plans or sensitive information about a particular investigation. Therefore, substantive public disclosure of the information required by the minimum practices should be the default.

We make two final recommendations to ensure the use case inventory is useful and used. First OMB should ensure these inventories contain sufficient detail to enable the public to evaluate the impact of an agency's AI use. This means agencies should be required to disclose the vendor(s) for any safety- or rights-impacting AI. We also join the recent recommendations by a coalition of civil rights and tech policy groups that the AI use can inventory include additional detail about demographic information on AI system use and outcomes.[17] Second, we recommend that OMB direct agencies institute a public complaint process that individuals or organizations can use if they believe an agency has not sufficiently documented, reported, or implemented a required minimum practice.

V. Supplement the law enforcement purposes presumed to be rights-impacting (Question 5)

The Guidance's list of presumed safety- and rights-impacting purposes is a strong start. The explicit inclusions of law enforcement use of facial recognition technology and other biometric tools, person-based and place-based predictive policing, and license plate readers are especially important. As noted above, these AI tools already have been the source of false arrests, unnecessary uses of force, and due process violations.[18]

To ensure the Guidance adequately captures high-risk law enforcement applications, we recommend two additions to the list of rights-impact AI. First, OMB should amend the rights-impacting list to include high-risk law enforcement applications of aerial vehicles (or drones) and robots. Although robotics (though not drones) are listed under "safety-impacting" purposes, the risks presented by law enforcement use of these tools stretch beyond the physical risks that this category seeks to protect. Drones and robots both have significant AI-powered surveillance capabilities that can present serious risks to the public's civil rights and liberties from privacy to free expression to racial discrimination. For example, policing agencies—including federal agencies—have used drones to surveil peaceful protests and to disproportionately monitor communities of color.[19] And police use of these tools is only increasing.[20] Both tools merit explicit inclusion in the "rights-impacting" list along with the AI-powered surveillance tools already present.

Second, because policing technology always is evolving, we recommend adding language to subsection 5(b)(ii)(B) that focuses on the capability of concern rather than just the specific device. Specifically, we would add a clause to cover law enforcement use of "any AI to identify criminal suspects and track or monitor individuals." Today, we rightly are concerned with law enforcement's ability to use specific AI-powered surveillance tools like facial recognition technology or license plate readers. But there is no predicting which new tools are coming down the pike tomorrow that will serve similar purposes. It is essential that the Guidance is flexible enough to cover future developments.

VI. Ensure CAIOs have civil rights and civil liberties expertise (Question 1)

OMB should amend the Guidance to require that the CAIO in agencies with law enforcement components have expertise in civil rights and civil liberties. When it comes to a high-risk context like law enforcement, this official must be qualified to assess the unique ways in which AI in policing can amplify harms to racial justice and individuals' civil rights and liberties. In policing, AI's oft-touted productivity gains have the potential to translate to more state-sponsored surveillance and over-enforcement in certain communities, often communities of color. To guard against these unique risks, we recommend the Guidance explicitly include expertise in civil rights and civil liberties as a necessary qualification for agencies with law enforcement components.

VII. Support sound AI governance through grantmaking (Question 3)

If implemented as currently drafted, the Guidance eventually should make the federal government a model of AI governance. This is no small accomplishment, but limiting its scope to federal agencies would represent a missed opportunity – especially when it comes to law enforcement. Law enforcement in particular remains largely a creature of the states. There are over 18,000 law enforcement agencies at the state and local levels compared to 83 at the federal.[21] And, relevant to this discussion, two things are true about many of these state and local law enforcement agencies: (1) many of them have been using AI systems ranging from facial recognition to ALPRs to predictive policing for years without any regulation or guidance in place; and (2) many receive federal funding to support their operations.

The Guidance should encourage federal agencies to use their grantmaking authority to apply these principles to state and local law enforcement agencies that receive federal funding and support. The federal government regularly uses funding as a carrot to achieve state and local compliance with rules like these. Just last year, President Biden's Executive Order 14074 on policing required the Attorney General and Secretary of Homeland Security to review and exercise their authority to award federal grants and provide support to state and local law enforcement based on adoption of the policies established in that Order.[22] OMB should direct agencies to engage in a similar review process to determine how the Guidance's provisions might be extendable to state and local law enforcement. By supplementing the Guidance with this requirement, OMB has an opportunity to ensure that its sound AI governance practices will apply to some of the most frequent users of safety and rights-impacting AI: state and local law enforcement agencies.

Thank you for the opportunity to comment.

NASCIO AI Comment Letter

December 4, 2023

Shaun Donovan, Director
Office of Management and Budget
725 17th St NW
Washington, DC 20503

Director Donovan:

The National Association of State Chief Information Officers (NASCIO) is the collective voice of the nation's state and territorial chief information officers, chief information security officers and chief privacy officers. Our mission is to foster government excellence through leadership of quality business practices, information management and technology. Today I write to share our feedback on the Office of Management and Budget's (OMB) draft memorandum, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* (OMB-2023-0020-0001.)

We are encouraged that our federal partners are working to address the increasing use of artificial intelligence (AI) in the operation of government. The proliferation of this technology will have a tremendous impact on how citizens interact with government at all levels and for almost all services. As a result, states have not waited for federal action before developing their own robust strategies to govern their use and deployment of generative AI technologies.

The policies enacted by states thus far have been developed with input from numerous stakeholders, including citizens groups, elected representatives, private industry, thought leaders in the AI field and others. They showcase efforts to integrate AI into state government operations in a way that maximizes the benefit of this burgeoning technology, while still addressing concerns over data protection, ethical usage, cybersecurity, and other harmful ramifications that can result from a misuse of AI.

As you work to finalize this memorandum, we urge you to consider how these policies will impact state government, to incorporate existing state AI best practices into your own procedures and collaborate with states on how these policies will be implemented. In doing so, we can ensure that the federal government's AI policy does not create inefficient duplicative regulations, harm state efforts to develop solutions that meet their unique needs and cultivate citizen trust in government application of AI.

We appreciate the opportunity to provide feedback on this important issue. We would also extend an offer to discuss any of the points mentioned above in greater detail with our members at your convenience. Please contact Alex Whitaker, Director of Government Affairs at NASCIO, at awhitaker@nascio.org if you have any questions.

Thank you,

Doug Robinson
Executive Director
NASCIO

ARTIFICIAL INTELLIGENCE

ENGINEERING YOUR AI FUTURE

RFI RESPONSE: ADVANCING GOVERNANCE, INNOVATION, AND RISK MANAGEMENT FOR AGENCY USE OF AI (88 FR 75625)

Prepared by Booz Allen Hamilton (BoozAllen.com/ai)

CONSULTING | ANALYTICS | DIGITAL SOLUTIONS | ENGINEERING | CYBER

INTRODUCTION

Trusted to transform missions with the power of tomorrow's technologies, Booz Allen Hamilton (Booz Allen) advances the nation's most critical civil, defense, and national security priorities. As the leading provider of AI services to the Federal Government[1], we lead, invest, and invent where it's needed most—at the forefront of complex missions, using innovation to define the future. We combine our in-depth expertise in AI and cybersecurity with leading-edge technology and engineering practices to deliver impactful solutions. Combining more than 100 years of strategic consulting expertise with the perspectives of diverse talent, we ensure results by integrating technology with an enduring focus on our clients.

Booz Allen is pleased to submit our response to the Office of Management and Budget's (OMB) Request for Information on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (88 FR 75625). We value the opportunity to provide input to the Administration as it undergoes this critical effort to implement Executive Order 14110 and stand ready to engage further with OMB to chart a path for the United States to both harness the extraordinary benefits of AI and mitigate the technology's risks.

OUR RESPONSE

Question 1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

To fully realize this objective – and ensure that agency Chief AI Officers (CAIOs) can fulfill their responsibilities and requirements indicated – we recommend that OMB's guidance focus more concretely on two areas: capacity and budget.

First, on the capacity of CAIOs: By including the option that "agencies may choose to designate an existing official," while only stipulating "...providing they have significant experience in AI and meet the other requirements in this section" (OMB: 3.b.i), we perceive a risk that agencies will designate these new and critical responsibilities to officials who may lack the necessary capacity to absorb them. We suggest incorporating a specific requirement that existing officials designated for this new role must have adequate capacity (and potentially defining/suggesting what this practically entails) in addition to having "significant experience in AI."

Second, on the budget: We recommend shifting the guidance in section three that "the head of each covered agency must also consider the necessary financial [and other] resources..." to a more explicit requirement to designate a specific budget for the CAIO and/or supporting staff. This may be built into the agency's AI strategy and accompanying financial plan, or specified elsewhere. But without a dedicated budget – especially in combination with the risk of CAIOs facing capacity challenges – we fear that a majority will be unprepared to fulfill this critical role for their agencies. CAIOs should have clear and sufficient support from both the heads of their agency and the administration to support the requirements set forth in this memo.

Question 2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

[1] GovWin IQ, Federal Artificial Intelligence Landscape, 2024, https://tinyurl.com/yk89knwh

A *benefit* of a new body that is focused exclusively on AI Governance is that it ensures the necessary experts convene in a forum dedicated to this already monumental body of work. And that existing - and equally important - priorities can be executed, without conflict, in more relevant standing forums.

The major drawbacks include a risk that AI Governance will wind up being "bolted on" to existing structures, rather than "built in" to existing structures, which can often be the more practical and useful approach. Additionally, introducing a new body adds an additional layer of responsibilities that will be levied on an already-saturated group of agency executives. And more generally, standing up a new AI Governance body is a non-trivial task, including major body of a significant work in resourcing, staffing, etc.

Ultimately, regardless of whether the AI Governance Body is formed as a new organizational entity, an updated scope to an existing group's responsibilities, or even potentially some hybrid, we recommend including guidance to fully recognize and account for the need to allocate substantial time, resources, and capacity across the teams. This will ensure the requirements put forth in this guidance can be met in a way that is integrated into existing structures, authorities, etc.

Question 3. How can OMB best advance responsible AI innovation?

Section four outlines a practical and useful approach to both advancing Responsible AI innovation and removing barriers to the responsible *use* of AI (separate but related things). Building on this checklist, we think that OMB can most effectively advance responsible AI innovation in several additional ways:

RAI remains an unfunded mandate until Congress acts. In light of that, we submit that it will be important to leverage the government's purchasing power by having RAI as a distinct, scoreable component for all acquisition processes. This will ensure a race-to-safety dynamic among vendors in the bid process, driving competition on *measurably* responsible AI systems and not perfunctory statements on safety and risk management.

To ensure that risk management requirements don't discourage innovation and early experimentation, we suggest providing guidance that differentiates requirements between levels such as: R&D/prototyping; piloting/testing; and production.

In order to enable progress and encourage standardization, OMB should provide agencies with templates and examples of the key documents, user guides, and lessons learned across these critical areas for CAIOs to engage their agency stakeholders. The OMB and the Interagency Council should work to enable CAIOs through sharing and re-use where applicable.

Finally, to advance responsible AI innovation in practical and tangible ways, we recommend focusing on three questions:

(1) What is the maximal good that AI can do for my [Mission/Project/Citizen Service/etc.]?
(2) What are the potential risks in using it this way?
(3) How can I mitigate these risks so that the maximal good can be achieved?

We believe this is a more balanced and straightforward way of identifying the mission-critical nature of an AI system's use, the risks this use entails with the right amount of context and specificity, and therefore the most appropriate way to design, deploy, and manage the risks of that system in an agency's governance process. This would also be consistent with the guidance for each agency to develop an AI strategy for their mission set with an AI-first posture. This mission-focused approach will ensure that both innovation and risk management are pursued in the right ratio in the right scenarios.

Question 4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Generative AI has the potential to act as a force multiplier across a variety of agency missions and business operations. With organizations as large as U.S. Government agencies, even incremental productivity gains could yield billions of dollars of efficiencies on an annual basis. OMB should continue to monitor the commercial industry for successful paths to organizational adoption of this technology, potentially soliciting RFIs to understand best practices and proven techniques to manage this transition most effectively. While considering further applications, OMB may also review work under the DoD's Task Force Lima that is gathering over 180 use cases and categorizing prospective applications into 16 high level functional areas. Most categories are applicable to *any* government agency and can be reused to identify applications relevant to a specific organization.

Question 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

As society evolves, AI's capabilities and uses will evolve, as will their rights- and safety-critical risks. Therefore, we recommend a combination of proscribed use cases (like the ones currently outlined in the memo) and a deliberate *process* to determine the next generation of use cases that agencies should consider rights- and safety-impacting. We also recommend including a requirement for any AI risk and impact assessment to include sociotechnical risks (e.g., differentiated regional impact, environmental impact, economic distortions, etc.), where the majority of the net new rights- and safety-impacting risks will originate.

NIST and/or OMB may want to consider standing up a shared repository for these use cases to be added to, adjudicated, and discussed across agencies over time and in a systematic way. The objective of such a repository would be to provide a body of shared knowledge and understanding to accompany an agency's AI registry that would inform, and allow coordination on, government-wide risk tolerances and collective adjudication.

Additionally, we recommend the criteria for "minimum practices" (5.c.iv) make a clearer distinction between two dimensions: type and severity. For example, "safety impacting" and "rights impacting" are *types* of risks. But depending on the use case, type does not necessarily mean *high risk*. We think adding a separate "risk severity" dimension, therefore, would be useful to most accurately assess the risk profile of an AI use case. Our experience has shown that the severity of an AI system's risk will range significantly across the types of use cases identified in the OMB guidance and, at times, even *within* a specific use case. This will better determine the nature of the "minimum practices" to be followed by an agency (i.e., a high risk, safety-impacting AI should, of course, have more rigorous "minimum practices" than a low risk AI system, even if it falls within a safety-impacting category).

Lastly, we recommend removal of the word "Termination" from this Section (5.a.i), as this could be substituted with an equivalent action (e.g. – "Ceasing") without the negative connotation.

Question 6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

In addition to the minimum practices indicated, we would suggest a number of tactical recommendations for consideration:

a) For (OMB: 5.c.iv.C), we recommend risk and impact assessments be included as a core component/gate of an ATO process. For example, implementing an ATO process focused on measurably responsible AI would ensure that risks are understood, addressed, and adjudicated at the appropriate points in the AI development lifecycle. Borrowing from and adapting existing processes such as an ATO are an emerging best practice that we recommend be adopted, if not required, for all AI projects (or at least those determined to be rights- or safety-

impacting). We also recommend that "human review" outlined in (OMB: 5.c.iv.D) take the form of a risk and impact assessment described here.

b) For (OMB: 5.c.iv.F.), we recommend that human-machine teaming be a core focus area/body of research of the AI Safety Institute. Specifically: the modeling and understanding of how human-machine teams produce emergent behavior and how we can better predict and control for that in critical operational scenarios. This is a body of research that mostly does not exist or is extremely immature relative to the need and safety-impacting nature of human-machine teams. The guidance in (OMB: 5.c.iv.G) is a good example of this type of research.
c) To the "before using new or existing covered safety-impacting or rights-impacting AI practices" (OMB: 5.c.iv), we suggest adding a requirement to determine a plan for what the *ongoing monitoring* (in the "while using" AI section) will consist of for each specific safety- or rights-impacting AI system. For example, who will be responsible, what cadence/frequency will be utilized, and what metrics/thresholds will be considered.
d) In conjunction with this guidance (OMB: 5.c.iv.A.2), "The expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, agencies should not use the AI," we recommend considering specifying the parties who need to be involved in adjudicating this decision as well as specifying a requirement to document that decision.

Question 7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Centralized contractual guidance from OMB will be important to yield consistent and effective AI implementation across the Federal government. In particular, for the action directed under "Recommendation on AI Documentation" (5.a.ii), industry would benefit from a period of public comment on the recommended documentation before incorporating into Federal AI contracts. Materials such as model, data, and system cards (5.d.ii.A), as well as test and evaluation documentation to support performance claims, will be critical to enabling the government's independent evaluation and oversight of AI.

OMB may consider the concept of an "AI Bill of Materials" to require specific documentation of AI component parts, which could help acquiring agencies make more transparent procurement decisions. AI vendors have not been required to provide this level of information heretofore, which would necessitate an industry pivot and benefit from public comment. These changes could lead to greater observability and auditability for the government, which would increase insight into the rights- and safety-impacting dimensions of AI systems.

Lastly, resources such as performance criteria that incentivize vendors and contractors to demonstrate responsible AI development will be necessary during the acquisition and delivery phases. OMB should develop and provide clear language and training to agencies on how to assess and score companies' ability to provide Responsible AI.

Question 8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

In addition to the information currently being collected and reported, we suggest all parties would benefit from agencies including in a structured data format (i.e., specific options to choose from versus open text fields) the following:

a) Their assessment of the level and nature of potential safety risks for their AI use cases. This could include an aggregate risk level (i.e., high, medium, or low), an indication of whether the use case is one that is safety-impacting, rights-impacting, both or neither, etc.
b) An indication of who the users/impacted parties are for each use case (e.g., is the use case intended to serve/benefit internal agency resources, members of the public, etc.).
c) An indication of the intention for the AI in the use case (i.e., this information is often included in the overall description of the use case, but it would be helpful to have the information in its own field).

About Booz Allen

Booz Allen Hamilton has been at the forefront of strategy and technology for more than 100 years. Today, the firm provides management and technology consulting and engineering services to leading *Fortune* 500 corporations, governments, and not-for-profits across the globe. Booz Allen partners with public and private sector clients to solve their most difficult challenges through a combination of consulting, analytics, mission operations, technology, systems delivery, cybersecurity, engineering, and innovation expertise.

Defense Unicorns AI Policy Public Comments

Public Comments on Proposed Policy "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"

I am writing on behalf of Defense Unicorns, a leading provider of platform technologies that empower rapid and reliable delivery of capabilities across diverse mission areas. Our team comprises dedicated and experienced innovators, software engineers, and veterans with a wealth of experience in technology programs within the Department of Defense and the broader federal market. One of our product offerings, AI for National Security (AI4NS), provides a suite of generative AI capabilities to improve understanding of complex mission data and accelerate decision-making that can be deployed to classified or air-gapped environments. Like all Defense Unicorns products, AI4NS is built on our foundation of open-source software to ensure flexibility while avoiding vendor lock-in. AI4NS is one of many products built by small companies that will be impacted by federal policy regarding AI.

While the proposed policy states an objective to "seize the opportunities AI presents," we believe its near-exclusive focus on risk prevention will contribute to a culture of inaction and indecision that risks harm to the security and advancement of our nation. As a company deeply invested in the success of government technology programs, Defense Unicorns offers the following recommendations to better align the proposed policy with its own stated goals and the goals expressed by the Artificial Intelligence in Government Act

of 2020, the Advancing American AI Act, and President Biden's Executive Order of October 30, 2023:

Include Examples of AI Applications that are *Not* Rights or Safety Impacting: While the policy justifiably provides substantial focus on limits for AI applications that are rights-impacting and safety-impacting, we encourage the memo to also provide clear examples of AI applications that are *not* considered rights-impacting or safety-impacting. By delineating an *illustrative* list of areas where AI can be used with fewer regulatory constraints, the policy can foster innovation and lower barriers to entry for small companies. Examples could include -

- **Administrative Automation**: AI designed for routine administrative tasks such as scheduling, document management, and basic data entry. These applications typically do not involve decision-making that affects individual rights or public safety and often have a positive impact on job satisfaction.
- **Predictive Maintenance in Non-Critical Systems**: AI designed for predictive maintenance of equipment or systems, where failure does not pose a direct threat to safety or significant operational disruption.
- **Assistance Troubleshooting Technical Tasks**: AI tools designed to assist skilled workers in things like debugging software, understanding complex equations, or drafting technical documents.
- **Drafting or Research Assistance**: AI designed to analyze internal data and policies to aid employees in finding relevant documents and information among government data.

Take Steps to Limit Over-Regulation and Reduce Impacts on Small Businesses: Regulation has a disproportionate impact on small businesses

that do not have the large legal and policy teams necessary to interpret and implement regulatory requirements. Additionally, in an area like AI with substantial commercial applications, it also causes businesses to opt out of offering their products or services to the federal government market. As a result, the federal government struggles to access the technology that it needs. To limit this impact, the policy should include steps to protect small businesses and encourage them to work with the government. Possibilities include a tiered compliance framework, public-private partnerships, and expedited review processes for small businesses.

Limit Scope of Procurement Recommendations: On page 22, the policy encourages agencies to include specific risk management requirements in contracts for generative AI. While such restrictions are likely appropriate in situations involving rights and safety or for research and development of new AI technologies, they are likely to be costly or burdensome in situations involving commercially available technology for low-risk activities. We suggest limiting the scope or taking steps to be more clear that the included guidelines should be carefully tailored based on the overall risk of the AI application with an aim toward minimizing restrictions for low-risk systems.

Distinguish Cybersecurity Risk versus AI Risk to Mission:

Cybersecurity risks to an information system hosting an AI capability are distinct from risks related to the AI capability itself. While the proposed policy does a good job of making this distinction, we recommend it be more explicit. Specifically, we recommend that AI risk to mission be handled primarily by those responsible for that mission.

Determining if an information system that is hosting AI capabilities is "sufficiently secure" in the traditional cybersecurity sense is very different from

determining if the AI capabilities it provides are “sufficiently accurate” for the mission at hand. Policies like FedRAMP assign responsibility for how a system is secured and dictate who may accept cybersecurity risks to authorize its use. This same person is likely not the best suited to assess or accept the AI risks to mission performance when authorizing a system for use.

Thus, we recommend the policy explicitly distinguish between cybersecurity and AI as unique domains with different types of risks to understand and accept. Then, using a blend of AI education and risk mitigation techniques, mission owners can make appropriate risk decisions about when to augment their capabilities with AI.

The Biggest Risk May Be Too Much Caution: The tendency of federal government decision-making towards risk aversion, especially in the context of AI, can inadvertently lead to strategic disadvantages and introduce some of the very risks it seeks to avoid. The recent decision by the US Space Force to ban the use of AI applications exemplifies this cautious approach. Such caution risks substantial unintended consequences, such as:

- **Adversaries Gaining a Technological Edge**: When federal decision-making is overly cautious and slow in adopting new AI technologies, it risks falling behind adversaries who may be more willing to rapidly integrate and experiment with AI. This technological gap can lead to strategic disadvantages in critical areas such as intelligence gathering, cybersecurity, and automated defense systems.
- **Unsanctioned Use of Unauthorized Systems**: Excessive caution and slow approval processes for AI applications (or outright bans) may drive personnel to use unauthorized AI systems out of personal convenience to keep pace with operational demands and the fast-

evolving nature of AI. Using these “shadow-IT” systems introduces significant security risks, potentially exposing sensitive data or putting critical systems at risk of breach or manipulation.

- **Stifling Personnel Initiative and Morale**: Overly restrictive policies can dampen the initiative and morale of personnel who recognize the potential of AI to enhance their work but are hindered by bureaucratic processes. This has the potential to further exacerbate the difficulties in recruiting and retaining skilled personnel within the federal government.

To mitigate these risks, the federal government must strike a balance between caution and innovation. This involves adopting a more agile approach to AI integration, where risks are carefully managed but do not completely hinder the exploration and adoption of AI technologies. Additionally, establishing clear guidelines and fast-track processes for the safe and secure use of AI can encourage adherence to approved systems while keeping pace with technological advancements. We recommend more explicitly adopting such a balanced approach.

Defense Unicorns is eager to contribute to this discourse and welcomes further dialogue to refine these recommendations. We are optimistic that together, we can enhance the proposed AI policy to better serve all stakeholders.

Thank you for considering our comments on the proposed policy changes.

Sincerely,

REBECCA K. LIVELY
Defense Unicorns

Comments on OMB memorandum

Comments on the memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

This memorandum is comprehensive, well-written and well-received.

Suggestion: The use of numbered lines is always a good idea as it enables the commentator to refer to specific statements and helps you locate them within the document. In this document, page numbers (P#) will be used.

P2: The memo does not mention the importance of mindset and cultural barriers among other barriers to the acceptability and usage of AI in the realm of fulfilling safety and rights.

P2: The rights and safety are wide-ranging, but not comprehensive enough to include all what is needed to implement AI in the government i.e. more criteria may be needed.

P2: For better clarity, please rephrase the following statement: "This memorandum does not address issues …."

P2: In the event of a conflict between previous policies and this memorandum, what is the prescribed course of action?

P4: for clarity and specificity regarding the statement on determination, it could be phrased as: or otherwise, a written justification ....

P4: It might look better if V. Reporting on AI Use Cases Not Subject to Inventory be rephrased to: Unreported inventoried AI Use Cases

P13: There should be a specific list to comply with or a template provided by OMB for Agencies to complete.

P15: No.3. Does that include explainability of the model used from the provider? How does the agency know which data is used to train the algorithm?

P16: Testing procedures for AI models are not currently available within the government. NIST may be directed to establish such procedures. The current testing methods, which follow conventional software testing, are insufficient for AI models. Agencies may need to follow up with vendors through DEVSECOPS pipeline procedures for static and dynamic testing.

P21: It may be more beneficial for the government to promote 'coopetition' between vendors/providers, where they can compete in some areas but cooperate in others. For instance, AI producers can compete in supervised AI, textual modeling techniques, and tools, but it would be more beneficial for them and the government to cooperate in unsupervised AI (reinforcement learning) because this area requires intensive innovation and pooling of tacit knowledge.

P22: iv. Currently, there is no law that requires AI producers to reveal training data, code, or model decomposition. However, it may be beneficial for vendors to disclose all data used for training of the module and the explanation of the module parameters and fitting errors to this data. This will help agencies deal with the "blackbox" dilemma more effectively".

P22: Just to make it easier for your readership, it may be more useful to provide short definitions of a few lines in this document, rather than referring to another document that might not be at hand or accessible during the reading of this document".

OMB Draft Guidance_Public Comment_AIethicist

Shalanda Young
Director Office of Management and Budget
72517th St NW, Washington, DC 20503 November 4, 2023

Re: AI Memo Request for Comment: Comments of Merve Hickok to the Office of Management and Budget (OMB) regarding the Draft Memorandum published in Federal Register 88 FR 75625

Dear Director Young,

The below is in response to the request for public comments on the draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*[1].

As the Founder of AIethicist.org, President and Research Director at Center for AI and Digital Policy (CAIDP), and Data Ethics Lecturer at University of Michigan, School of Information. I welcome the opportunity to comment on *The Notice seeks comments on the Proposed Memorandum for the Heads of Executive Departments and Agencies (hereinafter the "Guidance").*[2] My work is focused on AI policy and governance globally. In my role at CAIDP, I testified in the United States Congress.[3] I also continue to provide expert input to the Council of Europe AI convention, and EU AI Act.[4]

I conduct research, and provide training, and consulting on how to develop, procure, use and govern trustworthy AI. In 2022, I published "*Public procurement of artificial intelligence systems: new risks and future proofing*."[5] I am currently writing a book on implementation of trustworthy AI in public procurement decisions. For this project, I conducted 20+ interviews with procurement practitioners across the agencies in the United States, United Kingdom, Canada, Belgium, and Chile. I am also one of the co-authors of CAIDP's annual report "AI and Democratic Values Index,"[6] where we conduct comparative and longitudinal analysis of national AI policies and government use of AI systems. My comments reflect my years of research and analysis on government use of AI. This document answers questions 2, 3, 5, 6, 7 and 8 in the RFI.

[6] CAIDP, *AI and Democratic Values* (2023), https://www.caidp.org/reports/aidv-2022/

I commend the OMB for providing draft guidance to implement the Executive Order 14110, based on the principles of democratic values, human rights, and the rule of law, and to ensure trustworthy use of AI by federal agencies.[7] In particular, I applaud

- Promotion and incorporation of the Blueprint for an AI Bill of Rights[8] and NIST AI Risk Management Framework[9];
- Establishment of 'minimum practices' for government agencies to follow in design, development, and use of AI systems;
- The requirement for the agencies to document the intended purpose for the AI and its expected benefit, supported by specific metrics or qualitative analysis. Such transparency would provide evidence that the government has conducted necessary evaluations to establish AI is indeed necessary for the purpose, and has verified that the system is capable of meeting the quantitative and qualitative expectations.
- The termination obligation requiring agencies to ensure AI systems have guardrails before they are put to use, and those already in existence but cannot be brought into compliance must be terminated.
- The mandate for agencies to document the provenance and quality of the data for its intended purpose.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

Yes, the following are listed as rights-impacting AI, and the Guidance leaves it to each agency to determine whether the system can be used within a specific-context and use case. However, the list contains AI systems which **are pseudoscientific, and undermine rule of law, presumption of innocence and human dignity.** The list should be revised to include bans for these systems.

- **Ban emotion analysis systems:** which claim to infer emotions from physical features and micro gestures. In-depth research shows there is no universal manifestation of an emotion, and the way individuals express emotions are dependent on the context, consequences and cultural upbringing.[10] Such systems can also discriminate against people with facial disorders and disfigurement.

- **Ban thought, emotion, and deception detection systems:** Not only are these systems without a scientific basis, but they can be weaponized for a variety of reasons under the veneer of 'objective' technologies.

[7] Executive Order 14110, *Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence*, 88 FR 75191, (Oct. 30, 2023), https://www.govinfo.gov/content/pkg/FR-2023-11-01/pdf/2023-24283.pdf
[8] *Blueprint for an AI Bill of Rights*, White House Office of Science and Technology Policy, https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf.
[9] *Artificial Intelligence Risk Management Framework (AI RMF 1.0)*, NIST Publication AI 100-1, https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf.
[10] Le Mau, T., Hoemann, K., Lyons, S.H. *et al.* Professional actors demonstrate variability, not stereotypical expressions, when portraying emotional states in photographs. *Nat Commun* 12, 5037 (2021). https://doi.org/10.1038/s41467-021-25352-6

- **Ban biometric categorization systems:** which claim to identify then cluster a person into ethnic, racial, gender, political or sexual orientation, religious categories by using biometrics. These systems create spurious correlations between biometric data and subjective social constructs.

- **Ban surveillance-related risk assessments about individuals used by law enforcement and immigration authorities:** which claim to predict future behaviors and actions of an individual such as criminal recidivism, offending a person or be a victim of crime. These systems create spurious correlations and can be weaponized by authorities under the veneer of 'objective' technologies. Some of these systems have already led to unlawful decisions.[11] These systems undermine human agency, human aspirations, and are in conflict of presumption of innocence.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Guidance suggests CAIO of each agency should have the authority to waive AI systems from the minimum requirements. Such powers can create significant loopholes and undermine the whole Guidance.

- **Waiver determinations should be reviewed by an independent authority**. No single person should have complete control or responsibility over waiver decisions.

- The issuance of such **waivers should be 1)governed by strict and objective criteria 2)include a time limit to avoid indefinite waivers, and 3)include liability mechanisms** if the waived system later negatively impacted rights or safety.

- If and when a waiver is issued, the **time limit, evaluation of the agency against the objective criteria, and justification for the waiver must be disclosed** in the public case inventory.

- **Terminated AI systems should be documented** in detail in AI Use Case Inventory as evidence of assessment, for future accountability purposes, and to serve as lessons learned.

- **Public Incident Reporting:** In addition to the existing AI Use Case Inventory, agencies should establish a public incident reporting mechanism. Such reporting mechanisms can provide lessons to vendors, academic researchers, and state and local level governments.

---

[11] Robert Koulish & Kate Evans, Punishing With Impunity: The Legacy of Risk Classification Assessment in Immigration Detention, 36 *Georgetown Immigration Law Journal* 1-72 (2021). https://scholarship.law.duke.edu/faculty_scholarship/4115 ; Stroud, M. Heat Listed. The Verge. (May 24, 2021). https://www.theverge.com/c/22444020/chicago-pd-predictive-policing-heat-list

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

- An interdisciplinary AI Governance Body is the right call. **AI brings new challenges which go beyond traditional IT software or privacy concerns** due to 1)the socio-technical nature of these systems, 2)possibility for bias, and for the system and data to change and drift while in use, 3)new risks to human rights and civil rights to emerge based on probabilistic and predictive outcomes, and 4)complexities and interdependencies across data, models, and outcomes. AI systems can also change the decision-making process within an agency. Therefore, it is crucial to have a diverse, AI-focused governance body.

- The AI Governance Body in each agency should have **representation from independent academia and civil society** organizations with human rights and civil rights competence.

- **Mandated Privacy Impact Assessment are outdated.** These assessments do not consider the ability of AI systems to aggregate data from disparate sources to create granular insights about individuals. They also do not take into account the predictive and probabilistic nature of AI systems. Therefore, OMB should also consider additional guidance to update PIAs.

- The agencies should **notify the public about <u>planned</u> procurement** of a possibly rights-impacting AI system. The agency should conduct public consultation and consult with affected groups and incorporate their feedback. **Public consultation should also be conducted during the planned procurement stage**, not only in 'design, development, and use' stages.

- Guidance suggests "To the extent practicable and consistent with applicable law and governmentwide guidance, agencies must consult affected groups, including underserved communities, in the design, development, and use of the AI". **Public consultation should be mandated for rights-impacting AI systems, not left to a judgement of 'to the extent practicable'**.

3. How can OMB best advance responsible AI innovation?

As mentioned above, I conducted interviews with 20+ government procurement practitioners involved in AI acquisition. Consistent themes were:

- **Need to implement trustworthy AI during procurement:** The Guidance directs many of the 'minimum practices' to 'design, development, and use' of AI systems. The guidance references **'procured'** AI systems. This can be interpreted as an "after-the-fact" approach. If these practices and controls are only applicable to 'procured', government can commit

taxpayer funds for a system which is later found to be uncompliant with minimum practices.
These minimum practices must be conducted **"during the procurement"** of rights and safety impacting AI systems. Commitments of the U.S. government to trustworthy AI must be operationalized during the procurement process as well, and not as an afterthought.[12]
By setting trustworthy and responsible AI expectations upfront with vendors and contractors, OMB can create fairer competition.

- **Lack of government-sanctioned guidelines or resources to answer the AI-specific challenges** and questions which emerge during the procurement process. Interviewees warned that this either led to risk aversion and a decision not to adopt AI, or procuring AI without understanding its limitations, benefits and risks properly.

- **Need for agility and flexibility in AI procurement to reduce vendor lock-ins**. Interviewees noted that incumbent vendors had significant knowledge of federal procurement process which gave them advantage over smaller vendors. Even when products of smaller companies performed much better, the existing vendors were able to navigate the bureaucracy better and receive contract awards.

- **Federal Data Strategy:** While the mandate for agencies to document the provenance and quality of the data for its intended purpose is commended, this should be handled in a more systematic way. The Federal Data Strategy already provides a framework of operational principles and best practices to help agencies leverage consistent data infrastructure and strong data governance.[13] The Federal Data Strategy includes a set of principles including Ethical Governance, Conscious Design, and Learning Culture, as well as a set of 40 practices to guide agency data management activities. The requirements and best practices from the Data Strategy must be operationalized when agencies are making decisions about development, use, procurement, and governance of AI systems.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

- **Update procurement regulation:** Federal acquisition regulations should be updated to ensure these practices are conducted "during the procurement" of rights and safety impacting AI systems.

- **Add scientific validity, contestability and traceability as required minimum requirements**. AI systems used by the government can impact an individual's human

[12] Executive Order 13960, Promoting the Use of Trustworthy Artificial Intelligence in the Federal Government, 85 FR 78939, (Dec. 8, 2020), https://www.federalregister.gov/documents/2020/12/08/2020-27065/promoting-the-use-of-trustworthy-artificial-intelligence-in-the-federal-government
[13] Office of Management and Budget, Federal Data Strategy - A Framework for Consistency OMB-M-19-18 (June 2019). https://www.whitehouse.gov/wp-content/uploads/2019/06/M-19-18.pdf

rights, civil liberties, safety, and access to resources. Therefore, a system used by the government should have scientific validity and traceability, and the practices should allow for contestability.

- When a decision is made in an agency to use an AI system**, documentation should also include other algorithmic and non-algorithmic alternatives considered**. Such transparency would increase the public's confidence and trust in the government use of AI.

- **Redress & remedy process should be available without caveats:** For rights-impacting systems, the remedy process should not place unnecessary burden on the impacted individual.

- **System-level dependencies**: AI systems are dependent on data. Data produced from one AI system may be an input to another system in the government infrastructure. An erroneous or biased outcome from one system can have cascading impact on data and outcomes across the system. This can lead to discriminatory government decisions on individual's rights, liberties, and access to resources. Therefore, a system design approach is required to ensure the data flows and dependencies between the systems are evaluated before a system is put into use.

- **Establish a procurement category code for AI/ML systems**: this would allow procurement professionals across agencies to know if an existing system or contract can be scaled up. Currently, AI systems are procured by federal agencies using a variety of procurement categories such as software, consulting services, information technology services. This disparity can result in some systems put into use without application of minimum practices.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

- **Establish a menu of standard contract clauses** which address data quality, data ownership, data and model access, AI model performance assurance, risk management, and mandate for explainability and auditability of the system. The European Union has already drafted EU model contractual AI Clauses to use in procurements of AI and invites public organizations to pilot.[14] Such menu would help the government procurement professionals and legal teams to evaluate and apply clauses consistently relevant to the context of the AI system.

As noted in my congressional testimony, we need guardrails in place for AI systems, and the expertise in government to manage the consequences of the rapid changes that are now taking

[14] European Commission (2023) EU model contractual AI Clauses. https://public-buyers-community.ec.europa.eu/communities/procurement-ai/resources/eu-model-contractual-ai-clauses-pilot-procurements-ai

place.[15] Guardrails for development, procurement and use of AI systems need to reflect prioritization of human dignity, human rights, civil rights, democratic values, and rule of law. Governments must ensure alignment of policies and goals with the tools, while ensuring government does not lose its independent ability to verify and validate technology vendors' claims.

Thank you for your consideration of my views. I would welcome the opportunity to discuss these recommendations further.

AI EO Letter OMB SIGNED

Office of the Vice President
Government and Regulatory Affairs

600 14th Street, NW Suite 300
Washington, DC 20005

December 4, 2023

Ms. Shalanda D. Young
Director
Office of Management Budget
Washington, DC 20503

Dear Ms. Young,

Re: Public comment on Proposed Memorandum for the Heads of Executive Departments and Agencies: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence.

IBM appreciates the Office of Management and Budget welcoming input from stakeholders across the Artificial Intelligence (AI) community on this implementation guidance for President Biden's Executive Order of October 30, 2023 (Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence.)

AI is projected to enhance human productivity and unlock an astounding $16 trillion in value by 2030. Not only will this fuel economic growth and boost GDP, but it will also offer a competitive edge to individuals and organizations who effectively leverage its capabilities. AI could also help address some of our most pressing challenges, whether it's pioneering drug discovery, improving manufacturing and food production, or confronting climate change.

IBM has also long acknowledged the potential risks of AI adoption, and advocated for strong governance and for AI that is transparent, explainable, robust, fair, and which safeguards privacy. We have also developed tools and strategies for enterprises to manage this risk. Strong governance is required to ensure AI adoption is responsible and ethical.

AI presents a profound opportunity to enhance the critical work of our civil servants, and the importance of proper governance to manage this transition cannot be overstated. Fully realizing the benefits of AI across government agencies will require often extensive reengineering of how work is done. IBM believes that how the federal government uses its buying power for AI can significantly shape the overall adoption of AI in the United States.

This Executive Order broadly aligns with IBM's AI principals and pillars within the context of government AI adoption. It also aligns with our principals that government should focus on managing risk, using existing laws, and hold AI creators accountable.

IBM supports the decision not to create a single, cross government authority for AI, but instead grant the authority to manage and control AI systems to individual agencies. We believe that the Executive Order sends a clear message that AI creators and adopters should be held accountable for responsible and ethical AI adoption and for making decisions considerate of societal impacts.

While IBM strongly supports the framework in this proposed memorandum, there are several areas where we see opportunities for improvement to the proposed memorandum:

SECTION 3: Designating Chief AI Officers

IBM has long called for enterprise leaders to designate a single, appropriately empowered individual to guide AI implementation, and we are pleased to see the mandate for Chief AI Officer designation in the Executive Order.

Section 3.b of the memorandum defines the CAIO's expansive responsibilities, which represent a specialized and full-time role that will grow as agency AI adoption scales. Responsible AI adoption requires a CAIO with a strong technical background and AI subject matter expertise. The CAIO must be able to focus on AI adoption as their primary responsibility with the support of a strong AI office, dedicated funding, clear authority, and sufficient seniority.

Further, while section 3.a.ii of the proposed memorandum notes that there are recurring compliance and use case disclosure requirements under the AI in Government Act, without a robust AI office, there is risk that this disclosure may become a substitute for meaningful governance that truly reduce the risks to the rights and safety of Americans.

We recommend that the guidance be amended to state that while agencies may initially "dual hat" existing officials to serve in the CAIO role, that this be a temporary arrangement until agencies can create a strong AI office led by a CAIO whose primary role is leading that function. As noted below, we further recommend that agencies request dedicated AI office funding in their FY25 budgets.

SECTION 3: Strengthening Artificial Intelligence Governance

In many cases, AI applications will be adopted by government users as part of a suite of services or programs that cross agency boundaries. For example, claims processing for benefit programs, small business compliance, and environmental protection are uses cases where a common solution may be adopted by multiple agencies. While the proposed memorandum is strongly focused on agency governance, it does not address these cases where interagency coordination is needed to ensure that these AI solutions are evaluated in a uniform manner.

IBM recommends that OMB amend the proposed memorandum to include a governance provision that calls on agencies to coordinate governance of applications of AI that involve multiple agencies.

SECTION 4.a: AI Strategies

It seems likely that many agencies will not immediately have the capacity to hire and train personnel and time needed to create the organizational and leadership structures necessary to meet the goals detailed in the memorandum. Overall, the requirements of the memo will place a major burden on many of the CFO agencies across their IT enterprises.

IBM recommends that OMB clarify the guidance to more clearly direct agencies on how to implement the workforce elements of this directive if their existing resources are lacking.

We also recommend that OMB direct agencies to clarify in their FY25 budget requests to Congress 1) what FY24 resources they are devoting to AI adoption in general and the mandates of this Executive Order in particular, and 2) request additional dedicated FY25 funding to accelerate AI adoption and ensure that the resources required for strong implementation of this Executive Order are available.

SECTION 4.b.iii: Advancing Responsible Artificial Intelligence Innovation

Section 10.1(f) of the Executive Order directs prioritization generative AI capabilities for the FedRAMP process, and this is referenced in the memorandum. We do not believe this mandate is sufficient to bring forward secure capabilities into the federal market. Agencies remain reluctant to sponsor new capabilities for FedRAMP for a variety of reasons.

We have two recommendations that we believe would accelerate the adoption of secure AI capabilities:

First, that the FedRAMP Director create a path for direct authorizations of generative AI solutions without the time-consuming process of seeking agency authorizations. The FedRAMP Director should prioritize direct authorization for solutions that demonstrate strong alignment with federal agency use cases, governance objectives, and adherence to the NIST Risk Management Framework.

Second, FedRAMP should issue preliminary authorizations for generative AI capabilities that meet minimum standards. Preliminary authorizations for capabilities that meet minimum standards would allow agencies to pilot generative AI capabilities to improve their operations while those capabilities navigate the FedRAMP process.

SECTION 5.a.ii: Recommendation on AI Documentation

Transparency is one of IBM's core principles for AI adoption. Users of AI should understand when AI is being employed in ways that impact their lives, and users and stakeholders should have convenient access to understandable information about how that AI was trained and what data was used to train it.

We support the requirement in section 5.c.iv.H for publicly available "plain language" documentation on AI system functionality to accompany the use case inventories required by this memorandum for rights-impacting of safety-impacting AI. IBM has also conducted extensive work on AI Fact Sheets that reflects well the goals and objectives of this section.

IBM recommends that in implementing this requirement, the AI Interagency Council seek information on commercial best practices for AI Factsheets and work to ensure that the requirements are easily achievable by AI creators and vendors.

We also recommend that the guidance be modified to ensure that there is a standardized requirement and a baseline format for AI documentation across all federal agencies that is balanced and reasonable. AI documentation content and format requirements should be such that any AI developer can easily produce a fact sheet and provide updates periodically to the government user. Further, the need for AI developers to protect sensitive trade secrets must be recognized and balanced against the desire for transparency.

SECTION 5.d: Managing Risks in Federal Procurement of Artificial Intelligence

IBM suggests that OMB direct agencies to establish a plan to protect private sector IP through the procurement process. For example, how will IP embedded in AI products be protected if government procures it and then recompetes the contract? While we understand and acknowledge that in some instances there is co-development between public and private entities, at a minimum, we recommend the recognition of a general principle supporting the protection of private sector IP. Without safeguards for private companies the federal government may struggle to get access to the best AI technology.

Thank you for the opportunity to comment on this important matter. AI is a fast-moving technology, and it is imperative that industry and government continue to work together to ensure that regulation protects Americans while also avoiding unnecessary burdens and fostering innovation.

Sincerely,

Christopher Padilla
Vice President
Government and Regulatory Affairs

RE: OMB–2023–0020

Dear Ms. Martorana:

Thank you for the opportunity to comment upon the Office of Management and Budget memo directing Federal agencies to strengthen their AI governance and innovation programs while managing risks from the use of AI.

About CAST

Since 1984, CAST has worked relentlessly to ensure that our nation is one where learning has no limits for all individuals. We pioneered Universal Design for Learning (UDL), a framework for the intentional and inclusive design of learning and training environments that harness technology, the learning sciences, and instructional practices to remove barriers to learning in all settings: physical, digital, or blended. UDL encourages the design of flexible learning environments that anticipate learner variability and provide multiple routes to success; UDL acknowledges that variability across all learners is the norm rather than the exception. UDL also incorporates a responsive framework to support educators in their professional learning and application of new skills in any K-16 teaching environment, including in career and technical education (CTE), science, technology, engineering and math (STEM) and more. UDL is now incorporated into key federal legislation, career training, and workforce laws, including the Every Student Succeeds Act, the Higher Education Opportunity Act, the Strengthening Career and Technical Education for the 21st Century Act (Perkins V), and in the U.S. Department of Education's Education Technology Plan.[1]

CAST also has a distinguished history using UDL to support learners of all ages, including those with identified disabilities as well as others who may benefit from accessible materials due to literacy, language, or other barriers that may impede learning. CAST's aim is to create a level playing field where all learners have equitable opportunities to succeed by expanding access and opportunity to education and employment for all individuals, including those historically marginalized due to race, language, income, disability or other barriers. As a contribution to the education community, we have also developed CAST Figuration, an openly licensed, feature-rich, responsive, mobile first, accessible, front-end framework to develop websites that have usability and accessibility at their core from the start.

[1] See: P.L. 110-315, P.L. 113-128, P.L. 114-95, P.L. 115-224, National Education Technology Plan 2021, U.S. Department of Education.

Although AI will undoubtedly have widespread impacts across many sectors of U.S. and global society, CAST is focusing our comments on the potential benefits and barriers that we see AI holding for *educational systems and career/employment training settings*. AI holds exciting potential to improve teaching, learning, educational equity, and economic opportunity– if it is designed and implemented in flexible, accessible, and universally designed ways. If, conversely, AI is deployed inflexibly and inaccessibly in learning settings, these powerful technologies run the risk of widening educational disparities rather than narrowing them. Through this lens, we have selected the most appropriate questions from the RFI as the organizing framework for this response.

OMB Question 3. How can OMB best advance responsible AI innovation?

CAST Response:

1. **Make explicit that all federal agencies must meet the current accessibility standards as required under Section 508 of the Rehabilitation Act of 1973 (Section 508)[2] when investing in [any] AI technology.**
2. **Clarify that ensuring compliance with the current accessibility standards -as required by Section 508- will be strengthened when agencies incorporate and use the federally-recognized UDL Framework and Guidelines as they develop plans regarding federal investments in AI.**
3. **Require agencies to use more diverse data in training AI systems to ameliorate well-known challenges such as the tendency of AI image generation to replicate many biases (e.g., racial, gender, ableist) in its creation of human figures**.[3]
4. **Specify that agencies must consider the risk(s) of and do all they can to prevent profiling and/or incorrectly labeling the most vulnerable population of users, including individuals with disabilities who [may] leverage accessibility features and/or certain applications or conduct specific searches while utilizing AI**.[4]
5. **Maintain OMB's requirement for each agency to "maintain human consideration" AND also ensure that every agency keeps humans in the loop for internal planning and implementation.**

Rationale:

CAST appreciates that OMB has stated in 5(d)(i) that "Agencies should ensure that procured AI exhibits due respect for our Nation's values, is consistent with the Constitution, and complies with all other applicable laws, regulations, and policies, including those addressing privacy, confidentiality, copyright, human and civil rights, and civil liberties." We agree. However, in order to fully protect individuals with disabilities and others whose civil rights, liberties and accessibility needs must be protected and met, we believe OMB must go further to clarify the requirements of Section 508 of the Rehabilitation Act of 1973, including the recommendations of the World Wide Web Consortium (W3C). We also encourage OMB to promote federal

[2] Section 508 of the Rehabilitation Act of 1973 is the standard customarily used to consider whether or not environments or materials are compliant with requirements of the Americans with Disabilities Act (ADA). See: P.L. 93-112, as amended (29 U.S.C. §794d). See also: the "Electronic and Information Technology Accessibility Standards," authorized by the Architectural and Transportation Barriers Compliance Board—as well as recommendations of the World Wide Web Consortium (W3C).

[3] See: MIT Technology Review, I asked an AI to tell me how beautiful I am; https://www.technologyreview.com/2021/03/05/1020133/ai-algorithm-rate-beauty-score-attractive-face/

[4] See: Artificial Intelligence (AI) in K-12 VERSION 1.1, CoSN, Spring 2023; https://www.cosn.org/wpcontent/uploads/2023/03/CoSN-AI-Report-2023-1.pdf

agency use of the best practices that researchers and implementation specialists have demonstrated help ensure accessibility for any individual who may struggle due to literacy, language, disability, or other vulnerability, including the most current WCAG accessibility standards.

OMB makes just *one mention* regarding accessibility in the memo[5] –which provides for a human 'opt-out' provision with regard to accessibility– and CAST asserts that OMB must go further. Although CAST agrees that individual users should have the freedom to choose a human 'opt-out' provision, we also request OMB make explicit the requirement that every agency must do *all it can* to procure, design, develop, and implement AI systems and/or processes that are BORN accessible. The 42.5 million people with disabilities across the country who rely upon or require the support of numerous federal agencies daily are counting on the Administration to get this right - especially in the nascent phase of innovation, design, and application across multiple agencies and their platforms. CAST encourages OMB to emphasize that federal investments should require that, at minimum, innovative technologies meet Section 508 requirements: this will ensure that all grantees and partners working to assure U.S. competitiveness will develop technology and training programs that are accessible to all and available in accessible formats (online and in digital formats, including via websites, mobile applications, online systems, and all forms of information and communication technology (ICT). Below is further explanation and rationale for our recommendations regarding accessibility, UDL, and the impact of AI on unique populations.

Accessibility: AI must be accessible for all. "Available" is not the same as "accessible," nor does something being digital assure its accessibility. Indeed, much of current AI is demonstrably *inaccessible*. For example, many of the chatbots or image generators rely on print and keyboarding for communication between the person entering the AI prompt and the bot. Another issue is the way analytic AI systems present information in dashboards that, so far, are universally inaccessible (e.g., violations in color contrast, lack of image descriptions, indeterminate reading structure/order). These limitations in the current design and interface of AI tools make them inaccessible to individuals who are blind, visually impaired, have print or attention disabilities (such as dyslexia or ADHD), or other physical or sensory disabilities, and are counter to the requirements of Section 508. When these federal standards are applied to new or emerging technologies, such as AI technologies and tools, the standard of equivalent facilitation comes into play: these new technologies have to work as well or better for people with disabilities as they do for individuals without disabilities. This is a standard which the current best-of-field AI tools fall well short of; OMB must emphasize both the requirements of current law as well as the importance that the cutting-edge potential of AI benefit all U.S. learners rather than contributing to wider disparities in education and employment outcomes for individuals with disabilities and other vulnerable populations that may struggle due to race, language, income, or other challenges.

As AI is developed, used, and refined as advancements are made, it will only be accessible for some users if it does not proactively anticipate (and subsequently design for) this natural human variability. This supports the recent U.S. Department of Education Office of Education Technology (OET) recommendation to shift the focus of AI development from neurotypical to neurodiverse learners who can benefit from multiple pathways

[5] See: c. Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence (v)(F) which states: …Agencies must prominently provide and maintain a mechanism to conveniently opt out from AI functionality in favor of a human alternative where practicable and consistent with applicable law and governmentwide guidance. An opt-out mechanism must exist where the affected people have a reasonable expectation of an alternative or where lack of an alternative would meaningfully limit accessibility or create unwarranted harmful impacts.

to learn and interact with information. If developers use accessibility specifications and the UDL Guidelines to make AI models inclusive and AI tools accessible, AI use will increase the accessibility to education overall, especially for those learners we know experience the greatest barriers to learning due to language, literacy level, socio-economic status, disability, or a combination of these. If, however, developers do not consider learning variability in their designs of AI, students who are already underserved will have even less access to robust and inclusive learning, and as a result, may be further marginalized. UDL should be used as a metric and a standard in any policy or set of recommendations for the procurement, development, and or use of AI in education.

Furthermore, because AI is cutting edge technology, it would be inexcusable and unethical to mandate, fund and/or encourage the development and/or use of AI without incorporating what is understood today about human learning. The body of research about how humans learn is extensive yet–for most educators–synthesizing that knowledge base to better address learning variability into their daily practice is not reasonable. Educators worldwide regularly use CAST's UDL Guidelines to inform how they design learning and, as a result, thousands of educators are ensuring that millions of students worldwide have access to learning they did not have previously. **Therefore, the requirement to meet current accessibility standards as required under Section 508 and use the federally-recognized UDL Framework and Guidelines must be incorporated into any federal investments into AI**.

Data Modeling: It is important to recognize that AI is limited to the data sets it is trained on. For example, if AI is created utilizing algorithms that are not inclusive of the target population, it may harm, rather than support, the teaching and learning process. As the recent report by the OET states, "The process of developing an AI system may lead to bias in how patterns are detected and unfairness in how decisions are automated."[6] In order to mitigate risks, we must prioritize diverse teams working on AI, utilizing best practices in inclusive R&D and ensuring that outputs are "appropriate" or correct and reduce unwanted biases. It is also essential that data from individuals in underserved populations–persons with disabilities, those in racially minoritized groups, those living in poverty, those whose first language is not English–are included in AI data modeling rather than excluded as "outlier cases." Using more diverse data in training AI systems would help ameliorate well-known challenges with these technologies, such as the tendency of AI image generation to replicate many biases (e.g., racial, gender, ableist) in its creation of human figures.

Data Privacy: The power of AI tools and the ability to personalize learning opportunities is coupled with critical considerations regarding educator and student data privacy. Compliance with federal and state privacy regulations (including for K-16 education) is essential, but many AI tools were not built specifically for many of our public settings (e.g., schools) and therefore may or may not be in compliance. As systems leverage technology tools and resources and seamlessly access data via interoperable systems, the security of such data must remain at the forefront. The **risk of profiling users should be considered especially as individuals with disabilities leverage accessibility features and/or certain applications or conduct specific searches.** These users may be at risk to be labeled, albeit potentially incorrectly which may impact the most vulnerable populations[7].

---

[6] U.S. Department of Education, Office of Educational Technology, Artificial Intelligence and Future of Teaching and Learning: Insights and Recommendations, Washington, DC, 2023; https://www2.ed.gov/documents/ai-report/ai-report.pdf

[7] See: Artificial Intelligence (AI) in K-12 VERSION 1.1, CoSN, Spring 2023; https://www.cosn.org/wpcontent/uploads/2023/03/CoSN-AI-Report-2023-1.pdf

Human Consideration and Keeping Humans in the Loop: An over reliance on AI or misuse of AI capabilities is a sure way to increase inequities and cause harm to the nation's most vulnerable populations. This is why OMB's requirement for each agency to "maintain human consideration" is key and **must also ensure that every agency keeps humans in the loop --for all parts of internal planning and implementation**. While AI may appear to mimic human intelligence, it is still a machine and is only as good as the data inputted and the algorithms it is based upon. However, this commitment to maintaining human considerations should be taken as a rationale to be over reliant on human "opt-outs" in order to serve the needs of individuals with disabilities: such a structure too often results in non-equivalent access for some users, such as when information hotlines are offered with limited operating hours. OMB should make explicit the requirement that every agency must do *all it can* to procure, design, develop, and implement AI systems and/or processes that are BORN accessible.

OMB Question 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

CAST Response:

1. **Education:** To protect and assure all individuals' civil rights are protected as it relates to education, CAST requests edits in **bold** to OMB's use cases for Rights Impacting AI as included in (E).

   > E. In education, detecting student cheating or plagiarism, influencing admissions, monitoring students online or in virtual-reality, projecting student progress, recommending disciplinary interventions, determining **eligibility for any federal education program, determining** access to education resources and programs, determining eligibility for student aid.

   Further, CAST will work to help ensure the U.S. Department of Education can fulfill the requirements of the Executive Order which states:

   > *Sec. 8. Protecting Consumers, Patients, Passengers, and Students.*
   >
   > *(d) To help ensure the responsible development and deployment of AI in the education sector, the Secretary of Education shall, within 365 days of the date of this order, develop resources, policies, and guidance regarding AI. These resources shall address safe, responsible, and nondiscriminatory uses of AI in education, including the impact AI systems have on vulnerable and underserved communities, and shall be developed in consultation with stakeholders as appropriate. They shall also include the development of an "AI toolkit" for education leaders implementing recommendations from the Department of Education's AI and the Future of Teaching and Learning report, including appropriate human review of AI decisions, designing AI systems to enhance trust and safety and align with privacy-related laws and regulations in the educational context, and developing education-specific guardrails.*

As noted above, much of CAST's work has focused on accessibility and the importance of accessible design in any learning environment or experience. For nearly twenty years CAST has been home to a series of preeminent national technical assistance centers, funded by the United States Department of Education (ED),

and focused on better provision of Accessible Educational Materials (AEM) in K-16 learning environments[8]. Our Centers and projects create more inclusive technology systems. Specifically, we work with states, districts, schools, and educators to create systems that – seamlessly and effectively– incorporate accessibility to expand and increase the availability and use of accessible materials to help make learning inclusive, effective, and transformative for everyone.

CAST believes the potential for AI to support educators and student learning is vast and still being discovered; however, we do know that these tools–if properly designed, tested, and researched–could have huge potential for flexible and personalized learning. We are only just starting to see what generative AI (such as ChatGPT) can do, but surveys demonstrate how educators are aware of technology's potential while also desiring additional support around using tech to support student learning–especially for students with disabilities and other vulnerable populations such as those with below basic literacy skills and/or language barriers.

2. **Employment**: To protect and assure all individuals' civil rights are protected as it relates to employment, CAST requests edits **in bold** to OMB's use cases for Rights Impacting AI as included in (G).

> *G. Determining terms/conditions of employment, including pre-employment screening, pay, promotion, performance management, hiring, termination, time-on-task tracking, virtual or augmented reality workplace training/electronic workplace surveillance and management systems,* ***and determining eligibility for or access to resources and programs for pre-employment, apprenticeship, career training and/or employment programs****.*

For career training, including vocational rehabilitation, apprenticeship programs, and/or employment training programs authorized under such laws as the Individuals with Disabilities Education Act, the Perkins Act and the Workforce Innovation Opportunity Act, OMB must ensure that AI is only used to enhance and support access to and the accessibility of such training programs. At no time should one's eligibility under one or more of programs [and use of AI within or as part of any program] place an individual at risk of any potential or pre-determined/known negative outcome.

To further expand on Question 5, we also offer the following recommendations:

Data Modeling and Data Privacy: We reiterate our recommendations under Q3 about the importance of training AI on data sets that are inclusive of diverse populations, including neurodiverse learners, as well as the essential need to protect student data privacy and avoid any sort of student profiling around use of accessibility or UDL scaffolds in AI-supported learning.

Prioritize incentivizing diverse teams and ensuring that diverse teams work on AI at the federal level: Diverse teams produce better tools and technologies and lead to greater innovations and breakthroughs.

---

[8] See: The federally funded National Center on Accessible Education Materials (AEM Center) which works with individual educators, school districts, and states across the nation to help them provide educational materials and resources that are accessible to all learners, from early childhood through the workforce; and, the Center on Inclusive Software for Learning which works with school districts to create and sustain inclusive technology systems for all students.

There are many ways the federal government can play a role in incentivizing diverse teams through grant competitions and contracting vehicles. Microsoft, in its Inclusive Design Toolkit, refers to this as "learning from diversity," where including more people in the design process and widening the talent pool is key to addressing important societal challenges, so called "wicked problems." As our society moves to quickly adopt artificial intelligence and machine learning in ways that impact all areas of our lives, there is potential for greater inclusion or exclusion depending on the way the AI is designed and implemented. Including people with disabilities and other types of diversity in the design of the AI may help safeguard against the negative impacts of bias in AI, which is essential if we are to build an AI-driven future that is equitable for everyone in society. Moreover, many technologies we take for granted today, from captioning to text translated into speech, were created because of the lived experience of people with disabilities. Throughout history, examples abound of the "curb cut effect" in action, where solutions intended for people with disabilities result in innovations that benefit everyone.

OMB Question 7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

CAST Response: CAST reiterates what was stated in response to Q3. Every agency has access to information, tools and resources to ensure, at a minimum, compliance with Section 508, and in utilizing the UDL Framework. We encourage OMB to share and highlight these tools and resources in materials you provide to federal agencies.

In conclusion, our hope is that all Federal agency investment in, use of, and promotion of AI will spur educators, students, parents, and policymakers to come together to consider what skills our students really need to navigate uncertainty, solve complex challenges, and shape meaningful futures in a changing economy. Federal investments must emphasize that a competitive workforce will include all U.S. learners rather than settling for technologies and related training/workforce programs that contribute to wider disparities in education and employment outcomes for the vulnerable populations for whom the U.S. Departments of Education and Labor have shared responsibility.

We appreciate the opportunity to comment. Please contact Sherri Wilcauskas at swilcauskas@cast.org if we can provide additional information or answer any questions.

Sincerely,

Lindsay E. Jones
CEO

December 5, 2023

The Honorable Shalanda Young
Office of Management and Budget
725 17th St, NW
Washington, DC 20503

Submitted via the Federal Rulemaking Web Portal: http://www.regulations.gov

RE: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (OMB-2023-0020)

Dear Director Young,

The Blue Cross Blue Shield Association (BCBSA) appreciates the opportunity to provide comments on the Office of Management and Budget's (OMB) draft memorandum "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence," as published in the Federal Register on November 3, 2023 (88 FR 75625).

BCBSA is a national federation of 33 independent, community-based and locally operated BCBS companies (Plans) that collectively cover, serve and support 1 in 3 Americans in every ZIP code across all 50 states and Puerto Rico. BCBS Plans contract with 96% of hospitals and 95% of doctors across the country and serve those who are covered through Medicare, Medicaid, an employer, or purchase coverage on their own.

BCBSA believes that everyone should have access to high-quality health care. BCBSA's commitment to the health of our nation includes continuing to improve the way we gain insights on diverse health factors through the appropriate use of new and emerging technologies, and to provide innovative solutions and services to support Blue Plans and their members.

We commend you for soliciting feedback on the important issue of governance, innovation, and risk management for agency use of Artificial Intelligence (AI) from all stakeholders as the impacts of these policies will be felt beyond the federal government and will have effects across industry. BCBSA and our member Plans may be directly and indirectly impacted by the draft memorandum. As contractors for federal health programs, including as Federal Employee Health Benefit Program carriers, Medicare Advantage Organizations, and Medicaid Managed Care Organizations, any changes to federal procurement will directly impact our organizations. More broadly, this draft memorandum will impact nearly every federal agency and will become a model for AI governance in both the public and private sectors.

Informed by our experience, BCBSA respectfully offers the following comments for OMB's consideration as it finalizes the memorandum:

- **Regulatory Harmony Across Agencies**: The draft memorandum discusses the need for Chief AI Officers (CAIOs) to coordinate with "other responsible officials." It is critical that agencies' requirements are aligned to prevent conflicting approaches. Harmonizing federal oversight around AI accountability measures will ensure that regulations and requirements complement – not complicate – advances in technology. We appreciate that OMB has taken the first step in ensuring alignment through release of this draft memorandum, which seeks to create guidance for nearly every Federal agency.

- **Industry Stakeholder Participation**: The draft memorandum notes the need for CAIOs to coordinate with "appropriate stakeholders." This should include private sector entities that will be both directly and indirectly impacted by agency requirements. Specifically, BCBSA urges coordination with health plans on the development of guidance related to health insurance risk assessments, cost, and underwriting assessment activities, or the accessing of third-party systems for risk management functions. We applaud OMB for recognizing the need for broad stakeholder participation, including the private sector, by opening comments on this draft memorandum to the general public.

- **Flexible, Risk-based Frameworks**: The draft memorandum encourages agencies to incorporate best practices, including the National Institute of Standards and Technology (NIST) AI Risk Management Framework (RMF). We support OMB's recommendation to incorporate best practices, such as the NIST AI RMF, as the foundation of responsible and trustworthy AI is in the appropriate identification, measurement, and mitigation of risk through governance, protocols and internal controls tailored to a particular AI system and use case. It is important to note that there is no one-size-fits-all approach to measuring, managing, and mitigating potential risks of AI. A workable framework is one that has the necessary level of flexibility built into it to appropriately measure risks and enable entities to innovate by tailoring risk mitigation to each AI Systems and use cases.

- **Consumer Privacy Protections**: The draft memorandum discusses the need to ensure transparency in the use of AI, consistent with applicable law. There are many required regulatory disclosures in place today, such as Health Insurance Portability and Accountability Act privacy policies, application privacy policies and terms of use regulated by the Federal Trade Commission, and those discussed in the NIST AI RMF, which provide transparency to consumers and other stakeholders of organizations' data sharing practices. Alignment to existing disclosure requirements is vital to providing adequate transparency and should be incorporated into any AI governance approach.

We appreciate your consideration of our comments and believe that our recommendations will help with the development and use of trustworthy AI through sensible public policies. We look forward to working with OMB further on this issue and, if you have additional questions or comments, please contact Jennifer.Jones@bcbsa.com.

Sincerely,

Anshu Choudhri
Vice President, Policy Development and Strategy

Re: Response to the Office of Management and Budget's Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, published November 3, 2023

Dear Ms. Martorana:

I write on behalf of Verance Corporation in response to the Office of Management and Budget's Request for Comment, published November 3, 2023, seeking public comment on a draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)* (the "Memorandum") regarding the establishment of new agency requirements in areas of AI governance, innovation, and risk management. Specifically, Verance would like to respond to Questions 5 (regarding rights-impacting and safety-impacting use cases outlined in the draft Memorandum) and 7 (regarding resources to assist agencies in implementing the requirements).

Question 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

In the case of describing both safety-impacting and rights-impacting AI systems, Verance proposes that such AI systems not be limited to only those that are *actually* "used to control or meaningfully influence the outcome" of the listed activities, but that those AI systems which have, or could reasonably be expected to have, the ability to control or meaningfully influence the outcomes of such activities. An AI system which is not used with the intention of controlling the functioning of a dam, but nonetheless has the practical (even if unintended) impact of meaningfully impacting its functioning, can still represent a significant safety risk.

Regarding the list of both safety-impacting AI provided in Section 5.b.i of the draft Memorandum, and rights-impacting AI provided in Section 5.b.ii, Verance proposes adding use cases reflecting the clear danger of misinformation and disinformation. Specifically, it would seem appropriate to add AI systems which are used for generating and/or disseminating health or medical information, whether to individuals or the public at large, to the list of safety-impacting AI. During the recent Covid pandemic, we have all seen the confusion and potential for real, physical harm to result from the spread of incorrect, misleading, or outright falsified information regarding serious public health crises, including deadly diseases and their proper treatment. Should an applicable government agency make use of an AI system to operate as an online chat resource to answer health or medical questions typed in by

concerned citizens, it is imperative that the information provided be based on training the AI system with legitimate data and information and that the output of an AI system accurately reflects such legitimate input and is not inappropriately selective or biased in its application of its algorithms such that the output misrepresents otherwise legitimate input, so people may make informed decisions about their health care issues based on facts and an accurate portrayal of available medical expertise on the subject.

Similarly, while there is an entry in the safety-impacting list for the "integrity of election and voting infrastructure," one might assume this is narrowly directed to those systems which print ballots, count votes, and report results. Also of the utmost importance is the information provided to the public about how to go about exercising the right to vote. Verance proposes adding to the list of rights-impacting AI systems those systems which disseminate voting information to the public. In recent years, numerous communities have been attacked by robocalls providing false information about the availability of vote-by-mail options and the date of in-person voting. It is not hard to imagine an AI system being used to respond to the questions of citizens looking to cast their vote about where their voting location is, the availability of alternative methods to submit a ballot, or even basic questions about whether the citizen is eligible to vote in the first place. Such a system, if not able to differentiate between accurate and false information, could conceivably misdirect citizens, causing their valuable vote to not be counted.

Finally, to the list of rights-impacting AI systems, Verance proposes adding those AI systems which may use copyrighted works in performing its role. Authors and creators have collectively messaged Congress and the Copyright Office that issues of consent, attribution, and compensation are essential in respecting the rights of those who have created works that are ultimately ingested in AI training. The Copyright Office has also wrestled with the issue of how AI-generated content (*i.e.*, the output of a generative AI system) might be identified such that the protections of copyright afforded to human authors and creators is not applied to AI-generated works, which have been determined to not be eligible for copyright protection.

In all three cases touched on above, the reliable determination of both the provenance and authenticity of AI-ingested content and information and the identification and verification of the accuracy of AI-generated content and information are of utmost importance in both safety-impacting and rights-impacting AI systems.

Question 7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

As noted above, validating the provenance and authenticity of information and content used to train AI systems as well as identifying and verifying the accuracy of AI-generated content and information[i] are essential to protect the safety and preserve the rights of those using, and subject to the use of, such systems. The use of tools which enable such validation should be required to be used by any applicable AI system used by an agency pursuant to the Memorandum. Agency contracts with AI providers should include provisions specifying tools acknowledged to be applicable. Depending on the application, the AI provider might have a choice of approved tools to employ to achieve the agency's requirement. Verance Corporation, located in San Diego, California, is in its third decade of offering innovative, industry-leading watermarking technology to support the creation, distribution, and consumption of high-value digital entertainment content, including digital music, movies, and broadcast television. Verance has partnered with major record labels, movie studios, television broadcasters, and consumer electronics manufacturers as the recognized leader in watermarking technology. In fact, Verance was

awarded an Emmy for its watermarking technology. Verance watermark detectors have been incorporated into more than 500 million consumer electronics devices worldwide, including early digital music players, Blu-ray Disc players, and smart TVs.

A watermark is a signal, undetectable to human senses, that is embedded in a work, whether visual, audiovisual, or other format. Because the watermark is embedded in the work, it goes wherever the work goes, and generally survives transformation of the content from one format to another or transfer of the content from one medium to another. Participating devices scan incoming content for the presence of the Verance watermark. In response to detecting (or not detecting, depending on the nature of the content) the watermark, the participating device will take action based on its rules, which might be to reject playback of a pirated Blu-ray Disc, trigger an app or an online source on a smart TV or mobile phone for additional viewer interaction, or present a notice to the viewer that the news clip appears to not be legitimate. The watermark can also carry information which identifies the source of the content, providing the ability to determine whether the content is authorized to be used in the training of generative AI systems. When an ethical AI ecosystem broadly implements a watermark technology to indicate the provenance and authenticity of both the input and output of AI systems, the absence of the watermark can also become an indicator of a lack of authenticity such that a second look at the provenance and veracity of content lacking the watermark becomes good practice.

In practice, Verance's AI watermark is embedded in content to be included in a television broadcast, web site, or other content delivery system. The watermark carries both source identification and time code data. A participating receiving device (such as a television, mobile phone, tablet, or personal computer's web browser) screens incoming content for the presence of the watermark. Upon finding it, the device reads the data in the watermark and can present an on-screen notice to the viewer if the watermark appears to have been corrupted, for instance, because the time code is interrupted, indicating segments have been edited out. This gives viewers the ability to exercise discretion in whether to trust that such content is being presented honestly, reducing the risk that "fake news" will unfairly influence the public in a hotly-contested election season.

Because the watermark carries identification information, including the possibility of an indicator to express the creator's wishes regarding whether the content is authorized for inclusion in generative AI training, ethical AI providers will have a direct indication of whether they may proceed with using such content in their AI training, and, if consent of the creator is indicated, who should receive any applicable compensation and what attribution should be represented in the output product of the AI system. To the extent a direct excerpt of watermarked content is used in an AI-generated creation, the watermark will assist the creator in identifying the contribution (authorized or not) so that appropriate action may be taken by the parties.

Further, an AI system, as part of a larger ethical AI ecosystem, could apply the watermark to its output, identifying such output as AI-generated so that downstream devices can take appropriate action in response to detecting the watermark. As an example, given the current status of AI-generated works as not eligible for copyright protection, a recording device detecting that certain content is AI-generated, would know that it may make a copy of such content without penalty. In other contexts, the designation of content as AI-generated could trigger an examination of the works and data that were the input sources for the AI system, such that the accuracy of the output vis-à-vis the input could be assessed, enabling a viewer to determine if such output is falsely-presented or misleading.

Verance proudly announced in August of this year that it is launching its watermark technology to address issues of provenance and authenticity of copyrighted works in the context of AI, including, among other things the detection and identification of falsified or falsely-presented news clips. This will provide real-world assistance to consumers and strengthen confidence in our national election system during uncertain times which have seen an alarming surge in the existence of falsified and falsely-presented news clips designed to mislead consumers. Verance looks forward to working with news broadcasters, consumer electronics manufacturers, and additional stakeholders in making these tools available as broadly as possible. More information can be found at www.verance.com.

Thank you for the opportunity to participate in this process, and we look forward to any questions the Office of Management and Budget (or other interested parties) may have.

Sincerely,
Nil Shah
Chief Executive Officer

[i] *See*, Memorandum, Section 5.d.v.B, encouraging agencies to manage risk by "requiring generative AI models . . . reliably label or establish provenance for their content as generated or modified by AI."

PUBLIC SUBMISSION

As of: February 07, 2024
Tracking No. lpr-n8e4-ge62
Comments Due: December 05, 2023

Docket: OMB-2023-0020
Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Comment On: OMB-2023-0020-0001
Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Document: OMB-2023-0020-0060
Comment on OMB-2023-0020-0001

Submitter Information

Organization: Workday

General Comment

Workday appreciates the opportunity to provide the Office of Management and Budget (OMB) comments on the recently issued Proposed Memorandum, “Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence” (Draft Memorandum). When finalized, the Draft Memorandum will play an important role in how federal agencies can responsibly use and benefit from these critical emerging technologies. As written, the Draft Memorandum strikes a fair balance between advancing responsible AI and the federal government’s longstanding efforts to modernize its information technology systems.

We offer the attached recommendations to strengthen OMB’s Draft Memorandum as it seeks to advance both of these goals. Should you have questions or require additional information, please contact Evangelos Razis (evangelos.razis@workday.com).

Thank you,
The Workday Team

Workday - OMB Draft Memorandum Comments (as submitted) 120523

Comments on Proposed OMB Memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" OMB-2023-0020-0001

December 5, 2023

Workday appreciates the opportunity to provide the Office of Management and Budget (OMB) comments on the recently issued Proposed Memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" (Draft Memorandum). When finalized, the Draft Memorandum will play an important role in how federal agencies can responsibly use and benefit from these critical emerging technologies. As written, the Draft Memorandum strikes a fair balance between advancing responsible AI and the federal government's longstanding efforts to modernize its information technology systems.

We offer the following recommendations to strengthen OMB's Draft Memorandum as it seeks to advance both of these goals:

- **Emphasize the importance of "buy, not build."** Commercial solutions, including Workday's, are better positioned than custom-built ones at helping agencies streamline and standardize administrative processes, gain unprecedented visibility across organizations, and adapt quickly to change, including changes in fast-evolving technologies such as AI.

- **Retain the current focus on the federal workforce**. OMB rightly identifies workforce challenges as a barrier to AI adoption. The federal government's emerging focus on skills-based hiring, rather than solely on traditional credentials, is the right lens through which to view these workforce priorities. A skills-based approach to talent is difficult to scale without AI tools implemented in a responsible manner.

- **Impact assessments are the right AI accountability tool.** We applaud OMB's decision to require federal agencies to conduct impact assessments on high-risk AI tools. We recommend focusing impact assessments on identifying, documenting, and mitigating the "reasonably foreseeable" risk of harm to an individual's rights or safety. To streamline the impact assessment process, we recommend the use of common forms across federal agencies, which will rely on information regarding the quality and appropriateness of data in a standardized fashion.

- **Require federal agencies to use the NIST AI Risk Management Framework.** The framework was developed at the direction of Congress through an open, multi-stakeholder process with participation from academia, civil society, and the business community. There is growing bipartisan support in Congress for its adoption by the federal government. We urge OMB to go further than recognizing the NIST AI Risk Management as a "best practice" and require its adoption.

- **Refine the definition of "rights-impacting" AI**. We commend OMB for adopting a risk-based approach to AI governance. At the same time, we suggest that it refine the definition of "rights-impacting" AI by: (1) adopting an exhaustive and clearly defined list of

consequential *decisions*; and (2) focusing on AI tools that *automate* these decisions. Doing so would enable federal agencies to leverage human-in-the-loop AI systems and focus their risk management efforts on the tools with the highest risk profiles.

- **Distinguish between mission-specific and enterprise AI systems.** Federal agencies are best equipped to determine if an AI tool is "rights-" or "safety-impacting," when it relates to their mission. By contrast, enterprise AI systems, such as those for human resources and financial management, would benefit from a uniform determination across the federal government. This will promote consistency in determinations of "rights-" and "safety-impacting" AI tools and encourage a more consistent level of protection.

Introduction & Background

About Workday

By way of introduction, Workday is a leading provider of enterprise cloud applications for finance and human resources, helping customers adapt and thrive in a changing world. Our applications for financial management, human resources, planning, spend management, and analytics are built with artificial intelligence (AI) and machine learning at the core to help organizations embrace the future of work. Workday is used by more than 10,000 organizations around the world and across industries–from medium-sized businesses to more than 50 percent of the *Fortune* 500. Our customers also include state, local, and county governments and institutions of higher education. The Workday customer community has 65 million users, and in April of this year, nearly one in four of all U.S. job openings was processed on the Workday platform.[1]

Workday & the Federal Marketplace

In 2020, Workday officially entered the U.S. federal marketplace with our first federal agency customer, and in 2022, we obtained our FedRAMP authorization.[2] [3] Our entry comes at a time when the White House, Congress, and federal agencies are grappling with significant challenges, including recruiting, attracting, and retaining talent, reducing the government's dependency on outdated, legacy technology, and bolstering cybersecurity. These growing challenges have occurred against the backdrop of an aging incumbent workforce and difficulty in attracting younger talent. By the end of 2023, nearly two-thirds of people in senior government leadership positions will reach retirement age. By contrast, employees who are millennials and Generation Z are only 7 percent of the federal workforce.[4] This is compared to nearly 25 percent in the private sector.[5]

Federal hiring managers often lack the data, reporting, and analytic tools to understand their workforce, and track and match skills so that federal employees can continue to grow their careers within the government.[6] The federal government also often lacks systems to assess retention risks, provide development opportunities, and support self-service. Missing these essential tools can impact motivation, morale and engagement, even in a mission-driven environment.

Federal agencies realize they need to make investments in hiring, onboarding, and talent development initiatives and to create an environment more conducive to learning, growth, and equity.[7] They are also looking to establish thoughtful leadership practices around diversity and inclusivity. As remote work continues and evolves, federal agencies will also be looking for better ways to help assess employee engagement, productivity, and well-being while maintaining a supportive work environment.

Given the need to focus on their primary missions, agencies can and should look to commercially available solutions to their enterprise technology needs, rather than build their own. There is no doubt that technologies developed by the private sector evolve and improve faster than in-house and custom-agency projects. This is particularly true for AI, whether integrated into enterprise software services or offered as a stand-alone tool. Increasing partnerships between the public and private sectors will reduce complexity and costs, allowing the federal agencies to focus resources and staff on their core missions.

Modern and secure cloud-based systems are integral to achieving these government-wide priorities. Workday's solutions unify financial and talent management, time and attendance, and recruitment, which allows agencies the ability to automate their day-to-day personnel processes and give their workers more control through self-service options.[8] Our solutions enable agencies to operate more strategically, hire and develop a top-performing workforce and adapt quickly to change.

Skills to Empower the Federal Workforce

As with earlier advances in technology, AI will impact how people work and the skills their jobs require. Notable developments around generative AI are also accelerating the pace and depth of transformation that we will likely see in the next two to three years. As Workday partners with federal agencies to solve a litany of challenges, including strengthening and empowering the federal workforce, we recommend a shift to a skills-based approach to talent to adapt to the changing workplace.[9] [10] [11]

[11] Bryan Hancock et al., "Taking a Skills-Based Approach to Building the Future Workforce," McKinsey & Company, November 15, 2022,

By a skills-based approach to talent, we mean an emphasis on what a person can do or learn, rather than solely on their credentials. Awareness of the benefits of a skills-based approach to hiring, learning, and career development is growing.[12] In hiring guidance issued by the Office of Personnel Management last year, the federal government recognized the importance of a skills-based approach to recruiting its workforce.[13] Governors of at least ten states are also taking steps to remove degree requirements for most state opportunities.[14]

At Workday, we've found that successfully implementing a skills-based approach to talent can be difficult to scale without the right technology.[15] People use different words to describe a skill, and very different skills can be described with the same word. Workers often struggle to identify which skills they should develop to advance their careers, and the lack of consistency makes it difficult for employers to identify workers who can fill an open role.

Fortunately, AI is unique in that it will drive change in the workplace and power the tools that workers and employers need to successfully navigate those changes. AI can process large amounts of data associated with occupational roles and responsibilities and develop so-called "ontologies" or vocabularies that make skills data actionable. Workday's Skills Cloud, for example, aligns skills to a common vocabulary by using machine learning to map how different skills relate to each other and evolve over time.[16] Skills Cloud has been used over 40 million times, including by hiring managers for new job postings and by incumbent workers and candidates to communicate the skills they have. Over 25 percent of *Fortune* 500 companies are now live on Skills Cloud and workers have entered over 200 million skills into their profiles.

Incumbent workers can also use Career Hub, a one-stop-shop on the Workday platform where employees can find AI-enabled personalized recommendations, such as learning content and short-term projects on other teams where they can pick up new skills. For example, a program manager at the Department of Energy interested in management can discover a leadership role in another program office and take suggested learning courses to prepare them for that opportunity.[17] The result is a win-win for workers and employers: the program manager can pursue growth opportunities that align with their career goals, and the federal government can benefit from and support their incumbent workforce. This is one example of how AI and skills can take the guesswork out of workforce development and facilitate data-driven reskilling.

Our Commitment to Responsible AI

At Workday, we see incredible opportunities for AI to unlock human potential, including in the federal enterprise. We also recognize that the risk of unintended consequences stemming from AI's use is real and that trust is foundational to any technology's adoption. As a cloud-native enterprise software company, we learned early on that investing in rigorous technology governance aligns our solutions with our company values and earns and retains our customers' trust.[18] [19] This is why Workday put in place a robust responsible AI program that includes:

- **Leadership commitment** from a Responsible AI Advisory Board that is led by our General Counsel and counts our Chief Compliance Officer, Chief Technology Officer, and Chief Diversity Officer among its members.

- **An independent Responsible AI team** of social and data scientists and technology experts that reports through our Chief Compliance Officer to our Board of Directors. The team develops and maintains Workday's AI governance framework and receives cross-company support, including from responsible AI "champions" who provide subject matter expertise so that AI products are developed in accordance with Workday's ethics principles.[20]

- **Responsible AI guidelines and review processes** that turn our principles into documented practices and assessments. Our product teams use these assessments to evaluate a potential AI feature's risk profile in the earliest stages of its development. AI tools that may be used for consequential decisions, such as hiring or promotion, are treated as high-risk.

- **Disclosure** to equip our customers with a clear understanding of how our AI tools are developed and assessed. We also provide our customers with disclosures and choices about how their data is used.

Workday has instituted these guardrails so that our AI tools are developed in a responsible manner. In addition to disclosure, we provide our customers with the means to access their own data for bias testing and the choice of whether to use an AI tool at all. In this way, we view AI governance as a partnership between *developers*, or organizations that produce or design AI tools, and *deployers*, which use AI tools and interact with end users.[21] Similar to privacy and data protection laws, AI governance frameworks should distinguish between these roles and assign obligations accordingly. In the context of AI risk management, the Organization for Economic Cooperation and Development (OECD) has recognized this distinction as AI evaluated "in the lab" (i.e., developers) versus AI evaluated "in the field" (i.e., deployers).[22] Understanding the differences in control and visibility between developers and deployers is essential for a workable life-cycle approach to AI risk management.

Workday understands that the lack of public trust in AI must be addressed across industry and in partnership with governments. We know that people and organizations will not use technology

they don't trust. *Workday strongly supports government action to cultivate trust in AI, including new regulations on AI developed and used for consequential decisions*, such as decisions to hire, promote, or terminate an employee. We were early champions for the creation of the National Institute of Standards and Technology's (NIST) AI Risk Management Framework (AI RMF or Framework) because we recognized the need for a robust, flexible, and commonly accepted benchmark for AI governance.[23] Workday is an early adopter, and in September, NIST published a case study featuring Workday's use of the AI RMF, the first of any organization.[24]

As policymakers began considering a path forward on AI policy, we recognized the need for a practical roadmap for responsible AI in the workplace. With this in mind, Workday joined the Future of Privacy Forum and other leading technology companies to co-develop the *Best Practices for AI and Workplace Assessment Technologies*.[25] The *Best Practices* leverage our experience delivering trustworthy enterprise AI capabilities at scale, as well as federal government benchmarks, including the NIST AI RMF and guidance from the Equal Employment Opportunity Commission and Federal Trade Commission (FTC).[26] We were proud to endorse the *Best Practices* and have called on other organizations to join us in using them.[27]

Specific Comments on the Draft Memorandum

Advancing Responsible AI Innovation

Workday applauds OMB for recognizing that "AI can improve operations and deliver efficiencies across the federal government." We strongly agree with the Draft Memorandum's focus on identifying and removing barriers to the responsible adoption of AI in the federal enterprise. Robust AI governance is *not* incompatible with the federal government's longstanding efforts to modernize its information technology systems. The Draft Memorandum strikes a fair balance between these policy aims. We offer the following recommendations with the goal of advancing both priorities.

OMB should emphasize the importance of "buy, not build."

[23] "A Timely Bipartisan Push for Trust in AI: Congress and the NIST Trustworthy AI Framework." Morning Consult, January 12, 2021. https://morningconsult.com/opinions/congress-and-the-nist-trustworthy-ai-framework/.

[25] "Future of Privacy Forum and Leading Companies Release Best Practices for AI in Employment Relationships." Future of Privacy Forum, September 19, 2023. https://fpf.org/blog/future-of-privacy-forum-and-leading-companies-release-best-practices-for-ai-in-employment-relationships/.
[26] "Assessing Adverse Impact in Software, Algorithms, and Artificial Intelligence Used in Employment Selection Procedures under Title VII of the Civil Rights Act of 1964." US EEOC. https://www.eeoc.gov/laws/guidance/select-issues-assessing-adverse-impact-software-algorithms-and-artificial?utm_content=&utm_medium=email&utm_name=&utm_source=govdelivery&utm_term=.
[27] "Future of privacy forum and leading companies release best practices for AI in employment relationships." Future of Privacy Forum. https://fpf.org/blog/future-of-privacy-forum-and-leading-companies-release-best-practices-for-ai-in-employment-relationships/.

In 2022, there was $47.4 billion of private investment made in AI in the United States.[28] This underscores the scale of resources the U.S. private sector is devoting to developing cutting-edge AI technologies and deploying them at scale. For the federal government to efficiently and effectively modernize its IT systems, it is critical that federal agencies leverage the commercial solutions that emerge from these investments.

With this in mind, Workday welcomes the Draft Memorandum's recognition in Section 4 that "AI can improve operations and deliver efficiencies across the Federal Government." However, the Draft Memorandum also asserts that agencies "should ***build*** internal enterprise capacity to support responsible AI innovation." Unfortunately, this language may be interpreted by agencies as a directive to overlook commercially available solutions in favor of developing and deploying their own AI tools. ***We urge OMB to clarify this provision and reemphasize the importance of a "buy not build" approach to procuring information technology systems by the federal government***, including those that integrate AI.[29]

Custom-built technology solutions, whether developed by a federal agency or a government contractor, have historically had a high failure rate, are often more expensive than commercial alternatives, are costly and difficult to maintain, and quickly become obsolete.[30] Commercial solutions, including Workday's, are better positioned to help agencies streamline and standardize administrative processes, gain unprecedented visibility across organizations, and adapt quickly to change, including changes in fast-evolving technologies such as AI.

Existing federal acquisition rules and the *Federal Acquisition Streamlining Act of 1994* [31] have long required the federal government to prioritize and procure commercial items, to the maximum extent practicable, over custom development.[32] This should be no different when considering the procurement of secure, responsible AI tools. Given the fast-evolving nature of AI technology, as well as efforts by companies like Workday to develop AI in a responsible manner, it is critical that agencies turn to commercial solutions and expertise. We encourage OMB to make this clear in the final Memorandum.

OMB rightly identifies workforce challenges as a barrier to AI adoption.

As noted above, the federal government faces workforce challenges that are not limited to AI. At the same time, computer and AI literacy are increasingly needed for today's jobs, which we expect to grow in the future. We therefore applaud OMB for identifying workforce challenges as a barrier to agency adoption of AI. Consistent with the *Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence* (AI Executive Order), the Draft Memorandum highlights the need for the federal government to recruit, attract, and retain AI talent from across the country. Removing these barriers is paramount for the federal government to achieve *both* its AI and workforce goals. The emerging focus by the federal

government on skills-based hiring, rather than solely on traditional credentials, is the right lens through which to view these workforce priorities.[33]

AI is unique in that it will drive change in the workplace and power the tools that workers and employers need to successfully navigate those changes. In many ways, a skills-based approach to talent is difficult to scale at a level necessary for the federal government without AI-driven tools implemented in a responsible manner. For example, the AI tools we deliver to our customers help people to make more informed decisions by surfacing new insights, identifying opportunities for career development, and improving workers' day-to-day by simplifying labor-intensive tasks.[34]

Our guiding principle is that AI should be used in ways that augment, rather than displace people. We've found that this is an approach that builds trust with our customers and end users.[35] As such, Workday provides tools that enrich–but don't automate–human decisions and can make a skills-based approach to talent a reality. We encourage OMB to work with federal agencies to view AI as a tool to help address federal workforce challenges, including those being driven by federal AI-adoption.

Managing Risks from the Use of Artificial Intelligence

Impact assessments are the right AI accountability tool.

Workday strongly supports the use of impact assessments in AI governance frameworks and commends OMB for directing agencies to use them for "rights-impacting" AI systems. In 2021, we released a whitepaper, *Building Trust in Artificial Intelligence and Machine Learning*, in which we introduced a "Trustworthy by Design" framework.[36] Our whitepaper proposed that organizations adopt AI governance frameworks and conduct an AI impact assessment for each high-risk AI system that they intend to develop or deploy. We also called for developers to supply deployers with system information identifying the AI tool's intended purpose and any known limitations.

The state of AI technology and governance has advanced significantly since 2021. We nonetheless believe that impact assessments retain three important advantages over other potential AI accountability tools because:[37]

- **Impact assessments are familiar and reliable**. Widely used in the fields of privacy and data protection, organizations are experienced at conducting impact assessments. The

[36] Building Trust in AI and ML through principles, practice, and policy, n.d. https://www.workday.com/content/dam/web/en-us/documents/whitepapers/building-trust-in-ai-ml-principles-practice-policy.pdf.
[37] "Impact Assessments: Supporting AI Accountability & Trust." Access Partnership. 2023. https://www.workday.com/content/dam/web/en-us/documents/legal/access-partnership-workday-impact-assessment-paper.pdf.

European Union's *General Data Protection Regulation* and at least ten U.S. state privacy laws require private sector organizations to carry them out.[38] Under the *E-Government Act of 2002*, federal agencies are required to conduct privacy impact assessments before using a system that collects, maintains, or disseminates information about members of the public.[39] These serve as "one of the most valuable tools federal agencies use to ensure compliance with applicable privacy requirements and manage privacy risks."[40]

- **Impact assessments are practical** because they do not rely on technical standards or quantitative metrics, which in the field of AI governance are nascent.[41] An impact assessment can function as a holistic risk assessment that accounts for an AI tool's objective, design, intended use, and limitations.

- **Impact assessments are future-proof** because they can adapt as AI systems and AI governance evolve. With the launch of NIST's new AI Safety Institute, there is growing focus on the need to develop "a new measurement science that will enable the identification of proven, scalable, and interoperable techniques and metrics" for trustworthy AI.[42] As these metrics and international standards continue to develop, they can be incorporated into future impact assessments conducted by federal agencies.

For these reasons, there is a growing consensus among lawmakers, business leaders, and civil society that impact assessments for high-risk AI tools are the most promising accountability tool available today. *Accordingly, we agree with the proposed requirement, starting on August 1, 2024, that agencies complete AI impact assessments before using existing or new safety-impacting or rights-impacting AI.*

OMB should strengthen and streamline the proposed AI impact assessment process.

Workday makes the following recommendations to strengthen federal agencies' use of AI impact assessments. First, impact assessments should focus on identifying, documenting, and mitigating "reasonably foreseeable" risks of harm to an individual's rights or safety. The Draft Memorandum's current language on "potential risks" invites federal agencies to speculate on *any possible* risks that can arise from the use of an AI tool, which may militate against a tool's expected benefits altogether. Importantly, emerging benchmarks for AI governance in California and among key U.S. trading partners recognize "reasonably foreseeable" as a legal standard for mitigating harms.[43] The FTC has also issued guidance to businesses developing or using AI

[38] "Impact Assessments - a key part of AI accountability." BSA, https://www.bsa.org/policy-filings/impact-assessments-a-key-part-of-ai-accountability.
[39] P.L. 107–347.
[40] FPC.Gov. Federal Privacy Council, https://www.fpc.gov/elements-of-federal-privacy-program/privacy-impact-assessments/.
[41] The quality of an impact assessment, like all governance processes, is improved by technical standards. Unlike other accountability tools, however, technical standards are not *required* for impact assessments, which offer a holistic and robust identification, document, and mitigation of AI risk.
[42] U.S. Artificial Intelligence Safety Institute. NIST. 2023. https://www.nist.gov/artificial-intelligence/artificial-intelligence-safety-institute.
[43] California's *AB331* requires developers and deployers to conduct impact assessment to identify and mitigate the "reasonably foreseeable risk of algorithmic discrimination." Canada's draft *Artificial Intelligence and Data Act* and the European Union's *Artificial Intelligence Act* are also both expected to integrate "reasonably foreseeable risk" as a legal standard for assessing and mitigating potential harms.

and other high-risk technology to "know the reasonably foreseeable risks and impact" of their products.[44]

Second, OMB should require developers providing AI to the federal government to supply "data sheets" or "data cards" concerning training data. AI developers' representations concerning the provenance, relevance, breadth, reliability, and quality of their datasets would better ensure that agencies have the information necessary to complete reporting requirements, without unduly delaying agency impact assessments. To streamline the impact assessment process, we recommend the use of common forms across federal agencies, which will rely on information regarding the quality and appropriateness of data in a standardized fashion.

Third, OMB should require each covered agency to develop a plan to dedicate sufficient resources for conducting impact assessments, testing, and independent evaluations within 120 to 180 days. We note that agencies will need to apply appropriate resources to fulfill these requirements if they are to avoid bottlenecks for systems already in use, in development, or in procurement prior to and after August 1, 2024.

The Draft Memorandum should center federal AI risk management practices on the NIST AI Risk Management Framework.

Workday is pleased that the Draft Memorandum encourages federal agencies to incorporate the NIST AI RMF into their governance processes. ***We nonetheless urge OMB to go further than recognizing it as a "best practice," as the Draft Memorandum currently does, and instead require agencies to use the AI RMF.*** Doing so would advance a number of AI policy and governance goals, including: (1) ensuring federal agencies, contractors, and vendors have a common baseline by which to understand, assess, and communicate AI risk management practices and controls; and (2) signaling to the U.S. private sector and U.S. trading partners that the AI RMF is *the* benchmark for mapping, measuring, managing, and governing AI risk.

In addition to promoting a consistent approach to AI risk management and U.S. leadership in responsible AI governance, agency adoption of the NIST AI RMF will set stable expectations in the federal marketplace. In contrast to other "best practices," the NIST AI RMF was developed at the direction of Congress through an open, multi-stakeholder process with participation from academia, civil society, and the business community. There is bipartisan, bicameral support in Congress for its adoption by federal agencies,[45] including *The Federal AI Risk Management Act*.[46] These proposals echo the National AI Advisory Committee's (NAIAC) Year 1 Report to the President, which recommends federal use of the AI RMF.[47] A recent follow-up recommendation from the NAIAC outlines how the AI RMF can be implemented by federal agencies with a

---

rights-respecting approach.[48] This underscores that the AI RMF outlines a robust, flexible approach to AI governance that can advance a key objective of the Draft Memorandum: the upholding of civil rights, civil liberties, and consumer protection. Accordingly, the AI RMF warrants further consideration as a required baseline for federal agencies than currently envisioned in the Draft Memorandum.

Federal agencies' independent evaluations should avoid premature third-party audit requirements.

The Draft Memorandum envisions federal agencies conducting an independent evaluation of impact assessments and testing results. Given resource constraints, federal agencies may ultimately contract these independent evaluations to third-parties. Although internal agency evaluations are appropriate, we caution OMB that evaluations that rely on third-party auditors may not be fit for purpose.

Although promising in the medium- and long-term, AI auditing is a field that is still in development, as there are neither consensus technical standards nor a common set of criteria to audit AI tools against. Notwithstanding meaningful steps in favor of professionalizing the AI governance field, there are currently no binding standards on third-party AI auditors specifically, which are necessary for ensuring auditing quality and integrity.[49] As noted in the White House's 2023 *National AI Research and Development Strategic Plan*, absent such standards, the scalability of AI auditing is a significant practical challenge.[50] Without such building blocks, premature third-party audit requirements may unintentionally diminish trust in AI used in the federal enterprise by failing to promote consistent accountability and delaying the implementation of critical AI tools.

As one prominent researcher has noted, "inadequate audits or those without clear standards provide false assurance of compliance with norms and laws, 'audit-washing' problematic or illegal practices."[51] Only once critical building blocks are in place can third-party AI audits serve as an important accountability tool to complement impact assessments.

The definition of "right-impacting" systems should be refined.

The Draft Memorandum appropriately adopts a risk-based approach to AI governance that maximizes the benefits of AI and minimizes the risks of potential harm. As key U.S. trading partners are demonstrating, including Canada, the European Union, the United Kingdom, and Singapore, a risk-based approach means applying rules to contexts and uses of AI that carry the highest risk of potential harm to individuals. To implement a risk-based approach,

[50] National Artificial Intelligence Research and Development Strategic Plan. The Executive Office of the President. 2023. https://www.whitehouse.gov/wp-content/uploads/2023/05/National-Artificial-Intelligence-Research-and-Development-Strategic-Plan-2023-Update.pdf.

[51] Ellen P. Goodman and Julia Trehu, "AI Audit-Washing and Accountability," GMF. November 2022. https://www.gmfus.org/sites/default/files/2022-11/Goodman%20%26%20Trehu%20-%20Algorithmic%20Auditing%20-%20paper.pdf

policymakers have defined high-risk systems by focusing on: (1) the *purpose or intended purpose* for which an AI tool is used; and (2) *how* the AI tool's output is used to advance that purpose. Only by properly scoping *both* elements can a risk-based approach be workable in practice.

Although the Draft Memorandum's initial approach is promising, we recommend that OMB further refine its definition of a "right-impacting" system. The Draft Memorandum currently sets a presumption for federal agencies that an AI tool is "rights-impacting" if it is (1) used in a certain set of decisions, activities, or contexts (2) to "control or meaningfully influence" outcomes. Workday urges OMB to refine this definition because, as written, it is likely to capture AI tools that are not high-risk, thereby undercutting the benefits of a risk-based approach to AI governance and slowing AI adoption in the federal enterprise.

First, we recommend that OMB focus solely on consequential *decisions*, rather than a broader set of *contexts* or *activities*. Consequential decisions in the employment context are determinations as to an individual's access to important life opportunities, such as the decision to hire, terminate, set pay, or promote an employee. As written, the Draft Memorandum captures a wide spectrum of potential AI use cases with no indication of how they are "rights-impacting." It is unclear, for example, how *all* "virtual or augmented reality workplace training programs" impact the rights of an individual. By contrast, an individual's *selection* into such a training program directly impacts their access to that opportunity. Unfortunately, the Draft Memorandum's use of undefined terms (e.g., "workplace management system") adds to this uncertainty and invites different and likely competing interpretations by federal agencies. *Workday urges OMB to set an exhaustive and clearly defined list of consequential decisions.* Doing so will provide much needed clarity about which AI use cases are presumed to be "rights-impacting."

Second, we recommend that OMB focus the Draft Memorandum's scope on AI tools that *control* outcomes. This will improve the definition of "rights-impacting" systems in two respects. It will address the ambiguities associated with the current language on "control or meaningfully influence," because "meaningfully influence" is an unclear threshold.[52] Importantly, it will also distinguish between fully automated AI tools and those with an informed human-in-the-loop in the decision.[53] An AI tool that *replaces* human decisions poses a higher risk than an AI tool that *enriches* them. This is because an automated tool can make consequential decisions at a higher volume and velocity than a human, and without the judgment that a human brings. By contrast, when an informed human is in the loop, they can leverage an AI tool's insights and remain in control of and accountable for the final decision. *The Draft Memorandum already recognizes that a human-in-the-loop approach presents a lower-risk than fully automated ones; its definition for "rights-impacting" should recognize this as well*. Agencies that use "rights-impacting" systems, for example, would be required to have ongoing human training and assessment and human consideration in final decisions. By focusing on AI tools that are fully automated and scoping out those with an informed human-in-the-loop, a revised definition of "rights-impacting" AI would focus agencies' limited resources on tools with the highest risk profiles.

[52] If OMB believes a definition of "control" is needed, we recommend "the factor that is weighted more than all other factors together."
[53] Earlier this year, Workday surveyed 1,000 senior decision-makers in human resources, finance, and technology for their perspectives on AI. Nearly all (93 percent) said it was important to keep a "human in the loop" when making significant decisions. "AI IQ: Insights on AI in the Enterprise." Workday. June 2023. https://www.workday.com/en-us/why-workday/our-technology/artificial-intelligence/research/ai-iq.html.

OMB should encourage consistency in "rights-" and "safety-impacting" AI determinations by distinguishing between agency-specific AI systems and enterprise AI systems.

The Draft Memorandum treats the designation of "right-impacting" and "safety-impacting" AI as *presumptions* and enables federal agencies to either waive or make additional designations. This approach will likely result in inconsistent designations of which AI tools are or are not high-risk throughout the federal government. While agencies may be best placed to designate AI tools as "rights-" or "safety-impacting" if the use case relates to their mission, it is unclear how different designations of *enterprise* AI solutions advances AI risk management.

Workday recommends that OMB distinguish between agencies' mission-specific AI systems (for which individual agencies are best equipped to tailor definitions and make determinations) and enterprise systems such as human resources and financial management systems (for which a uniform determination across the whole of government is more desirable). This will promote consistency in determinations of "rights-" and "safety-impacting" AI tools throughout the federal government and encourage a more consistent level of protection.

In the case of enterprise systems that may serve multiple agencies, CAIOs should, to the maximum extent practicable, coordinate through the interagency council that will be established under Section 10.1(a) of the *AI Executive Order*, to ensure consistent determinations about "rights-" or "safety-impacting" AI systems and features. Coordination through the interagency council would benefit AI adoption across the federal government by reducing duplicative agency efforts and compliance burdens on federal contractors and vendors.

We also recommend that OMB direct CAIOs to distinguish between mission-specific and enterprise AI uses in agencies' annual AI use case inventories. This information would enable OMB to catalog widely-used AI features for which government-wide determinations would be most valuable, and avoid inconsistent determinations between multiple agencies utilizing the same enterprise AI features for the same or similar purposes. As discussed in further detail below, the interagency council should also develop and implement frameworks for mutual recognition of AI authorizations and monitoring activities, and to ensure that enterprise AI systems are not subject to unnecessarily duplicative, wasteful, or disparate requirements.

OMB Should Enhance Standardization and Encourage Reciprocity by Minimizing Agency-Specific Definitions and Practices.

As noted above, adoption of beneficial AI systems by the federal government is best served by uniform definitions and practices across federal agencies. An agency-by-agency approach to developing key definitions and requirements will likely result in fragmentation that will subject a single AI tool to diverging authorization, testing, and monitoring practices between agencies. This would result in an expensive repetition of effort for both government agencies and AI developers without a corresponding benefit.

To avoid this result, OMB should remove language in the Draft Memorandum that encourages agencies to develop agency-specific definitions and practices. *We recommend OMB instead establish a framework for standardized and reciprocal AI authorization and monitoring processes.* The current FedRAMP program provides a model on which this approach could be designed, emphasizing reciprocity of AI authorizations across agencies and a presumption that the authorization and monitoring activities of an initial sponsoring agency are adequate for

similar use cases at any other agency.[54] In short, a single set of definitions and required practices would enable an efficient AI authorization framework inspired by the FedRAMP program and would enable government-wide AI adoption. Agency-specific deviations would inhibit this effort.

To the extent that agencies need the flexibility to identify agency-specific purposes, definitions, or practices, we recommend that they be limited to only those AI systems designed to address a single agency's mission. *Workday also recommends that agency-specific deviations from OMB guidance be applied to AI systems only after the agency policies are clearly defined and made subject to public comments via Notice in the Federal Register.*

AI Governance Boards will strengthen federal agencies' AI risk management.

We applaud the Draft Memorandum's requirement that federal agencies institute an AI Governance Board. As discussed above, Workday has instituted a Responsible AI Advisory Board to ensure senior leadership and provide executive oversight of our responsible AI program.[55] This internal advisory group meets regularly to review and approve new aspects of Workday's responsible AI program, and to advise on novel issues that are not currently contemplated by existing policies or processes—helping to address edge cases and escalations as needed. The advisory board members' seniority and cross-disciplinary diversity enables it to make difficult decisions, mandate necessary risk mitigations, and delay or stop product releases if the technology fails to align with the company's AI principles and core values.

OMB should clarify the Draft Memorandum's proposed opt-out requirement.

The Draft Memorandum would require agencies deploying "right-impacting" AI tools to "provide and maintain a mechanism to conveniently opt out from AI functionality in favor of a human alternative." Given the broad definition of "rights-impacting" AI, we encourage OMB to clarify that opt out rights apply to AI tools used for consequential *decisions*, where the tool's output is the *sole* criterion for the decision. This would bring the Draft Memorandum in line with commonly accepted legal requirements, including the EU's *General Data Protection Regulation*, which recognize that an opt out requirement is appropriate for fully automated systems, rather than those with a human-in-the-loop. Moreover, as AI features are being integrated throughout commercial software, a broad opt out from all AI tools will likely serve as a barrier to AI adoption in the federal enterprise.

Managing Risks in Federal Procurement

OMB Should Clarify the Definition of "AI Contract" and Exclude "Common Commercial Products."

To ensure consistency with section 7224(d) of the *Advancing American AI Act* and Section 10.1(d)(ii) of the *AI Executive Order*, Workday recommends that the Draft Memorandum adopt the definition of "artificial intelligence system" set forth in section 7223(4) of the Act:

---

[54] *See e.g.* 44 U.S.C. § 3613 ("The assessment of security controls and materials within the authorization package for a FedRAMP authorization shall be presumed adequate for use in an agency authorization to operate cloud computing products and services").

[55] "Empowering Innovation through Responsible AI Governance." Workday Blog. https://forms.workday.com/en-us/whitepapers/empowering-innovation-through-responsible-ai-governance/form.html.

ARTIFICIAL INTELLIGENCE SYSTEM.—The term "artificial intelligence system"—

> *(A) means any data system, software, application, tool, or utility that operates in whole or in part using dynamic or static machine learning algorithms or other forms of artificial intelligence, whether—*
>
> > *(i) the data system, software, application, tool, or utility is established primarily for the purpose of researching, developing, or implementing artificial intelligence technology; or*
> >
> > *(ii) artificial intelligence capability is integrated into another system or agency business process, operational activity, or technology system; and*
>
> *(B) does not include any common commercial product within which artificial intelligence is embedded, such as a word processor or map navigation system.*

We suggest that OMB issue additional definitions and guidance to enable covered agencies to distinguish "AI contracts" within the meaning of the Draft Memorandum (or "contracts for the acquisition of an artificial intelligence system or service" within the meaning of the section 7224(d) of the Act), from contracts for any "common commercial product" excluded from the definition of AI system by section 7223(4)(B) of the Act. Given procurement preferences in favor of commercial products and services "consistent with customary commercial practice," this guidance should refrain from applying new government-specific contract requirements to the acquisition of common commercial products–especially commercial items and commercial-off-the-shelf software products–that embed AI.

OMB should maximize the value of data for AI consistent with commercial terms and existing data rights clauses.

When a covered agency intends to procure an "artificial intelligence system or service" within the meaning of the section 7224(d) of the Act, the procurement laws and regulations applicable to commercial products and services still apply. With respect to data rights, we believe that covered agencies should not seek additional rights to data that are inconsistent with commercial practice or beyond the requirements of existing FAR data rights clauses.[56]

For example, customary commercial practices and FAR data rights clauses would not grant the government buyer rights in data first produced outside of the performance of the contract, such as rights in a dataset initially used to train an AI model. Nor would they grant the government rights in model improvements that are a part of commercial computer software provided under the terms of a commercial license. Standard FAR data rights clauses and customary commercial practices would, however, grant the government rights in technical data first produced in the performance of a contract, such as rights in improvements or enrichments of government data developed through data cleaning or data labeling efforts. No further regulatory requirements are necessary to protect these government rights.

[56] FAR § 52.227-14; Defense Federal Acquisition Regulation Supplement § 252.227-7015.

Where rights in data produced under a contract will facilitate the government's continued design, development, testing, and operation of AI, we recommend that OMB not encourage agencies to seek additional rights that are inconsistent with commercial terms. Similarly, while agencies may consider provisions that would protect government data from use to train or improve the functionality of commercial AI without express permission from the agency, agencies should also understand that limiting the use of data – especially de-identified, disaggregated, anonymized data – in an AI developer's general product improvement cycle may be inconsistent with commercial practices.

OMB Should prepare acquisition planning materials and contract clauses for procurement of "rights-" and "safety-impacting" AI and encourage bilateral modification of impacted contracts.

While the minimum practices for "rights-" and "safety-impacting" uses of AI are intended to be agency responsibilities, the practices applied to an AI developer's systems will inevitably impact the scope of the contractor's efforts under an AI contract. It is therefore critical that agencies identify potential for "rights-" or "safety-impacting" uses of AI as early as possible in acquisition planning, and include requirements in their solicitations and contracts. OMB should assist agencies in the effort by preparing acquisition planning checklists and other guidance for identifying safety- or rights-impacting uses of AI – especially in "non-AI" procurements. OMB should also prepare sample contract requirements or clauses for agencies to include in their solicitations.

Finally, OMB should recognize the importance of minimizing disruptive changes to existing and future contracts that did not anticipate the requirements of the minimum practices at the time that they were executed by the parties. We suggest that the specific requirements for an AI system developer to support the minimum practices be included in the solicitation, and the contract for the AI product or services.

In the event that the requirements were not included because the contract was executed prior to the Draft Memorandum, or because the product or service was not identified as "rights-" or "safety-impacting" AI at the time, additional obligations should not be imposed on the contractor except by bilateral modification of the contract. This guidance would support contractors' certainty in their obligations as the government continues to develop frameworks for the use of AI, and insulate contractors from shifting determinations or waivers that may result from changes in an agency's CAIO, or updates to policies and practices over time. This will also reduce any subsequent litigation between the contractors and the agency relating to any such modifications.

Conclusion

Workday appreciates OMB's efforts to produce a Draft Memorandum that recognizes the benefits of federal agencies adopting responsible AI. The challenges facing the federal government and the importance of agencies' missions are only growing, making the availability of modern and secure cloud-based systems and AI tools essential.

At the same time, AI adoption can result in unintended consequences. Workday strongly believes in the need for smart AI guardrails and supports regulations that ensure AI can be deployed safely, users can trust the technology, and developers can continue to innovate. We

congratulate OMB on taking a thoughtful approach and embracing a risk-based path forward that uses impact assessments.

We offer the above comments, which are informed by our approach to responsibly developing AI tools and our engagement with policymakers on AI issues at the global, federal, state, and local levels, to strengthen OMB's proposal. Please contact Evangelos Razis, Senior Manager, Public Policy, (evangelos.razis@workday.com) if there is additional information we can provide.

Proposed Memorandum for the Heads of Executive Departments and Agencies: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

Comments prepared by James Broughel, Competitive Enterprise Institute

To Shalanda D. Young, Director of the Office of Management and Budget:

The Competitive Enterprise Institute (CEI) is a non-profit public interest organization committed to advancing the principles of free markets and limited government. CEI has a longstanding interest in applying these principles to the rulemaking process and has frequently commented on issues related to oversight of rulemaking and the regulatory process. On behalf of CEI, I am pleased to provide comments to the Office of Management and Budget (OMB) on its proposed draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence."[1]

Background and Recommendations

The draft memorandum lays out proposed requirements and recommendations for federal agencies to govern, innovate with, and manage risks from artificial intelligence (AI), particularly where AI impacts rights and safety. It calls for agencies to designate Chief AI Officers, develop AI strategies, and implement minimum practices for rights-impacting and safety-impacting AI systems by August of 2024. These practices include conducting AI impact assessments, collecting representative data, imposing non-discrimination safeguards, gathering stakeholder feedback, and implementing ongoing monitoring and transparency measures.

While the draft memo takes some proactive steps in the direction of responsible and safe governmental use of AI, OMB can further improve its approach to AI risk management by more formally incorporating risk analysis methods into agencies' implementation plans. As explained in the attached book chapter,[2] risk analysis is a powerful tool for comparing a policy or

regulation's target risk reductions to the countervailing risk increases that stem from the opportunity costs of these same policy actions. Opportunity costs essentially result from any regulation or policy.

The chapter, written by Salisbury University Professor Dustin Chambers and me, focuses on mortality risks specifically and outlines a method by which analysts can conduct robust risk analysis in ten steps. While the chapter focuses on policies in the state of Wisconsin, the lessons are relevant to any jurisdiction.

The ten steps of robust mortality risk analysis are:

1. Evaluate if the policy saves lives directly.
2. Estimate the number of lives saved, if applicable.
3. Calculate the accounting costs over time.
4. Identify any corresponding cost savings, to calculate net accounting cost.
5. Determine the opportunity cost, based on what would have been consumed vs. invested from the accounting costs.
6. Calculate the net present value of costs net of cost savings.
7. Calculate the cost-effectiveness as the net present value of costs, divided by lives saved.
8. Compare the cost-per-life-saved to the "value of an induced death" to see if the policy increases or reduces mortality risk immediately.
9. Determine if the policy will increase risk at some point in the future.
10. Make a table tracking costs, lives saved, and risk over time, identifying any risk reversals.

This approach allows policymakers to quantify mortality impacts and identify regulations or other policies that may increase overall mortality risk. By incorporating this analysis into AI strategies and assessments, agencies can better evaluate the tradeoffs they face and demonstrate whether their AI systems are net risk reducing.

Following these steps is a practical way to implement OMB's requirements for AI impact assessments[3] as well as to comply with standards for AI risk management, such as those outlined from the National Institute of Standards and Technology.[4] While these documents include some commonly-accepted principles, they leave unexplained many of the specifics of how risks should be analyzed. The attached book chapter fills these gaps.

The inputs needed in this kind of analysis are modest—really just the costs and the estimated lives saved from the policy. While no doubt other risks are often relevant aside from mortality, few would argue against mortality risks being some of the most important risks affected by

government actions. Importantly, however, sound risk analysis can only be conducted if the opportunity cost of government policies is properly considered.[5]

Conclusion

I urge OMB to direct agencies to consult the attached book chapter as they develop implementation plans for the memorandum. Few resources will offer such specific and easy-to-follow instructions for risk analysis as this guide. By extension, AI impact assessments can easily be produced that account for mortality risk.

With adequate personnel dedicated to the task, federal agencies' compliance with the proposed draft memorandum could integrate mortality risk analysis without much difficulty. This would significantly strengthen OMB's approach to ensuring AI safety across government.

I appreciate your consideration of these comments.

Sincerely,

James Broughel, PhD

Senior Fellow, Competitive Enterprise Institute

7 How Risk Analysis Can Improve Wisconsin Regulations and Save Lives

Each morning when we wake up, we face a plethora of risks in the day ahead. These may include the risk of getting into a car accident on the way to work, the risk of catching COVID-19 from our coworkers, and the risk of contracting heart disease from eating poorly or not exercising. Although risks are usually thought to be associated with harms (which is primarily how they will be discussed in the context of this chapter), some risks can be beneficial. When we buy a lottery ticket there is a risk we might win. There is a risk of meeting our future spouse when we walk into a nightclub, a risk of landing our dream job after we submit an employment application.

The reason policy makers care about risks is that a responsibility of public policy is to prevent harms of various kinds. However, no harm will occur with certainty. There may be only a small chance of an asteroid hitting the earth, but the results would be catastrophic. By contrast, there is a high probability that a citizen will experience a mosquito bite this year; however, the harm from this event is minuscule. How should policy makers react to such a divergence in risks?

What these events have in common is they combine an outcome with an associated probability. For example, there might be a 1 percent chance of developing cancer from walking onto a radioactive waste site with no protective equipment. Or there could be a one-in-a-million chance of being hit by lighting during a thunderstorm. In each case, the overall level of risk depends both on the likelihood some event will occur (the probability) and on the consequences of the event itself. These consequences can be very significant, as with death, or they can be trivial, as with the mosquito bite.

Policy makers should be deliberate when assessing risks for the simple reason that there are opportunity costs to using public funds. Spending money to mitigate the risk of children drowning in swimming pools means fewer resources are available to devote to fire prevention. The result is that the overall level of risk may be higher than it could be, given the current allotment of public resources. In other words, optimizing the government's risk mitigation strategy (and allocating the current level of funding accordingly) could lead to a reduction in the risk faced by the community with no additional funds spent. However, without careful analysis, it is usually not obvious how resources should be spent, which is why risk analysis is critical to the efficient implementation of risk policy.

In determining how much risk to take on, a person must consider a number of factors, including but not limited to the specific *target* risk being addressed. For example, let's say someone is concerned about the risk of dying in a car accident. One could reduce risk substantially by sitting at home all day rather than driving to work. A salesperson who spends most of the day on the telephone might be able to perform this job from almost anywhere, so the option to telework might be available, making this risk-reduction strategy more palatable. On the other hand, a plumber doesn't have this luxury. In choosing the stay home, the plumber forgoes a considerable amount of income. As we will see, forgoing income results in elevated *substitute* risks of various kinds.

Risks that increase when another risk falls are called "countervailing risks," and in some cases these can even be large enough to offset the risk that is directly being reduced by policy (the "target risk"). By choosing to stay home rather than drive to work, the plumber described above has reduced the chance of dying in a car accident. But by forgoing income, the plumber might have to cut back on a monthly gym membership or make cheaper and less healthful eating choices. These behavioral changes could increase risks associated with poor health.

Even the example of the teleworking salesperson presents tradeoffs, since social isolation might increase the risk of depression. Some people might opt to drive to work in spite of having the option to telework, simply because they prefer to chat

with coworkers in the coffee room or to see their colleagues face to face in meetings. For both the salesperson and the plumber, staying at home is not costless, including in terms of accepting countervailing risks.

Public policy makers have it even harder because they must make decisions about risk for an entire community. The state of Wisconsin has annual expenditures of roughly $60 billion (Urban Institute 2022). Some of these funds are spent to reduce residents' risks. Spending on police departments reduces the risk that certain crimes will occur, such as robberies or vandalism. Spending on hospitals reduces the risk of a child dying after accidentally drinking poisonous chemicals. Spending on free or subsidized school lunches reduces the risk of malnutrition. And so on. Since public funds are not unlimited, public policy makers must make tough decisions and set priorities about which risks to mitigate.

Directing spending toward the largest risks is not necessarily an optimal strategy either. There is a 100 percent chance that every person on this planet will die at some point. Consequently, this risk presents us with a very high-impact outcome (death) and a high likelihood of it occurring (100 percent). But that does not mean that all of our resources should be spent on the development of antiaging drugs or artificial hearts and brains. After all, such drugs and technologies might not be very effective, so we might not get a high return on investment. Relatedly, if we only have a limited amount to spend on risk reduction, we might save more lives by directing scarce resources toward other purposes. For example, spending a few million dollars on additional traffic lights might save more lives than devoting the same resources toward antiaging research that has little chance of working.

Another important concept policy makers should consider is what economists call "diminishing marginal returns." Even if traffic lights are very effective at preventing deaths, it wouldn't make sense to have them at every street corner. At some point we don't want more traffic lights. The cost of lights becomes prohibitively expensive because the lights slow down the flow of traffic and increase travel times, which causes other problems. At some point, even high-payoff risk reduction efforts start producing lower returns, so it makes sense to spend on other priorities—perhaps higher-visibility crosswalks.

This is where risk analysis comes in. Risk analysis is a tool that analysts can use to assess the magnitude of risks for the purposes of making the kinds of comparisons just described. The purpose of this chapter is to explain to policy makers what risk analysis is and how it can be used to inform policy in Wisconsin, and also to walk through how that analysis is produced, including how to avoid some common pitfalls. We will focus primarily on mortality risks—that is, the risk of death—since these risks tend to be the largest and most significant risks that individuals and policy makers are concerned with. However, it is worth noting that the principles described in this chapter can be applied to other risks as well.

We begin our chapter with a review of the literature on "mortality risk analysis," explaining how the analysis of mortality risks has gained acceptance over time. This acceptance, however, has come primarily from the academic community, because most governments around the world still do a poor job analyzing risks. We therefore proceed with some step-by-step instructions that policy makers can follow in order to assess risks.

An important tool for deciding how to deal with risks is "cost-effectiveness analysis," which is used to evaluate how much it costs to achieve a particular change in outcomes. For example, an analyst might estimate the cost-per-life-saved of various policy alternatives and then see which one saves the most lives for the least cost. In order to perform cost-effectiveness analysis prudently, one needs to estimate the opportunity costs of funds that are to be devoted to implementing a regulation or other policy. These opportunity costs include how funds might be used to reduce risks in the absence of the policy. Calculating opportunity cost sounds hard to do, but

there are sound conceptual ways to do it. With such information in hand, regulators and other policy makers can make more effective decisions that save both money and lives.

Our chapter concludes by examining several recent Wisconsin regulations for which regulators have produced an economic impact analysis. We demonstrate how key values from this kind of analysis can be used to determine whether a regulation actually increases or reduces mortality risks. Fortunately, a cost estimate is often all that is needed to make a preliminary assessment of a regulation's impact on mortality risk. Since Wisconsin regulators don't appear to be considering these outcomes at present, there is an opportunity for tools like risk analysis to be incorporated into the Wisconsin policy making process. Moreover, the analysis recommended in this chapter is fairly easy to conduct, so the state could perform this kind of analysis on a modest budget, so long as analysts are adequately trained.

All told, there are many opportunities available to Wisconsin policy makers (as well as to policy makers in other states) to make their regulatory system more evidence-based and rational from a risk perspective. This chapter offers an accessible explanation of how to do it.

Risk-Risk Tradeoffs

The academic literature on the mortality costs of policy expenditures chiefly traces back to the scholarship of Aaron Wildavsky, a political scientist at the University of California, Berkeley, who famously coined the phrase "richer is safer" (1981). Wildavsky's argument was that wealth is the primary means by which society combats risk. With fewer resources, fewer risks can be addressed and with more resources, more risks can be addressed. Hence, richer is safer. This theoretical argument has been borne out in the data as well. At the individual level, richer individuals tend to live longer (Chetty et al. 2016). The finding extends to the national level: richer countries overcome many of the risks that plague developing countries, such as malaria (Pritchett and Summers 1996).[1]

Since having more resources means one is able to combat more risks, it is easy to see how this logic also applies in reverse when resources are taken from people. That is to say, when individuals' incomes are lowered, they have fewer resources to devote to risk reduction, and hence they are likely to see some risks increase in their lives. A classic example involves job loss. If a person is living on the margins and barely making rent, losing a job might compel a move to a worse neighborhood with more crime and lower-performing schools, which in turn might result in short-run dangers while also having long-lasting impacts on the person's children. It is easy to see why low-income families are more susceptible to the kinds of risk increases that accompany a decline in income (Thomas 2019).

The association between income and health contributes to what economists call "risk-risk tradeoffs," or the idea that when one risk is reduced, another risk might be increased at the same time (Graham and Wiener 1995). For example, taking a Tylenol might reduce the risk of a headache while simultaneously increasing the risk of a stomachache. In the context of income and health, spending money to reduce risks through public programs can increase risk as citizens are taxed to pay for the risk mitigation measures.

Risk-risk tradeoffs are commonplace. One recent study that analyzed Germany's policy of phasing out its nuclear power plants found that reducing the risk of a Fukushima-style meltdown by closing nuclear power plants resulted in increased coal-fired power plant emissions, thereby raising risks associated with air pollution (Jarvis, Deschenes, and Jha 2019). Here we see an example of a countervailing risk (air pollution) increasing in lockstep with the reduction of a target risk (nuclear power plant meltdown). It is also possible for "coincident risk" reductions to occur, whereby a risk falls in tandem with target risk reductions. For example, exercising frequently at the gym might reduce the risk of a heart attack and the risk of a stroke at the same time.

Many risk-risk tradeoffs are unique to the circumstances involved with a particular public policy action. For example, not every policy is going to lead to more coal-fired power plant emissions, as was the case with the German nuclear policy. However, there are some risk-risk tradeoffs that are more general, such as those related to income losses. All public policies cost resources to varying extents, and consuming resources for one purpose means those resources can't be utilized for other purposes. The corresponding loss of private income owing to the taxing and spending of resources to support public policies increases some private risks, since reducing household incomes limits individuals' ability to mitigate risks using their own resources.

Cost-Effectiveness Analysis and Mortality Risk Analysis

In the early 1990s, economists and risk analysts began estimating the extent of the income-safety relationship using real-world data. One such scholar was a decision scientist named Ralph Keeney. Relying on the correlation between income and mortality, Keeney published a paper that argued that when a $5 million cost is spread across American society, this will likely produce one additional death due to the income-loss effect (Keeney 1990). This $5 million number is known as the "value of an induced death," or VOID.

Keeney's paper was fairly primitive and suffered from some statistical problems, which were quickly pointed out by critics (Sinsheimer 1991). As a result, future studies improved on Keeney's model by better controlling for variables that might correlate with income and also have an influence on mortality, thereby leading to improved estimates of the effect that a loss of income has on mortality.

One recent study we wrote (Broughel and Chambers 2022) found that for every $38.6 million in lost income among Americans, one death can be expected. Newer studies like ours do not completely overcome the statistical problems identified by Keeney's critics, but they do a much better job. Moreover, a separate line of research relying on theoretical models (rather than correlations in data) has also been developed to explain the income-mortality relationship. These models yield somewhat higher VOID estimates and are also useful. For example, a recent study by one of us and a coauthor (Broughel and Viscusi 2021) estimated that the VOID was closer to $108.6 million. Thus, it is reasonable to conclude that the average VOID for the United States lies somewhere between these two recent estimates, perhaps near the midpoint of these values (if one gives each estimate equal weight), which is $73.6 million. For the purposes of this chapter, we will use a VOID of $75 million.

An interesting use of the VOID concept is that it can be paired with cost-effectiveness analysis to determine whether a policy increases or reduces mortality on balance. As noted earlier, cost-effectiveness analysis estimates the cost per unit of the result desired. If the policy goal is to save lives, a cost-effectiveness analysis will estimate the cost to save one life. Therefore, a policy that costs $100 million and saves 100 lives would have a cost effectiveness of $1 million per life saved. This kind of information can be used to determine which policy among several saves the most lives for a given level of spending. For example, if one policy has a cost effectiveness of $10,000 per life saved and another a cost effectiveness of $1 million per life saved, spending on the first policy is often better because devoting a given amount of resources toward it saves more lives. (In this case $1 million could save 100 lives with the first policy but just one life with the second.)

Former Office of Management and Budget analyst John Morrall published an article in 1986 highlighting how a suite of lifesaving regulations from the federal government ranged in their cost effectiveness from $100,000 to $72 billion (1984 dollars) per life saved. Another cost-effectiveness study from the 1990s suggested that if the US federal government reallocated existing resources more efficiently, it could save 60,000 additional lives per year without spending any additional money (Tengs and Graham 1996). These examples highlight how cost-effectiveness analysis can be a

powerful tool to make policy more beneficial to the public.

The cost effectiveness of a policy or regulation can also be combined with the VOID to ascertain whether, on balance, a policy is risk reducing or risk increasing. For example, if the VOID is $75 million and a regulation costs $75 million per life saved, then the risk benefits exactly offset the risk costs from income losses. In other words, in this simple case, for every dollar spent addressing target risks, countervailing risks increase to exactly offset the risk benefits. Therefore, the policy's overall impact on risk is neutral. In this way, the VOID value acts as a kind of cost-effectiveness cutoff whereby when a regulation or other policy's cost effectiveness exceeds the VOID value, the regulation can be expected to increase, rather than decrease, mortality risk.[2]

Limitations Of Cost-Effectiveness Analysis

Cost-effectiveness analysis is an incredibly valuable tool. However, it does have some shortcomings that are worth noting. To understand these limitations, it helps to compare cost-effectiveness analysis to an alternative policy analysis tool known as cost-benefit analysis. Whereas a cost-effectiveness analysis for a lifesaving policy would count up how many lives are saved by a policy or regulation, a cost-benefit analysis would try to assign a dollar value to the expected lives saved. For example, if a regulation saves 10 expected lives and a life is valued at $500,000, then the benefits from the regulation would be worth $5 million.

By assigning dollar values to benefits—even those, like human lives, that aren't traded in markets—analysts can consider more of the benefits a regulation produces, whereas cost-effectiveness analysis typically considers only a single benefit. This is not so controversial with a benefit like saving lives, but in other cases, people may not agree that a particular policy goal is a good idea. For instance, some policy makers might think building more public parks is a good idea while others might think we have too many public parks as it is. In this case, the goal is not agreed upon, so it's easy to see why finding the most cost-effective ways to build public parks may not be very useful.

Decisions about which goals should be prioritized depend on value judgments, and it should not be the job of analysts to make these kinds of value judgments. That said, once a particular goal is identified—for example, through legislation—analysts can proceed with that information and identify the cheapest ways to achieve the goals already decided upon.

There are also some problems with the way cost-effectiveness analysis has historically been implemented, though these problems are sometimes easy to address. First, the costs estimated are often accounting expenditures, not economic costs. To see the difference, consider a simple regulation that forces $1 million to be spent on compliance by businesses. An accounting analysis would value the costs at $1 million because that is what is spent. But the true economic cost to society likely differs from $1 million. Had there been no regulation, some of the funds spent on compliance might have been invested and might have grown in value (a concept known as the opportunity cost of capital). Other funds might have gone toward consumption or even been wasted. The true economic cost of the regulation likely differs from the $1 million accounting cost.

A related issue with cost-effectiveness analysis is that health-related benefits are usually discounted in cost-effectiveness analysis.[3] In other words, a life saved or another health-related benefit is treated as less valuable the further it is in the future. This is a problem because the rate at which health-related benefits are discounted is basically arbitrary (or "normative," because it depends on a value judgment).

Also problematic is that discounting health-related benefits converts health benefits into a measure of lifetime welfare. (The idea behind discounting is that lifetime welfare is lower when the health benefits arrive later than when they arrive sooner.) This is problematic because welfare in economics is measured on an ordinal scale (see Broughel and Baxter 2022)—that is, a scale that involves rankings

but not intensities. This is a problem for cost-effectiveness analysis because cost-effectiveness values become difficult to interpret when they involve rankings. To make the issue more concrete, imagine that an analysis of major league baseball teams finds that for each $50 million in total player payroll, a team can expect to move up one place in their end-of-season ranking. This statistic doesn't offer much general guidance about how much to spend on player personnel, because the value of going from 11th place to 10th place is probably not as valuable as going from 2nd place to 1st place. In the latter scenario, spending $50 million might be worthwhile to become a championship contender; in former scenario, the team will simply be less mediocre. The relative positions are hard to compare.

When the outcome analysts are interested in is welfare, the problem becomes even harder than this baseball example illustrates, because we don't know where we are starting from on the scale. Whether to spend $1 million to move up five notches on a welfare scale is pretty abstract—not much guidance for practical policy use. The simplest way around this issue is to evaluate cost effectiveness in units of outcomes (e.g., actual lives saved) as opposed to units of welfare (e.g., discounted lives saved).

In the sections that follow, we will outline a process for conducting a cost-effectiveness analysis that overcomes the problems with both discounting and measuring opportunity costs appropriately. The discounting problem is fairly easy to address—we can simply measure cost effectiveness in terms of lives saved rather than in terms of welfare. The problem with opportunity cost analysis is slightly trickier, but it is not impossible to correct.

Mortality Risk Analysis: Step By Step

This section provides a more detailed explanation of the procedure a state like Wisconsin can use to conduct proper mortality risk analysis. As the name implies, mortality risk analysis aims to predict whether policies (on balance) are expected to increase or reduce mortality. It compares a regulation or other policy's target risk reductions with the countervailing risk increases stemming from lost household income. Such analysis can be produced by regulatory agencies, centralized analytical offices in the government, independent economists in the private sector, or academic experts.

Step 1: Evaluate whether the policy is lifesaving

The first step in a mortality risk analysis is to determine if the goals of a particular policy under review are related to health or safety risks. Many policies do not target health or safety hazards. For example, a financial services or insurance regulation might reduce the risk of fraud but not the risk of death. This is not necessarily a drawback, because reducing mortality is not the purpose of such regulations. Nonetheless, in addition to having these other benefits, such regulations will affect mortality risk through their impact on household income, and this is pertinent information that may prove useful to policy makers.

If a policy does not save any expected lives but imposes positive costs on the community, it can be expected to increase mortality risk. In such a case, the cost-per-life-saved ratio is infinite since there are zero lives saved in the denominator of the ratio. Since the cost-per-life saved exceeds the VOID level, this signals that the policy increases mortality risk.

It is also possible for a policy to save the community money by reducing costs—for example, costs on businesses. Such policies will impose negative costs and therefore tend to reduce mortality risk when there are no other direct health effects to target risks.

Step 2: If the policy is lifesaving, estimate how many lives it will save

If a policy is intended to save lives, the next step is to estimate the number of lives it will save. This requires that analysts understand the magnitude of the risk involved and how (as well as why) the policy is expected to reduce the risk. For example, if a regulation is targeting a hazardous waste site, the regulatory agency should try to

ascertain how many individuals die from this hazard annually and how many of these deaths the regulator believes its regulation can prevent if it conducts a cleanup.

The timeline over which lives are saved is also important and should be determined. Despite the fact that discounting lives can be problematic for the reasons described above, the timing of lives saved still matters because of the time value of money. Saving lives often saves money or boosts economic output (for example, because individuals work and earn incomes), and it is preferable to accrue these benefits earlier because they can be invested and earn positive returns.

Step 3: Calculate the accounting costs of the regulation over time

Once an analyst ascertains how many lives a policy is expected to save, it's time to estimate the accounting cost of the regulation. Accounting costs are the actual public and private financial expenditures (or savings) caused by the policy. For example, if a regulation forces businesses to spend a million dollars on capital expenditures, this would be considered a part of the accounting costs of the regulation. Similarly, if a regulation causes a business to forgo revenues—or close altogether—this would be an additional accounting cost on top of any spending on compliance. Analysts should also tally the expected accounting costs borne by the government to administer and enforce a given regulation. The timing of these expenditures should also be calculated.

As noted, some policies save money; money saved can be counted as negative costs (or cost savings). For example, a new government regulation might streamline or repeal previously existing inefficient regulations, resulting in a lower compliance burden on individuals and businesses. Additionally, saving lives also generates benefits. Additional production or earnings stemming from saved lives can be conceptualized as cost savings and should be deducted from the total gross cost of the regulation.

Step 4: Determine the opportunity cost of the regulation and its cost effectiveness

The expenditures calculated in step 3 represent accounting costs, not economic opportunity costs. To understand why, consider a manager at a company who must devote more time to compliance because of a new regulation. A regulatory analyst might calculate the cost of the regulation as the additional time the manager spends on compliance multiplied by the manager's salary. However, the new compliance activities also displace other productive activities, such as developing new product lines. With or without the regulation, the manager's salary is likely to be the same, but the manager's productive output will likely fall with the regulation in place. Consequently, multiplying a manager's hourly wage by required compliance time results in a measure of accounting cost but not of economic opportunity cost. To determine the latter, we need to estimate the value of the productive activities that never occurred because of the regulation.

The opportunity cost of expenditures—what is forgone when the regulation is enacted—is not the value of the expenditures themselves, in this case the manager's salary, but rather the value associated with the manager's activities in a setting where the regulation was never enacted. In theory this value could be positive, negative, or zero. For instance, if in the absence of the regulation the manager would have been playing video games on the job, then the opportunity cost of the manager's time could be zero. On the other hand, if the manager would have been rolling out software enhancements to boost employees' productivity, then the opportunity cost is probably quite high.

Identifying the opportunity cost can be tricky, but essentially it involves considering what the most likely use of resources would be in the absence of a policy and identifying a rate of return associated with that use of resources. This may sound hard, but it is no different from what businesses do routinely when they identify a weighted average cost of capital or a minimum required rate of return (a hurdle rate) for projects.

Government analysts should adopt similar methodologies to establish a reasonable opportunity cost rate that projects need to overcome to be deemed worthwhile.

At this point, accounting expenditure flows should be divided into resources that would have been consumed in absence of the regulation and those that would have been invested. The investment flows can be discounted at the rate of return associated with those investments, and this information can be compiled to generate a cost-per-life-saved estimate. Note that the opportunity cost discount rate serves a different purpose from a discount rate intended to discount health or other social benefits because they occur in the future.

Step 5. Compare the cost effectiveness of the policy to the VOID

Suppose that a policy saves lives at the cost of $50 million in present value terms for each life saved. Furthermore, suppose that the VOID is $75 million. In this case the policy reduces mortality risk, at least initially, because the direct cost of saving a life ($50 million) is less than the cost at which policies unintentionally take an additional life ($75 million). If policy makers decide to scale up this policy by tripling spending to a total of $150 million, then we would expect it to save three lives ($150 million divided by $50 million per life saved). However, since the cost of this program reduces household incomes by $150 million, we can also expect the loss of two lives ($150 million divided by $75 million per induced death). On net, this policy can be expected to save one life.

By contrast, if a policy has a cost effectiveness with a present value that exceeds the VOID (e.g., if the policy costs $100 million per life saved), then the policy increases mortality risk in the near term. In this case, the expected deaths resulting from lower household income exceed the expected lives saved directly by the policy.

These risk calculations, however, are just the beginning of the story, because the two inputs in a cost-effectiveness analysis—cost and the outcome variable estimate—are not evolving over time in the same way. Displaced investments are growing at the rate of return associated with the opportunity cost of capital, while the lives saved may be a fixed amount, may be an amount that is ongoing (e.g., five lives saved each year), or may be growing over time.

Step 6: Produce a table of outcomes, tracking the policy's impact over time on real resources and risk

A very simple equation for calculating the opportunity cost of capital is f × ROI, where f is the fraction of the return on an investment that is reinvested each period and ROI is the rate of return on the investment. For example, if f is 0.75 and ROI is 10 percent, then f × ROI will be 7.5 percent. We believe a reasonable hurdle rate for projects is in the range of 5 to 7 percent since it is likely that most of the marginal return displaced for compliance purposes is invested, and because market rates are often estimated to be in the range of 7 to 10 percent annually on marginal investments.[4]

Table 7.1 shows a hypothetical regulation that saves 35 lives five years after being enacted (with no additional lives saved thereafter). The economic costs have a present value of $250 million. Meanwhile, the VOID in this example is assumed to equal $75 million in the current year.

In the first period, the regulation has an economic cost of $250 million (labeled in table 7.1 as the "total cost"). The VOID in period 1 is $75 million, so this regulation increases risk in the initial period because it imposes positive costs immediately but no lives are saved until year 5. Thus, for the first five years after the regulation goes into effect, overall risk is increased since the cost effectiveness (i.e., the cost to save a life) of the regulation exceeds the VOID during that timeframe.

The economic costs are changing over time, however, because of the opportunity cost of capital. To understand what is happening, the total costs accrued must be broken down into units of real resources (in other words, they must be divided between forgone consumption and forgone investment). Because *f* is assumed to be 0.7 here, $175 million of the $250 million in initial economic costs would have been

Table 7.1 The Mortality Costs of a Hypothetical Regulation

Year	Total Lives Saved	Total Cost (millions)	Forgone Consumption (millions)	Investment Value (millions)	Cumulative Forgone Consumption (millions)	Cost per Life Saved (millions)	VOID (millions)	Cumulative Expected Deaths from Lost Income	Net Lives Saved	Risk Increasing?
0	0	$250	$75	$175	$75	$∞	$75	3	−3	yes
1	0	$318	$56	$187	$131	$∞	$76	4	−4	yes
5	35	$643	$74	$245	$398	$18	$80	8	27	no
10	35	$1,195	$103	$344	$851	$34	$85	14	21	no
25	35	$4,578	$285	$950	$3,628	$131	$102	45	−10	yes
50	35	$26,087	$1,546	$5,155	$22,912	$802	$140	201	−166	yes

Note: $f = 0.7$, ROI = 10%, VOID = $75 million, $p = 1.25\%$. Source: Authors' calculations.

invested in the absence of the regulation and $75 million would have been consumed in the initial period.

The value of the capital investment grows at a rate of $f \times$ ROI each year going forward. So, for example, by year 5, the capital investment "fund" that has been lost because of the regulation will have grown to be worth $245 million. In the first year after implementation, the value of forgone investment is $187 million ($175 × 1.07). This investment fund would have generated consumption worth $56 million in the first period ($187 × 0.3). The value of this displaced consumption stream also grows at a rate of $f \times$ ROI going forward. For example, the consumption stream the capital fund would have generated would have grown to an annual value of $74 million by year 5, and the cumulative consumption forgone over the first five years of the regulation being in place would equal $398 million.

What is called total cost in table 7.1 is equal to the total consumption stream lost up until that point in time plus the value of investment capital at that point in time (as if it were to be cashed in and all the proceeds consumed in that period). This total cost can also be used to estimate the expected deaths a regulation has indirectly generated up until that point in time.

In year 0, there are three expected deaths ($250 million divided by a $75 million VOID). The VOID is assumed to grow at the rate of productivity, here assumed to be 1.25 percent annually. Once the regulation saves 35 lives in year 5, the regulation becomes risk reducing because the total cost per life saved is less than the VOID at that time. By year 25, however, this situation reverses, since in year 22 the expected deaths imposed by the regulation overtake the number of expected lives saved, and thus the regulation cumulatively increases mortality risk from that point forward.[5] Such reversals could be grounds for building sunset provisions into regulations so that they expire before their more detrimental impacts take hold.

Step 7: Report information to decision makers

The example above highlights how the effects of a regulation on mortality risk can differ depending on the time period being analyzed. Many regulations initially increase risk since compliance expenditures are often made up front while benefits are realized with a lag. This situation often reverses once some of the benefits accrue. However, the situation can then reverse again (as in the example above), because money can be reinvested (with compound returns) while lives cannot. Thus, a critical question for policy makers is not just *whether* a policy increases risk but *when* it does so.

Ultimately, it's a value judgment whether policies are worth implementing when they increase mortality risk at various points in time. Such value judgments depend on a variety of factors, including the number of lives a policy saves, whose life specifically is

saved (e.g., how old they are), and the overall costs. That said, some value judgments are easier to make than others. If a regulation aims to reduce risk but increases risk across all time periods, it is hard to see what the justification could be for that regulation. But without a formal mortality risk analysis, the likelihood that policy makers will identify such counterproductive regulations is low.

Case Study: Wisconsin Regulations

In this section, we consider several actual Wisconsin regulations to demonstrate how mortality analysis can be used in a real-world context. Wisconsin already has a law in place that requires state regulatory agencies to produce budgetary and economic analysis for new regulations. Specifically, agencies fill out a standardized form, known as a "Fiscal Estimate & Economic Impact Analysis," when they enact new regulations. This is a form from the Wisconsin Department of Administration (2016),[6] and there is a similar template for analyzing existing rules (Wisconsin Department of Administration 2012). It is worth noting that there is no mention of risk issues in either of these templates.

Unfortunately, there is no publicly available central repository for these economic impact statements in Wisconsin, making them difficult to collect and analyze. Creating such a repository would be beneficial both for transparency purposes and for the purposes of research. Given this shortcoming, we relied on internet searches to identify a few examples of agencies using these forms. We found two regulations from the Department of Natural Resources, which we will examine in this section.

We chose these rules primarily because (1) they are relatively recent; (2) they could in theory be risk-related, given their relation to environmental programs (although the agency does not calculate lives saved in either instance); and (3) one regulation imposes net costs, according to the agency, while the other is cost saving. Thus, they offer useful examples to demonstrate the kind of information a properly conducted risk assessment can uncover. However, we caution readers that these regulations should not be construed as representative of all regulations in Wisconsin. We merely offer them as examples.

Example 1: Hazardous Waste Disposal

Our first example is a Wisconsin Department of Natural Resources (DNR) regulation, finalized in 2019, related to disposal of hazardous waste (Wisconsin Department of Natural Resources 2019). The primary aim of the regulation was for the state to stay in compliance with the US Environmental Protection Agency's Resource Conservation and Recovery Act requirements, which were updated in the years leading up to this regulatory action. According to the Wisconsin DNR, the regulation will increase compliance costs for regulated entities by between $334,785 and $617,785 per year while at the same time saving regulated entities approximately $840,533 to $2,146,805 per year. Thus, even if one assumes a worst-case scenario for both compliance costs ($617,785) and savings ($840,533), this regulation is predicted to generate net cost savings.

The Wisconsin DNR makes no claims that this regulation will save lives. Rather, the DNR notes that many aspects of the regulation are related to "paperwork reductions" and "relaxations of regulations," though there appear to be several "new information collection burdens." This helps explain why the regulation is cost saving, because it is most likely a deregulatory action.

In many respects, the analysis of this regulation can end here. The cost analysis demonstrates that the regulation is cost saving, thereby reducing some mortality risks through the household-income channel. There are no other apparent mortality benefits or costs; thus, this regulation is likely to reduce mortality risk overall, assuming that the agency's calculations are correct.

It may be worth digging a little deeper into the DNR's calculations, however, in order to better ascertain the magnitude and timing of these risk reductions. There are several issues worth noting about the DNR's calculations. First, the agency has calculated both costs and cost savings, and these

estimates are presented transparently. This represents a best practice.

However, the DNR's estimates, as stated, are not suitable for use in a cost-effectiveness analysis without some adjustment. First of all, the dollar year these numbers are reported in is not stated in the economic analysis. The regulation is from 2019, so presumably these estimates are reported in 2019 dollars, but it would be helpful if this were stated explicitly by the agency.[7] Second, the costs are presented in annualized form: that is, these are estimates of ongoing costs averaged on a per-year basis. Far more useful for our purposes is the present value of costs, which better reflects the total cost of the rule. (Much as a monthly mortgage payment provides an incomplete picture of the total amount of money owed on a mortgage, an annualized value of cost does not fully capture the total cost of a rule.)

An additional problem with reporting annualized values is that they conceal the fact that costs are often growing at some rate over time, owing to the opportunity cost of capital. An annualized value, because it is an average, appears to flatten out costs. This can be misleading because it can give the false impression that benefits exceed the costs, though this may not be the case if costs are growing over time and benefits are not (or vice versa).

For simplicity's sake, we will use the midpoint between $334,785 and $617,785 in annual costs, which is $476,285. In table 7.2 we compare this DNR regulation to another regulation that imposes costs in 2021. To make the two regulations comparable, we present costs in inflation-adjusted 2021 dollars. According to the consumer price index, this is $494,961. If we assume that the opportunity cost of capital rate is 7 percent, then the present value of this stream of annualized costs (assuming the annualized cost continues in perpetuity) is $7.1 million in 2021 dollars.

When we do similar calculations for costs savings, we get an estimate of $22.2 million in cost savings expressed as a prevent value (in 2021 dollars), for a net improvement of $15.1 million in reduced costs. This is roughly two-fifths of our estimate of the VOID. Therefore, this regulation initially produces indirect benefits worth two-fifths of a saved life. This regulation can be expected to save more lives in the future as cost savings compound over time. The first life saved would be expected to occur in 2025 if the 2019 VOID is $75 million and is growing at 1.25 percent annually.[8] See table 7.2.

Example 2: Stormwater Discharge Permits

Our second example is another Wisconsin DNR regulation. This one is from 2021 and is related to stormwater discharge permits (Wisconsin Department of Natural Resources 2021). Like the previous regulation, this rule is also intended to bring the state of Wisconsin's regulatory regime in line with federal regulations. However, in this case the regulation is anticipated to impose net costs. According to the agency, the regulation will generate total costs of $2,778,900 per year. Additionally, it will generate savings of $1,118,400 annually, for a net compliance cost burden of $1,660,500. As with the previous regulation, the DNR does not claim that this regulation will save any lives. Thus, this regulation can be expected to increase mortality risk on balance since its cost effectiveness (which is infinite in this case) exceeds the VOID.

We assume that the DNR's estimates are expressed in 2021 dollars, since this was the year the rule was finalized and no other information is available. The annualized cost has a present value of $23.7 million at a 7 percent discount rate. Since we are evaluating the regulation in 2021, there is no need to adjust this value for inflation. $23.7 million is about one-third of our estimate of the VOID, and this initial value would be expected to grow over time. One could produce a cost-effectiveness table similar to what is presented in table 7.2 to track this growth. We forgo doing that here for simplicity's sake.

Discussion

There are several takeaways worth noting after reviewing the regulatory analyses performed for the two DNR example

Table 7.2 The Mortality Cost of the Wisconsin DNR's 2019 Hazardous Waste Disposal Regulation

Year	Total Lives Saved (target risk)	Total Cost (millions)	Forgone Consumption (millions)	Investment Value (millions)	Cumulative Forgone Consumption (millions)	Cost per Life Saved	VOID (millions)	Cumulative Expected Deaths from Lost Income	Net Lives Saved	Risk Increasing?
2019	0	–$15	–$5	–$11	–$5	–$∞	$75	0	0	no
2020	0	–$19	–$3	–$11	–$8	–$∞	$76	0	0	no
2024	0	–$39	–$4	–$15	–$24	–$∞	$80	0	0	no
2029	0	–$72	–$6	–$21	–$51	–$∞	$85	–1	1	no
2044	0	–$275	–$17	–$57	–$218	–$∞	$102	–3	3	no
2069	0	–$1,684	–$93	–$309	–$1,375	–$∞	$140	–12	12	no

Sources: Wisconsin Department of Natural Resources (2019); authors' calculations.

Note: $f = 0.7$, ROI = 10%, VOID = $75 million, $p = 1.25\%$.

regulations in the previous section. First, the DNR deserves credit for calculating both the costs and the cost savings associated with its regulations. This is clearly a best practice, and thus avoids a common practice of many federal agencies of intermingling financial costs and savings with nonpecuniary benefits and costs, which often aren't directly comparable.

However, the DNR's analyses may be unintentionally misleading because they present costs in annualized rather than present-value form. Although regulatory costs can be expressed in both annualized and present-value form, present values are more useful since these better reflect total costs and make cost-effectiveness analysis easier to produce.

These two examples are also interesting because the risk reduction benefits of the deregulatory action offset some of the risk-increasing costs of the regulatory action. At first glance, the costs of stormwater permit regulation exceed the cost savings generated by the hazardous waste regulation. However, it is important to note that a cost borne in 2019 is not the same as an equivalent cost borne in 2021. A dollar in compliance is more costly to society in 2019 than in 2021 owing to the opportunity cost of capital, and this difference must be accounted for in order to make an accurate comparison between the two regulations.

Taking a step back, Wisconsin's rulemaking process is notable because it involves the production of economic analysis (Broughel and Hoffer 2021), which the examples above show can include useful information that is easily converted into a format usable for cost-effectiveness and mortality analysis. This implies that risk analysis could be incorporated into the existing rule evaluation process in Wisconsin without much difficulty.

Cost-effectiveness analysis requires in its most basic form just two inputs: the accounting costs of the policy in question and an estimate of the primary benefit achieved by the policy. A cost-effectiveness estimate based on these inputs could be required as a standard part of regulatory analysis. That said, to ensure that analysis is useful, Wisconsin may also need to invest in personnel capable of performing rigorous analysis. Most of what seems to constitute economic analysis for regulations in the state seems to be little more than a form that is filled out by agencies according to a short, standard template. If Wisconsin is under-investing in analysts qualified to produce economic analysis, analysis will necessarily be of low quality. That said, owing to the relatively simple nature of cost-effectiveness analysis, a small investment may be all that is needed to start performing some basic, but useful, risk analysis.

Conclusion and Policy Recommendations

The analysis of risks is important both in our daily lives as individuals and at a collective level when governments set policy. Wisconsin policy makers should consider requiring risk analysis like that outlined in this chapter. It may be fairly easy to incorporate risk analysis into existing regulatory analysis (or to add it as an additional requirement), thereby improving the objectiveness and transparency of Wisconsin regulations' impacts. If such analysis is conducted properly and used in decision making, it could save lives and reduce costs simultaneously.

To produce a risk analysis, policy makers could use a simple checklist that follows the steps outlined in this chapter. We have included an example of such a template in the appendix. Moreover, interested parties in Wisconsin need not wait until government officials adopt this kind of analysis before they use it to inform policy. Academic economists, industry trade associations, advocacy groups of various kinds, and even private citizens could perform such analysis themselves with the appropriate training. Indeed, as this chapter has shown, it is fairly easy to produce a mortality risk analysis by drawing on information from agencies' existing economic analysis or by supplementing those reports with data from other sources, such as academic studies.[9]

As one analysis recently put it, "On paper, Wisconsin's process for reviewing new and existing rules appears to be quite thorough, especially relative to some other states" (Broughel and Hoffer 2021). However, risk analysis is a glaring omission from a system that otherwise appears to be tailored for producing evidence-based regulations. We see abundant opportunities for improving the regulatory system in Wisconsin by creating a more robust role for the economic analysis of risks.

APPENDIX: Risk Analysis Template For State Regulations

1. Is the regulation lifesaving?
2. If yes, how many lives will the regulation save?
3. What compliance expenditures are likely to result from this regulation (including forgone expenditures because of lower income or revenues, as well as government expenditures)?
4. What cost savings are likely to result from the regulation?
5. What is the opportunity cost of the regulation? In other words, what fraction of foregone expenditures would have been consumed vs. invested, and what rate of return would have been earned on the foregone investments?
6. On the basis of the regulation's opportunity cost, what is the present value of the regulation's costs (net of cost savings)? Clearly state the dollar-year and year in which the cost is evaluated (e.g., a cost borne in 2019 expressed in 2021 dollars).
7. Calculate the cost effectiveness of the regulation (i.e., the present value of costs net of cost savings per life expected to be saved).
8. Based on the relevant value of an induced death, is the regulation expected to increase risk in present-value terms?
9. Will the regulation increase risk in the future? If so, when?
10. Provide a table detailing how the regulation will affect real resources (e.g., consumption and investment), as well as risk, over several decades.

Notes

[1] An important caveat here involves so-called deaths of despair. These tend to be deaths related to drug overdoses, suicide, and alcoholism, which are contributing to life expectancies falling among some groups in high-income countries, in particular in the United States. See Case and Deaton (2020).

[2] When a policy is said to cost $75 million per life saved, this does not imply that $75 million will actually be spent. For example, a regulation that costs $7.5 billion in order to save 100 lives has a cost effectiveness of $75 million per life saved. The same cost effectiveness applies if one spends $750,000 in order to save an expected one-hundredth of a life. In fact, many regulations have high cost-effectiveness values not because they cost a lot of money but because they don't produce much in the way of benefits.

[3] Opportunity cost and discounting are related because health benefits are sometimes discounted on the basis of an argument that capital has an opportunity cost in that it can be invested. This line of argumentation confuses two concepts: the rate of return on capital and the rate of time preference of society.

[4] Arguably, public project hurdle rates should include risk and irreversibility premiums as well. On the marginal rate of return to private investment, see Broughel and Baxter (2022). See also Harberger and Jenkins (2015).

[5] Note that a cumulative change in risk and a marginal change in risk can occur in different periods. For example, a regulation might increase risk for a few years before all the mortality benefits from previous years are offset.

[6] Wisconsin has a cost-benefit analysis template as well, but it appears to be for procurement purposes only. See Wisconsin Department of Administration (2019).

[7] Notably, the estimated compliance costs did not change from 2017 (when the rule was first proposed) to 2019 (when the rule was finalized). See Wisconsin Department of Natural Resources (2017).

[8] The expected life is saved in 2025 owing to rounding. In actuality, the predicted total cost savings would exceed the VOID in 2031.

[9] For a similar example of a risk analysis that applies this methodology, see Broughel and Baxter (2022).

ONWARD Wisconsin

Unleashing Capitalism with Common Sense Public Policy

How can we create a more prosperous future for Wisconsin? This edited volume was assembled to answer that question by engaging a team of economic scholars and experts who have each provided ideas for policy reforms that can accomplish that goal.

Our authors have based their research on published academic literature, not on politics. The issues addressed in this book were not chosen based on whether they align with the positions of any particular political party or administration. While the authors address a broad spectrum of issues, from tax policy to legal and regulatory reform, there is a common theme in the conclusions they reach regarding the current problem areas of Wisconsin's state policy.

Based upon over 200 years of research it is clear that higher levels of economic freedom can achieve higher rates of long-term economic growth, and these authors conclude that making Wisconsin's state policy climate more consistent with economic freedom will result in increased capital formation, higher labor productivity and wages, and faster long-run economic growth.

We hope that readers will come away with a better understanding of Wisconsin's economic issues and possible ways to reform policy to improve prosperity in the Badger state.

General Comment

We appreciate the opportunity to comment on the proposed Memo on Agency Use of Artificial Intelligence. As the CEO and founder of a small and innovative solutions provider, stackArmor, Inc., headquartered in Tysons VA, I applaud your efforts to foster transparency and solicit ideas and comments.

We believe the three most important initiatives in the memo to help agencies advance governance, innovation, and risk management for use of AI are:
(1) ensuring agencies have access to adequate IT infrastructure,

(2) modernizing cybersecurity authorization processes to better address the needs of AI application, and

(3) establishing uniform and consistent shared practices to independently evaluate the AI and conduct ongoing monitoring.

We base our remarks on our experience helping US Federal agencies transform their information technology systems using new and emerging technologies like cloud computing technologies since 2009 with the first migration of a government wide system – Recovery.gov to a commercial cloud service provider. Since then, we have had the privilege of supporting numerous transformation initiatives including being part of the GSA Centers of Excellence (COE) since 2018 and having contributed towards the development of the Cloud Adoption Playbook while supporting transformation engagements at agencies including USDA, HUD, NIH and OPM amongst others agencies.

Our comments on the DRAFT OMB Memorandum are presented in the attached PDF file.

Very respectfully,
GP

stackArmor Comments on OMB DRAFT Memorandum on Advancing Agency Use of Artificial Intelligence

Ms. Clare Martorana,

U.S. Federal Chief Information Officer,

Office of the Federal Chief Information Officer,

Office of Management Budget.

Subject: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Ms. Martorana,

We appreciate the opportunity to comment on the proposed Memo on Agency Use of Artificial Intelligence. As the CEO and founder of a small and innovative solutions provider, stackArmor, Inc., headquartered in Tysons VA, I applaud your efforts to foster transparency and solicit ideas and comments.

We believe the three most important initiatives in the memo to help agencies advance governance, innovation, and risk management for use of AI are:

(1) ensuring agencies have access to adequate IT infrastructure,

(2) modernizing cybersecurity authorization processes to better address the needs of AI application, and

(3) establishing uniform and consistent shared practices to independently evaluate the AI and conduct ongoing monitoring.

We base our remarks on our experience helping US Federal agencies transform their information technology systems using new and emerging technologies like cloud computing technologies since 2009 with the first migration of a government wide system – Recovery.gov to a commercial cloud service provider. Since then, we have had the privilege of supporting numerous transformation initiatives including being part of the GSA Centers of Excellence (COE) since 2018 and having contributed towards the development of the Cloud Adoption Playbook while supporting transformation engagements at agencies including USDA, HUD, NIH and OPM amongst others agencies.

Our approach to Risk Management and Governance is rooted in using open standards and frameworks provided by NIST. We believe that OMB's guidance should encourage the augmentation and tailoring of existing risk management processes to ensure that Federal agencies can start accruing the benefits of AI technologies without costly delays associated with implementing a new governance program. A pragmatic approach that tailors NIST RMF, NIST SP 800-53 and governance models such as ATOs (Authority to Operate) to align with the NIST AI RMF (NIST AI 100-1) provides a balanced approach that ensures that AI specific risks like safety, bias and explainability are adequately covered while being able to leverage the existing

Copyright © 2023 stackArmor, Inc

cyber workforce, risk management procedures, and body of knowledge associated with NIST RMF/800-53.

We are providing the following specific comments to questions from OMB requesting feedback.

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

Given that most AI capabilities within an agency will be delivered by IT systems that are highly likely to be based on cloud computing technologies (public or private), **the designated Chief AI Officers should have sufficient experience with and exposure to cloud computing technologies as well as the Federal Risk and Authorization Management Program (FedRAMP®)** to ensure that cost-effective and secure commercial solutions can help meet the agency's AI needs. Such experience helps agencies rapidly reap the benefits of AI capabilities, maximizing the use of secure and compliant commercial solutions will be critical and to the extent Chief AI Officers understand AI systems and commercial solutions, it will help in remove roadblocks and avoid duplication of efforts, where agencies re-create capabilities that already exist in the commercial sector.

Further Chief AI Officers should have a keen understanding of the agency's mission and how AI can enhance and improve or bring new service delivery capabilities. Agencies should have the flexibilities to determine appropriate reporting structures that best fit their needs, and where the Chief AI Officer is not dual hatted with the CIO or CDO, for example, ensure close collaboration and coordination with other CxO's (e.g. CIO, CDO, CXO, CISO, Chief Privacy Officer).

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

We believe that augmenting and building upon existing risk management mechanisms especially in the IT domain is likely to help accelerate AI adoption in support of the mission without causing costly delays associated with standing up a brand new governance body or model. Using an approach that ties NIST AI RMF to existing cyber risk management models based on NIST RMF, NIST SP 800-53 and NIST SP 800-53A as well as leveraging the work done by the Federal Privacy Council, there is a critical mass of understanding and knowledge that agencies can leverage to reduce the time and cost with AI adoption across the federal enterprise. To help avoid a situation where every agency comes up with its own governance model, OMB could direct NIST, GSA and DHS/CISA to create a FISMA Profile for NIST AI RMF, which then can be tailored and adopted by each one of the 24 CFO Act agencies.

Copyright © 2023 stackArmor, Inc
Feedback: atoforai@stackArmor.com

Additionally, given that most AI capabilities will be delivered using IT systems, modernizing existing cyber processes and equipping the workforce with critical skills like ethics, safety and civil rights awareness specific to AI systems can help ease the transition burden associated with new technology insertion.

3. How can OMB best advance responsible AI innovation?

OMB should consider creating a consistent and uniform governance model that does not vary from agency to agency. The creation of "snowflake" compliance models unique to a agency will deter participation by small and innovative solution providers across the country. Once the initial wave of foundational systems and AI computing platforms (e.g. commercial or private clouds), the enduring set of government or agency specific solutions are likely to come from small, nimble businesses. Therefore, **ensuring market access for small businesses through existing channels like FedRAMP, SBA's SBIR/STTR funding programs as well as reiterating the need to meet small business and socio-economic goals for AI solutions and systems are important actions that OMB can take to help advance the deployment of AI innovation** while ensuring an equitable and competitive marketplace that does not get concentrated into a handful of large players.

OMB should also designate or delegate actions for defining criteria, processes, and operational creation of pathways for "independent review". Unless there is a responsible center point with funding to buildout the operational substantiation of this concept, there is a risk that the independent review because substantially costly or burdensome as to become a barrier to innovation. The FedRAMP program has established an objective and standards based program with third-party assessor organizations (3PAO), which could serve as a starting point for enabling an independent review framework.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

We believe an iterative low-risk approach to generative AI adoption will likely be the most productive. In many ways, we draw parallels to how commercial cloud computing adoption occurred almost a decade ago. Given the lack of understanding and the initial trust deficit in cloud solutions, low risk public facing websites were some of the early workloads to migrate to the cloud. Some of the earliest systems to move to the cloud were Recovery.gov and Treasury.gov. More mission critical systems then began moving to the cloud once greater confidence, understanding and trust was established and the governance model matured.

Initially, NIST SP 800-53 Rev 3 was used with cloud computing overlays, then subsequently FedRAMP came along and NIST incorporated cloud computing-aware controls into SP 800-53 Rev 4. Similarly, as the governance model matures, mission critical use cases that will benefit from AI will start to emerge.

There are a number of relatively low-risk use cases around software development using code generators; marketing & outreach automation and enhanced customer engagement are areas of rapid industry innovation that translate for use across the federal enterprise.

Copyright © 2023 stackArmor, Inc

Additionally, OMB should reinforce and support agencies on their overall data maturity such that agencies are better positioned to take advantage of AI capabilities. The Federal Data Strategy 10-year plan, if followed, is a solid model created to drive government-wide data maturity. Improved data maturity ensures faster, better, and more reliable AI generated outcomes.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

No comment

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

We believe an approach that draws upon existing IT/cyber risk management practices offers a pathway to allow agencies to implement minimum baselines while having the freedom to innovate and tailor the model to suit the wide diversity of mission requirements across the federal enterprise. Our ATO for AI™ approach recommends **considering a FIPS 199 like model** where agencies categorize risk baselines as high, moderate and low across confidentiality, integrity and availability dimensions. Similarly, for AI systems risk baseline categorized as high, moderate or low across safety, bias/rights, and explainability dimensions. This allows every agency to suitably tailor the risk management controls based on its specific requirements while adhering to the overall guardrails agencies must follow. The consolidated NIST AI RMF mapped baseline should be based on all six categories – 1) confidentiality, 2) integrity, 3) availability, 4) safety, 5) bias/rights and 6) explainability.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

We recommend OMB direct NIST, DOD, DHS/CISA and GSA to develop FISMA and FedRAMP Profile for NIST AI RMF that helps provide an actionable implementation model for agencies. **We believe an approach that maps and augments NIST SP 800-53 controls to NIST AI RMF risk categories and sub-categories offers an expeditious pathway well understood by a broad cross section of acquisition, program and industry members.** The acquisition solicitations can then reference the need to comply with NIST AI RMF/FISMA AI Profile as part of the acquisition's language.

There should also be directive to separate the evaluation process for AI capabilities that are embedded in vendor solutions and AI capabilities that are built by government agencies.

Procurement and budget officials should also have a view of the key components of "AI" so that the suggested controls and evaluations for AI are applied to the appropriate elements of the acquisition – infrastructure, devices, data, software platforms and all related "as a service" elements.

Copyright © 2023 stackArmor, Inc

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

We believe that **the AI use case inventory should offer meaningful information on mission and quantifiable outcomes (work effort savings, elimination of errors, and efficiency gains amongst others) achieved through the deployment of the AI technology**. Additionally, the AI use case inventory should also provide an indication on technology components used e.g. FedRAMP accredited cloud services or GOTS as a case in point. Such data will enable the analysis of consumption patterns, the estimation of supply chain risk to the government, the enhancement of overall learning, and improved decision-making. Because agencies work together and exchange information as they deliver services, the information should also reflect or indicate cross-agency use-cases.

I hope you find the information and contents of this brief document useful as OMB formulates and finalizes the OMB memo on safe and secure AI adoption in agencies.

Very respectfully, 12/4/2023

Gaurav Pal

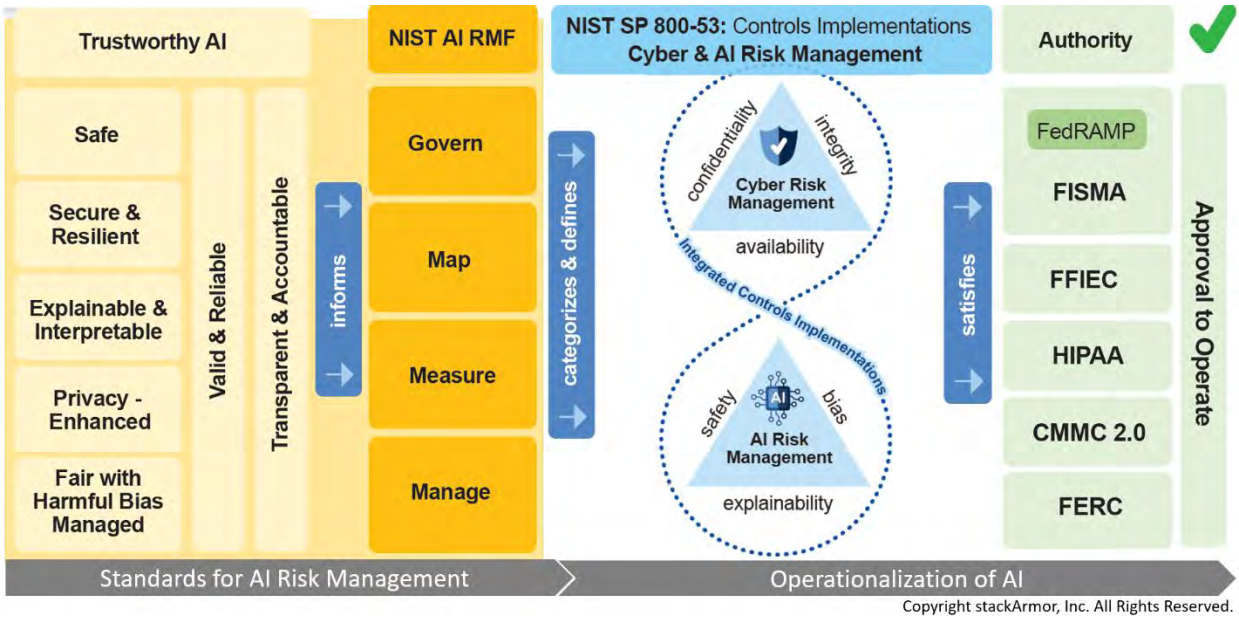
Appendix – ATO for AI™ Open Governance Model based on NIST Standards

Based on our experience helping agencies, commercial organizations and regulated entities implement security controls, we have developed an open and standards-based governance model that we call ATO for AI™. This model begins with the seven trustworthy characteristics of AI and the NIST AI RMF risk categories & sub-categories and maps them to the NIST SP 800-53 Rev 5 control families and controls. . The model adds an AI Overlay construct that includes AI-specific controls not adequately covered by existing NIST SP 800-53 Rev 5 controls. Hence, the combination of tailored NIST SP 800-53 Rev 5 controls with an AI overlay provide an actionable and well-understood approach to risk management that can accelerate the adoption of AI while reducing the time delays and costs of alternate approaches to AI risk management and governance. The infographic below provides an overview of our overall approach to AI risk management and governance.



Infographic demonstrating an end-to-end risk management and governance model that augments and builds upon existing processes, procedures and body of knowledge within an agency for AI

We have prepared detailed mappings of the controls and have vetted our approach by sharing it with the NIST public working groups on AI as well as leading industry and government executives as part of our AI Risk Management Centers of Excellence (CoE). Members of our CoE include:

- Ms. Suzette Kent, former U.S. Federal CIO
- Ms. Maria Roat, former U.S. Deputy Federal CIO
- Mr. Richard Spires, former U.S. Department of Homeland Security CIO
- Mr. Alan Thomas, former commissioner of the GSA Federal Acquisition Service
- Ms. Teresa Carlson, transformational industry executive with over 25 years of leadership

Copyright © 2023 stackArmor, Inc

Our COE members have rich operational and policy experience and have offered the following comments on our approach.

"Harnessing the power of AI for delivery of government mission and services will be transformational. But, it is complicated to align all the emerging policy, risk frameworks, approval processes and existing policy and law. I am thrilled to be included in the COE because I have seen the work of the stackArmor team to drill down to details and find a path to connect all the pieces. We can only get to use of operational AI at scale by working through these details. I hope the output of the COE will deliver tools that agencies can use to move faster and to confidently scale AI capabilities."

Suzette Kent, Former Federal CIO. Ms. Kent as an extensive private and public sector background. As the Federal CIO, Ms. Kent was responsible for government-wide IT policies and spending, and also chaired the Federal CIO Council and the Technology Modernization Fund Board.

"The adoption of risk-based methods for managing and governing AI systems that leverage security controls defined in NIST SP 800-53 Rev 5 as well as established governance programs like FedRAMP can help agencies adopt AI more rapidly. Reducing the time and cost burden on agencies and supporting contractors by enhancing existing protocols is critical to ensuring timely deployment of AI systems for supporting the government mission."

Maria Roat, Former Deputy Federal CIO, SBA CIO and Director, FedRAMP PMO. Ms. Roat is a Senior Information Technology and Cybersecurity Executive with 3+ decades' experience driving enterprise-scale digital transformation within Federal Government. Recognized as builder, collaborator, and solutions innovator with vision, audacity, and drive to lead complex multibillion-dollar technology initiatives.

"Managing risk associated with AI systems is essential to ensuring Government's ability to improve agency effectiveness and efficiency using next generation AI and Automated Decision Support systems. stackArmor's systems engineering approach to applying NIST security controls to AI systems provides a reasonable blueprint for AI risk management."

Richard Spires, Former DHS, and IRS CIO. Mr. Spires provides advice to companies and government agencies in strategy, digital transformation, operations, and business development. He previously served as the Chief Information Office (CIO) of the U.S. Department of Homeland Security (DHS) and as CIO of the Internal Revenue Service (IRS).

"ATO for AI offers government agencies a fiscally prudent pathway to safe and secure AI adoption that builds upon lessons learned upon implementing existing governance frameworks

Copyright © 2023 stackArmor, Inc

like FISMA and FedRAMP. stackArmor's approach of operationalizing NIST AI RMF with actionable control implementations can help agencies accelerate safe AI systems adoption without having to retrain thousands of program, acquisition and IT specialists on new governance models for AI."

Alan Thomas, Former Commissioner, Federal Acquisition Service, GSA. Mr. Thomas is an Operating executive and former Federal political appointee with more than 25 years delivering mission critical programs, championing large scale digital transformation initiatives, and building deep functional expertise in acquisition and procurement.

"The unique combination of AI-enabled applications on cloud-computing powered services offers a once-in-a-generation opportunity to truly enable a digital-first government. Transforming legacy applications at scale by using accelerators that deliver safe and secure AI-native applications developed by innovative ISVs on FedRAMP accredited cloud service providers can help us dramatically shorten the time and cost of AI adoption."

Teresa Carlson, transformational industry executive with over 25 years of leadership in modernizing public sector organizations using commercial solutions.

You can access more details about our open and standards based approach to helping accelerate AI deployments by augmenting existing risk management controls to align with NIST AI RMF by visiting our website downloading our whitepaper.

OMB Request for Comment on AI

Office of Management and Budget (OMB) Request for Public Comment on Draft Memorandum Titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)"

Point of Contact: Vince Minerva, Member of the Public

December 5, 2023

Question 7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

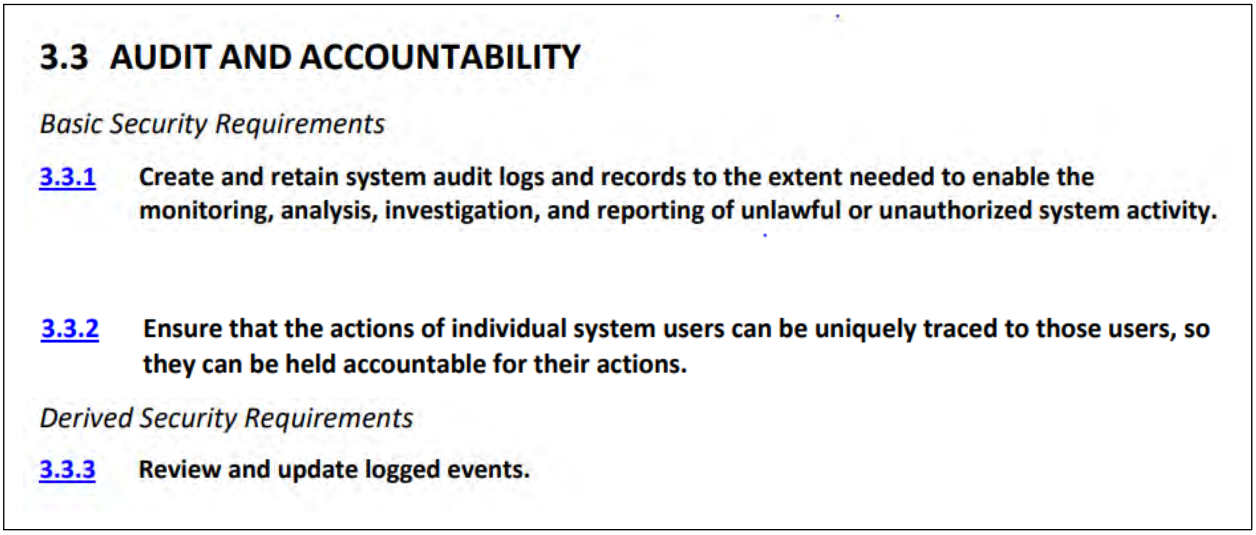
Establishing foundational guidance for development, deployment, and ongoing monitoring of trustworthy Artificial Intelligence (AI) systems by leveraging proven federal government strategies for information security, can drive reliable access to verifiable, trustworthy information (Reference Question 1). Creating actionable trustworthiness requirements for AI systems analogous to NIST Special Publication (SP) 800-171, Protecting Controlled Unclassified Information in Nonfederal Systems and Organizations (Ref. 1), provides necessary technical leadership for the AI community. NIST SP 800-171 provides information security requirements applicable to all nonfederal systems and organizations that process, store, and/or transmit controlled unclassified information. NIST SP 800-171 is intended for use by federal agencies in contractual vehicles or other agreements established between those agencies and nonfederal organizations (Ref. 1, p. iii). For example, the Department of Defense requires a significant percentage of the 100,000 + (Ref. 2) Defense Industrial Base (DIB) companies to comply with NIST SP 800-171 via contractual requirements which benefits our national security by safeguarding sensitive information. Similarly, creating a NIST publication of requirements for trustworthy AI systems should strengthen our national AI capabilities. Many of the use cases for Generative AI require large scale computing resources, which will likely result in most of the public and private industry users acquiring services from commercial providers. Many, if not most, of the cloud and enterprise IT providers with financial and IT system resources sufficient to run large language models are contractors to the federal government. The federal government's ability to influence the trustworthiness of AI systems should be increased similarly to the demonstrated successes in cybersecurity.

Developing Guidance for Trustworthy AI Systems

NIST SP 800-171 security requirements are organized into fourteen (14) security families containing basic and derived requirements as shown in Figures 1 and 2 below. Each of the requirements has a discussion section providing additional information to facilitate requirement implementation and assessment.

FAMILY	FAMILY
Access Control	Media Protection
Awareness and Training	Personnel Security
Audit and Accountability	Physical Protection
Configuration Management	Risk Assessment
Identification and Authentication	Security Assessment
Incident Response	System and Communications Protection
Maintenance	System and Information Integrity

Figure 1: NIST SP 800-171 Security Requirements Families (Ref. 1, p. 7)



3.3 AUDIT AND ACCOUNTABILITY

Basic Security Requirements

3.3.1 **Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.**

3.3.2 **Ensure that the actions of individual system users can be uniquely traced to those users, so they can be held accountable for their actions.**

Derived Security Requirements

3.3.3 **Review and update logged events.**

Figure 2: NIST SP 800-171 Basic and Derived Requirements Examples (Ref. 1, pp. 17-18)

Applying this approach to AI Systems leads to trustworthiness requirement families as shown in Table 1 below. The seventeen (17) candidate trustworthiness families were primarily derived from the NIST AI RMF 1.0 and the AI Bill of Rights. However, the process of formalizing the trustworthiness families enables incorporation of concepts from a diverse set of resources, such as, the Organization for Economic Co-operation and Development (OECD) AI Principles (Ref. 3). Once the trustworthiness families are defined through proven review and comment processes, they can be defined by basic and derived requirements.

Trustworthiness Requirement Family	**Summary Objective**
Accountability	"This is the fundamental need: to ensure that machines remain subject to effective oversight by people and the people who design

	and operate machines remain accountable to everyone else. In short, we must always ensure that AI remains under human control." Ref. 4, p. 4
Accuracy	"Accuracy is defined by ISO/IEC TS 5723:2022 as "closeness of results of observations, computations, or estimates to the true values or the values accepted as being true." Measures of accuracy should consider computational-centric measures (e.g., false positive and false negative rates), human-AI teaming, and demonstrate external validity (generalizable beyond the training conditions)." Ref. 5, p. 14; AI systems should provide a confidence level for predictions.
Explainability and Interpretability	*"Explainability* refers to a representation of the mechanisms underlying AI systems' operation, whereas *interpretability* refers to the meaning of AI systems' output in the context of their designed functional purposes." Ref. 5, p. 16
Fairness	Fairness in AI includes concerns for equality and equity by addressing issues such as harmful bias and discrimination. Ref. 5, p. 17
Ongoing Monitoring	Automated systems should have ongoing monitoring procedures, including recalibration procedures, in place to ensure that their performance does not fall below an acceptable level over time, based on changing real-world conditions or deployment contexts, post-deployment modification, or unexpected conditions." Ref. 6
Planning	Develop, document, and disseminate policies, plans, and procedures necessary to implement trustworthiness requirements.
Privacy	"Privacy refers generally to the norms and practices that help to safeguard human autonomy, identity, and dignity." Ref. 5, p. 17; "Automated systems should be designed and built with privacy protected by default". Ref. 7
Reliable	"Reliability is defined in the same standard as the "ability of an item to perform as required, without failure, for a given time interval, under given conditions" (Source: ISO/IEC TS 5723:2022)." Ref. 5, p.13
Resiliency	"AI systems, as well as the ecosystems in which they are deployed, may be said to be resilient if they can withstand unexpected adverse events or unexpected changes in their environment or use – or if they can maintain their functions and structure in the face of internal and external change and degrade safely and gracefully when this is necessary (Adapted from: ISO/IEC TS 5723:2022)." Ref. 5, p. 15
Risk Management	"AI risk management offers a path to minimize potential negative impacts of AI systems, such as threats to civil liberties and rights, while also providing opportunities to maximize positive impacts. Addressing, documenting, and managing AI risks and potential negative impacts effectively can lead to more trustworthy AI systems." Ref. 5, p. 4

Robustness	"Robustness or generalizability is defined as the "ability of a system to maintain its level of performance under a variety of circumstances" (Source: ISO/IEC TS 5723:2022). Robustness is a goal for appropriate system functionality in a broad set of conditions and circumstances, including uses of AI systems not initially anticipated." Ref. 5, p. 14
Safety	"AI systems should "not under defined conditions, lead to a state in which human life, health, property, or the environment is endangered" (Source: ISO/IEC TS 5723:2022)." Ref. 5, p. 14
Security	"…concerns related to the confidentiality, integrity, and availability of the system and its training and output data…" Ref. 5, p. 8
Supply Chain Risk Management	"Policies and procedures are in place to address AI risks and benefits arising from third-party software and data and other supply chain issues." Ref. 5, p. 24
Test, Evaluation, Verification, and Validation (TEVV)	Tasks are performed throughout the AI lifecycle that are carried out by AI actors who examine the AI system or its components or detect and remediate problems. Ref. 5, p. 35
Transparency	"Transparency reflects the extent to which information about an AI system and its outputs is available to individuals interacting with such a system – regardless of whether they are even aware that they are doing so." Ref. 5, p. 15
Valid	"Validation is the "confirmation, through the provision of objective evidence, that the requirements for a specific intended use or application have been fulfilled" (Source: ISO 9000:2015)." Ref. 5, P. 13

Table 1: Candidate Trustworthiness Requirement Families

Additional support can be provided to the AI Systems community by creating a document that provides procedures for self-attestation or third-party audits of trustworthiness requirements similar to NIST SP 800-171A, Assessing Security Requirements for Controlled Unclassified Information (Ref. 8). NIST SP 800-171A enables organizations to generate evidence to support assertion of requirements satisfaction.

Summary

- Establishing foundational guidance documents for developing and using trustworthy AI systems strengthens federal government leadership in the AI community.
- Leveraging federal government demonstrated successes with information security provides confidence in a high value outcome.
- Processes used to develop trustworthiness requirements facilitate collaboration amongst a diverse set of stakeholders.
- The voluntary commitments to manage risk posed by AI secured from leading AI companies by the Biden-Harris Administration (Ref. 9) are easily incorporated into the trustworthiness requirements.

- Trustworthiness requirements support development of Generative AI systems aligned with federal government priorities such as the AI Bill of Rights.
- NIST-led effort ensures that the necessary cybersecurity principles for secure AI systems are incorporated into trustworthiness requirements.

Question 5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

Recommend adding a section 5biL citing satellite systems and associated ground infrastructure critical to public safety. The rationale for the incorporation is that many civilian satellite systems are essentially critical infrastructure systems. For example, the NOAA Geostationary Operational Environmental Satellites (GOES) provide hurricane track and intensity forecasts relied on by the public and emergency service providers to make critical safety decisions.

Question 6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Yes, the practices identified set an appropriate baseline. The minimum practices can be improved by strengthening alignment with Executive Order 13960 section 3e by incorporating section 3e language that states, “Agencies shall ensure that the operations and outcomes of their AI applications are sufficiently understandable by subject matter experts, users, and others, as appropriate.” A suggested location is a new Section 5civI on p. 18 of the draft OMB memorandum.

Additionally, strengthen alignment with the AI Bill of Rights by adding a sentence after the first sentence in Paragraph 5cvD on p. 20 (**Notify negatively affected individuals)** stating, "Affected parties should know how and why an outcome impacting them was determined by an automated system, including when the automated system is not the sole input determining the outcome."

General Comment

The "Blueprint for an AI Bill of Rights" attempts to navigate the complex terrain of integrating AI into society, but it falls short in several critical areas, reflecting a somewhat myopic vision that fails to grapple with the broader implications of AI integration.

1. Lack of Unified Vision for AI Integration: The Blueprint is glaringly silent on the need for a unified, coordinated approach to AI across various government agencies. By allowing each agency to independently navigate AI integration, it perpetuates a fragmented landscape that could lead to the creation of AI silos. This disjointed approach risks inconsistencies in implementation, inefficiencies, and a missed opportunity for a cohesive national strategy. The absence of a plan to eventually converge these efforts signals a lack of foresight, leaving the U.S. vulnerable to a disjointed and inefficient AI ecosystem.

2. Absence of Quantitative Metrics and Accountability: The Blueprint conspicuously lacks any form of quantifiable metrics to measure the success or failure of its implementation. Without clear benchmarks, how can we evaluate the efficacy of these guidelines? It seems to be more of a performative gesture rather than a concrete plan with measurable outcomes. This omission casts doubt on its practical utility and leaves room for ambiguity and ineffectiveness. Hiring personnel without a clear roadmap or success metrics can lead to a bureaucratic quagmire filled with individuals who may lack the necessary expertise to navigate the complexities of AI.

3. No Plan for Budget Reappropriation and Staffing Adjustments: The document fails to address the crucial issue of budget reappropriation in light of the expected increased efficiency due to AI implementation. If AI is to streamline processes and enhance productivity, there should be a corresponding plan for staffing reductions and budget adjustments across federal agencies. The absence of such a plan suggests a lack of long-term strategic planning and raises questions about the financial sustainability of this initiative. It's imperative to balance the introduction of AI with financial prudence and foresight.

4. Neglect of Labor Market Impacts and Safety Nets: The Blueprint is alarmingly silent on the potential repercussions on the labor market. With the introduction of AI, there's a tangible risk of job displacement.

Yet, there's no mention of the Department of Labor's preparedness to handle these changes. Are there safety nets and resources in place to support those whose jobs may be rendered obsolete? This oversight reflects a lack of empathy and understanding of the human cost of technological advancement.

5. Absence of Checks on Big Tech's Growing Influence: Finally, the Blueprint misses a crucial opportunity to address the elephant in the room – the burgeoning power of big tech companies. As these entities grow increasingly integral in developing and deploying AI, there's a real risk of them becoming too big to fail, wielding disproportionate influence over the economy and society. The Blueprint fails to propose any limitations or checks on these corporations, leaving a gaping hole in the governance of AI.

In conclusion, the "Blueprint for an AI Bill of Rights" reads more like a tentative first draft rather than a comprehensive, forward-thinking policy document. It's a piecemeal approach that lacks the depth and breadth required to effectively govern the integration of AI into society. The absence of a unified strategy, quantitative metrics, budgetary foresight, labor market considerations, and checks on big tech, makes it a document that falls dramatically short of the mark in addressing the multifaceted challenges posed by AI.

CSET Response to Docket OMB-2023-0020 12.5.2023 FINAL

December 5, 2023

OMB RFI: 88 FR 75625
Organization: The Center for Security and Emerging Technology (CSET)
Respondent type: Organization>Academic institution / Think tank
Primary POC: Tessa Baker, Director of Communications (tgb5@georgetown.edu)

The Center for Security and Emerging Technology (CSET) at Georgetown University offers the following comments in response to OMB's Request for Comments on the *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum.*

A policy research organization within Georgetown University, CSET provides decision-makers with evidence-based analysis on the security implications of emerging technologies, focusing on artificial intelligence, advanced computing, cybersecurity, and biotechnology. We appreciate the opportunity to offer these comments. This response was compiled by the Primary POC, but represents contributions from Mia Hoffmann, Mina Narayanan, Dahlia Peterson, Emelia Probasco, Jack Corrigan, William Hannas, Huey-Meei Chang, Dewey Murdick, Margarita Konaev, and others.

We address OMB's eight questions below. In addition to OMB's efforts to enable AI adoption within the USG, we think it's important that the USG devise a resourced plan to actively monitor the adoption of these technologies by other governments (friend and foe) to ensure we can learn from others as well as ensuring that our technological approaches (and security practices) are calibrated to the potential offensive use of these technologies by other state and non-state actors.

Question 1: Chief AI Officer Roles and Responsibilities

As described in the draft memo, the roles, responsibilities, seniority, position, and reporting structures for CAIO's appear sufficiently flexible. However, the anticipated breadth of responsibilities is vast. Depending on the size of the agency, a single individual or small team may struggle to engage effectively on all of the anticipated activities, which include coordinating agency use of AI (and reporting), communicating the value of AI to each agency's mission, promoting innovation, and managing risks.

Additionally, the absence of clear budget or approval authority may hamstring CAIO's from ensuring compliance with the EO, preventing risky use cases, or monitoring adoption across agencies. We recommend:

- Requiring CAIOs at Chief Financial Officer (CFO) Act agencies, at minimum, not be dual-hatted with other significant roles like CTO or CIO given the breadth of their responsibilities.
- Include AI use cases and relevant categorical information in future updates to Technology Business Management (TBM) Taxonomy or other IT taxonomies and include clear instructions on how agencies should report on investments in AI for mission delivery in future revisions of A-11 Guidance (Section 55) and/or A-130 Guidance, to enable better tracking of investments in AI technologies.
- Requiring CAIOs be involved in agency Capital Planning and Investment Control (CPIC) procedures and milestone reviews in order to enable visibility into agency projects of sufficient scale that may already leverage AI or might benefit from AI advancements. In addition:
    - Strongly consider granting CAIOs approval authority for new CPIC investments in AI-related projects to ensure that they are involved in all aspects of project development and implementation.
    - Consider integrating agency AI use case inventories into existing dashboards like ITdashboard.gov so that both use cases and funding/investment levels can be interrogated by the public.
- Consider revising agency guidance in A-123 or comparable instructions to ensure CAIO's risk review responsibilities re: AI are codified and incorporated into Enterprise Risk Management Procedures to strengthen the CAIO's position and ensure appropriate internal agency governance.

Question 2: Coordination Mechanisms for AI Governance Bodies

In light of the desired expediency in implementing EO 14410, convening new governance bodies rather than repurposing or leveraging existing governing bodies seems likely to increase the administrative burden and delay meaningful results.

We recommend:

- To the extent that agencies have already established effective Data Governance Bodies, as contemplated in M-19-23, leveraging these or similar CPIC or IT-related governance bodies rather than creating standalone AI Working Groups would be a good starting point. Since AI is an enabling tool that requires data, compute, and people to be effective, piggybacking on existing governance infrastructure would enable CAIOs to more easily engage with relevant stakeholders, including Chief Data Officers, Chief Human Capital Officers, Chief Information Officers, and Chief Technology Officers.
- Similarly, we'd also recommend that existing infrastructure, like the CIO Council, serve as a launching point for any contemplated interagency coordination of AI activities, rather than creating standalone coordination and clearinghouse functions on day one in addition to the AI Development Council (EO14410, Section 10.1.a), AI Technology Task Force (EO14410, Section 10.2.b), and the White House AI Policy Council (EO14410, Section 12).

Question 3: OMB and Responsible AI Innovation

AI offers tremendous opportunity, but it may not be the solution for every mission or every government agency, and it requires people to be able to discern use cases and mitigate implementation hurdles. In order to best enable responsible AI innovation, OMB can do two things now:

- Prioritize Workforce Development and Recruitment/Retention: Section 10.2 of EO 14410 demonstrates the administration's commitment to talent as a critical enabler of the potential of AI for government. Hiring, (re)training existing employees, providing relevant career tracks for existing and new technical talent, and identifying gaps in capability are essential for the long-term, sustainable implementation (and maintenance) of AI systems in agencies. Without the talent to execute this memorandum or the EO, federal efforts to regulate and deploy AI systems may falter.
    - As noted in Section 4.b.iv of the draft memorandum, both technical and non-technical workers are essential to AI implementation. CSET research demonstrates the vital importance of not just the data scientists, engineers, or IT

workers who can develop and fine-tune AI, but also those, including contracting officers and product managers that enable AI adoption.

- Focus Agencies on Requirements, Not Hype: OMB can ensure agencies appropriately adopt AI for relevant mission areas by encouraging agencies to first identify capability needs, including legacy IT retirement/modernization requirements. By focusing first on requirements, we are hopeful that agencies can steward the public's trust and resources to the areas where AI might be most helpful, while also protecting the ability of agencies to continue executing their missions.

Question 4: Leveraging Generative AI (safely) to Accomplish Agency Missions

Given the varied missions of USG agencies, we cannot prescribe specific use cases in this response. However, we would like to emphasize the importance of clear requirements, establishing anticipated concepts of operations, and ensuring issues and harms are reported appropriately and promptly to support the responsible use of these technologies. We believe agencies should have clearly defined use cases for incorporating AI into their missions or business operations, be it generative AI or topic modeling **before** adopting these tools. If agencies determine that their goals are best served by taking advantage of AI, they should be ready to clarify the goal of the AI in context of use, how the goal aligns with agency objectives, how the AI achieves the goal, and who – if anyone – is tasked with enabling the AI to achieve the goal. NIST AI RMF Profiles may be a helpful starting point.

Question 5: Additional Use Cases for Consideration

The AI applications that are deemed safety-impacting and rights-impacting in Section 5 appear to constitute a fairly comprehensive list. We recommend:

- Add to Safety Impacting list (Memo Section 5.b.i): AI used to control/meaningfully impact the function of critical digital infrastructure (including emergency broadcasting systems and critical information delivery platforms);
- Move from Safety (Section 5.b.i) to Rights-Impacting (Section 5.b.ii): The functioning of ….”integrity of elections and voting infrastructure” because the draft memo specifies additional impact and rights assessments for rights-impacting technologies, including user testing and public comment (Section 5.c.iv).
- Add additional use cases to Rights-Impacting technologies, including:
    - ii.B (Law Enforcement or Surveillance-related): Identifying or predicting location of crime through techniques like gunshot detection algorithms;

- ii.C (Deciding immigration, asylum, or detention status): Verification of travel documents and migration analytics, including the forecasting of migration patterns and/or border crossings.
- ii.E (Education): Assessing student performance and learning outcomes.
- ii.G (Employment): Real-time task allocation/scheduling.

Question 6: Minimum Practices for Safety and Rights Impacting AI

The proposed practices and requirements are an excellent starting point, we recommend the following additions and modifications:

- Impact and Risk Assessments (iv.A.2) should (specifically) include evaluations of forces outside of an AI system, such as its suppliers or downstream applications creating undesirable impacts or negative system effects, and should include evaluating the cybersecurity of the AI system.
- Data Assessment (iv.A.3): Minimum documentation requirements should also include:
  - a description of the data collection process, and steps taken to prepare or pre-process the data;
  - Any assumptions made about the information the data represents; and,
    - For example, if healthcare expenses are used as a proxy for healthcare needs, this reflects an underlying assumption that all people seek out medical care at the same rates.
  - A description of relevant data gaps and how they are addressed.
- Monitoring (iv.D): Agencies (or ideally, OMB) should set up a mechanism to identify, record and report AI incidents. Incidents can be realizations or near-realizations of previously identified or unforeseen risks and can emerge as a result of AI system behavior or failure of human-AI-teams, among other reasons. Incidents should be investigated to determine their cause and the resulting findings used to improve risk mitigation strategies across the agency going forward. While the authorization and responsibility for this decision may lie with the CAIO, a clear, mandatory reporting and accountability structure should facilitate the identification and reporting of those conditions by staff directly interacting with the AI systems.
- Mitigation Approaches (iv.E): Before deploying an AI, agencies should define circumstances and conditions that would trigger immediate review and/or suspension of the AI system and prepare a response plan, especially for AI systems that are tightly integrated with other entities. Among the considerations should be the criteria under which any fail-safe or override modes are triggered, as well as the criteria under which

the system should be recalled or shut down. Agencies should also document the circumstances in which changes to an AI system or its operating environment necessitate reassessment or re-testing.

In addition, we'd recommend providing clear policy guidance to all agencies regarding the proper supervision and control of AI deployed at agencies, including minimum training on standards for employees involved in adjudicating AI recommendations. In particular, for systems that are safety- or rights-impacting it is prudent to assess both AI and human capabilities and limitations (together) for a given AI use case and implement comprehensive risk mitigation measures rather than evaluating the AI system in isolation. It is also worth considering standards for enabling timely intervention mechanisms and override authority in cases where AI failure is causing unacceptable harm. DoD policies on autonomous weapons systems (DODD 3000.09) provide a helpful model.

Question 7: Materials and Resources To Enable Agency Implementation in Contracts

We suspect that agencies will need to reallocate funding and/or deprioritize existing efforts to meet the aggressive timelines contemplated in this memorandum and the attendant EO. Guidance on flexibilities in existing services contracts, to enable agencies to re-task existing contractors would seem helpful. Additionally, templated language regarding minimum AI system compliance standards (as documented in 5.iv of the memo) for vendor contracts and GSA-established contracting vehicles (like IDIQs or BPAs) that support CAIO and other task execution would be useful.

Question 8: Key Data Elements for Annual Agency AI Use Case Inventories

We believe agency use cases should document:

- **Intended Goal:** the goal of the AI in context of use and how it would improve the status quo, how the goal aligns with agency objectives, how the AI achieves the goal, and who (if anyone) is tasked with enabling the AI to achieve the goal.
- **Anticipated Concept of Operations (CONOPs):** More detailed documentation can stem from agency goals, such as clarifying whether the AI system will interact with people in pursuit of agency objectives or unpacking how the AI achieves its goals by documenting its tasks, methods, and the data it relies on.
- **Cost and Resourcing Information:** As stated elsewhere, including budget and resourcing information in public disclosures would permit the public (and researchers

such as ourselves) to evaluate the relative efficacy of AI use cases to improve the efficiency and performance of government services.

    - **Staff Profiles and Contractor Counts:** Descriptions of the skills and qualifications of people charged with implementing AI systems would be helpful for transparency and to inform AI workforce development.

- **Risk Rating:** Use cases should also include a description of risks that AI systems pose and a grading of these risks so it is easy to determine which AI use cases in an agency are higher risk than others – the existing IT Portfolio Management Risk categories may be a useful starting point for this categorization.
- **AI Incidents:** As stated above, effective monitoring will require capturing any instances of AI harms or near-misses to ensure the USG and public have a comprehensive view into the kinds of issues emerging from the wholesale adoption of AI-technologies in government.

From an AI assessment perspective, all of this information will make it easier to evaluate these systems and make sure they are working as intended.

Additional Assistance

Additional CSET research on workforce, AI assessment, and cybersecurity, may also be helpful as agencies implement the EO and associated guidance. CSET is happy to brief on our prior work and engage, as helpful, with the USG as they undertake this important work. Please reach out to the primary POC or cset@georgetown.edu for further assistance.

General Comment

Artificial Intelligence (AI) is not just transforming economies and industries; it holds the key to revolutionizing public engagement with the federal government. The potential for AI to bridge communication gaps, streamline feedback, and foster inclusion is immense, yet unrealized.

Front and center in the guidance is the requirement for each agency to appoint a Chief AI Officer (CAIO) whose primary responsibility is “coordination, innovation, and risk management” of their agency’s uses of artificial intelligence.

The establishment of a senior AI role in every department underscores the importance of technology in governance. However, the role of the CAIOs should be explicitly linked to innovating public engagement through AI, ensuring that every voice is heard and accounted for in the policymaking process.

In order to take advantage of AI’s unmatched potential to analyze public sentiment, manage feedback, and scale engagement across diverse demographics, OMB’s guidance must evolve to explicitly require federal agencies to implement AI solutions that facilitate and enhance public consultations.

While the proposed guidance calls for “consult[ing] affected groups, including underserved communities, in the design, development and use of the AI, and use [of] such feedback to inform agency decision-making,” the guidance calls for doing so by means of antiquated methods, including:

User testing
Soliciting comments via the Federal Register
Customer feedback
Public hearings, or meetings, such as listening sessions, or
Any other transparent process

Noticeably absent is any injunction to take advantage of AI to make such consultations easier, faster and more equitable than the above methods.

While traditional methods of public participation are valuable, they are often limited by scale, speed, and accessibility. People might talk but it is very difficult for either the agency or the public to hear them because of the volume of comments.

Integrating AI can overcome these limitations, offering real-time analysis and broader inclusivity, particularly for underrepresented communities.

The guidance should be amended to require that the CAIO consults regularly with the public and use AI to make those consultations more effective and equitable.

There is a wide array of tools already in use by other governments. Over 500 governments use the Citizen Lab platform, which incorporates AI to cluster, group and organize public comments. AI is much faster than humans at making sense of large quantities of text and can automate the process of summarizing what people are saying, classifying submissions by topic and sorting them into categories to make it easier for governments and the public to read.

Your Priorities, a free, open source tool for public engagement from Citizens Foundation and used in thousands of online engagements globally, uses AI to scan incoming postings for toxicity. AI automates the process of spotting offensive speech that violates terms of service and community norms, bringing such language to the attention of moderators and reducing the cost of organizing engagements. Your Priorities uses AI to offer a “chatbot” so that the public and government organizers can get answers to questions such as “show me all the comments on Topic X” or “summarize the best comments on Topic Y.”

At MIT, Deb Roy’s Cortico uses machine learning to synthesize comments in live, face-to-face discussions. Remesh leverages artificial intelligence to rapidly make sense of answers to live questions in online sessions, making it possible to extract insights even from spoken conversations such as with communities that are low literacy.

AI translation tools like Facebook’s open source SeamlessM4T make it possible to translate writing into 100 languages and speech into 35 languages, creating avenues for non-native English speakers to participate in conversations on a level playing field.

If OMB amends the guidance to mandate that federal agencies use AI to enable broader, deeper, more meaningful and equitable engagement, innovators will produce even more such tools and agencies will learn how to use them.

Instead of telling agencies, as the guidance does, that they only have to engage “to the extent practicable,” OMB’s guidance should embrace the use of artificial intelligence to foster equitable engagement. It is time for federal agencies to lead by example, leveraging AI to ensure that participatory democracy is not just a principle but a daily practice.

We offer free, independent, evidence-based research on how to use AI for public engagement at https://rebootdemocracy.ai, including a chatbot (coming in early December 2023) to provide answers to questions about effectively using AI for engagement.

RE: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

To Whom It May Concern:

TechNet appreciates the opportunity to comment on the Office of Management and Budget's (OMB) draft memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)." TechNet members make up many of our nation's leading AI developers, deployers, researchers, and users.

TechNet is the national, bipartisan network of technology CEOs and senior executives that promotes the growth of the innovation economy by advocating a targeted policy agenda at the federal and 50-state level. TechNet's diverse membership includes dynamic American businesses ranging from startups to the most iconic companies on the planet and represents over 4.2 million employees and countless customers in the fields of information technology, artificial intelligence, e-commerce, the sharing and gig economies, advanced energy, transportation, cybersecurity, venture capital, and finance.

Millions of Americans have been using AI for years to navigate traffic, search the internet, undertake research, conduct a spell check, vacuum their home, and discover new music. AI is also being used to predict severe weather more accurately, protect critical infrastructure, defend against cyber threats, and accelerate the development of new medical treatments, including life-saving vaccines and ways to detect earlier signs of cancer.

OMB's memorandum advances the impactful provisions in President Biden's recent Executive Order on "Safe, Secure, and Trustworthy Artificial Intelligence." This EO will bolster our workforce through investments in upskilling and training programs and our ability to attract and retain the world's best talent, policies TechNet has long championed. It will also lower the barrier to entry for AI research through the National AI Research Resource (NAIRR), strengthen our nation's cyber defenses, especially in the financial sector, and improve health care and education outcomes. We believe America must be the global leader in setting standards for the responsible development and deployment of AI. TechNet looks forward to working with the Biden Administration and Congress to ensure AI continues to deliver benefits for all Americans.

We appreciate that OMB's memorandum builds upon past efforts to properly inventory the federal government's use of AI. In December 2020, the prior Administration issued Executive Order 13960, providing guiding principles for federal agencies to follow in their development of AI methods and tools. Executive Order 13960 also ordered federal agencies

to annually "prepare an inventory of its non-classified and non-sensitive use cases of AI."[1] Each agency produces a uniquely structured inventory. This presents difficulties in building a comprehensive picture of the federal government's progress in utilizing artificial intelligence. To produce more fidelity in this area, TechNet consolidated the various annual inventories.[2] As of summer 2023, the federal government reported over 731 AI projects, 25% of which were undertaken by the Department of Energy, followed by the Department of Health and Human Services at 21%. AI is clearly already helping empower the U.S. government to better deliver essential services to the American public.

Forward-Looking Policies

We applaud the OMB for several insightful policies in this memorandum. These actions will help maintain the United States as the global AI development leader. We appreciate that part of Chief AI Officers' (CAIO) responsibilities will include efforts to remove barriers to responsible AI deployment through ensuring adequate IT infrastructure, effective and consistent datasets, development of the federal AI workforce, and utilization of generative AI.

CAIOs are also charged with "advocating within their agency and to the public on the opportunities and benefits of AI to the agency's mission." Our international competitors are working quickly to overtake America's lead in AI development; spending in China's AI industry is expected to hit $14.75 billion this year, accounting for about 10% of the world's total.[3] China also currently leads in AI adoption, with 58% of companies deploying AI and 30% considering integration. In comparison, the United States has less than half this adoption rate, with 25% of companies utilizing AI and 43% exploring its potential applications. CAIOs have an important role to play in building greater public trust and understanding of AI systems. The U.S. government should serve as a leader in novel deployments and innovation to drive the nation's global technology leadership in both the private and public sectors.

TechNet supports the government in developing "AI Ready Data." The federal government is one of the biggest producers of data in the world, and these important datasets are already fueling innovation in the public and private sectors. As we move to greater deployment of AI systems, ensuring this data is well-organized will allow these modern tools to deliver faster, cost-effective, and more accurate insights. We encourage OMB and other agencies to make datasets public when appropriate to increase AI research and development.

Existing Legal Protections

It is important to note that the use of AI in furtherance of unlawful behavior is already prohibited and actionable under existing laws, even in the absence of AI-specific regulation. For example, many existing anti-discrimination laws apply to AI models in important areas, including education, healthcare, employment, housing, financial services, policing and

[1] The federal database of AI use cases can be found here: https://ai.gov/ai-use-cases/
[2] TechNet's consolidated report on "Artificial Intelligence and the Federal Government" can be found here: https://drive.google.com/file/d/1i-7Gg4Z1thcFnAZ3C6TDjovdZdGgDg_j/view?usp=sharing
[3] Carreon, Miguel, and Michael De La Cruz. "According to IDC'S Forecast, China's AI Market to Exceed US$26 Billion by 2026, Hardware to Make Up 56% of Market." International Data Corporation. May 18, 2023. https://www.idc.com/getdoc.jsp?containerId=prAP50688623.

criminal justice, and access to goods and services.[4] We want to stress that agencies should utilize existing legal requirements when considering AI management practices and seek to build upon legal precedent for addressing this emerging technology.

Several federal leaders have stated their intent to use existing laws to regulate AI; for example, on April 25, the Consumer Financial Protection Bureau, the Department of Justice's Civil Rights Division, the Equal Employment Opportunity Commission, and the Federal Trade Commission issued a joint statement outlining how their existing enforcement authorities apply to automated systems.[5] In addition, National Labor Relations Board (NLRB) General Counsel Jennifer Abruzzo has stated that she will "… apply the [National Labor Relations] Act to protect employees from intrusive electronic monitoring and automated management practices…".[6] Additional oversight in these areas should not be unnecessarily duplicative or create inconsistent or conflicting standards.

The private sector must comply with existing legal requirements, including laws protecting privacy and preventing discrimination. The use of AI applications falls within the scope of these legal protections, and we encourage OMB to utilize existing legal frameworks and not create potentially duplicative regulations. Accordingly, TechNet members are designing, developing, deploying, and using AI technology cautiously and only after rigorously assessing the benefits and risks of implementation.

Manual and Automated Systems

The memorandum mentions that agencies should review when AI systems should have "opt-out" options. We write to urge that any "opt-out" requirements for AI systems should be narrowly tailored to avoid undermining effective AI research and deployment. TechNet agrees that developers should thoroughly review their systems' resiliency and contingency considerations; however, requiring a "manual" version of all automated systems is neither technically feasible nor practical.

Requiring an overly broad "opt-out" feature to direct users to manual systems will ultimately discourage the development of trustworthy AI by disincentivizing AI research and deployment. If companies providing AI systems for the government are also required to offer a manual system in broad circumstances, there will be less of a compelling business case to innovate and develop advanced, responsible AI technologies. This, in turn, will depress American AI development when the stakes for global leadership in AI innovation are at their highest and could cause the United States to not only cede its role as the world's global technology leader but also provide a pathway for foreign adversaries to exceed U.S. capabilities. It also could lead to greater inefficiencies and costs for the American public,

increased cybersecurity risks, and hamper access to digital services. TechNet believes that requirements for manual alternatives should be based on the known risks of each use case.

Rights-Impacting AI

We have concerns that the memorandum's current definition of "Rights-Impacting AI" could encompass helpful and rights-neutral AI tools and use cases. The memorandum states that "Rights-Impacting AI" should include AI systems whose output is the basis for decisions that impact one's "access to critical resources or services, including healthcare, financial services, social services, transportation, non-deceptive information about goods and services, and government benefits or privileges." We urge agencies to instead of marking all AI deployments in an industry as "rights-impacting" to utilize a risk-based approach to the specific use case. For example, specific to financial services, we suggest instead tailoring the requirement to focus on known or rationally anticipated harms. Without this risk-based approach, very low-risk AI activity could be categorized as high-risk or "Rights-Impacting" and subject to overbroad requirements. Low-risk financial AI use cases could include:

- AI to categorize expenses for tax or other financial planning/budgeting purposes.
- AI to connect people to financial experts based on the consumer's financial/tax needs and the expert's areas of expertise.
- AI to "read" and extract data from financial forms so consumers don't have to enter data and minimize manual entry errors.

The memorandum also lists purposes that are "presumed to be rights-impacting" if an AI system is used to "control or meaningfully influence the outcomes of any of the following activities or decisions." We also urge that these purposes be reviewed considering the known risks instead of generalizing impacts on broad deployment contexts. We specifically want to draw attention to item G on this list, which includes AI use cases in the workplace. We believe it is important to underscore that AI is currently being deployed in the workforce to benefit employees, and we advise not broadly restricting this technology.

Automated systems are being deployed in workplaces across the country to help free employees from rote and inefficient tasks so they can focus on creative outputs. Several of our members utilize automated tools to assist with scheduling, which can ensure more experienced managers are on the same shift as new employees for mentoring, coordinating predictive maintenance for equipment, or when additional orders for needed supplies should go out. While a human could organize these services, by automating these operations, employees are able to make decisions more quickly and go about their workday in a more efficient manner. We are seeing that AI-driven tools enable larger, more integrated teams because entities can coordinate and collaborate more effectively. According to a study by MIT Sloan, employees that are empowered by AI feel more competent in their roles, more autonomous in their actions, and more connected to their work, colleagues, partners, and customers. Notably, only 8% of the global survey respondents were less satisfied with their jobs because of AI.[7] When reviewing whether automated tools in the workplace are "Rights-Impacting," TechNet urges OMB and federal agencies to consider the broader context of these systems' impact on employees' well-being in their careers.

[7] S. Ransbotham, D. Kiron, F. Candelon, S. Khodabandeh, and M. Chu, "Achieving Individual — and Organizational — Value With AI," *MIT Sloan Management Review* and Boston Consulting Group, November 2022

TECHNET
THE VOICE OF THE
INNOVATION ECONOMY

We also want to underscore that bias in human processes that impacts one's rights is well documented but can be difficult to spot until it is too late to correct. By contrast, TechNet members are developing AI systems that can detect and avoid or mitigate bias. TechNet members follow legal guidelines at all stages when developing, testing, and monitoring AI assessments, and in many cases, they test for group differences beyond those required by law.

Conclusion

We look forward to working with you on AI policy and appreciate the opportunity to discuss this innovative technology. We stand ready to serve as a resource to you in your examination of this important issue. Thank you for your consideration of our perspective.

Sincerely,

Carl Holshouser

Executive Vice President and Corporate Secretary

12052023.OMB.Agency Use of AI

HITACHI
Inspire the Next

December 5, 2023

The Honorable Clare Martorana
U.S. Federal Chief Information Officer
Office of the Federal Chief Information Officer
Office of Management and Budget
725 17th Street NW
Washington, DC 20503

RE: *Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum*

Dear Ms. Martorana:

The following comments are submitted by Hitachi Group companies (Hitachi) doing business in the United States in response to OMB's November 3 *Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum.*

Companies like Hitachi have been developing artificial intelligence (AI) solutions for decades. Even before the recent discussions surrounding the technology, Hitachi has recognized the potential for AI—especially in the industrial and generative spaces—as a tool for productivity, efficiency, and automation. Effectively harnessing AI is a path for business acceleration and a catalyst for innovation.

Given our understanding of the potential impact of this technology to positively further the U.S.' standing, Hitachi appreciates the opportunity to engage with the OMB and offer comments regarding the advancement of AI technology within the U.S. federal government.

Responses to OMB Questions

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

The speed of change and innovation associated with this technology and the potential of its impact requires collaboration, coordination, and consistent communication across the federal government. It is possible an AI solution created in one agency may be applicable to a need in a different agency. By openly and regularly sharing and discussing solutions across agencies, the federal government can maximize its resources rather than duplicating efforts by creating the same system via different vendors. It may also capitalize on existing innovations, spur new ideas, and limit or eliminate development redundancies.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body?

What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Hitachi is in favor of the establishment of AI Governance Bodies to support policy monitoring, governance, and enforcement; efficient and timely information (e.g. training data in model development, performance metrics) and best practice sharing; and accelerated innovation and identification of challenges and opportunities specifically associated with AI technology and solutions. This allows for direct focus on this topic rather than a potentially broader set of concerns that may be on the docket for existing groups with overlapping interests or concerns.

Hitachi applauds the OMB's encouragement that agencies incorporate additional best practices from existing AI guidelines such as the National Institute of Standards and Technology (NIST) AI Risk Management Framework, the White House Blueprint for an AI Bill of Rights, and applicable international standards. Agencies such as the Consumer Financial Protection Bureau, the Department of Justice (Civil Rights Division), the Food & Drug Administration (FDA), and the Equal Employment Opportunity Commission (EEOC) also have their own guidance related to AI and civil rights, workforce development, consumer protections, employment, and the like. We therefore recommend that agencies with overlapping concerns and/or focus areas research the standards that already exist throughout the federal government before creating their own frameworks related to risk management, consumer protection, cybersecurity, etc. to avoid having an excess of duplicate or similar guidelines.

As for the potential of agencies establishing AI Governance Bodies, their existence could promote a "one-stop shop" for AI developers and other employees using AI systems looking for guidance on specific situations from experts or those well-versed in agency and government AI guidance. Similarly, having AI Governance Bodies could allow for better communication amongst agencies, thereby allowing more efficient and streamlined efforts to update guidance and avoid overlap, as mentioned above.

3. How can OMB best advance responsible AI innovation?

AI development and advancement is key to future innovation across industries in the U.S. We cannot afford to fall behind. Adequate guardrails to preserve and promote safety, security, and responsible use of AI systems is paramount to OMB's considerations; however, this must go hand-in-hand with the understanding that regulations that are too stringent or overreaching will push innovation elsewhere, jeopardizing our standing as a global leader and introducing unintended risks to competitiveness and national security. In this vein, Hitachi strongly cautions against over-regulating AI, especially when it comes to certain factors such as heavily regulating open-source AI. This would essentially concentrate "power"–that is, the ability to freely innovate–into a few sources, thereby removing competition, encouraging monopolization of data, and stifling creativity, innovation, and digital transformation.

We recommend that open architecture be a key criterion in any government system, including AI-based systems that are constantly learning and improving over time. This will ensure that the AI system is interoperable and not siloed. Transparent sharing of the current performance metrics

of an operational AI system is important for those looking to leverage and reuse an existing solution for a similar or new application. Note that performance is heavily dependent on the underlying infrastructure for both model development and application predictions. Additionally, model shift can be evaluated to trigger model re-training and evaluation of additional machine learning.

When creating recommendations to promote the advancement of responsible AI innovation, we suggest that OMB should focus on how government use of AI systems can improve both the quality of agency outcomes (e.g. securing the protection of classes and/or individuals) and U.S. economic efficiency, financial standing, and global position. Framing the advancement of AI from behind these two lenses will allow the OMB to provide requirements and guidance that prioritize our people and our country while also creating an environment where AI can proliferate and thrive.

We also suggest that, moving forward, the OMB provide an explicit map of how AI systems with larger or critical impacts, such as those associated with public health or military operations, are tiered. This would allow for a clear understanding of how agencies throughout the federal government should assess large, overarching risks that could potentially have a harmful or large-scale impact on the U.S. population.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

When used with adequate safeguards, there is tremendous potential for generative AI as a tool for productivity, efficiency, and automation; a business enabler; a path for business acceleration; and a catalyst for innovation.

Examples for the use of generative AI for productivity and efficiency may include:

- **The unification, collation and streamlining of data to find the "single truth"** from multiple documents or cases.
    - This would be beneficial in cases where individuals are communicating with multiple agencies or over multiple interations. If an individual has previously communicated with an agency and has undertaken actions in between, generative AI can sort through the initial communication and the actions to recommend the best solution for the individual's case. Even if the subsequent actions occurred with separate agencies, the initial agency could still employ a generative AI system to read through this individual's timeline and suggest next steps. This might be especially useful for departments that have historically had complex interactions with individuals requiring the input of several teams/offices or the ability to parse through specific details and situations, such as the IRS, the SSA, or the U.S. Citizens Services divisions of U.S. Embassies overseas.
- **Clearing of backlogs in department processes**, including those caused by understaffing or residual impacts from the COVID-19 pandemic, and the **expediting of customer response times.**
    - Generative AI can provide personalized suggestions to individuals, user types, and/or agencies, which not only streamlines workflows but may also accelerate

an agency's ability to solve issues. By reducing the number of vague form responses, minimizing response times, and providing personalized next steps, this can also cut back on the frustration and inaction that often follows in these situations.

- **The simplification and streamlining of federal grant applications.**
    - Given the vast and varied amount of funding that the government provides, generative AI could be offered by agencies as a tool for those applying to grants, especially those in areas that are critical to national security, climate change, and the stability of the economy. Generative AI systems could help to determine eligibility, sort through available grants, or even help with filling out grant applications. This, in turn, can allow for greater accessibility to government funding by helping individuals and small businesses overcome barriers such as lack of time and understanding of the grants process.

These are but a few examples of many ways agencies can take advantage of generative AI to improve operations. As innovation and development continues and the uses of generative AI become clearer, it is likely these opportunities will grow exponentially.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

Hitachi believes that the cases suggested for presumed safety- and rights-impacting AI are currently sufficient. However, we agree with the text that this is not an exhaustive list and that agencies should create their own scope of possible cases based on precedent and knowledge of their specific area of expertise.

It is important to note that, although implied in the rights-impacting section on page 12, we recommend that the OMB explicitly suggest that minimum practices should be followed for all AI systems that deal with restricting, lessening, and/or studying the spread of misinformation/disinformation in the U.S. The proliferation of misinformation/disinformation, including the use of deep fakes, has been proven to both control and/or meaningfully influence outcomes (e.g. the integrity of elections and voting infrastructure and the protection of young people engaging in online activities). Therefore, this should be clearly stated in this section.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

As AI technology is constantly evolving and new applications and concepts are constantly emerging, the minimum practices outlined here must be regularly re-evaluated and updated. This should occur more frequently than other non-AI federal government policies given the speed of change and innovation of this technology.

Regarding context specific mitigations: as agencies begin to apply their own context-specific mitigations and situations emerge that may require action outside of the expectations of what is

outlined in the OMB policies, Hitachi encourages the federal government to actively avoid instances where they may accidentally provide updated guidelines that are bogged down in restrictions or risk mitigations that are too specific.

Regarding the need for independent evaluation of the AI system (page 16): while this is a necessary practice, using third-party vendors to conduct evaluations can create intellectual property (IP) protection and other security concerns. Guardrails should be put in place to prevent IP leakage and address privacy and security concerns. There should also be work with partners to assist in creating testbeds for third-party verification to ensure AI systems work as intended and avoid compromising IP. These testbeds can also be used to assess other, more complex dimensions of accountability, such as fairness and trustworthiness.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

As noted elsewhere, the transparent sharing of clear and concise information about the following information can help agencies, as appropriate, incorporate the requirements and recommendations into relevant contracts:

- Policies (including those in-flight for visibility and alignment), governance, and enforcement.
    - Includes risk-assessment tiering for AI systems with large or critical impacts, such as those associated with public health or military operations. Also should include guardrails for third-party collaborations on evaluations, testbed creation, system verifications, etc.
- Best practices and learnings (e.g. training data in model development, performance metrics, use cases, etc).
- Ongoing concerns and current challenges and opportunities associated with AI technology and solutions being explored.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

Hitachi recommends that agencies provide more detailed information, such as training data, related to the metadata that is already released. In order to provide the most accurate picture possible regarding agency use of AI systems, we suggest that the following questions also be addressed when possible:

- How does the agency deal with data drift?
- How can the data used in the system be repurposed for other agencies and/or use cases?
- How did the agency choose the system that was eventually deployed? What were the parameters for comparison to other potential models (e.g. the evaluation metrics, testing results, etc.)?

It is recommended, although not required as part of the annual use case inventory, for agencies to publish which use cases have gone through responsible AI evaluation and are auditable. This would allow an AI system and/or its users to explain how they arrived at a particular decision or

inference. This could involve tracing, which would show, via AI, all the steps logged while solving a problem. Auditability would allow agencies to review documents and records necessary to ensure responsible AI (explainable, ethical, and efficient).

Historically, there have been incidences where agency AI use cases have been removed, seemingly at random, after being released to the public. As such, going forward, it would be helpful and recommended for agencies to provide explanations of why a certain use case was removed from public reports despite having been available for some time.

Conclusion

Hitachi appreciates OMB's work in creating new agency policies, requirements, and guidance related to AI governance, innovation, and risk management, including providing specific minimum risk practices for uses of AI that impact the rights and safety of the public as well as the economic growth of the U.S.

We look forward to continuing to work with the Biden-Harris Administration and your office to provide meaningful feedback as needed in this space.

Sincerely,

Gajen Kandiah
President, Hitachi Digital
Executive Chairman, Hitachi Digital Services
Co-Leader, Hitachi AI Transformation Center

Background on Hitachi

Hitachi, founded in 1910 and headquartered in Tokyo, Japan, drives Social Innovation Business, creating a sustainable society with data and technology. We solve customers' and society's challenges with Lumada solutions leveraging information technology (IT), operational technology (OT), and products under the business structure of Digital Systems & Services, Green Energy & Mobility, Connective Industries and Automotive Systems. Driven by green, digital, and innovation, we aim for growth through collaboration with our customers. The company's consolidated revenues for FY22 (ended March 31, 2023) totaled $80.6B, with 696 consolidated subsidiaries and approximately 322,000 employees worldwide.

Since establishing a regional subsidiary in the United States in 1959, Hitachi has been a committed American partner. For over thirty years, it has invested heavily in research and development (R&D) in the U.S., and this continued reinvestment has resulted in 24 major R&D centers that support high-skilled jobs in manufacturing and technology. Dedicated to delivering the technologies of tomorrow, Hitachi located our digital headquarters in Santa Clara, Calif. to explore applications in ML, AI, Internet of Things (IoT) devices, data analytics, and autonomous vehicles among other advanced technologies. Hitachi is also proud of its human capital investment with more than 16,000 employees across 60 companies in the U.S. At 17% of total revenue, North America is Hitachi, Ltd.'s second largest market, following only the Japanese market, with $13.9 billion in revenue in FY22.

Innocence Project Comments on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* Draft Memorandum

Background

The Innocence Project (IP) is pleased to respond to The White House and OMB's request for public input on its draft memorandum *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)*. We are the leading national organization working to free the innocent, prevent wrongful convictions, and create fair, compassionate, and equitable systems of justice for all. We commend the Administration's efforts to create comprehensive safeguards for the use of AI as it increasingly applies to a broad range of aspects of our culture, life, and governance.

IP's work is organized around three fundamental pillars: restoring freedom for wrongfully convicted people, transforming system inequities and problems that lead to wrongful convictions, and advancing the movement of organizations providing support and legal representation to people with innocence claims. Given the prominent role that misapplied science has played in wrongful conviction cases, ensuring the integrity of science and technology is a key part of our efforts to transform systems. We work to 1) strengthen the standards that govern the use of science in the criminal legal system, 2) urge system actors to examine the evidence for scientific accuracy and reliability, and 3) consider the broader civil rights implications of surveillance and investigative technologies.

We, therefore, view the introduction of emerging technologies–like facial recognition technology and predictive policing–into the criminal legal system with significant concern. We know from hard-learned experience that the use of untested, unreliable, and unregulated technologies can and will draw innocent people into the criminal legal system, perpetuate racial biases, and exacerbate racial disproportionality.

Support for AI Core Principles and Priorities

The Innocence Project supports the following principles and priorities on the use of AI: 1) transparency, 2) scientific integrity, 3) equity, dignity, and fairness, 4) the duty to correct and notify, and 5) data protection.

We are very pleased to see that the OMB memorandum thoroughly covers and considers most of these principles and priorities, as described below.

<u>Transparency</u>
Transparency is critical to promoting accountability and public trust. It can be achieved by providing clear public notification and information about the case-based use of AI and obtaining

input from stakeholders and directly impacted communities. We commend the OMB for promoting transparency by requiring Chief Financial Officers (CFO) Act agencies to implement the following practices:

- Maintain AI use case inventories that are publicly available.
- Consult and incorporate feedback from affected groups.
- Develop and publicly release a "strategy for identifying and removing barriers to the responsible use of AI and achieving enterprise-wide advances in AI maturity."
- Take steps to ensure transparency and adequate performance for their procured AI.
- Notify "individuals when AI meaningfully influences the outcome of decisions specifically concerning them."

Scientific Integrity

Scientific integrity refers to a pattern of research conduct, characterized by the application and promotion of ethical and deontological principles, that encourages and assures responsible and reliable processes.[1] A 2010 memorandum from the Office of Science and Technology (OSTP) states that a culture of scientific integrity is ensured by relying on honest investigation, open discussion, refining understanding, and commitment to the evidence.[2] Assessing the validity and reliability of an AI system and providing training and educational resources contribute to the maintenance of scientific integrity. We are pleased to see that these values are encouraged through some of the minimum practices listed in Section 5, such as the following:

- Ensure adequate human training and assessment.
- Test the AI for performance in a real-world context.
- Independently evaluate the AI.

Equity, Dignity, and Fairness

AI introduces new ethical, legal, and social challenges, including risks of discrimination that can lead to unfair outcomes. Certain communities are more likely to be subject to the use of a range of AI technologies and thus to their inherent bias and discrimination. Models that are built using biased, inaccurate, or non-representative data are inherently flawed and have an increased risk of making discriminatory predictions or decisions that lead to entanglement in the criminal legal system. An overarching, standardized, and regulated mechanism for reviewing and mitigating risks associated with the use of AI is thus necessary to advance equity, dignity, and fairness. We are pleased with the minimum practices that aim to investigate and mitigate risks as well as maintain equity, dignity, and fairness, such as the following:

- Conduct ongoing monitoring and mitigation for AI-enabled discrimination.
- Take steps to ensure that the AI will advance equity, dignity, and fairness.
- Complete an AI impact assessment.
- Promote competition in the procurement of AI.
- Maintain options to opt-out where practicable.

Duty to Correct and Notify

---

[1] Rita H. Pickler, *Artificial "Intelligence" and Scientific Integrity*, 72 NURS. RES. 165 (2023).
[2] John P. Holden, *Memorandum for the Heads of Executive Departments and Agencies, Scientific Integrity*, https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/scientific-integrity-memo-12172010.pdf.

The duty to correct and notify refers to an agency's obligation to remediate adverse events and notify individuals who are negatively impacted by them. This ensures accountability and increases public trust. The following minimum practices will encourage CFO Act agencies to uphold the duty to correct and notify:

- Notify negatively affected individuals.
- Maintain human consideration and remedy processes.

Data Protection

Because of the risks of impact that certain AI systems may pose and the risks of data breaches, data protection is essential. There is no single overarching data protection legislation in the United States, but rather multiple federal and state laws that address personal data protection.[3] Agencies must adhere to the appropriate legislation and develop plans for how (and by whom) data is collected, stored, secured, used, retained, and destroyed. The memo aligns with this priority by requiring agencies to do the following:

- Develop and publicly release a plan for establishing adequate enterprise capacity for AI innovation, which must include cybersecurity compliance.
- Update cybersecurity authorization.

Proposed Additional Considerations

While we applaud the practices and requirements described in the memorandum, we believe that some areas need more depth or guidance and additional practices should be considered. We recommend that the following proposals be incorporated into the memorandum for implementation. These may be particularly relevant in response to Question 6 (Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?), though they have implications more broadly.

Minimum qualification for Chief AI Officers (CAIOs)

The CAIO serves as the lynchpin for the development and implementation of AI protections and policies within each agency. CAIO roles, responsibilities, seniority, position, and reporting structures are outlined in the memo; however, the CAIO's minimum qualifications are not clearly stated. IP recommends including a clear list of minimum qualifications to aid agencies in finding individuals with the education, experience, and skill sets needed to effectively do the job.

Human intervention

Section 5(c)(iv)(A)(3) states that agencies need to conduct an AI impact assessment but if they cannot directly evaluate the quality and appropriateness of the data due to a lack of access, they can obtain sufficient descriptive information from the AI or data provider. The reporting of human intervention should be listed as a minimum requirement for descriptive information. Human intervention relates to human manipulation of the data, e.g. if any human has filtered,

[3] Relevant Legislation and Competent Authorities, https://iclg.com/practice-areas/data-protection-laws-and-regulations/usa.

applied labels to, or edited the data.[4] This can greatly affect the reliability, accuracy, and quality of the data.

Limited use of AI black boxes

The AI black box problem refers to the inability to see how some AI systems make their decisions. Many machine learning algorithms are indecipherable, particularly popular deep learning neural network methods.[5] The processes that occur in these boxes are self-driven and most programmers, data scientists, and users are unable to interpret them. The lack of explainability makes it difficult to adequately assess bias and determine where problems stem from. Black box models that preclude a clear understanding of their decision-making processes warrant additional up-front and ongoing scrutiny.

Explainability is attained by describing how deployed AI models' algorithms work or how the model predictions carry out the decision-making process.[6] Algorithms are deemed to be explainable when how they function or arrive at certain predictions can be described. AI explainability builds understanding and trust. Agencies should be encouraged to utilize AI systems that are explainable. When there are no explainable algorithms available for a particular task, understanding and trust can still be forged by explaining how the AI predictions influence the decision-making process. AI developers and agencies need to understand how to achieve explainability for various AI models and find a balance between prediction accuracy and explanation.

Repeatability, reproducibility, and robustness

Repeatability, reproducibility, and robustness assessments of proposed safety-impacting and rights-impacting AI systems should be listed as a minimum standard. Repeatability is the ability to continuously act, under the same conditions, without outcome variation. Repeatable AI models output the same predictions with little to no variation during independent tests conducted using the same or similar conditions.[7] If the model is repeatable, the AI user will have greater confidence in it.

Reproducibility is the ability of independent team members to draw the same conclusions using the same AI methods by relying on documentation made by the original tester.[8] Reproducibility affects the trustworthiness of the AI product and the agencies utilizing them.[9] The reproducibility of AI methods is a cornerstone of trustworthy AI.[10] Agencies need to measure the repeatability

and reproducibility of deployed AI systems to understand where potential variations may stem from.

Lastly, robustness refers to an AI system's ability to handle error during execution and erroneous inputs.[11] Robustness is measured by the degree to which the whole system or a component of it can function accurately in the presence of erroneous inputs or taxing conditions.[12] Agencies can build trust in the AI system when they prove that the deployed model is sufficiently robust. Agencies need to evaluate robustness because it is not possible for models to determine and set out all preconditions and consequences for a particular action.[13] Hence, there is a probability of models generating nonsensical or unexpected results that may not be perceived by a human when minor modifications are made to inputs. Robustness assessments involve scenario-based testing of anticipated erroneous inputs.

We note that repeatability, reproducibility, and robustness assessments may be resource-intensive. If necessary, agencies can take a risk-based approach and focus this testing on the AI-powered features that they plan to utilize.

Facilitating the auditing process through traceability

Agencies that use safety-impacting and rights-impacting AI systems should be required to keep a record of data provenance, procurement, preprocessing, storage, and security to facilitate internal and external auditing processes.[14] The records should also include notes about data representation, sufficiency, integrity, relevance, and timeline, as well as any unpredicted data issues that were encountered. All of this information should be stored in a process log. As an alternative to manual record-keeping, agencies can use traceable AI models. A model is traceable when its predictions as well as processes and datasets used to generate those predictions are automatically documented in an understandable way (audit logs). Traceability is another key requirement for trustworthy AI.[15] Traceability opens the door for explainability and transparency.

Guidance on risk levels

AI systems can and should be classified as low, moderate, and high risk. For example, the European Union AI Act classifies AI systems that will be used to make biometric identification of humans and systems that will use biometric data to make inferences about humans (with the exclusion of some) as high risk.[16] The memo needs to provide guidance on how to determine the risk levels for particular AI systems to ensure clarity and consistency across the board and to ensure that higher levels of care are taken in the use of high risk AI systems.

Human involvement in AI-augmented decision-making at all levels of risk

To mitigate automation bias, AI-augmented decision-making should be human-centric, i.e., involve human consideration. The memo makes this a minimum practice for decisions that pose high risks to rights and safety. However, human involvement should be considered for some decisions that initially pose low to moderate risks because these decisions may collectively pose high risks to rights and safety. Agencies need to determine and document the extent of human oversight.[17] Generally, AI should be approached as a collaboration between humans and machines in all contexts, not only those determined to be high risk.

Increased Transparency

In addition to the information that agencies are already required to post on their website, agencies should also be required to post the findings of their impact assessments, internal validations, and ongoing monitoring. Doing this does not only promote transparency, but it can help other agencies with their decision-making and AI procurement processes.

Address overuse of certain AI in particular communities

The memo needs to address the overuse of rights-impacting AI, e.g. surveillance technologies, in certain communities. Even if agencies utilizing rights-impacting AI meet the minimum standards outlined in the current memo, the collective use of multiple AI systems may result in disproportionate burdens and impacts on particular communities. Additionally, impact assessments' documentation of the potential risks of using AI should include consideration of how the AI system under evaluation may interact with other systems operating in the same arena.

Moving Forward Together

Advances in technology have always presented opportunities and risks, and artificial intelligence is no different. It is one of today's most powerful technologies, with the potential to improve people's lives and tackle some of society's biggest challenges. At the same time, it has the potential to dramatically increase threats to safety and security, infringe upon civil rights and privacy, and erode public trust and faith in democracy. We believe that the requirements and minimum standards in this draft memorandum will help to reduce those risks and are a step in the right direction We encourage the Biden Administration and OMB to consider the additional guidance and practices offered above to increase the transparency and scientific integrity of these emerging technologies and to mitigate harms to communities disproportionately impacted by the criminal legal system.

About MITRE

MITRE is a not-for-profit company that works in the public interest to tackle difficult problems that challenge the safety, stability, security, and well-being of our nation. We operate multiple federally funded research and development centers (FFRDCs), participate in public-private partnerships across national security and civilian agency missions, and maintain an independent technology research program in areas such as artificial intelligence, intuitive data science, quantum information science, health informatics, policy and economic expertise, trustworthy autonomy, cyber threat sharing, and cyber resilience. MITRE's 10,000-plus employees work in the public interest to solve problems for a safer world, with scientific integrity being fundamental to our existence. We are prohibited from lobbying, do not develop or sell products, have no owners or shareholders, and do not compete with industry—allowing MITRE's efforts to be truly objective and data driven. Our multidisciplinary teams (including engineers, scientists, data analysts, organizational change specialists, policy professionals, and more) are thus free to dig into problems from all angles, with no political or commercial pressures to influence our decision making, technical findings, or policy recommendations.

MITRE has a 50-year history of partnering with federal agencies to apply the best elements of artificial intelligence (AI) and machine learning (ML) to advance agency missions while developing and supporting ethical guardrails to protect people and their personal data. Our team's experience with the entirety of the AI/ML adoption and life cycle has strengthened our ability to anticipate and resolve future needs that are vital to the safety, well-being, and success of the public and the country.

Introduction and Overarching Recommendations

MITRE reviewed with interest the recent Executive Order (EO) on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence[1,2] and the Office of Management and Budget's (OMB) draft implementation memorandum. The federal government can serve as a catalyst to accelerate the development of tools and framework to mitigate risks and enhance the trustworthiness and security of AI systems, and the approaches outlined in the EO will help advance that outcome considerably. Our overall reactions are provided below, with answers to the OMB request for information's (RFI's) specific questions in the section that follows.

Level of selected governance model. Managing and regulating emerging technologies like AI is challenging due to the field's rapid evolution, wide-ranging adoption possibilities, and the community's developing understanding of AI's risks. The EO and draft memorandum take a balanced governance approach, allocating complementary responsibilities across both the Executive Office of the President (EOP) and individual federal agencies. This approach avoids the pitfalls of a single entity approach, which can result in decisions lacking context and

[1] Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence. 2023. The White House, https://www.whitehouse.gov/briefing-room/presidential-actions/2023/10/30/executive-order-on-the-safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence/. Last accessed December 1, 2023.

[2] Please note that any unspecified references to an EO within this document are explicitly referring to this particular EO (14110 of October 30, 2023).

regulatory confusion. It also avoids the pitfalls of a completely distributed approach, which demands duplicative expertise and is nearly impossible to implement consistently or analyze effectively at the whole-of-government level.

However, this balanced governance approach necessitates substantial effort in bridging the gap between EOP policymakers and agency implementation, as well as between government and industry. Activities such as establishing a common understanding, standardized frameworks, and shared infrastructure are crucial. While EOP staff may be able to prioritize these tasks initially, such coordination efforts run the risk of being sidelined over time (especially across presidential administrations), jeopardizing the long-term success of the initiative. Therefore, MITRE recommends that OMB incorporate this bridging function into its implementation plan for the EO. Various coordination approaches can be employed, including a federal coordination office, an Information Sharing and Analysis Center, a Center of Excellence, a consortium, and/or an FFRDC. MITRE has experience with each of these approaches and would be pleased to discuss their advantages and disadvantages in helping OMB and federal agencies achieve their AI goals.

EOP messaging. It is essential for the EOP to strike a better balance between focusing on managing risks posed by and ensuring agencies feel encouraged to leverage AI to enhance their missions. By fostering a supportive environment for responsible and impactful AI use, agencies will be more inclined to adopt AI technologies and contribute to the overall advancement of AI in the federal government.

The EOP should also openly lead by example by initiating projects to responsibly leverage AI in meeting their own missions. This would not only set an example for agencies to follow but also provide the EOP with insights and experiences that will be necessary in fulfilling their oversight and interagency coordination responsibilities.

Flexibility and adaptability in AI governance. The importance of flexibility and adaptability in AI governance cannot be overstated, as each agency will have different needs and requirements based on their size, organization, budget, mission, and internal AI talent. Common best practices, guidance, training, and a list of priority risks of common concern[3] will help agencies navigate the AI landscape without OMB direction becoming overly prescriptive.

Clear governance inputs and processes. Based on our extensive experience in cyber governance, we understand that efficient governance necessitates well-defined inputs, processes, outputs, roles, responsibilities, information sharing, and decision-making authorities. The same will hold true for AI governance. This clarity is crucial regardless of whether a new AI governance body is established or AI governance is integrated into existing governance bodies. A well-defined governance structure will facilitate the responsible planning, development, deployment, and use of AI across federal agencies.

Collaboration and coordination. The advancement of responsible AI innovation and the achievement of EO objectives rely heavily on collaboration and coordination between agencies, as well as with external stakeholders and subject matter experts (SMEs). By fostering a culture of cooperation, the federal government can harness the collective knowledge and expertise of various stakeholders to ensure the safe, secure, and trustworthy development and use of AI

[3] Developing something similar to Appendix 5 within the Capital Programming Guide (https://www.whitehouse.gov/wp-content/uploads/2021/01/capital_programming_guide.pdf) supplement to OMB Circular A-11 could be useful.

technologies. The EO and this draft OMB memorandum naturally focus on internal federal government activities, but efforts to ensure the federal government collaborates with and leverages insights from nongovernmental organizations will also be required.

Requirements for agencies that are part of a CFO Act agency. The draft memorandum prescribes requirements for agencies that are considered a CFO Act agency[4]. A CFO Act agency must designate a Chief Artificial Intelligence Officer (CAIO) responsible for the requirements specifically called out for CFO Act CAIOs, as well as the broader CAIO requirements. Agencies that are not CFO Act agencies must also establish a CAIO. However, the current memo is confusing regarding whether a CFO Act agency that has one CAIO at the top level (e.g., HHS) obviates the requirement for (subordinate) agencies within that CFO Act agency to establish a CAIO (e.g., for FDA, CMS, CDC, etc.). Several sections of the draft memorandum call out different requirements for all CAIOs versus CFO Act CAIOs specifically (e.g., Section 3(a)(i), Section 3(a)(ii), Section 3(b)(i), Section 3(b)(iii)), but the guidance can be interpreted as requiring a "top-level" CAIO only for CFO Act agencies. MITRE recommends that OMB better clarify these requirements and their expectations on different categories of agencies in the memo.

Resourcing. The requirements outlined in the EO and this draft OMB memorandum are extensive. Moreover, our discussions throughout the federal AI community suggest that the community has likely been underestimating the resources necessary to properly assure AI. We recommend that OMB proactively work with agencies (in the near term) as well as with Congress (on future budgets) to find appropriate ways to ensure resources are available to meet these requirements.

In conclusion, MITRE emphasizes the importance of a balanced governance model, flexibility and adaptability in AI governance, clear governance inputs and processes, and collaboration and coordination between agencies and external stakeholders. By addressing these key points, the federal government can more effectively advance responsible AI innovation and meet the objectives outlined in the Executive Order and OMB memo.

Questions Posed in the RFI

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

The roles, responsibilities, seniority, position, and reporting structures outlined for CAIOs are sufficiently flexible and achievable from an overall perspective. Maximizing flexibility in meeting these requirements will be critical given the wide variance of agency sizes, operating functions, and management approaches taken. However, there are areas for recommended improvement, as listed below.

[4] As defined under the Chief Financial Officers (CFO) Act of 1990.

Authorities and accountability. One major gap in this memorandum is specificity on authorities and accountability of the CAIOs within the agency's management and decision-making processes. Effectively describing these management and decision-making authorities and accountabilities will benefit not only the CAIOs, but also other leaders and staff throughout the agency. These authorities and accountabilities should not be fully specified within the OMB memorandum, but OMB should select a minimal core set that agencies could fine-tune (and expand upon) for their unique situations. Without doing so, the chances of confusion within agencies and uniformity across agencies are high, which could impede both AI oversight and the agencies' business operations.

The clarification of management and decision-making authorities and accountabilities is crucial for individuals in the CAIO role, as it ensures they have the necessary authorities outlined in Section 3.b.H of the draft memo to eliminate barriers effectively. However, mandating these authorities may create issues for some agencies, as there could be valid existing reasons or processes that need to be addressed before removing the barriers appropriately. OMB must exercise caution when defining expectations for CAIO authorities and roles within agencies to avoid creating unnecessary bureaucratic layers or circumventing critical decision-making processes.

A crucial aspect of AI governance is the review and management of investments, which ideally should be integrated with an agency's existing investment management process. AI leadership should have a say in investment and resource allocation decisions. However, it is not advisable to designate funding for AI exclusively under the management of the CAIO. Instead, the CAIO role should function as a collaborative intermediary between the acquisition process and the mission-oriented stakeholders (with intended users) who are funding the development. This approach fosters better coordination and alignment of AI investments with the agency's overall objectives.

Resourcing. For large agencies with multiple operating divisions, the work required to perform the tasking in this EO and memorandum will be quite extensive, necessitating more than simply designating a single individual as a CAIO. These large agencies will likely need a dedicated staff office to perform CAIO functions. These agencies should signal this need to OMB and work collaboratively with them to determine how to adequately resource the staff to ensure success.

Creating new bodies versus leveraging existing ones. Agencies should have the flexibility to choose the most suitable approach for both the CAIO position and the internal agency governance body. However, MITRE recommends that OMB provide some baseline guidance. For instance, an agency should not automatically create new AI governance positions and bodies just because the EO calls for those functions. Instead, new AI governance positions and/or bodies should be established only if the agency believes doing so will add significant value compared with utilizing existing governance positions and/or bodies. In the short term, agencies must also consider whether they possess adequate AI expertise to staff their desired approach, or if temporary alternative approaches need to be explored.

The requirement in 3.c.i of the draft memo that agency AI Governance Boards must be vice-chaired by the CAIO could in many cases effectively preclude agencies from using existing boards to fulfill this function, which conflicts with providing this as an option. OMB should rethink this requirement to ensure that use of existing boards truly is an option for agencies to consider.

CAIO position qualifications. The minimum qualifications of a CAIO provided in 3.b.i of the draft memo are vague. While that vagueness may be necessary in the early stages of implementing this memorandum, OMB should also initiate work to more fully define minimum requirements (or at least best practices) and initiate training programs to prepare the selected officials for success. The MITRE paper *Interagency S&T Leadership*[5] provides experience-driven insights on how to effectively provide such leadership from both inside a federal department/agency and from an EOP/interagency perspective, and can be leveraged to help in fulfilling this task.

The requirement in 3.b.iii of the draft memo for CAIOs to be senior executive service (SES) equivalents in CFO agencies could create near-term issues given the short timelines provided in this memorandum. Finding individuals who both are already SES certified and have the required AI experiences to succeed in this role will be extremely difficult. Requisite AI expertise, relationships with agency senior leaders, and formally dictated authorities and accountabilities will be much more important than "checking an SES box" upfront. Rather, OMB should consider this SES requirement to be an aspirational goal for agencies to reach within a defined timeframe rather than an upfront requirement that could create more issues than it solves.

Communications. In addition to formal reports to OMB on implementing this memorandum, agency CAIOs should also be expected to (1) document and exchange lessons learned and best practices with their peers in other agencies and (2) collaborate with their agency's external communications teams to explain how they are leveraging and assuring AI, as well as regularly highlighting the benefits that their use of AI has provided.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

There are many potential governance coordination mechanisms and approaches, the best fit of which will vary based on an agency's AI goals and status of existent governance processes and mechanisms. Before making decisions on those, however, MITRE feels that a more definitive description from OMB is needed about what AI governance entails.

AI governance. First, agencies will benefit from defining "AI governance" to ensure clarity in their approach to establishing AI governance mechanisms. The following definition of AI governance is offered based on MITRE work: *AI governance is the set of processes, practices, principles, and policies that an agency uses (within and adjunct to existing governance structures) to direct and control its planning, development, deployment, and use of AI to meet mission needs. The purpose of AI governance is to manage and address potential risks, harms, and challenges posed by AI while maximizing the benefits of AI and ensuring alignment with trustworthy AI principles (e.g., safety and security, human rights protection, privacy,*

[5] D. Blackburn. Interagency S&T Leadership. 2023/2016. MITRE, https://www.mitre.org/sites/default/files/2023-08/PR-16-0916-interagency-s-and-t-leadership-full-paper.pdf.

fairness/equity, responsible and ethical use of AI (including accountability), transparency, explainability, robustness and reliability, and traceability).

Second, more definitive descriptions of the types of processes included in AI governance are also needed. MITRE recommends that an agency's AI governance—whether integrated into or established alongside existing governance processes—include the following processes and coordination mechanisms:

- AI strategy development, including defining the agency's AI strategy (direction), monitoring progress of strategy implementation, and refreshing the AI strategy when needed. The AI strategy should align with the agency's overall strategic goals and objectives.
- A definition of Trustworthy AI and operating principles, aligned with the agency's mission.
- AI investment management, integrated into the agency's existing investment management process. This activity includes the regular maintenance of the agency's AI Use Case Inventory (required by EO 13960) as well as overall awareness and tracking of the agency's current AI efforts inclusive of AI prototypes, pilots, operationalization projects, and (when appliable) programs of record. Including AI efforts in existing investment management reviews ensures that AI investments align with the agency's strategic objectives, ethical principles, and risk management practices. In addition to common elements captured in investment reviews (e.g., strategic alignment, risk, resource allocation, performance measurement), additional investment review elements to capture for AI efforts include (but are not necessarily limited to) ethical/responsible use, impacted users, safety impacts, rights impacts, and regulation compliance. Capturing and tracking the pipeline of AI efforts helps the agency make more effective decisions on whether to move an AI effort forward to the next stage based on measured value demonstrated.
- AI risk and harm management approach and procedures as part of existing agency investment and risk management processes, including identification of potential risks and harms (especially safety-impacting and rights-impacting risks), mitigation strategies, and monitoring.
- AI assurance, a lifecycle process that provides justified confidence in an AI system's ability to operate effectively with acceptable levels of risk to stakeholders. AI assurance provides the operational framework for risk management and procedures, as part of existing agency investment and risk management processes, including identification of potential risks and harms (especially safety-impacting and rights-impacting risks), mitigation strategies, and monitoring. The AI assurance approach should provide AI capability development oversight, which may entail an independent internal-agency SME committee reviewing AI development efforts throughout their lifecycle and, when needed, providing recommendations to AI governance decision-making body(ies). An AI capability development oversight process may also include algorithm "registration" and SME committee review checkpoints to ensure AI-enabled capabilities are functioning as intended, will integrate into agency business processes and workflows, will integrate into agency IT systems, will be accepted by business owners and users, and adhere to the

agency's trustworthy AI principles. If a similar oversight process exists for IT or analytics projects, the agency should identify whether AI efforts can be addressed in the existing process or whether a special committee is needed to review the unique aspects of AI.

- AI policy creation and response, which includes creation and dissemination of agency policies related to AI planning, experimentation, prototyping, piloting, and operationalization, as well as agency response to government oversight policies and regulations.
- External AI stakeholder collaboration and partnerships to share best practices, tools, and data; obtain feedback; and stay informed on emerging trends and regulatory developments. Public-private partnerships are an effective way for government, industry, and public interest groups to develop solutions that address many stakeholder perspectives. These entities provide a voice to often underrepresented groups and allow diverse opinions to be heard in a moderated and safe environment. Considering the viewpoints of the public and community representatives is especially important for safety-impacting and rights-impacting AI. Public-private partnerships can offer valuable insights to government agencies, leading to better policies, practices, and AI-enabled systems.

Of the above processes and practices that are part of AI governance, two should be integrated into existing agency processes: risk management and investment management. An AI capability development oversight process may be able to be integrated into existing project reviews and checkpoints for analytics or IT, depending on scope of and participation in the existing process.

Coordination mechanisms. Additional coordination mechanism recommendations for effective AI governance include:

- Clearly defined and communicated AI governance processes, featuring well-defined inputs (e.g., identifying AI efforts by risk level and life-cycle stage), procedures, outputs (decisions), and decision-making roles, authorities, and responsibilities. This includes identifying who has decision-making authority and who has responsibility for acting on decisions. The agency's AI Use Case Inventory serves as a valuable mechanism for clarifying inputs to AI governance processes.
- Involvement of stakeholders and subject matter experts in governance forums to inform decision makers. These stakeholders and SMEs may include acquisition managers, project/program managers, AI developers, data managers, ethicists, business owners, end-user representatives, business process specialists, attorneys, and others as relevant to the AI use case, type of AI effort life-cycle stage, and decisions being made.
- Allocation of sufficient resources to organize AI governance activities, such as creating governance decision-making schedules, providing quality assurance of incoming materials, prioritizing topics for review, tracking action items to completion, managing risk status, and communicating with stakeholders. These resources may report to the CAIO or other senior leader role fulfilling AI governance duties.
- Integration of the AI governance decision workflow into a workflow system, as part of existing governance process workflows where applicable and to the extent possible.

Updating existing governance or establishing new AI governance. As mentioned earlier, governance best practices recommend incorporating AI governance into existing agency governance processes, practices, and bodies wherever possible. When discussing AI investments/projects in governance processes, additional unique factors must be addressed, such as responsible use of AI, visibility to vendor data and models, and impacts to safety and rights. Addressing these unique AI factors can be achieved by bringing AI SMEs (e.g., acquisition managers, developers, data scientists, program/project managers, ethicists, attorneys, business/mission representatives) into governance forums to provide guidance and recommendations to decision makers.

- Clear objectives, processes, decision-making authorities, roles, and responsibilities are crucial for effective governance. The agency must precisely outline the decisions that need to be made concerning various AI initiatives, such as prototypes, pilots, operationalization projects, and enterprise programs. It is essential to determine when and where these decisions should be made (within specific governance processes and forums), who is responsible for making them (decision-maker), who will be affected by them (the recipient of the decision), and who must take action based on the decisions. This clarity ensures a well-structured and efficient governance system for AI efforts within the agency.If existing governance bodies and governance processes are used for AI governance, the agency must be very clear about when and how AI decisions are integrated into existing bodies and decision-making processes, and who is accountable and responsible for decisions related to the planning, development, deployment, and use of AI.
- If a new AI governance body and separate AI governance processes are established, it is essential to clearly define the roles, responsibilities, decision-making authorities, and the inputs and outputs that interact with other (preexisting) governance processes and bodies. Furthermore, it is necessary to develop criteria that indicate when a topic should be escalated from AI governance to the next higher level of authority. This clarity ensures a well-structured and efficient governance system that effectively integrates AI governance with the broader organizational framework..

Recall that AI governance set up separately from existing governance structures should primarily focus on agency AI strategy development, internal AI standards (e.g., trustworthy AI principles and AI-specific policies), AI partnerships, and AI assurance. AI capability development oversight may be integrated into existing project review processes (e.g., for IT or analytics projects) or may need to be set up separately. Existing governance authorities and processes should add AI representation to their decision-making bodies to inject subject matter expertise, provide risk management, and conduct investment reviews and make decisions on possible AI-enabled solutions to mission-focused needs.

The benefits and drawbacks of establishing a new AI governance body versus updating existing governance bodies are outlined below:

- Benefits of establishing a new (and dedicated) AI governance body:
    - Dedicated focus on AI governance, which can elevate AI into mainstream decision-making processes and lessen financial and mission risk

  - Increased opportunities for AI adoption in the agency given increased communication and awareness of AI's potential across programs and mission areas
  - Increased focus on attracting and retaining AI-specific expertise, which may not be present in existing governance bodies (such as those focused on privacy, IT, or data)
  - Greater visibility and prominence for AI issues, which can help in raising awareness and promoting accountability
  - Potentially increased adoption of agency AI standards that align with national/international AI regulations and policies
  - Potential for lessened AI-related risks
- Drawbacks of establishing a new AI governance body:
  - Potential duplication of efforts and resources, as existing governance groups (especially data and analytics governance) may already be working on AI-related investment decisions, risk management, oversight, and other AI topics
  - Potential duplication of existing governance processes that may not be AI specific but AI relevant.
  - The need for additional resources, such as funding and personnel, to establish and maintain a new AI governance body
  - Probable challenges in coordinating and integrating the work of the new AI governance body with existing groups and initiatives, which may create conflict and/or confusion and may minimize/overtake existing responsibilities
  - Possibility of governance fatigue if membership overlaps too much across the new and existing bodies
- Benefits of updating the scope of an existing governance body(ies):
  - Leveraging existing resources, expertise, and relationships, which can help establish efficient and effective AI governance that is integrated with other investment management and risk management
  - Leveraging existing governance processes that may not be AI specific but AI relevant.
  - Avoiding duplication of efforts and resources, as existing groups can build on their current work to address AI governance issues
  - Easier integration and coordination with other existing groups and initiatives, as the updated group would already be part of the existing governance ecosystem
- Drawbacks of updating the scope of existing governance body(ies):
  - The potential for AI governance issues to be overshadowed by other priorities and concerns within the existing group
  - The possible lack of AI-specific expertise within the existing group, which may limit its effectiveness in addressing AI governance issues

- Challenges in adapting the existing group's processes and structures to accommodate the unique complexities and challenges of AI governance

3. How can OMB best advance responsible AI innovation?

In addition to the guidance OMB provides in its draft memo, the following are other ways for OMB to advance responsible AI innovation:

First and foremost, OMB should lead by example by incorporating AI into its own core functions, many of which stand to benefit significantly from AI integration. By doing so, OMB can demonstrate the potential benefits AI can bring in terms of enhancing mission effectiveness, reducing time and costs, and ensuring security and privacy, thus encouraging agencies to follow OMB's example in their own missions and use cases. For example, OMB could leverage AI-driven analytics and decision-making tools to optimize budget allocation and resource management by analyzing historical data, predicting future trends, and identifying inefficiencies.

Relatedly, OMB could initiate a new and substantial activity that encourages agencies to leverage AI while meeting the current President's Management Agenda. This could involve, for instance, working with federal agencies to identify areas where AI can be used to improve service delivery, reduce wait times, and enhance the overall customer experience.

Such activities will not only enhance OMB's own mission but also provide OMB with hands-on insights and experiences that are necessary to effectively oversee and guide federal department and agency activities, as well as earn the respect of other federal agencies in the process. By actively embracing AI and showcasing its potential, OMB can effectively promote responsible AI innovation across the federal government and its various sectors.

Address resource requirements for AI capabilities. The EO and this draft memorandum mandate numerous additional activities that federal agencies must undertake using their existing funding. While this is a standard aspect of EOP leadership, the size and scope of activities called for within this EO and draft OMB memo are unprecedented. The resources required to meet these requirements are substantial. Moreover, our discussions throughout the federal AI community suggest that the community is likely underestimating the resources necessary to properly assure AI as they use it to enhance agency missions. Pilots to better characterize cost requirements are needed. Operating in a level budget environment while addressing these factors necessitates the reallocation of resources from other activities to meet these demands. OMB has a critical role to play in this regard and should proactively work with agencies (in the near term) as well as with Congress (on future budgets) to find appropriate ways to address this resource issue.

As a first step, OMB should proactively identify existing requirements (e.g., Privacy Act implementation, Federal Data Strategy) that are similar or closely aligned to the new AI requirements and then develop strategies to meet common requirements with a single work product.

Foster public-private partnerships to help agencies meet AI objectives (from the EO and OMB's draft memo) and accelerate the advancement of priority initiatives. The federal government recognizes the value of AI knowledge and use cases from various sources, including nongovernmental entities. These entities will also be developing insights and lessons learned, which the federal government should proactively seek to leverage. As we previously mentioned in our discussion on AI governance, engaging a broad set of stakeholders is critical not only for knowledge-sharing but also for risk management; different stakeholders can perceive and articulate diverse risks in AI utilization. Likewise, OMB should ensure that agencies engage a diverse range of stakeholders throughout the AI life cycle, including business/mission owners, user representatives, ethicists, legal SMEs, business process designers, organizational change management SMEs, and human-machine teaming SMEs. By fostering collaboration and knowledge-sharing, OMB can further promote responsible AI innovation across various sectors.

Better balance OMB's focus on safety/security with encouraging agencies to leverage AI. The EO and this draft OMB memorandum both place significant emphasis on ensuring safety and equity in AI development and deployment. While these aspects are undoubtedly crucial, there is comparatively less focus on mandating and ensuring that agencies proactively work to leverage AI appropriately to enhance their missions. To address this imbalance, OMB should allocate more attention to identifying, characterizing, and promoting the practical application of AI within agencies and emphasize the importance of harnessing AI's potential to improve operational efficiency and effectiveness. In doing so, OMB should ensure that its communications more fully promote both connected objectives – the responsible development and deployment of AI, as well as its practical application to enhance agency missions. By striking a better balance between these two aspects, OMB can foster a more comprehensive approach to AI innovation that not only ensures safety and equity but also actively encourages agencies to harness the transformative power of AI to improve their operations and better serve the public.

Additionally, OMB should explicitly state that decisions on whether to use AI should be based on its improvement over the status quo, rather than how close it comes to reaching an idealized state of accuracy and bias. Current (non-AI) practices are not, by any means, free from error or bias. The pursuit of "perfection" should not overshadow solutions that are simply "significantly better" than current practices and can still provide substantial benefits.[6]

Refine the concept of "responsible use" and establish clear expectations. Currently, the term "responsible use" lacks a precise definition, leading to varying interpretations and potential inconsistencies in its application. To address this issue, OMB should develop a consistent definition and baseline expectations. OMB and agencies can incorporate this understanding into their AI governance processes, such as AI strategy development, mission need/problem identification, the AI use case selection process, the AI algorithm oversight process, the AI assurance process, and the AI risk management process. By embedding responsible use principles in these processes, agencies can ensure that AI systems are developed and deployed in a manner that aligns with ethical, legal, and societal considerations.

[6] This is discussed in further detail in *MITRE's Response to the OSTP RFI on a National Artificial Intelligence Strategy*, available at https://www.mitre.org/sites/default/files/2023-07/PR-22-01891-22-MITRE-National-AI-Strategy.pdf.

Missing or minimized elements:

- ***AI assurance***. While the EO references AI assurance a few times, this draft OMB memo does not explicitly define or address AI assurance as a distinct concept, although some aspects are scattered throughout the document. AI assurance should be a clearly visible building block for the EO's implementation. It is a key part of AI governance that informs and is informed by other AI governance processes; governing AI systems without assurance is not feasible.

  MITRE defines "AI assurance" as *a life-cycle process that provides justified confidence in an AI system's ability to operate effectively with acceptable levels of risk to its stakeholders*.

  - Operating effectively entails meeting functional requirements with valid outputs.
  - Assurance risks may be associated with or stemming from a variety of factors depending on use context, including but not limited to AI system safety, security, equity, reliability, interpretability, robustness, directability, privacy, and governability.

- ***Acquisition considerations***. The memo currently provides limited guidance on acquisition considerations, even though they will significantly influence the federal government's use of AI. Therefore, acquisition should be addressed more comprehensively. It can be helpful to consider AI-specific aspects for acquisition in much the same way the community has considered cybersecurity throughout the system's life cycle: establishing clear business and technical requirements, ensuring fielded solutions comply with appropriate AI policies and regulations, verifying and validating algorithms and data relative to the established requirements and to criteria defined to assure trustworthy AI, and validating to an Authority to Operate, with ongoing measurement and monitoring thereafter.

- ***Accountability and protections for agencies and federal staff***. The EO and memo currently do not provide protections for agencies and federal staff when AI-enabled outcomes are not ideal, even if they exhibited due diligence in their AI acquisition, deployment, and governance decisions. Addressing this aspect is essential to encourage responsible decision making; otherwise, agencies and federal staff may remain too risk averse.

- ***Enhancing agency AI workforce endeavors***. The OMB memo's inclusion of non-practitioners in its AI workforce planning requirements for agencies is positive. The internal agency AI workforce planning and development requirements in the OMB memo can be enriched by identifying four workforce categories that agencies need to address: AI end-users (such as employees whose work is directly impacted by AI), technical AI practitioners (e.g., AI developers, AI engineers, data scientists), non-technical AI practitioners (e.g., acquisition managers, project/program managers, business process designers, governance actors, risk managers, investment managers), and the general workforce (for overall agency workforce AI literacy). For each of these four workforce categories, agencies can use specific strategies to build workforce capacity for AI.

- ***Whole-of-government workforce endeavors***. The memo does not identify any whole-of-government AI workforce initiatives. This is a notable gap, as there are likely many

similarities in workforce development activities across federal agencies that could be more effectively and consistently addressed through a holistic approach. In a recent MITRE project, we investigated whole-of-government workforce investment needs for AI and a handful of other critical and emerging technologies, which are summarized in Figure 1 below. This can be a good starting point for subsequent OMB analysis.

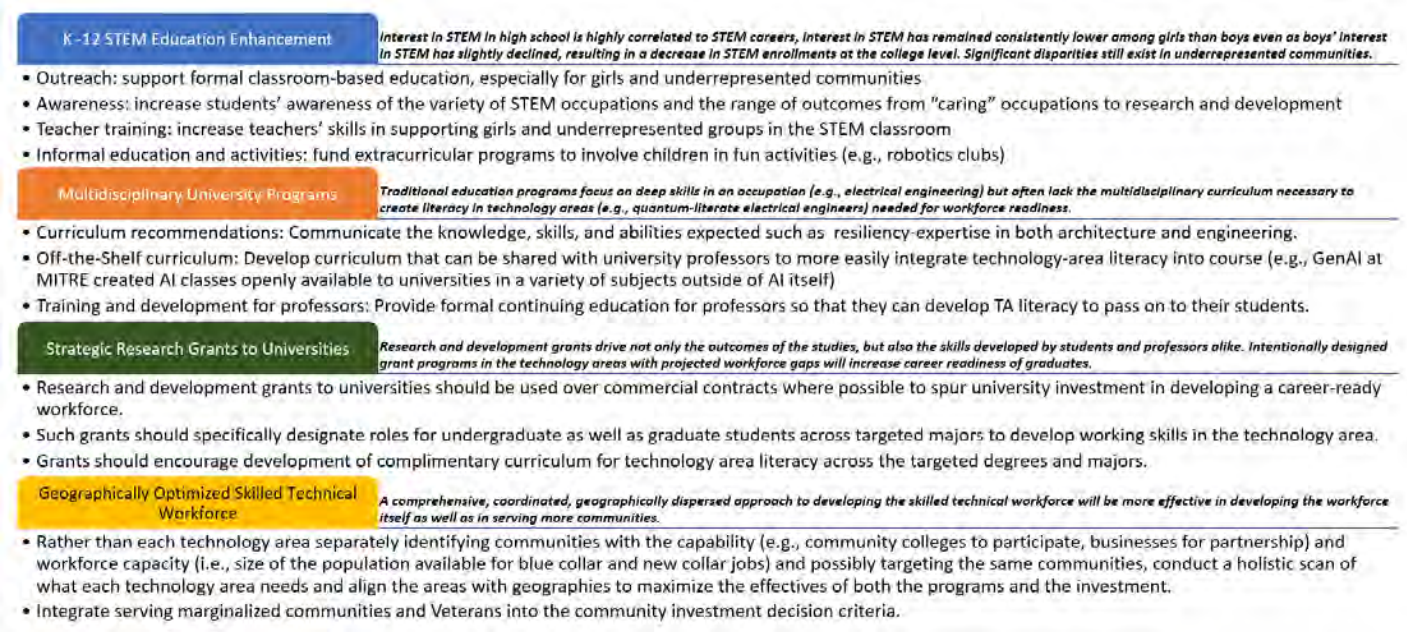

Figure 1 - Workforce Needs for Critical & Emerging Technologies

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Agencies should take a phased approach to adopting generative AI. Adopting an enterprise view of generative AI (and AI in general) provides guardrails that increase trustworthiness and enable increasing sophistication, while managing and mitigating risk. A principled approach to generative AI adoption will enable more success through tools, processes, and frameworks that adapt to evolving risks and requirements. Agencies will need to leverage third-party foundation models for a variety of use cases, ranging from relatively low-risk situations to those with very high consequences, spanning diverse business needs.. Such adoption should follow a healthy prescriptive of "crawl, walk, run," where an agency should:

1. Initially focus on value-added generative AI capabilities (and AI capabilities in general) that have a high probability of end-user adoption success and low risk.
2. Learn from that experience and evolve AI efforts and supporting processes and practices that can inform the adoption of additional generative AI capabilities.
3. Advance generative AI adoption until the desired improvements and transformational changes in mission operations and/or service delivery are achieved.

Preparing an agency for adopting responsible generative AI (and AI in general) can be addressed by the agency executing the three phases described below. Each phase will yield products that advance the agency's ability to adopt generative AI more efficiently and with more assured systems.

1. ***Assess***. Perform an assessment of the agency's current and desired states of generative AI maturity using the AI Maturity Model.[7] A guided AI maturity assessment will yield current and desired states, potential blockers, and priorities for building the agency's capacity for AI implementation in general, as well as progress measures. Aspects to assess are governance and strategy; ethical, equitable, and responsible use; organization; technology enablers; data; and performance and application. As part of this assessment, examine acquisition practices as well as business processes and workforce from enterprise and organizational change management perspectives.
2. ***Strategize***. Define an overarching AI strategy that articulates the agency's goals and objectives for using AI to improve mission operations and service delivery. Identify current and near-term planned AI use cases to solve important mission problems and needs. For each use case, identify the business and end-user impacts and corresponding business process and organizational (e.g., role, responsibility) changes needed for successful use case implementation. Demonstrated mission value, end-user and business owner acceptance, and fit within business processes and workflows will all be required for successful AI adoption. Also identify infrastructure changes (e.g., data pipelines, computing resources, tools, software) needed to support the agency's pursuit of the AI use case. Use the results of the assessment; the selected AI use case(s); and the identified infrastructure, business process, and organizational changes to develop a roadmap with checkpoints, measures of progress, and sequenced generative AI efforts.
3. ***Enact***. Perform generative AI projects in sequence, expanding scope from experiments to proofs-of-concept, prototypes, and operationalization projects when value is shown. Measure agency AI maturity progress at checkpoints, adopt beneficial practices, and iterate learning. The sequences for projects will follow the "crawl, walk, run" strategy mentioned above that starts with straightforward, mature AI technologies and advances in complexity as AI project experiences build the organization's acceptance of and capacity for AI over time. Progress measures in the roadmap are assessed at checkpoints and will identify beneficial changes and enable learning for course correction.

With these guardrails in place, agencies should explore and leverage generative AI for a wide range of use cases. To begin, an agency can pursue low-hanging fruit with generative AI applications that are immediately possible and low risk. Success here builds workforce acceptance of and citizen confidence in leveraging generative AI, which in turn builds agency momentum to focus on more advanced use cases involving more risk but greater rewards from positive outcomes. Below are a few examples (from simple and lower risk to more complex) of the many evolving opportunities agencies might take to responsibly use generative AI to improve service delivery and mission operations:

[7] E. Bloedorn et al. The MITRE AI Maturity Model and Organizational Assessment Tool Guide. 2023. MITRE, https://www.mitre.org/sites/default/files/2023-11/PR-22-1879-MITRE-AI-Maturity-Model-and-Organizational-Assessment-Tool-Guide.pdf.

- Use "out-of-the-box" third-party generative AI for basic functions such as summarizing meeting notes, drafting internal communications, and drafting documents and emails, etc.
- Use a conversational large language model (LLM), also known as a chatbot, to help with information gathering applications, such as helping a person understand what information may be necessary for filling out a form.
- Take a third-party LLM used for information retrieval and summarization and tune/augment it on agency-specific data to enhance the agency's ability to discover information from its large repository of unstructured documents.
- Use an LLM to train an agency-supporting chatbot that in turn would have expertise in answering questions (e.g., about employee benefits or helping connect an employee to training or new work opportunities).
- Have non-technical workers use an LLM "agent" that can take a natural language request for information and translate it into a technical (e.g., SQL) database query to access corporate records.
- Use generative AI to create future "trajectories" of agency services, resource consumption, or behavioral patterns of workers or clients for the purpose of robustness and resilience planning for possible future events and circumstances.
- Use an agency-augmented LLM to assist in course of action planning, where the user would tell the AI model the objective, and the AI would help a human develop a plan, drawing on both internal agency information and external knowledge.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

The use cases outlined in Section 5(b) of the draft OMB memo appear suitable, and we do not have substantive revisions to suggest. However, we would like to offer two related recommendations that OMB will find beneficial as further detailed and mature work in this area progresses: tool qualification and synthetic data.

Tool qualification. The example use cases for safety-impacting and rights-impacting AI primarily focus on the deployed system itself—the running code in use. While this is undoubtedly the first priority, it may be beneficial to also consider the concept of "tool qualification" to increase rigor and reduce potential rework. Tool qualification refers to a process that promotes the safety of a system by minimizing the risk of tool errors, either by reducing the number of errors or ensuring that they do not impact safety. Although establishing justified confidence in the deployed and to-be deployed systems that are rights-impacting and safety-impacting is of utmost importance, requirements for tool qualification should likely be considered a secondary priority. Introducing the topic now could prompt valuable efforts to include this aspect in the justification process.

In safety-critical sectors such as transportation, tool qualification is a mandatory safety procedure, as outlined in standards DO-178C and DO-330 for aviation[8] and ISO-26262[9] for automotive safety. These standards typically define three levels of tool qualification:

1. Development tools that could introduce errors into operating safety-critical software
2. Verification tools that might fail to detect errors but are used to reduce other development or verification activities
3. Verification tools that might fail to detect errors but are not used to reduce other development or verification activities

The Tool Qualification Level (TQL) required for a tool depends on its criteria and the criticality of the software for which it is used. DO-330 provides detailed guidance on tool qualification, acknowledging the differences between the execution environments for airborne software and tools.

Errors introduced into safety-impacting or rights-impacting AI are well covered. However, some tools may be used to verify or characterize rights-impacting or safety-impacting AI, and they should also be considered based on their role. A machine learning-based test case generator and automated test harness could, for example, miss failure conditions if it failed in execution. This would increase the risk that latent failures in the AI system to be deployed are not detected and corrected, reducing confidence in the final system.

A detailed set of verification tool use cases is not required, but it would be useful to introduce the concept of tool qualification for verification tools in the rights-impacting and safety-impacting development chain.

DO-330 also addresses the use of previously qualified tools. In summary, reusing a previously qualified tool is permitted if the developer can demonstrate, through a change impact analysis, that the tool still meets its TQL requirements despite any changes in the operational environment or the tool itself.

Synthetic data. A second related recommendation is to focus on the application of AI and/or synthetic data in the design, development, or assessment of other AI capabilities that are considered safety-impacting or rights-impacting. This use case is important to consider because AI systems and synthetic data are increasingly being utilized in the development and evaluation of other AI technologies. Incorporating AI and synthetic data in the design and assessment process can potentially introduce biases, inaccuracies, or other unintended consequences that may impact the safety and rights of individuals. Therefore, it is crucial to ensure that AI systems and synthetic data used in these contexts adhere to the same standards of safety, security, and trustworthiness as the AI capabilities they are helping create or evaluate.

To address this use case, this memo should provide guidance on the following aspects:

---

[8] DO-330 Software tool qualification considerations: When, where, and how it applies. 2023. LDRA, https://ldra.com/do-330/. Last accessed December 1, 2023.

[9] ISO 26262-1:2018 - Road vehicles — Functional safety — Part 1: Vocabulary. 2018. International Organization for Standardization, https://www.iso.org/standard/68383.html. Last accessed December 1, 2023.

- Ensuring that AI systems and synthetic data used in the design, development, or assessment of safety-impacting or rights-impacting AI capabilities are subject to the same requirements and oversight as the AI capabilities themselves.
- Establishing best practices for the use of AI and synthetic data in the design and assessment process, including transparency, documentation, and validation of the AI systems and synthetic data used.
- Encouraging collaboration and information sharing among agencies and stakeholders to identify and mitigate potential risks and challenges associated with the use of AI and synthetic data in the development and evaluation of safety-impacting or rights-impacting AI capabilities. This collaboration can also share best practices and opportunities to use synthetic data to enhance confidence in the safety or rights-preserving assurances for an application.

By including this consideration in the memo, the government can ensure that AI systems and synthetic data used in the design and assessment of safety-impacting or rights-impacting AI capabilities are held to the same high standards of safety, security, and trustworthiness, ultimately leading to more reliable and responsible AI applications in the public sector.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

MITRE has the following recommendations to enhance these minimum practices:

- Section 4.D, pg. 17. We suggest adding a requirement that the monitoring for performance degradation must not focus only on aggregate performance measures that can mask disparate outcomes for various population cohorts. For example, some facial recognition systems may have reasonable overall precision and recall averaged across the entire population but show significant underperformance for women of color compared with the aggregate and over-performance for white males compared with the aggregate. An explanation of the population cohorts used to analyze errors and the results by cohort should be included in the documentation of the monitoring process and model performance.
- Appendix I; pg. 26; Consolidated Table of Actions. We recommend clarifying with an additional table footnote that rows 6 (Section 5(a)(i)), 8 (Section 5(c)(iv)(D)), and 9 (Sections 5(b) and 5(c)(iii)) apply to AI used by each agency, including DoD agencies, on information systems other than National Security Systems.
- Section 4(b)(ii); pg. 9; Data. Making datasets publicly accessible should be weighed against the potential for misuse by domestic or foreign actors who seek to thwart U.S. interests.

- Section 5(c)(iv)(A)(3); pg. 15. Cases where agencies cannot access data and must obtain sufficient descriptive information require establishing requirements for AI or data providers to follow.
- Missing definitions:
  - Section 5(c)(v)(A)(3); pg. 19; "Communities"
  - Section 6; pg. 24; Recommend adding an item (8) that explicitly speaks to AI security more comprehensively.
  - Section 6; pg. 25; #2 should be clarified such that it refers to climate or environment outcomes resulting from actions taken on the basis of AI outputs and not to climate or environment outcomes resulting from the training of AI.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

Create a federal AI acquisition best practices guidebook. The Department of the Air Force and Massachusetts Institute of Technology's AI Accelerator has developed an AI Acquisition Guidebook[10] focused on providing a basic understanding of the AI acquisition life cycle related to data, finance, and legal considerations, which can be leveraged to create a federal AI acquisition best practices guidebook.

Develop and share guidelines for market research, RFIs, solicitations, and contracts/agreements for agencies to use. These guidelines should address aspects such as how AI could be applied as a full or partial solution; what (if any) embedded AI solutions a vendor plans to propose (e.g., commercial solutions); and language that provides the acquiring government agency visibility into the training, testing, and validation of datasets used by the vendor as well as the vendor's AI model. In addition to guidance offered in Section 5.2 of the DoD Office of Developmental Test, Evaluation & Analysis's Systems Engineering Processes to Test AI Right,[11] the following may be considered for acquiring AI solutions:

- Treat the AI model as a subcomponent with its own specific test and evaluation (T&E) requirements.
- Ensure contracts have access to test the AI model subcomponent and test infrastructure resources.
- Plan for periodic model retraining post-deployment by monitoring the system in operation to ensure that the periodic retraining is actually improving or at least maintaining performance.

[10] Artificial Intelligence Acquisition Guidebook. 2022. Massachusetts Institute of Technology, https://aia.mit.edu/wp-content/uploads/2022/02/AI-Acquisition-Guidebook_CAO-14-Feb-2022.pdf.

[11] C. Balhana et al. Systems Engineering Processes to Test AI Right (SEPTAR) Release 1. 2023. MITRE, https://apps.dtic.mil/sti/trecms/pdf/AD1211716.pdf.

- Determine and consider model training data approaches in contracts, such as buying off-the-shelf pre-trained models, providing government-furnished information, or paying contractors to gather data.
- Adopt Data Cards and Model Cards to document dataset contents and trained ML model specifications.
- Establish agreements to document the AI method (e.g., Convolutional Neural Network) and, possibly, its training parameters to enable effective T&E and risk assessment.
- Address training data, test data, and (potentially) AI-generated data ownership, management, location, access, security, rights, retention, and provenance in agreements and memorandums.
- Communicate the relevance of the AI threat during contracting and use resources like DoD's Validated Online Lifecycle Threat to document known threats.
- Include clauses in contracts to address additional or added scenarios where the AI-enabled system is expected to be deployed in conditions beyond its originally intended use.
- In requests for proposals, require respondents to advise on the presence of AI and the nature of its implementation, and consider engaging T&E SMEs to support the evaluation process.

Train the federal acquisition workforce on AI. Topics should include AI "101" fundamentals (how AI differs from traditional software), best practices for acquiring AI-enabled systems, and program and contract considerations for AI acquisitions. Deploy this training through a variety of methods, including through the Federal Acquisition Institute.[12] Additional considerations include:

- Engage with the Defense Acquisition University (DAU) to collaborate on key learning objectives for AI/ML training. DAU has developed an introductory Machine Learning course video suitable for technical and non-technical audiences.[13]
- Engage with the OPM-moderated Chief Learning Officers Council[14] to share leading practices and learn from each other to train the acquisition and procurement workforce at federal agencies. Identifying AI career paths and succession planning may also be an important contribution that Chief Learning Officers can provide to their respective agencies.

Develop plans to cultivate an organizational culture that embraces AI as part of doing business as well as acquiring AI solutions. Evolve organizational mindsets from risk averse and compliance-focused to embracing new technology that enables processes and solutions that

[12] Federal Acquisition Institute. 2023. General Services Administration, https://fai.gov/. Last accessed December 1, 2023.

[13] R. Maus. SWE 0057 What is Machine Learning?. 2023. Defense Acquisition University, https://media.dau.edu/media/t/1_hsij16av. Last accessed December 1, 2023.

[14] Chief Learning Officers Council. 2023. Office of Personnel Management, https://www.chcoc.gov/content/chief-learning-officers-council-cloc. Last accessed December 1, 2023.

meet standards and requirements. Focus on recruiting an AI NextGen workforce to enable AI-driven solutions and processes.

Establish auditing standards to ensure that vendors of AI tools are honoring agreements in contracts. For example, maintain government awareness of the evolution of any "black boxes" post-testing/acceptance and constant monitoring and correction as more datasets are added and outputs may drift unexpectedly.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The Advancing American AI Act and Executive Order 13960 require agencies to "prepare and maintain an inventory of the AI use cases of the agency, including current and planned uses." This information is to be shared across agencies and with the public. To date, 21 agencies have listed about 500 use cases on inventories available via ai.gov, with six agencies declaring no AI use cases. These inventories vary widely in terms of the fields provided, depth of description, and completeness of the information. Many of the 21 inventories reuse fields from other inventories.

MITRE supports several sponsors that have created systems to track AI capabilities and how they are used. These systems organize information into the following categories:

1. Description: Information about who developed the capability, how it was developed, and what it is intended to do
2. Performance: Information about how the capability was tested and its performance, resilience, and usability
3. Use: Information about how the capability is used (more specific than its intended function), who is using it, what it is approved for, and how it is performing in operation

Description information should include known stakeholders (beyond the users of the capability) and information about whether those stakeholders have been or can be involved in the development and/or monitoring of the capability. Stakeholders who may be impacted include entities whose data is used in the use case and people whose jobs may be affected by the use case.

Information about the development of the capability should include a description of any training and test data used and the AI method (e.g., natural language processing) used to create the capability. This information, combined with performance information, can be used by others to validate the correctness of the approach.

Section 4.b of the RFI says, "Where an agency currently uses or plans to use AI for a purpose described below, the CAIO, in coordination with other relevant officials as specified by the agency, may make a determination (or reverse a prior determination) that the AI application or component does not match the definitions of 'safety-impacting AI' or 'rights-impacting AI' and is therefore not subject to the minimum practices." Description information should include the results of this determination for the capability and its intended use, with supporting information about the reasons for this determination. The benefits of doing this include greater public

transparency, greater ease for auditing, and clearer and more consistent criteria for third-party developers to appreciate earlier in their modeling process.

Performance information should include specific details about metrics used to determine whether to approve the use case. Typically, precision and recall are important metrics, but the use case may weigh one more than the other and may have additional metrics, including operating factors like size of the trained model and how long it takes to process a new input. Performance information should include information about the diversity of test conditions and variation in performance across them.

Use information should include the current status of the capability, whether planned, under development, in pilot, in full operation, and so forth. Many of the existing inventories include fields for this information, but currently list only capabilities that are in operation or that are planned. It is important for agencies to maintain inventories of both planned and operational AI use cases.

Use information should include what the agency has approved as responsible uses of the capability. The memorandum should elaborate the definition of what must be considered when determining responsible uses, including impacts to safety, rights, and jobs. This information should address both uses of the capability (including potential uses outside the agency and reuse within the agency) and uses of the information produced by and decisions made by the capability. Finally, when possible, use information should reference mission efficacy of AI that has been deployed. Although it may not be possible to establish cause and effect, it may still be beneficial to benchmark relevant mission performance indicators before AI deployment against post AI deployment.

An important consideration for the memorandum is which aspects of this information should be made available to the public, and how often. While transparency is important for ensuring equity and enhancing quality, it also can enable adversarial attacks on AI capabilities by providing insight into how those capabilities work and how they are used. Disclosure may also impact the privacy of people whose data were used in the development of a capability, because some attacks can reverse engineer training data from an operational model. OMB may need to provide for third-party technical review of inventory information to identify risks of disclosure and maximize transparency.

AI incident reporting should also be considered in the context of any published, deployed AI use cases. Sharing AI incidents through collaboration frameworks such as MITRE ATLAS[15] helps AI system developers and owners mitigate risks for the government and public. In cases where publicly disclosing such information may not be permissible, anonymized disclosure approaches can be used through trusted parties.

BSA Comments on OMB Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence
December 5, 2023

BSA | The Software Alliance appreciates the opportunity to provide comments on the Office of Management and Budget's Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (OMB memo).

BSA is the leading advocate for the global software industry.[1] BSA members are at the forefront of developing cutting-edge services — including AI — and their products are used by businesses across every sector of the economy.[2] For example, BSA members provide tools including cloud storage and data processing services, customer relationship management software, human resource management programs, identity management services, and collaboration software. BSA members are on the leading edge of providing AI-enabled products and services. BSA members have also supported the federal government's IT modernization efforts and have extensive experience providing software services, including AI, to the federal government. As a result, they have unique insights into the technology's tremendous potential to spur digital transformation and the policies that can best support the responsible use of AI.

BSA's views are informed by our experience working with member companies to develop the BSA Framework to Build Trust in AI,[3] a risk management framework we published more than two years ago to help companies mitigate the potential for unintended bias in AI systems. Built on a vast body of research and informed by the experience of leading AI developers, the BSA Framework outlines a lifecycle-based approach for performing impact assessments and highlights corresponding best practices.[4] Our experience on these issues informs our recommendations on the OMB memo.

The OMB memo has important ramifications for federal IT modernization. Given the increase of AI in software services, it is critical that the guidance strikes the right balance in creating safeguards that promote the responsible use of AI while maximizing its benefits to the federal government. If it fails to do so, the gap between the commercial and federal marketplace will only grow.

The OMB memo establishes a range of important risk management practices across federal agencies. We are encouraged that the OMB memo requires agencies to take important steps to adopt strong risk management practices and attempt to categorize risks associated with government use of AI. This approach aims to help agencies focus on uses of AI that pose high risks to the public.

We recommend revising several aspects of the OMB memo, to ensure agencies can better implement these risk management practices. Specifically, we recommend that OMB:

- Continue to remove barriers to the responsible use and adoption of AI;
- Ensure uniform definitions of rights-impacting and safety-impacting AI across federal agencies;
- Ensure the definitions and list of rights-impacting and safety-impacting AI use cases focus on those risks that impact individuals;
- Further encourage the use of the NIST AI Risk Management Framework;
- Refine the minimum risk management practices required for federal agencies;
- Extend the timeline for agency implementation;
- Revise procurement obligations, to ensure vendors' ability to further train AI models and to recognize the importance of internal testing; and
- Harmonize concurrent regulatory actions affecting AI procurement.

I. The OMB Memo Should Continue to Strengthen AI Governance and Remove Barriers to the Responsible Use of AI by Agencies.

At the outset, we want to recognize that the OMB memo includes important guidance for strengthening federal agencies' AI governance and advancing AI innovation across the federal government. We appreciate the OMB's focus on promoting strong risk management practices and removing barriers to the use of AI by federal agencies. We highlight three important aspects of this part of the OMB memo.

- First, the OMB memo's requirement for agencies to designate a Chief AI Officer is an important aspect of implementing AI risk management programs across agencies. Designating specific personnel responsible for addressing AI is a key part of developing a successful AI governance program. The Chief AI Officer can fulfill important functions to help promote agencies' use of AI and manage AI risks.

- Second, we appreciate the OMB memo's focus on removing barriers to the use of AI. The OMB memo identifies key mechanisms for achieving this goal, including ensuring access to adequate IT infrastructure and encouraging the use of agency and public access datasets. We encourage agencies to ensure access to multi-cloud environments as part of their IT modernization. We also encourage federal agencies to expand open and secure access to federal data, recognizing that government-generated data is an important asset that can serve as a powerful engine for creating new jobs, promoting economic growth, and enabling innovation in AI-related technologies. Agencies collect and generate vast quantities of data that offer unique insights into virtually every facet of the modern world, from

200 Massachusetts Avenue, NW
Suite 310
Washington, DC 20001

P 202-872-5500
W bsa.org

satellite imagery that can help predict the weather to transportation data that can help reduce congestion. To enhance AI innovation, agencies should continue to prioritize the release of high-value, non-sensitive government data.

- Third, the OMB memo aims to reduce barriers to the use of AI by filling gaps in AI talent. The focus on increasing and training the workforce for AI positions will be a critical part of advancing AI innovation across the federal government. Global competition to train and recruit the next generation of tech talent is fierce, and solving the high-tech workforce shortage will require a broad strategy including the practices identified in the OMB memo for recruiting, training, and retaining workers.

II. The OMB Memo Should Ensure Uniform Application of the Definitions of Rights-Impacting and Safety-Impacting AI Across Federal Agencies and Focus on Risks That Impact Individuals.

The OMB memo requires agencies to implement minimum risk management practices for rights-impacting and safety-impacting AI. It also includes a list of purposes for which AI is presumed to be rights-impacting or safety-impacting, while encouraging agencies to supplement this list by adding additional contexts where AI tools would be subject to heightened requirements. We recommend revising the OMB memo to address four issues raised by the memo's approach to defining rights-impacting and safety-impacting AI.

- First, at the outset, we note that the definitions in Section 6 of rights-impacting and safety-impacting AI are overbroad and ambiguous. For example, the definition of safety-impacting AI refers to "AI that has the potential to meaningfully impact" safety, and the definition of rights-impacting AI refers to "non-deceptive information about goods and services." The reference to "potential" unnecessarily expands the scope of the definition to scenarios that don't actually pose safety risks, just as the reference to information about goods and services could inadvertently and significantly expand the scope of this language. In lieu of applying ambiguous definitions of safety-impacting and rights-impacting AI, **OMB should focus on high-risk use cases resulting in consequential decisions about individuals, namely decisions that create legal or similarly significant effects on individuals.**

- Second, to the extent that OMB maintains these categories, including a non-exhaustive list of rights-impacting and safety-impacting AI in the OMB memo while allowing agencies to develop additional agency-specific lists creates fragmentation. This undermines the US government's ability to develop a uniform government-wide approach to AI risk management that applies consistent standards across agencies. Under the current approach, two different agencies could evaluate the same AI system and reach conflicting results about whether it is rights-impacting or safety-impacting. This leads to inconsistent protection from AI risks. It also creates unpredictability for vendors, who will not know whether their AI system will be treated in the same manner across federal agencies — or if agencies will apply different obligations for the same AI system. A fragmented approach to AI governance also raises costs for agencies because it leads to duplicative assessments and because vendors may not be able to provide the same software services across different agencies. **We recommend revising the OMB memo to include an exhaustive list of purposes and use cases that are rights-impacting and safety-impacting.** Alternatively, OMB could be provided the authority to update this list over time, at set intervals, which would create a more stable approach than creating an agency-by-agency approach.

200 Massachusetts Avenue, NW
Suite 310
Washington, DC 20001

P 202-872-5500
W bsa.org

- Third, the threshold for determining whether AI is rights-impacting or safety-impacting is vague and can lead to differing interpretations across agencies. This heightens the risks of fragmentation discussed above. Specifically, the OMB memo states that AI is rights-impacting or safety-impacting "if it is used to control or meaningfully influence the outcomes" of the enumerated activities. The phrase "meaningfully influence" is susceptible to varied interpretations and does not provide a clear threshold for identifying instances in which an outcome is the direct result of AI. **We recommend omitting the phrase "meaningfully influence" and relying solely on the concept of "control."**

- Fourth, the list of AI that is presumed to be rights-impacting and safety-impacting captures a broad set of AI applications, rather than specific use cases. This expansive list of applications and sectors would ultimately cover beneficial use cases, putting innovation at risk in very dynamic areas, such as cybersecurity. The approach to employment is also overly broad, lacking a clear focus on specific uses that create heightened risks. For example, the OMB memo references virtual workplace training programs, although it is not clear how or why these uses of AI would create meaningful risks to employees. Key terms such as "performance management" are also undefined. **We recommend that OMB tailor this section to focus on consequential employment decisions – decisions by agencies to hire, terminate, determine the pay, or promote individuals.**

III. The OMB Memo Should Better Leverage the NIST AI RMF.

We urge OMB to revise the memo to better leverage the NIST AI RMF.

The OMB memo currently refers to the NIST AI RMF as a gap-filling tool. It encourages agencies to identify additional context-specific risks and to fill potential risk management gaps by incorporating the NIST AI RMF, the Blueprint for an AI Bill of Rights, applicable international standards, or the workforce principles established pursuant to the AI executive order. This approach treats the NIST AI RMF as one of many reference points, without looking to the NIST AI RMF as a key aspect of implementing the memo's required minimum risk management practices. We note that, in contrast to the policies, principles, or international standards referenced, the NIST AI RMF was developed at the direction of Congress.

We encourage OMB to better leverage the NIST AI RMF, which is a flexible framework for identifying and mitigating risks. Adopting the AI RMF across government agencies would make the US a market leader on responsible AI and embrace best practices for managing AI risks. Leveraging the AI RMF can also help address the memo's fragmented approach to AI governance across the federal government, because the AI RMF can serve as a common language for assessing agencies' AI governance activities.

Creating the NIST AI RMF was a significant achievement that builds on NIST's work creating frameworks for managing cybersecurity and privacy risks. For example, the NIST Cybersecurity Framework (CSF) is widely used by private and public-sector organizations worldwide; since 2017, it has been mandatory for federal agencies to use the CSF to improve their cybersecurity risk management programs.[5] **We strongly encourage OMB to**

[5] *See* NIST, Cybersecurity Framework, Questions and Answers, (discussing federal agency use of the NIST CSF), *available at* https://www.nist.gov/cyberframework/frequently-asked-questions/framework-basics#agency.

200 Massachusetts Avenue, NW
Suite 310
Washington, DC 20001

P 202-872-5500
W bsa.org

incorporate the NIST AI RMF as part of the memo's minimum risk management practices for federal agencies.

IV. The OMB Memo Should Refine its Minimum Risk Management Practices.

The OMB memo requires federal agencies to adopt minimum risk management practices for rights-impacting and safety-impacting AI. These requirements are designed to help agencies manage AI risks. We offer several recommendations on how OMB can best support agencies' implementation of these practices.

A. Impact assessments

The OMB memo recognizes the importance of performing impact assessments for high-risk AI systems, by requiring federal agencies to complete an impact assessment for both rights-impacting AI and safety-impacting AI. Performing impact assessments is a key part of creating a strong risk management program. Impact assessments have three purposes: (1) identifying potential risks that an AI system may pose, (2) quantifying the degree of potential harms the system could generate, and (3) documenting steps taken to mitigate those risks.[6] We appreciate that the OMB memo recognizes the utility of this important accountability tool and offer three recommendations as you implement this obligation:

- **First, the OMB memo should be revised to recognize that an agency's impact assessment should reflect the agency's role in obtaining and using the AI system at issue.** This is important because different agencies will play different roles in developing and using AI systems. As a result, they will have access to different types of information and be positioned to take different types of actions to identify and mitigate risks associated with the use of an AI system. We strongly recommend revising the OMB guidance to incorporate the overarching point that the impact assessment should reflect the agency's role in developing or using the AI system at issue.

- **Second, the OMB memo should not require agencies to provide specific metrics or qualitative analysis supporting its intended purpose and expected benefits.** The OMB memo currently requires an impact assessment to specify not just the intended purpose of the AI system, but also quantifiable metrics or qualitative analysis of the intended purpose and its expected benefits. This obligation should be omitted because it is likely to create barriers to using AI, which is in tension with the stated goal of removing barriers to the responsible use of AI.

- **Third, the OMB memo should streamline its requirements for documenting data used in the development and testing of AI.** The OMB memo requires documentation of several items, including the provenance and quality of data for its intended purpose; whether the data comes from an adequately reliable source; and whether the data is sufficiently broad enough to address the real-world inputs it might encounter. However, to the extent agencies rely on vendors for AI systems, the disclosure of this information is likely to implicate proprietary information and create a barrier to using vendor AI unless the relevant information has already been made available to the public or the downstream provider with whom the agency has contracted. It could also unintentionally undermine privacy and security of the AI

[6] *See* BSA, Impact Assessments: A Key Part of AI Accountability, *available at* https://www.bsa.org/files/policy-filings/08012023impactassess.pdf.

200 Massachusetts Avenue, NW

W bsa.org

system. For example, disclosures that require information detailing how network defenders use and train AI systems to secure networks could unintentionally create a roadmap for cyber adversaries to break through those defenses, in turn jeopardizing the underlying security of network and information systems. To address this concern, OMB should adjust these requirements to make them more high-level, such as requiring an overview of the training data.

- **Fourth, the OMB memo should provide that an agency can rely on another agency's impact assessment if the use case and context are the same or substantially the same.** This approach both enhances efficiency and promotes consistency among agencies' implementation.

- **Fifth, OMB should set a time frame for agencies to carry out impact assessment requirements for those conducted after the initial implementation deadline.** This will ensure that the implementation of safeguards does not slow down the adoption of AI.

B. Identifying algorithmic discrimination

The OMB memo requires agencies to take steps to ensure AI will advance equity, dignity, and fairness, as an additional obligation for rights-impacting AI.

The goal of this provision is important, as the need to identify and mitigate potential biases in AI systems is a critical issue. In our view, when AI is used in ways that could adversely impact civil rights or access to important life opportunities, the public should be assured that such systems have been thoroughly vetted and will be continuously monitored to account for the risks associated with unintended unlawful bias. We also believe that civil rights laws should be fully enforced.

At the same time, we encourage OMB to revise this aspect of the memo, to recognize several practical challenges that arise in identifying and mitigating potential biases. For example, the OMB memo currently requires agencies to identify and remove factors contributing to algorithmic discrimination or bias for rights-impacting AI. This involves determining if the AI relies on information about a protected class under federal nondiscrimination laws. However, there may be a lack of information for agencies to make these assessments, such as when the training data at issue does not contain information about protected classes. In addition, agencies will have to balance their privacy obligations, which can limit their ability to collect additional information that may provide insight on potential biases, with the need to assess AI for bias and discrimination.[7] **We urge OMB to further consult with stakeholders on the best approaches for agencies to identify potential biases and create flexibility in the memo by recognizing that agencies may not have access to information that would assist them in identifying potential biases.**

C. Consultation with stakeholders

The OMB memo also requires agencies to consult and incorporate feedback from affected groups, as an additional minimum practice for rights-impacting AI. Although we recognize

[7] *See* Jennifer King, Daniel Ho, et al., The Privacy-Bias Tradeoff: Data Minimization and Racial Disparity Assessments in U.S. Government, *available at* https://dl.acm.org/doi/10.1145/3593013.3594015.

200 Massachusetts Avenue, NW
Suite 310
Washington, DC 20001

P 202-872-5500
W bsa.org

the importance of stakeholder feedback, we urge OMB to revise the memo's approach to soliciting and responding to such feedback in this context.

The OMB memo requires OMB to consult affected groups in the development and use of rights-impacting AI. If agencies receive "negative feedback," OMB advises them to consider not deploying the AI or removing the AI from use. While it is important for stakeholders to provide input on an agency's policies and overarching approach to important issues, the memo focuses stakeholder feedback on how agencies use a specific AI product, as opposed to a broader policy approach to AI technologies. This product-specific approach creates the potential for stakeholders to veto or otherwise slow down the use of a specific AI system. The process is also open to abuse by competitors and may become a second forum for bid protests. Moreover, the standard for "negative feedback" is vague and undefined. **OMB should revise the memo to advise agencies to take feedback into account without encouraging them to terminate use of a particular AI product in the event of negative feedback.**

V. The OMB Memo Should Extend the Timeline for Agency Implementation.

The OMB memo requires agencies to implement the minimum risk management practices and terminate non-compliant AI by August 1, 2024. Given the complexity of the issues that agencies are addressing, the implementation deadline is too soon for agencies to implement the required practices in advance of the stated deadline.

We strongly recommend agencies be given more time. If this deadline is not extended, agencies risk ending up in a scenario where they are not able to use AI simply because they have not been able to implement a substantial set of new practices across the agency within this short time frame. **We recognize that agencies can seek extensions under the OMB memo, but agency-by-agency extensions should not be a substitute for establishing an initial deadline that sets a strong and workable timeline for all agencies to adopt and implement the required new practices.**

VI. OMB Should Revise the Memo's Procurement Recommendations.

The OMB memo also addresses the process by which federal agencies procure AI systems. We recommend revising the memo's procurement provisions in three ways:

- **First, OMB should revise the memo to establish standard practices across agencies.** The procurement section of the OMB memo currently takes an agency-by-agency approach to procurement. For example, it requires agencies to include "tailored risk management requirements" in procurement contracts, and to encourage individual agencies to obtain adequate documentation of procured AI. We recommend revising this approach, so that procurement requirements are standardized across agencies. A standard process can better permit federal agencies to procure technology quickly. In contrast, allowing agencies to independently set these procurement requirements means that companies must tailor their systems for each agency, which takes time and increases costs to the taxpayer. The OMB memo should create a standard set of government-wide practices for AI procurement, helping ensure agencies can effectively adopt the technology.

- **Second, OMB should revise the memo's approach to external testing of procured generative AI systems.** The OMB memo encourages agencies to incorporate tailored risk management requirements in contracts for generative AI.

200 Massachusetts Avenue, NW
Suite 310
Washington, DC 20001

P 202-872-5500
W bsa.org

These requirements include obligations for testing and safeguards, including external red teaming. We urge OMB to revise the memo's approach to these issues and delete the reference to "external" red teaming. Testing is an important part of ensuring appropriate functionality, but involving external entities in such testing can create concerns around access to trade secrets, proprietary information, or information that could jeopardize network and information security, and is likely to create barriers to using AI. Encouraging internal testing avoids requirements for companies to disclose this sensitive information to third parties and run the risk of such information ending up in the wrong hands.

- **Third, OMB should support the improvement of procured AI systems.** The OMB memo includes important provisions that encourage federal agencies to consider contracting provisions that incentivize the continuous improvement of procured AI. However, the memo also recommends that agencies consider contracting provisions that ensure that government data cannot be used to train or improve functionality of commercial AI offerings by the vendor without express permission from the agency. This creates tension with the broader goal of ensuring agencies have access to continually improved AI. Allowing vendors to use agencies' data to train their commercial products to continue to improve the technology is critical to ensuring the continuous improvement of procured AI, and to ensuring an AI system can more accurately support the agency's goals and data types. We recommend that OMB revise the memo to encourage agencies to permit their data to be used for further training of AI systems used by the government, subject to appropriate privacy and security safeguards.

VII. The OMB Memo Must Be Harmonized With Concurrent Regulatory Actions.

The OMB memo includes recommendations to agencies for AI procurement. We strongly encourage OMB to ensure the memo takes account of other ongoing regulatory actions that intersect with issues at the center of the OMB memo.

We recommend the memo acknowledge the need for OMB to work towards harmonizing the range of draft regulations and guidance that are currently out for industry comment and review. These include the OMB's memo on FedRAMP, "Modernizing the Federal Risk Authorization Management Program." The extension for comments on that draft guidance is helpful as the FedRAMP regulations will impact the larger cloud market, which in turn, will impact the AI market.[8] Moreover, the Federal Acquisitions Council is considering three rules for which the comment period was extended to February 2, 2024 (FAR-2021-0017 Federal Acquisition Regulation: Cyber Threat and Incident Reporting and Information Sharing; FAR-2021-0019 Federal Acquisition Regulation: Standardizing Cybersecurity Requirements for Unclassified Federal Information Systems), and (FAR- 2023 – 06 Federal Acquisition Regulation: Implementation of Federal Acquisition Supply Chain Security Act (FASCASA) Orders).

We urge OMB to consult with stakeholders including industry to look at these changes in concert, as the multiple regulations will need a coordinated approach to advancing AI innovation. With the number of changes in the regulatory environments for IT and

[8] These issues are closely related, as different AI models may have stronger performance in different clouds, making competition in the cloud marketplace crucial.

specifically, AI, thoughtful analysis on the interplay between these rules and regulations can help the federal government better achieve its stated goals.

* * *

We appreciate the opportunity to provide comments on the OMB memo and would be happy to serve as a resource as you continue to develop your approach to these issues.

Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (Document ID: OMB-2023-0020-0001)

Dear Director Young:

On behalf of the Partnership for Public Service, I am writing to share comments on the Office of Management and Budget's draft memorandum regarding "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" released on November 3, 2023.

The Partnership is a nonprofit, nonpartisan organization committed to building a better government and a stronger democracy. Core to our mission is the belief that a merit-based, nonpartisan civil service, who represents the diversity of the country, is central to our system of government. Since the Partnership's founding over two decades ago, we have advocated across administrations for changes to federal law, regulations, policies, and programs that improve our government's ability to attract, hire and retain a talented and diverse workforce that effectively serves the public.

The Partnership commends OMB for its thoughtful approach to leveraging artificial intelligence (AI) in government and we appreciate the chance to comment on this guidance. AI can be a powerful tool, but it is important not to lose sight of the people using and enabling its functions in government. Without the appropriate workforce and human capital mechanisms in place—including recruitment, hiring, training, development, and retention efforts—the federal government won't be able to effectively, securely and appropriately utilize these technologies.

There are references to human capital issues throughout the guidance, but agencies would benefit from clearer direction to shape their AI efforts. We recommend that OMB pull the disparate references to human capital and talent into a separate strategic human capital framework section in its guidance, so agencies incorporate human capital best practices from the start of their AI journeys. Clear guidance from OMB on this topic will ensure that AI human capital needs are well-coordinated across government and compel agencies to think strategically about AI talent, development and leadership long before inadequacies cause challenges and delays to the other work directed by the memo.

Although AI use in government represents uncharted territory in some respects, there are scores of best practices related to the federal workforce and human capital management that can, and should, be applied to this issue. Core focus areas for strengthening the federal AI workforce include:

- Utilizing surge hiring best practices and available hiring flexibilities;
- Deploying skills-based hiring and considering job classification;
- Developing position descriptions and making them shareable government-wide;
- Empowering and developing modern government leaders;
- Equipping leaders and supervisors with training on technology principles; and
- Mitigating human capital risks (e.g., privacy, bias and transparency).

We believe these tenets and specific proposals will help ensure that the federal workforce is equipped to deploy emerging technologies, such as AI, today and in the future. Below we further outline recommendations for OMB regarding the draft guidance, including a separate strategic human capital framework section and suggestions for additional provisions.

Strategic Human Capital Framework

Agencies must think strategically and work collaboratively to address the human capital needs that AI implementation requires. To assist them in this process, OMB should expand its guidance by creating a strategic human capital framework section. This framework should be developed in coordination with the Office of Personnel Management (OPM) and build upon considerations OMB has accounted for in its proposed guidance. We recommend including the following best practices:

Utilize surge hiring best practices and available hiring flexibilities:

The rapid advancement of government-wide AI capacity will require a thoughtful hiring surge that incorporates learned best practices from recent talent buildups.[i] While focused on onboarding AI talent, the federal government should seize this opportunity and broaden the scope of the surge to encompass the range of roles needed to leverage AI, including not just technologists, but data analysts, data scientists, customer experience specialists, and any other enabling roles. Additionally, it's critical that agencies focus on bringing in early-career employees to build the talent pipeline, not just experts at higher grades. We recommend that OMB's guidance ensure that agencies are focused on a variety of grade levels and skillsets – this will allow agencies to fill mission-critical skills gaps while hiring for AI talent and enable the federal government to better leverage this emerging technology in the long run.

To that end, OMB and OPM should determine which government-wide or agency-specific hiring authorities best meet the needs of the pending surge, develop a recruiting infrastructure that leverages data and technology, hire recruiters or train current staff on how to attract candidates and guide them through the hiring process, and apply a project management approach to streamlining the hiring surge. OMB mentions some of these considerations in the "Advancing Responsible Artificial Intelligence Innovation" section of its guidance and should further specify them to provide agencies with a baseline of information that they can customize to their needs. These best practices can help overcome a disjointed hiring process and have been used by agencies to rapidly grow their workforces in response to various challenges and initiatives.

Deploy skills-based hiring and consider job classification:

Unnecessary degree requirements can create barriers for job seekers, particularly in technology-focused occupations. Progress has been made on this front in recent years (e.g., the 2020 executive order[ii] emphasizing skills over degree requirements) but government can still strengthen its talent pipelines for jobs that do not require a four-year degree—such as those in IT, cyber and AI—by demystifying the hiring process and using rigorous technical assessments to identify qualified talent, building relationships with community colleges and workforce development organizations, and removing barriers to professional development and advancement. Doing so would benefit federal agencies by connecting them with potential applicants who too often are overlooked and talent within underserved

communities.[iii] This guidance should also make clear to agency human capital leadership that four-year degrees should not be required, and direct new Chief AI Officers (CAIOs) to work with Chief Human Capital Officers (CHCOs) to ensure that HR specialists understand what alternate programs and bootcamps confer the required skills absent a formal degree.

Additionally, agencies should be directed as part of their strategic AI human capital planning to identify which occupational series they will use to fill AI roles, as these positions encompass a range of work beyond and including those mentioned in Executive Order 14110 section 10.2(d)(i) – IT Specialist (2210), Computer Scientist (1550), Computer Engineer (0854), and Program Analyst (0343) focused on AI. Depending on the job classification, there will be certain hiring flexibilities and pay considerations available to bring those candidates on board (e.g. direct hire for certain STEM occupations) that every agency must understand and have available to them – all critical elements that must be considered before ever posting a job.

Develop position descriptions and make them shareable government-wide:

Rather than using antiquated job titles heavy on government vernacular, agencies should aim to attract prospective candidates by titling jobs in accordance with industry-wide standards. Additionally, position descriptions should be modernized and clearly outline expected responsibilities. OPM issued guidance on the skills and competencies needed for federal AI positions in July 2023,[iv] offering a list of general and technical competencies that can serve as a starting point for agency job analysis efforts – we recommend including this resource in OMB's guidance. To help agencies effectively recruit tech and AI talent, it would be useful to develop a set of common job titles and position descriptions, make those shareable government-wide, and undertake pooled hiring actions for those roles. The Partnership commends OMB's reference in 4(b)(iv) of its guidance to the use of descriptive job titles and recommends that this be expanded to cover updated position descriptions and job announcements for greater effect.

Empower and develop modern government leaders:

Leaders across government, from every discipline and practice, should apply modern ways of working to their programs and organizations. It is critical that agency leadership be prepared to respond to the ongoing evolution of AI, along with any emerging technology or tool, and their broad impacts. To this end, the federal government should invest in hiring and training government leaders[v] who integrate modern ways of working for their organizations. This approach is customer-centered, outcome-oriented, evidence-based, transparent, strategically evaluates risks, and technologically open-minded. It empowers federal leaders to simultaneously harness AI's immense potential for public good while actively mitigating its potential for harm.

To achieve this goal, these types of leadership skills should be adopted across government, regardless of the leader's functional relationship to technology. Emphasizing their adoption in updates to the Executive Core Qualifications (ECQs), as outlined in section 10.2(d)(vii) of the EO, is a critical opportunity – and this guidance should ensure that any updates to the ECQs are applicable not just to those directly overseeing technology or related areas, but to any senior leader. Furthermore, any review of the ECQs should not just be limited to how the skills are applicable to AI and data, but more broadly how they outline the skills required of all modern leaders. We recommend that OMB and OPM partner with

agencies and external stakeholders through that process to develop modern leadership standards and build off existing models, such as the Partnership's Public Service Leadership Model.[vi] These principles will help guide efficient, equitable and effective delivery for the public while centering the humans who create, implement, benefit, and are impacted by AI's growth.

Finally, the AI executive order and OMB's subsequent guidance outline a governance structure which includes a designated Chief AI Officer. For AI efforts to be successfully coordinated at agencies, it is imperative that this role not operate in a silo. Simply designating a "chief" only scratches the surface of the cross-organizational leadership necessary to meet this AI moment head on. Ultimately, if the person in the role isn't empowered to lead and work collaboratively across the enterprise, there will be little progress on these issues. We recommend that this role not be dual hatted with other chief roles unless the person has specific leadership skills applicable to the AI role or has a technical deputy that can serve as the link between senior leaders and the AI workforce. Additionally, we question whether this needs to be another "chief" role, or should rather be embedded across existing data, IT, cyber, and program offices that all play parts in enabling any emerging technology such as AI. Regardless of where the CAIO sits, it is crucial to ensure that the person in this role has the requisite skills to enable successful AI adoption and usage, which may mean bringing in talent from outside of government.

Equip leaders and supervisors with training on technology principles:

In addition to a federal workforce that is able to responsibly use AI for public service and protect against its harms, we need federal leaders who are equipped to lead AI decision-making effectively and responsibly. Regardless of their technical background, leaders should make a concerted effort to learn new technologies and see how they can be used in service to the public. Responsibly evaluating, implementing and using artificial intelligence tools requires successful collaboration between technical and non-technical leaders. The data scientists building AI tools, the CAIOs or Chief Information Officers operating them, the general counsels reviewing their privacy implications, the program managers interpreting their results, plus many others, must all collaborate for AI use to follow responsible principles.[vii]

Whether agencies are building their own AI systems or acquiring them from outside vendors, they should ensure that federal employees have sufficient expertise to evaluate and operate artificial intelligence tools. Agencies should also explore ways to develop technical and non-technical staff capacity to understand the risks, benefits and implications of using AI for service delivery. Some current efforts recognize this need and aim to assist agencies in developing expertise, such as the AI Training Act signed into law in October 2022 which charges OMB with developing a training program to help acquisition professionals better understand AI and its potential risks and benefits.[viii] OMB should consider whether this already-underway framework can and should be applied to other training opportunities.

Additionally, leaders should communicate with employees early and often about the potential of AI to disrupt and alter their work. The federal government should investigate and prepare for changes to the workplace resulting from AI adoption similarly to the planned studies on the broader workforce outlined in section 6 of Executive Order 14110. A holistic response will train workers to partner with AI to create responsible "human-in-the-loop" decision-making processes, identify areas of need within the government and retrain workers into those roles, and ensure that pathways for dedicated civil servants

to grow in their careers remain open at all levels of government operations. To see the true benefits of AI in the federal workplace, it is imperative that government retains and empowers federal workers to achieve their mission of impactful, inclusive public service and benefits delivery.

Mitigate human capital risks:

OMB's guidance provides an opportunity to mitigate AI-related human capital risks, addressing concerns surrounding leadership, transparency, privacy, bias and much more. The Partnership recommends that OMB update its guidance to account for the following considerations and best practices.

First, the risk mitigation framework defined for rights impacting uses of AI is holistic and flexible, allowing it to adapt to the rapid acceleration of AI capabilities. Providing further details for agencies on key, foreseeable harms in the human capital and hiring domain can ensure safer rollout in the near-term. We recommend the following:

- CAIOs should collaborate with their respective CHCOs to define and release a restricted list of model features and uses in the human capital domain that are not already associated with protected classes. Of particular importance are restrictions on the use of biometric and personality-based features and evaluation techniques.
- Agencies should publish their criteria for evaluating human capital use cases for algorithmic bias and discrimination, publicly defining the acceptable range of outcomes for protected groups.
- The federal government must prevent the creation of a pay-to-play paradigm in job and benefits application use cases, wherein the supplying vendor—or associated developers—creates and sells a consumer product that tailors application materials to pass the screening algorithms they provide to the government.
- Agencies should expand the protections for federal data described in guidance section 5(d)(iv) on contracting to include their procurement evaluation processes to safeguard privacy and retain the data's value for the government.

Next, there are a variety of opportunities and risks in using AI to recruit and hire talent. Before AI is fully embedded in talent management there must be more progress made with previous executive orders around data integrity, as most federal HR systems are fragmented and lack comprehensive data points to effectively inform algorithm development. Additionally, government must inject more transparency into the hiring process. A common question we hear in our work with career advisors and jobseekers centers around the role of technology and AI in reviewing applications. Students and advisors are often surprised to learn that a human reviews and scores at least part of their application. Should those standards change as the role of AI becomes more prominent, it will be important to inform the public.

Finally, the risk of bias in human capital operations must be considered. When it comes to talent management, AI can be a useful tool for identifying possible gaps and differentiators of talent. However, it should not be used as an isolated decision-maker, because it is challenging to replace the nuances of human experiences and historical references (e.g., racism, sexism, etc.) when assessing people's contributions within a complex social network like a federal agency. As OMB, agencies and the administration continue exploring the use of AI in government, bias mitigation must be more prominently considered, particularly as it applies to human capital management. OMB, along with OPM, should create more explicit guidance for agencies on the use of AI in this area.

Additional Provisions

While much of the focus of these comments has focused on the human capital aspects of the draft guidance, we offer the following comments on a few other areas as well.

Define AI hallucination thresholds for federal information and content developed by generative AI:

Hallucination (false or misleading information created by AI) thresholds should be defined wherever the federal government makes decisions or provides information developed by generative AI. Recent research has found that publicly available chatbot products have hallucination rates ranging from 3-27% of generated content.[ix] For government to deliver on its mission and maintain public confidence, it must ensure automated information delivery is accurate and trustworthy. These thresholds should be tailored to the specific risks associated with misinformation on a particular subject. Recognizing that eliminating these errors is not currently feasible, agencies should develop processes to identify and remedy instances of hallucinations that occur during public-facing service delivery. We recommend addressing this issue in risk management section 5(c) of the guidance.

Prevent non-government actors from mimicking federal AI outputs:

The federal government must take steps to prevent non-government actors from mimicking outputs created by federal generative AI. While watermarking can be an effective means of tracing provenance, it is currently technologically inconsistent, ineffective on text-based generation tasks, and vulnerable to mimicry. The federal government should investigate the efficacy of algorithmic methods that prevent content from being reproduced by adversarial generative AI. These practices, broadly known as "cloaking," are critical to upholding trust in government by preventing misinformation, abuse and fraud. We recommend addressing this issue in risk management section 5(c) of the guidance.

Spotlight review allowances under the Paperwork Reduction Act:

One of the best practices in designing products is the collection of user feedback. This ensures that a product is designed for the customer, in addition to being user-friendly and accessible. Far too often, government products and services are not designed this way and agencies do not incorporate real-time user feedback at points throughout the development process to drive improvements – often this is due to a real or perceived ban on collecting user feedback unless agencies go through the requirements of the Paperwork Reduction Act. We applaud the guidance for stating in footnote 33 (page 19) that agencies are not required to go through the Paperwork Reduction Act review if user feedback is collected in the ways stated in the guidance. We recommend that this be elevated from the footnote and more clearly stated in the guidance. Agencies may be reluctant to allow this sort of user feedback without specific and ongoing guidance from OMB that it is not only allowable but encouraged.

Conclusion

We appreciate OMB's efforts to support the responsible use of AI in government and the thoughtful guidance outlined in this draft memo. In addition to efforts aimed at establishing policies related to AI, OMB and policymakers should continue seeking opportunities to deploy tried and true best practices to strengthen the federal workforce. As these efforts continue in the days, weeks and years to come—and

as technology continues to rapidly evolve—we implore policymakers and agency officials to continue supporting federal employees, integrating technology efforts across the enterprise, and applying human capital best practices.

Thank you for the opportunity to share our thoughts and recommendations. We welcome the opportunity to work together toward our shared goal of supporting the federal civil service today and in the future.

Sincerely,

Max Stier
President and CEO

Re: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

Dear Director Young,

As a leading US federal services company, Accenture Federal Services (AFS) provides a broad range of services and solutions in strategy and consulting, technology, and operations. AFS is a subsidiary of Accenture LLP and supports every cabinet-level department and 30 of the largest federal organizations. We partner with federal agencies to develop and launch Artificial Intelligence (AI) applications that unlock value from data, automate operations, and enhance decision-support to achieve mission outcomes.

We have seen first-hand the remarkable impact of AI in transforming how federal agencies achieve their mission, serve people, and manage their organization. Our Data and AI practice has helped federal agencies responsibly and securely prototype, test, and launch AI solutions that accelerate the delivery of public services and solve enterprise challenges. Through our Discovery Lab, we pilot and incubate cutting-edge technologies to deliver breakthrough solutions that advance federal capabilities for trustworthy, transparent, and accountable use of AI. We carefully track the evolving AI ecosystem to make informed recommendations for federal agencies and understand the required balance between embracing and safeguarding technology adoption.

AFS appreciates the opportunity to provide input on the draft memorandum. Overall, we strongly support the proposed guidance. The level of detail provides clear accountability and specific steps forward, which will strengthen the federal government's ability to deliver innovative AI solutions while managing risks. We provide additional comments in the attached memorandum and stand ready to assist the federal government in its ongoing efforts to advance responsible AI innovation.

Sincerely,

Aaron Jackson
Technology Lead

Noelle Russell
Data and AI Market Lead

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

We believe that the proposed responsibilities, seniority, and reporting structures for Chief AI Officers are sufficiently flexible and achievable to be successful across federal agencies. Additionally, the detailed list of responsibilities provided in the guidelines is beneficial to provide clarity and accountability within an agency's AI program.

To be successful, it will be important that federal agencies take action to ensure the CAIO's authority and resources are adequate to match the scope of responsibilities.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

Rather than requiring a new body, we recommend allowing agencies to identify and tailor the approach that supports the greatest level of leadership engagement and most effective oversight of AI. Instead, inclusion of AI Governance Body makeup and ombudsman information in agency AI Strategies will allow for this tailored approach, while creating transparency.

Many agencies will benefit from establishing a new AI Governance Body. This will allow a dedicated focus on the unique considerations of AI and allow the cadence, structure, and norms of the group to be tailored to this objective. However, this may not be true for all agencies – given the potential overlap of membership with existing governance bodies, some agencies may find it most effective to update the scope of an existing group.

Tailored, executive level training for AI Governance Board members can support active engagement and effective governance. Given the highly varied backgrounds and roles of the participants, it is important to establish a common language, provide a baseline knowledge of best practices for responsible AI and risk management, and create awareness of the types of transformative opportunities and use cases that AI can unlock in federal government.

Based on AFS's experience working with CDOs after the Evidence Act, the most important mechanism for an effective AI Governance Body to build momentum and drive results is to focus on 1-3 top issues that the body will address. This focuses the group and drives engagement from the participating stakeholders, which is critical at the early stage. Without focus, the new

body can quickly be undermined by organizational dynamics from the existing established structure.

3. How can OMB best advance responsible AI innovation?

While the OMB guidance appropriately focuses on governance and risk management, there is an opportunity to better emphasize the centrality of AI innovation to "seize the opportunities" AI presents. AI has proven to streamline operations, enhance decision-making, and make government services easier to find, access and understand. This will not happen unless federal agencies are able to proactively build the capability for AI including use case identification, prototyping capabilities, workforce education, data preparation, and technology infrastructure.

OMB can advance responsible AI innovation by providing specific, measurable guidance related to innovation. We support the proposed memorandum's inclusion of innovation in the CAIO's responsibilities (including "identifying and removing barriers to the responsible use of AI"), the scope of the AI Governance Board, and the AI Strategy. When possible, adding additional detail to these requirements will help agency AI programs prioritize innovation as a key focus in addition to risk management. OMB can further support this goal in templates, guides and resources that will support implementation of this memorandum.

Additionally, OMB can advance responsible use of AI providing agencies with an incentive to identify and prioritize use cases. An important first step is publishing this memo which encourages experimentation, that said, the perceived or inherent risk in practical execution of AI experimentation may prevent further adoption in a risk-averse organization. Further encouragement will be needed to empower CIOs and agency decision makers to embrace this risk. OMB should consider ways to recommend change management and workforce education initiatives to mitigate cultural barriers to adoption.

Although not addressed in the proposed memo, the OMB-led AI interagency council (as required by Section 10.1 of Executive Order 14110) can significantly contribute to advancing responsible AI innovation across federal agencies. We recommend that the council identify common opportunities for AI innovation across agencies, track and monitor the overall progress towards responsible innovation, and work to address common challenges or gaps in enablers.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

The potential of generative AI to enhance workplace productivity and collaboration is enormous. Generative AI can dramatically increase the efficiency of research, analysis and content production. It can accelerate secure software development and provide new methods to identify vulnerabilities. Overall, generative AI will empower federal agencies to make their existing enterprise data more accessible and discoverable, unlocking decades of embedded value. These developments will allow agencies to reimagine their workforce with solutions that empower federal employees as the human in the loop for these solutions.

We recommend three key actions for federal agencies to take advantage of the transformative potential of generative AI.

First, government organizations should engage their workforce to solicit new ways to educate the workforce and capture employee ideas for use cases. Generative AI offers opportunities for task augmentation and automation in parts of the enterprise that may not have engaged in previous data and technology innovation efforts. Many generative AI opportunities will involve enhancement and reinforcement of human capabilities, and the direct engagement of the workforce in identifying, testing, and refining these capabilities is essential.

Second, federal agencies should prioritize learning through prototyping to assess benefits, understand potential risks, understand user adoption, and build approaches to responsible, trustworthy generative AI. Resources such as the NIST Risk Management Framework provide a valuable starting point, but hands-on testing and evaluation will empower agencies to set metrics to measure success and determine the safeguards needed to successfully deploy these transformative technologies.

Third, agencies should establish mechanisms for safely and responsibly gaining hands-on experience with state-of-the-art, performant commercial and freely-available generative models. The pace of development in generative AI is such that any snapshot of capabilities and risks can be obviated within just a few weeks. Access to technologies can demystify their functions and allow for development of adaptive, responsive risk assessment methodologies.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

Overall, we find the approach of the memorandum to be effective. The principles-based definitions in Section 6 will allow agencies to determine if a use case is safety-impacting or rights-impacting, and the provided list of presumed use cases provides clarity on the applicability and scope of the definitions.

The following rights-impacting use case "D. Detecting or measuring emotions, thought, or deception in humans" could be interpreted to apply to sentiment analysis, a common natural language processing (NLP) technique that analyzes text and provides insight into the underlying sentiment or emotion expressed. This technique is commonly used to better understand themes or trends in large sets of aggregated text, e.g. customer feedback or public comments. AFS does not believe the general application of sentiment analysis to text is right-impacting as defined in Section 6 of the proposed memorandum. OMB should provide further clarity to help agencies understand if sentiment analysis of text is presumed to be rights-impacting.

The rights-impacting use case "B … social media monitoring" can be clarified. It is presented in the context of law enforcement and surveillance. However, social media monitoring is applied in many innocuous contexts outside of law enforcement, such as to identify emergent local or national events. This could be clarified as "social media monitoring in law enforcement contexts".

The rights-impacting use case "G … virtual or augmented reality workplace training program" appears in the context or terms and conditions of employment. Not all applications of AI in virtual workplace training are necessarily rights-impacting. For example, AI is used widely to

provide translation or captioning in virtual training, making courses more accessible to populations who might otherwise be excluded. Constraining the use of AI in this context in a fashion that exceeds the burden applied to less performant, non-AI software could be counter-productive.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

We believe the minimum practices for safety-impacting and rights-impacting AI are a suitable baseline for federal agencies given the flexibility for context-specific risk mitigations.

However, no minimum practices were provided for AI uses cases that do not impact rights or safety, including potentially moderate or high risk use cases. Agencies will need to identify their own approach from best practices including the NIST AI Risk Management Framework and its companion Playbook, and AI Bill of Rights.

AFS recommends providing a clear, consistent framework to identify required minimum practices across all AI use cases. This would help federal staff understand how to incorporate responsible practices throughout the development of AI, rather than identifying relevant controls at the end of a development process. This clarity would help to streamline development, unlock experimentation, and advance responsible AI.

Overall, a greater level of detail will help agencies interpret specific risk management requirements. For example, the requirement that agencies "*test their AI to determine whether there are significant disparities in the AI's performance across demographic groups"* could potentially be interpreted as requiring testing for *all* demographic groups. The first sentence could be amended to refer to "relevant or potentially impacted demographic groups" to add greater clarity. Testing for *all* demographic groups may be infeasible and could take valuable resources away from assessment focused on vulnerable communities.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

It would be valuable to provide agencies with specific resources such as templates to create efficiency across federal agencies, manage risk through consistent requirements, and contribute to accountability and transparency.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

To the extent consistent with applicable law and governmentwide guidance, agencies should provide a greater level of detail on the anticipated benefits, data sources used, and status of the

AI application (planned, in development, production). This information would help the public understand and engage with the AI inventories in a deeper way.

For rights and safety impacting AI, the inventories should include information on identified risks and mitigations.

USTPC OMB AI Memo Comments 120523

December 5, 2023

RESPONSE TO OMB REQUEST FOR COMMENTS ON DRAFT MEMORANDUM REGARDING ADVANCING GOVERNANCE, INNOVATION, AND RISK MANAGEMENT FOR AGENCY USE OF ARTIFICIAL INTELLIGENCE*

The Association for Computing Machinery (ACM), founded in 1947 as a non-profit and non-lobbying organization, is the world's largest and longest-established society of individual professionals involved in virtually every aspect of computing. Our over 50,000 members in the United States and 100,000 worldwide serve in government, industry, academia, and the public sector. Many have pioneered and continue to pursue work on the cutting edge of computing, including artificial intelligence.

Through its U.S. Technology Policy Committee (USTPC), ACM strives to provide apolitical technical expertise and analysis to Congress, the Executive Branch, and policymakers throughout government to inform technology policy. Consistent with this mission, USTPC is pleased to offer the following general recommendations in response to the Office of Management and Budget's *Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum* (OMB Memorandum):[1]

1) Devise and Implement a National Strategy for the Interoperability of Digital Services

USTPC recommends that OMB orchestrate the development and implementation of a comprehensive and detailed strategy to assure the interoperability of digital services, including those enabled by AI, across all federal agencies.[2] It should be neutral and open, and accompanied by comprehensive principles and guidelines to inform its implementation to be followed by

---

* These comments were principally drafted for USTPC by Committee member Carlos Jimenez-Gomez and Committee Chair Larry Medsker. Also contributing were Past USTPC Chair Jim Hendler, Algorithms and AI Subcommittee Chair Jeanna Matthews, and Subcommittee members Ricardo Baeza-Yates, Simson Garfinkel, and Demetrios Kirkiles.

[1] See 88 FR 75625 (November 3, 2023) [https://www.federalregister.gov/documents/2023/11/03/2023-24269/request-for-comments-on-advancing-governance-innovation-and-risk-management-for-agency-use-of].

[2] USTPC notes that the OMB Memorandum directly addresses interoperability. See, *e.g.*, Sec. 5.d. on "Managing Risks in Federal Procurement of Artificial Intelligence," subsection 5.d.iii. on "Promoting Competition in Procurement of AI," as follows: "Agencies should take appropriate steps to ensure that Federal AI procurement practices promote opportunities for competition among contractors and do not improperly entrench incumbents. Such steps may include promoting interoperability and ensuring that vendors do not inappropriately favor their own products." In addition, Sec. 11 of the President's October 30, 2023 Executive Order states: "To advance responsible global technical standards for AI development and use outside of military and intelligence areas, the Secretary of Commerce, in coordination with the Secretary of State and the heads of other relevant agencies as appropriate, shall lead preparations for

government agencies.[3] These should also provide mechanisms to guide and facilitate its adoption. Specifically, such an ecosystem, at minimum, must be:

- Multi-dimensional – The strategy must address multiple dimensions of interoperability including, but not limited to: technical, semantic (data and information),[4] and organizational (as well as interoperability governance). We note that NATO[5] and the European Union have taken such a holistic approach, the latter having also addressed legal interoperability;[6] and

- Universal/Available – USTPC also urges OMB to create a centralized repository of trusted interoperable resources accessible to all germane agencies that includes detailed information documenting the specific means employed by agencies to minimize efforts and maximize impact.[7] Not only would such a mechanism promote interoperability, but it also could enhance effectiveness, efficiency, consistency, and the adoption of more trusted, safe, and secure digital services. Open and interoperable resources also could help to accelerate convergence in the standardization of digital services and potentially boost the nations' digital economy.

2) Emphasize Responsible AI

The term "responsible AI" is often used as a shorthand for a number of properties of algorithmic systems in general, and AI systems in particular, that require guiding principles and practices. The USTPC has developed statements on a number of these including the transparency, accountability, and the safety of all algorithmic systems, as well as on specific requirements for the principled development of generative AI programs. See:

- *ACM TechBrief: Generative AI* (Summer 2023);[8]

---

a coordinated effort with key international allies and partners and with standards development organizations, to drive the development and implementation of AI-related consensus standards, cooperation and coordination, and information sharing."

[3] See, for example, the European Interoperability Framework. See https://ec.europa.eu/isa2/eif_en/.

[4] Among other points, components such as common taxonomies, ontologies, and other elements linked to semantic interoperability can be enablers to leverage AI-based results.

[5] See https://www.nato.int/cps/en/natohq/topics_84112.htm

- *ACM TechBrief: Safer Algorithmic Systems* (January 2023);[11] and
- Statement on Principles for Responsible Algorithmic Systems (October 2022).[12]

USTPC thus regards the OMB Memorandum as an opportunity to underscore and widely disseminate the importance of a code and culture of ethics (essentially defined as the combination of the above principles) being at the core of AI technology development and deployment.[13] Accordingly, USTPC recommends that the OMB Memorandum formally articulate and endorse strengthening the ethical use of AI as a core value.[14] Doing so, we note, also may help prevent intended and unintended bias and misuses of AI.

3) Address Privacy from the Beginning of the Design and Development Process

USTPC has long advocated that the disciplines of privacy by design[15] and privacy by default inform and be incorporated into federal policy wherever relevant.[16] The OMB Memorandum presents a prime opportunity to do so, particularly with specific references to auditing processes and audit trails. USTPC anticipates that implementing this recommendation will foster stricter control of data, increased privacy, and enhanced personal data protection.

[16] See, *e.g.*, USACM Statement on the Importance of Preserving Personal Privacy (March 1, 2018).

4) Standardize Definitions and Concepts

Common understanding of key AI-related terms and concepts among all federal agencies, the computing profession, and the public will be critical to the development of policies and mechanisms for the efficient delivery of AI-based digital services. USTPC believes that the need for such consistency and clarity has increasingly been publicly recognized and pursued. Indeed, the Organization for Economic Co-operation and Development's (OECD) Council recently adopted this new definition of Artificial Intelligence: "An AI system is a machine-based system that, for explicit or implicit objectives, infers, from the input it receives, how to generate outputs such as predictions, content, recommendations, or decisions that can influence physical or virtual environments. Different AI systems vary in their levels of autonomy and adaptiveness after deployment."[17]

In addition, we note that the Technology Standards Working Group of the US - EU Trade and Technology Council recently sought broad public comment on a detailed first edition of a *Terminology and Taxonomy for Artificial Intelligence*.[18] USTPC commends the comments of ACM's Europe Technology Policy Council in that proceeding to OMB for its consideration in producing the next draft of the OMB Memorandum, together with the five recent documents cited in Section 2 above.

USTPC stands ready to further assist OMB. Should questions arise concerning this document, or to arrange a technical briefing with ACM and USTPC's expert members, please contact ACM's Technology Policy Office at acmpo@acm.org or 202-580-6555.

December 5, 2023

Clare Martorana
U.S. Federal Chief Information Officer
Office of the Federal Chief Information Officer
Office of Management Budget
725 17th St., NW
Washington, DC 20503

Re: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, OMB 2023-0020-0001

Dear Ms. Martorana:

The Surveillance Resistance Lab is a think and act tank focused on state and corporate surveillance as one of the greatest threats to migrant justice, racial equity, economic justice, and democracy. We challenge how surveillance at the nexus of state and corporate power not only threatens privacy, but seriously erodes fundamental rights leading to heightened oppression and repression.

While the White House's recent Executive Order on "AI"[1] technologies and the related OMB guidance promise new oversight structures for federal agencies contracting with private companies to provide "AI" services, it also risks conceding critical ground—that corporate

[1] While we use "AI" throughout our comment to maintain consistency with OMB's proposed guidance, we must name that the adoption of marketing language like "AI" or "artificial intelligence" by the government as the shorthand term used to describe regulation and governance of a variety of different automated decision-making tools contributes to public and consumer confusion about what "AI" is and is not. As Luis Perez-Breva, lecturer and research scientist at MIT School of Engineering, observes, "I see a rush to over-market as AI anything that involves computation with data. That just sows a lot of confusion. Things advertised as "AI" today have no intelligence of their own." Greg Nichols, Don't be alarmed, but you're probably using the term AI wrong | ZDNET, Nov. 15, 2017. Available at: https://www.zdnet.com/article/dont-be-alarmed-but-youre-probably-using-the-term-ai-wrong/,

needs, and not the public's, will drive agencies' governing strategies. The guidance privileges "innovation" at the expense of the public sector.[2]

The public and government's ability to hold contractors accountable for harm caused by safety and rights-impacting "AI" systems is already diluted by laws that protect corporations from transparency, oversight, and accountability mechanisms necessary for the public to understand and influence governance. For example, government contractors sued for violating the United States Constitution or other laws through the services they provide the government may invoke the "government contractor defense", limiting the public's access to the courts for remedies of constitutional magnitude.[3] Public notice and comment opportunities through administrative agencies, like this one, are not required before the procurement of technologies, even when policy decisions are embedded in the design of such technology.[4] Government agencies are also already exempt from disclosing information to the public and investigative media via Freedom of Information Act exemptions, such as Exemption 4, which exempts "trade secrets and commercial or financial information obtained from a person and privileged or confidential" from disclosure.[5]

As "AI" produced by the private sector becomes increasingly embedded and deployed by government institutions, we must take forceful action to ensure that the public interest values of transparency, inclusivity, reasonableness, and political equity[6] are not eroded by profit-driven corporate imperatives of secrecy, scarcity, competition, and market-driven metrics. To protect the public's need over corporate interests, we must guard against corporate attempts to dominate narratives related to product performance and conditions in the public sector that impact investments as well as "risk management" approaches to protecting the public.

AI is being fueled by a handful of extremely well resourced corporations who are in a fierce competition to define our futures.[7] The chaos that resulted from OpenAI's three-person Board of Directors decision over one weekend firing and rehiring its CEO, for example, is exactly the type of corporate theater that may impact the future of AI governance technologies behind closed doors.[8]

In this interview, Justin Hendrix's observes, "That does seem to be the conclusion of [Karen Hao's] piece the other day, even

Other examples of how corporate imperatives begin to trump constitutional and public interests include a lawsuit brought by teachers in Houston who sued their school district for constitutional due process violations related to using a privately-developed performance algorithm to evaluate teachers for pay and continued employment. When they demanded information about how the system made their employment action decisions, the company claimed trade secret privilege to prevent disclosure of information the teachers were entitled to.[9] In criminal courts across the country, where explicit constitutional rights of confrontation protect the accused's right to access information, private technology companies have argued against allowing defense experts access to the mechanics behind their system's outcomes.[10]

By committing to the outsourcing of "AI" services and a "risk management" approach to enforcement of public constitutional and statutory protections[11] through procurement and contract monitoring, the federal government has already chosen to fundamentally

---

though this may have seemed like a crazy moment with OpenAI possibly falling apart, possibly somehow being folded into Microsoft, now, it appears, carrying on as an independent entity, but very much under the puppet strings of Microsoft. One detail that I hadn't really quite understood was the extent to which the $10 billion investment Microsoft's made in OpenAI is really for computing resources, almost like a barter, which is interesting. Just like any old startup taking credits from Amazon or Microsoft, OpenAI is in this similar boat, hooked on its cloud compute infrastructure. This idea that, at the end of the day, there's only a handful of folks in Silicon Valley that are defining the future of these technologies, that are making the decisions." Karen Hao responds: **"And that is, I think, the most important lesson that we need to learn from this weekend, and that policymakers should very much be realizing, and I hope acting on,** which is if we actually want to get to a place where, if we believe the general premise that OpenAI says, which is, we're building [artificial general intelligence (or "AGI")] that's beneficial for humanity, if we actually want something like that, setting aside skepticism around AGI or whatever, but a technology that benefits everyone can only arise when there is a broad base of people participating in it and helping to usher it forward in an inclusive and democratic way. And that's just absolutely not… It's like the polar opposite extreme that's happening. The fact that it really came down to three members of a board that led to the cascading of these events, three people that could completely fundamentally change the direction of AI development, …and all of those discussions are happening behind closed doors, and t is not healthy or sustainable in terms of getting to a future that is better and more inclusive."

[9] Tom Temin, "How federal procurement can keep artificial intelligence in its swim lane," Federal News Network, Nov. 3, 2023. Available at: https://federalnewsnetwork.com/artificial-intelligence/2023/11/how-federal-procurement-can-keep-artificial-intelligence-in-its-swim-lane/. In this interview with University of Pennsylvania law professor and federal regulation expert Cary Coglianese, Prof. Coglianese reports, "But back several years ago, the school teachers in the city of Houston took the school district to court, because the school district had been applying a performance algorithm that was being used to evaluate teachers for pay and continued employment. The algorithm had been developed and was run by a private contractor who claimed trade secret protection over the algorithm. And the teachers said, Wait a minute, we're public employees, school district, you're a public entity. We have constitutional due process rights to some degree of transparency and fairness in how we are being evaluated. And we can't even know what that is. And the court agreed with them. **And it seemed to me, in retrospect, an obvious fix for that would have been to have the school district during the contracting process require the vendor to provide adequate information**." [10] Rebecca Wexler, "Code of Silence", Washington Monthly, Jun. 11, 2017. Available at: https://washingtonmonthly.com/2017/06/11/code-of-silence/

[11] OMB guidance Section 6 (p24)

weaken public access to transparency and accountability mechanisms.[12] In addition, OMB's guidance to agencies around "workforce"[13] that prioritizes administrative agency staff hiring for people with "AI" interpretation skills rather than the subject-matter expertise of that agency's focus will gut its internal staff subject-matter expertise capacity and legitimacy.[14] Undermining the authority of federal administrative agencies further serves technology companies future interests–for example, Meta (formerly known as "Facebook") is already actively seeking to limit the enforcement power of federal agencies through litigation.[15]

Given this relinquishment of traditional mechanisms for public accountability, it is critical that the OMB Guidance on "AI" create clear mandates and open avenues for public transparency, intervention, and accountability in order to preserve the public's right to learn about and intervene against "AI" companies involved in governing their lives, especially in ways that increase risks to safety and not only individuals' constitutional rights, but communities' rights to protect their future. **Instead, the guidance opens avenues for unprecedented opacity around corporate influence in government through extension and waiver loopholes allowing "AI" corporations to withhold critical information about governing without oversight or consequences.**

Language around waivers should be eliminated entirely – this creates a dangerous loophole through which the government may not only withhold information from the public without a declassification process, but evade the process of the minimum impact assessments in full. This invites companies to market their services as high risk for the purposes of avoiding AI impact assessments. For exceptional situations, agencies should use existing classification standards.

Where possible, the guidance should also offer model contract language to mitigate the potential of interpretations that weaken the effectiveness of these provisions. Examples of model contractual provisions may be found in Confronting Black Boxes, A Shadow Report of the New York City Automated Decision-making Task Force.[16]

---

[12] The Lab co-authored, along with other immigration advocacy organizations, a public comment addressing the specific reasons why a risk management framework dilutes accountability and inappropriately assigns agencies like the Department of Homeland Security the duties of self-policing their use of AI and its harms despite already demonstrating its inability to do so.

[13] Section (4)(b)(iv)

[14]Ryan Calo & Danielle K. Citron, The Automated Administrative State: A Crisis of Legitimacy, 70 Emory L. J. 797, 804 (2021). Available at: https://scholarlycommons.law.emory.edu/elj/vol70/iss4/1, "Mounting evidence suggests that agencies are turning to systems in which they hold no expertise, and that foreclose discretion, individuation, and reason-giving almost entirely. The automated administrative state is less and less the imperfect compromise between the text of the Constitution and the realities of contemporary governance. **At some point, the trend toward throwing away expertise, discretion, and flexibility with both hands strains the very rationale for creating and maintaining an administrative state. This is especially true where, as often, the very same processes of automation also frustrate the guardrails put in place by Congress and the courts to ensure agency accountability.**"

[15] The Associated Press, "Facebook parent Meta sues the FTC claiming 'unconstitutional authority' in child privacy case", ABC News, Nov. 30, 2023. Available at: https://abcnews.go.com/Politics/wireStory/facebook-parent-meta-sues-ftc-claiming-unconstitutional-authority-105288850

[16] Rashida Richardson, ed., "Confronting Black Boxes: A Shadow Report of the New York

Below are more specific recommended amendments (in order of importance) to strengthen the public's ability to hold federal agencies accountable for threats to safety and rights posed by government contractors' when procuring "AI" services.

(1) Amend (5)(d)(i)(p21) to make agencies contractually bind "AI" companies to uphold the United States Constitution and laws. Clarify that entities operating "AI" on behalf of the government will be designated as state actors.

Current OMB Guidance:

Aligning to National Values and Law. Agencies should ensure that procured AI exhibits due respect for our Nation's values, is consistent with the Constitution, and complies with all other applicable laws, regulations, and policies, including those addressing privacy, confidentiality, copyright, human and civil rights, and civil liberties.

Recommended amendment:

Aligning to National Values and Law. Agencies **must ensure that federal contracts for** procured AI **bind companies to uphold** the Constitution, and comply with all other applicable laws, regulations, and policies, including those addressing privacy, confidentiality, copyright, human and civil rights, and civil liberties. **Government contracts with entities operating "AI" on behalf of the government shall designate the contractor as a state actor. All existing contracts with companies providing "AI" services must be updated to reflect this expectation.**

Without binding contractual language, agencies have little power to force government contractors to "exhibit[] due respect" for the constitution, laws, regulations, and policies, and the public has even less. Requiring government contractors to adopt state actor status will protect the public's ability to access the courts to remedy harms caused by new technologies. "[The] applicability of the state action doctrine to AI vendors and their systems will be a central question for AI accountability going forward."[17] OMB guidance should preserve the public's ability to have standing and file for both remedial and injunctive relief from deployment of harmful technology. Not doing so dangerously insulates both government contractors and government actors from important venues for public accountability.

City Automated Decision System Task Force," AI Now Institute, December 4, 2019, Available at https://ainowinstitute.org/publication/confronting-black-boxes-a-shadow-report-of-the-new-york-city-automated

[17] Kate Crawford and Jason Schultz, 2019 'AI Systems As State Actors', Columbia Law Review, 119(7), 1941-1972, 1958. Available at: https://columbialawreview.org/content/ai-systems-as-state-actors/

(2) Amend (5)(c)(iii)(p14) to align the circumstances when CAIO's may waive minimum protective practices for safety and right-threatening technologies with existing classification processes

> Current OMB Guidance:
>
> Waivers from Minimum Practices. In coordination with other relevant officials, an agency CAIO may waive one or more of the requirements in this section for a specific covered AI application or component after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations. Such waivers are applicable for the duration of the AI's use, but must be reassessed by the CAIO if there are significant changes to the conditions or context in which the AI is used. An agency CAIO may also revoke a previously issued waiver at any time. Agencies must report to OMB within 30 days of granting such a waiver, detailing the scope, justifications, and supporting evidence.
>
> Recommended amendment:
>
> ~~Waivers from Minimum Practices. In coordination with other relevant officials,~~ **If an agency CAIO determines that fulfilling the minimum practices would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations, the CAIO must nevertheless complete the AI assessment and apply for an AI system's impact assessment to be classified under existing classification standards and procedures in Executive Order 13256.**

Rather than allowing agencies to evade production of AI assessments without a declassification process, OMB should deploy existing structures, such as the classification (and declassification) system, to determine what information cannot be shared publicly, why, and for how long. Through this guidance, OMB risks encouraging that agencies govern by waiver (or, as many FOIA officers do, by endless extensions) and that technology companies market their products as systems whose impact assessments may be waived. New understaffed offices will be tempted to overuse system-specific risk assessments to grant extensions and waivers as short cuts around the rigorous and more laborious task of completing the AI impact assessments.

In addition, the most potentially harmful technologies that are being deployed already by federal law enforcement and state and local law enforcement with the support of federal dollars foreseeably will seek to exempt their technologies from the Minimum Practices, along with the companies marketing these dangerous technologies. New Yorkers saw this exact opposition when the New York City Council passed a bill requiring city agencies to similarly inventory their algorithmic decision-making systems.[18] New York City's Police Department testified and complained to the media that "compliance with the legislation would 'help criminals and

[18] Richardson at 11-13.

terrorists.'"[19] As we wrote alongside the immigration coalition organizations in another letter, law enforcement has already proven it is incapable of critically assessing the life-threatening and community-devastating corporate technologies it has already deployed. The government should not evade the process of assessing the risks of any type of AI system so that potential harms are primarily identified early and avoided and, in the event harm results, the government's knowledge of the risk of harm and the company's knowledge about the risk of harm are well-documented and undisputed.

We echo the third concern of the immigration coalition organizations: "we are concerned that intelligence and law enforcement-related technologies will fall under 'critical agency operations,' allowing agencies to avoid scrutiny, and enabling the procurement and implementation of harmful technologies that do not meet minimum standards. We are additionally concerned about these issues being relegated to the National Security Memo where they could receive even less public scrutiny."[20]

(3) Amend (5)(c)(iv)(A)(1)(p15) to require articulation of the problem "AI" is sought to solve, public engagement about that problem, and to rule out less harmful alternatives to "AI"

Current OMB Guidance:

The intended purpose for the AI and its expected benefit, supported by specific metrics or qualitative analysis. Metrics should be quantifiable measures of positive outcomes for an agency's mission, for example to reduce costs, wait time for customers, or risk to human life, that can be measured after the AI is deployed to confirm or disprove the value of using AI. Where quantification is not feasible, qualitative analysis should demonstrate an expected positive outcome, such as for improvements to customer experience or human interactions—and demonstrate that AI is a good fit to accomplish the relevant task.

Recommended amendment:

The intended **problem that AI is being proposed to solve and efforts to engage the public about the priority of that problem, the exhaustion of government-led strategies, the history of government attempts to solve this problem, identification of specific reasons why this particular problem might be addressable through outsourcing AI services. The assessment of the problem must also include and document public, civil society, and other stakeholder input gathered through notice and comments. It should also document the** purpose for the AI and its expected benefit, supported by specific metrics or qualitative analysis. Metrics should be quantifiable measures of positive outcomes for an agency's mission, for example to

[19] Id. at 12
[20] Public comment submitted by Just Futures Law, et al at 2.

reduce costs, wait time for customers. **If risk to human life is projected**, **the AI should not be deployed.** Where quantification is not feasible, qualitative analysis should demonstrate an expected positive outcome such as for improvements to customer experience or human interactions **weighed against any negative outcomes**—and demonstrate that AI is a good fit to accomplish the relevant task. **If measures required to mitigate risk, for example human review, dilutes any "efficiencies" initially deemed positive, this should be included.**

Whether or not this problem is a priority, and whether technology promises the appropriate solution, not only to the agency programmatic staff, but to its constituents and the people who will be subjected to the technology, is left out of the AI assessment. How is risk to human life a positive outcome for any agency's mission, for example? It is during the process of defining a problem, understanding what conditions need to change in order to solve it that an agency can better prepare itself for a future assessment of whether AI is the right solution, whether the problem is not a priority, or whether alternatives should be used.

(4) Amend (5)(b)(i)(J)(p10-11) to broaden the types of safety-impacting risks the minimum practices must be presumed to apply to

Current OMB guidance:

Access to or security of government facilities;

Recommended amendment:

Access to or security of government facilities **or places where people live**

Nothing in the current list of safety-impacting threats speaks to the safety of people, whether in the United States or elsewhere. Weaponized AI systems absolutely have the ability to threaten the safety of individuals and entire communities and should be included in this list.

(5) Amend (5)(b)(ii)(p12) to broaden the types of rights-impacting risks the minimum practices must be presumed to apply to

Current OMB guidance:

Purposes That Are Presumed to Be Rights-Impacting. Unless the CAIO determines otherwise, covered AI is presumed to be rights-impacting (and potentially also safety-impacting) and agencies must follow the minimum practices for rights-impacting AI and safety-impacting AI if it is used to control or meaningfully influence the outcomes of any of the following activities or decisions:

Recommended amendment:

> Purposes That Are Presumed to Be Rights-Impacting. Unless the CAIO determines otherwise, covered AI is presumed to be rights-impacting (and potentially also safety-impacting) and agencies must follow the minimum practices for rights-impacting AI and safety-impacting AI if it is used to control or meaningfully influence the outcomes of any of the following activities or decisions **about individuals or communities**:

This recommendation echoes a concern also raised in the comment we co-authored along with other immigration justice organizations: “OMB should consider including the concept of collective privacy because worker and labor organizing or immigrants rights advocacy often mean that individual privacy and collective privacy are intertwined. Reducing the risk of retaliation against labor organizing or people engaged in protected First Amendment activity requires assessing the needs of organizing collectives engaged in that enterprise.”[21]

Conclusion

The federal government has already chosen to fundamentally weaken public access to transparency and accountability mechanisms by privileging corporate-driven outsourcing of public sector responsibilities. Given this relinquishment of traditional mechanisms for public accountability, the OMB Guidance on “AI” must create clear mandates and require open avenues for public transparency, intervention, and accountability in order to preserve the public’s right to learn about and intervene against “AI” companies involved in governing their lives, especially in ways that increase risks to safety and not only individuals’ rights to self-determination, but communities’ rights to protect their future. There must be consequences for non-compliance, overuse of waivers and extensions, contract monitoring and enforcement, and oversight of agencies’ engagement in monitoring “AI” systems.

Thank you,

Surveillance Resistance Lab

OMB AI Memo - Cyber Florida Comments

ADVANCING GOVERNANCE, INNOVATION, AND RISK MANAGEMENT FOR AGENCY USE OF ARTIFICIAL INTELLIGENCE:

PROPOSED MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

CYBER FLORIDA
at the UNIVERSITY OF SOUTH FLORIDA

CYBER FLORIDA
at the UNIVERSITY OF SOUTH FLORIDA

CYBERFLORIDA.ORG

04 December 2023

Office of Management and Budget:

On behalf of the Florida Center for Cybersecurity, also known as Cyber Florida, I would like to thank you for the opportunity to submit a response to your request for public comment and address the important issue of advancing artificial intelligence innovation and determining risk management policies.

Cyber Florida was established by statute in 2014 to help position Florida as a national leader in cybersecurity by promoting cybersecurity education, research, and outreach. Hosted by the University of South Florida, Cyber Florida leads a spectrum of initiatives to support industry-advancing research, inspire and educate future and current professionals, and help people and organizations better understand and prepare for cyber threats.

Among our key mission areas at Cyber Florida is to advance cybersecurity research, including that of artificial intelligence, to improve the cyber readiness of the state and Nation. In that regard, we've included several recommendations in this response that we believe will assist in developing a comprehensive plan for agencies regarding the proper use of artificial intelligence and its impact on the rights and safety of the public.

We commend the Office of Management and Budget for leading the effort on advancing governance, innovation, and risk management for agency use of artificial intelligence, as we believe this to be of utmost importance in our Nation's continuous fight against cyber threats. Cyber Florida is committed to serving as a resource to help the Office of Management and Budget address this issue and others. We remain at your disposal for further discussion.

Respectfully,

General (Ret.) Kenneth F. McKenzie Jr.
Executive Director, The Florida Center for Cybersecurity

4202 E. Fowler Avenue, ISA7020, Tampa, FL 33620-7120 | info@cyberflorida.org | 813 974 2604

MARSHALL
STUDENT CENTER

The Florida Center for Cybersecurity (Cyber Florida)

The Florida Center for Cybersecurity was established within the University of South Florida in 2014 under Florida statute 1004.444. The goals of the center are to: position Florida as a national leader in cybersecurity and its related workforce through education, research, and community engagement; assist in the creation of jobs in the state's cybersecurity industry and enhance the existing cybersecurity workforce; act as a cooperative facilitator for state business and higher education communities to share cybersecurity knowledge, resources, and training; seek out partnerships with major military installations to assist, when possible, in homeland cybersecurity defense initiatives; attract cybersecurity companies to the state with an emphasis on defense, finance, health care, transportation, and utility sectors.

Comment

Artificial Intelligence (AI) is no longer a term associated solely with experts in technology. It has become so commonplace that even children can and are experiencing the impact of AI on their lives, and beyond that, they can actually comprehend the change AI is enabling today. Applications unimaginable five years ago are now seeing rapid permeance in our society. Humanity has seen nothing equal to the scope, scale and speed of AI advances in its recent history. The time is indeed now to ensure that mistakes made in the past – a most glaring example

is cutting corners in cybersecurity with the development of the Internet and its protocols – are not repeated, and a clear, comprehensive and practical plan for managing AI advances and their associated risks is a critical need now. We are delighted that the Office of Management and Budget is taking a leadership role in this regard. Cyber Florida is also eager to contribute its expertise to this effort.

Strengthening AI Governance: As identified in the current draft report, we fully support the need for a dedicated Chief AI Officer (CAIO) tasked with the broad oversight of myriad ways in which AI advances might impact the functioning of a federal agency. Apart from this, a Governance Board that can periodically oversee and advise the CAIO on AI-related topics is highly recommended. In fact, a cursory look across hiring in the C-Suite categories now reveals a growing trend in Chief AI Officers positions in the private sector. We believe that a federal agency CAIO cannot just be someone with significant technical expertise (AI or otherwise), but instead must be well-versed with agencies' priorities, understand the complex dynamics of departments within the agencies—where opportunities and barriers for AI innovation lie—and understand/identify clear use cases. Most importantly, stakeholders in the respective agencies need to sensitize to the fact that AI may not solve everything (like the perception that the advent of Chat GPT has enabled), and hence the CAIO must be someone with a deep understanding of not only the strengths of AI, but also its limitations within the purview of each agency. The presence of a formal Governance Board will go a long way in giving a clearer sense of purpose and direction to the CAIO. Cyber Florida recommends that the Governance Board be made up of members who are as diverse as possible, since sources of innovations in AI are not restricted to computing fields alone, but instead have spanned psychology, neuroscience, biology, physics, mathematics, cybersecurity and much more. Having a trans-disciplinary Governance Board will further decisions that are rooted in sound science, ethics and practicality as well.

Advancing Responsible AI Innovation: The current draft from the OMB is comprehensive and presents a detailed list of activities to fuel responsible innovations in AI. We particularly support the clear documentation of AI use-cases and periodically refreshing these as and when AI technologies and intended applications change. We also support the creation of robust cybersecurity policies to better address needs of AI applications, and authorizations to further AI use. The presence of a qualified cybersecurity expert in the AI Governance Board is critical to accomplishing this important goal. We have two additional recommendations in addition to what is presented in the current OMB draft:

- **Data Storage:** We recommend due diligence in safeguarding data that was trained, validated and tested while developing the AI model. We recommend state-of-the-art access and data control policies in terms of data access and its modifications. With reinforcement learning and federated learning proving to be effective for myriad AI applications, access to current data will be a constant theme, and thereby are increasing avenues for its compromise. Critical recommendations we make are a) the need to store all data within the geographical boundaries of the US; b) multi-layered and fine-grained access control so that impacts of any information leakage are gradual and not catastrophic; c) having a cybersecurity-specific Incident Response Plan (adapted to current NIST standards) for AI-centric data and models; and d) investments in homomorphic encryption technologies that allow for AI models trained and executed on encrypted data to enable privacy-preserving AI learning.

- **Periodic AI Model Auditing:** Cyber Florida recommends a robust national scale program to periodically audit all aspects of the AI models, including fidelity of data, security controls, model performance, computing and storage requirements, use-case inventory, test scenarios (in-lab and in the field) and more. We also recommend that OMB create long-term funded and competitive research programs—potentially overseen by agencies like NSF and NIST—that enable non-profit agencies like universities (in collaboration with governmental and military bodies, when possible) to conduct these audits (serving as red teams). Research outcomes will provide impartial reviews to federal agencies, while also ensuring that the next-generation student talent coming out of our universities are well-aware and trained on threats, attacks and countermeasures to ensure safe, accountable and risk-free AI innovation and use, without bias.

Managing Risks from the use of AI: Cyber Florida believes that there are clear risks to safety and rights of the public due to misuse of AI. There are documented evidences of certain governments using AI techniques (most significantly, computer vision) to surreptitiously perform surveillance on civilians, hence infringing upon their rights. There are also reports wherein emergent techniques like Generative AI and LLM models are being utilized for information censorship, misinformation spreading, and denying rights to free speech. As such, this aspect may be the most critical of all to consider in a free and fair democracy like the US and other like-minded nations and allies. At the outset, Cyber Florida believes that the specific risks identified in the draft report are reasonably comprehensive and practical, although we like to mention that safety risks to AI models that influence decision making in the financial and health infrastructure sectors are missing. We believe they should be added.

In addition, Cyber Florida has the following comments in the avenue of managing risks from AI usage:

- **Cyber Florida supports the creation of an AI-Compliance Plan, but has concerns on the August 2024 deadline to ensure compliance:** We see from the draft report that OMB will provide templates for AI compliance to all federal agencies, which is welcome. However, the draft report states that *"By August 1, 2024, agencies must implement the minimum practices in Section 5(c) of this memorandum for safety-impacting or rights-impacting AI, or else stop using any AI that is not compliant with the minimum practices, consistent with the details and caveats in that section."* The minimum practices identified in Section 5(c) are very comprehensive. However, based on our own experiences with cybersecurity compliance in the state of Florida, agencies may need at least two years to implement the detailed list of proposed recommendations made by OMB. Expecting agencies to *"stop using any AI that is not compliant"* starting August 2024 does not seem realistic.
- **Create a comprehensive Incident Response Plan:** Cyber Florida recommends the creation of a comprehensive Incident Response Plan across agencies in the event of any identified misuse of AI. This plan is different from the aforementioned AI-compliance plan, since the Incident Response Plan will specifically focus on the aftermath of detected AI misuse. While a general template can be the foundation, we recommend a fine-tuned template per agency that takes into account the specifics within that agency and respective usage of AI. The Response Plan should be comprehensive covering every aspect of AI usage including data, storage, data access/security policies, AI models, test-scenarios, AI usage history, stakeholders impacted (including the general public), organization of

governance board, audit history and more. Cyber Florida also recommends that agencies like NIST be tasked with designing guidelines and specifics for such a plan, very similar to what is being done in the cybersecurity arena. Cyber Florida also recommends free and open sharing of such plans across agencies, to commercial entities across the US and the public for their awareness.

- **Cyber Florida recommends the creation of a national-level AI task force with global outlook:** This task force should be comprised of AI experts across diverse spectrum of federal agencies who will specifically monitor, document and assess AI innovations and use cases across the globe, especially across countries of concern. Having such an agency will not only prepare the US for potential misuse of foreign-developed AI against US citizens, but also help domestic federal agencies assess risk better, which will further strengthen their existing AI innovations and policies as they continue to adapt.

Final Remarks: To summarize, Cyber Florida is delighted at the depth of detail which OMB has provided in advancing governance, innovation and risk management for agency use of AI technologies. The effort is critical and will stimulate significant activity across federal agencies, which will eventually permeate into state and local entities serving the nation. We agree with the vision that "AI only works when it works for all of us." Cyber Florida is delighted to offer its comments to the draft report, and hope that they fine-tune the carefully thought out, comprehensive and timely vision of the OMB to practically enable responsible AI governance and innovation while simultaneously protecting our safety and rights.

Washington, DC 20503

Re: Request for Comments on Advancing Governance, Innovation and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (OMB-2023-0020)

To whom it may concern:

On behalf of the 14,000 members of the National Association of Manufacturers, the largest manufacturing association in the United States representing manufacturers in every industrial sector and in all 50 states, the NAM submits these comments in response to the Office of Management and Budget's request for comment on Advancing Governance, Innovation and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum.

Manufacturing employs nearly 13 million men and women, contributes $2.9 trillion to the U.S. economy annually, has one of the largest economic multipliers of any major sector and accounts for 53% of all private-sector research and development in the nation.[1] The NAM is the voice of the manufacturing community and the leading advocate for a policy agenda that helps manufacturers compete in the global economy and create jobs across the United States.

The NAM welcomes the opportunity to provide input on OMB's draft memorandum to executive departments and federal agencies. Manufacturers are key developers and deployers of the technologies that enable AI, as well as key innovators developing products and applications for AI across sectors. In a recent survey of manufacturers by the NAM's Manufacturing Leadership Council, 57% of manufacturers are experimenting with a range of small-scale AI pilot programs.[2] Manufacturers anticipate investments in AI will lead to benefits such as more predictive insights, better design making, cost savings, improved planning, greater productivity and increased competitive advantage.[3]

The NAM believes the growth of AI represents an opportunity for manufacturers to strengthen their lead in innovating new technologies and realizing efficiencies that can boost our industry's competitiveness. It also provides the means for the sector to develop products and processes that increase safety and improve people's quality of life. Manufacturers are

[1] https://www.nam.org/facts-about-manufacturing/
[2] https://www.manufacturingleadershipcouncil.com/wp-content/uploads/2023/06/The-Future-Of-AI-In-Manufacturing-MLC-2023.pdf
[3] Ibid.

committed to the responsible development of emerging technologies, including AI, and are committed to working with the public and private sectors to advance this goal.

Providing guidance to federal agencies to inform their requirements and guidance for AI is a positive first step to ensuring cohesion across the federal government in its approach to AI, and the NAM encourages continued coordination and cohesion. Regular communication and information sharing can result in streamlined processes, multiple applications of solutions and a lessened risk of duplicative efforts.

The NAM also supports the draft's sentiment that "embracing innovation requires removing unnecessary and unhelpful barriers to the use of AI while retaining and strengthening the guardrails that ensure its responsible use."[4] Embracing innovation is necessary in the federal government, as innovation will promote economic competitiveness and efficiency. The NAM supports regulation of AI that does not hinder competitiveness and is indexed to the nature of the risk. A risk-based approach accounts for the diversity of current and future applications of AI. An inflexible framework to regulating AI will impede innovation; therefore, agencies should include these considerations in both regulatory and nonregulatory approaches to AI. Furthermore, as an agency factors the benefits and costs related to potential action, manufacturers believe it is important for agencies to receive input that provides a clear understanding of the technology's benefits. This analysis must also account for the fact that our present understanding of risks, costs and benefits may be limited because technology lends itself to future unanticipated breakthroughs and applications.

Manufacturers also support OMB's desire to harmonize current and future frameworks at the domestic and international levels, when applicable, so manufacturers do not have to navigate a complex patchwork of AI regulation. The NAM also encourages the federal government to continue to engage with the industry for its perspective as it continues to develop AI guardrails.

The NAM appreciates the opportunity to comment on this draft memorandum and supports OMB's actions to provide guidance on AI. Manufacturers will readily engage and provide insights as we work with you to harness the opportunity of AI.

ICBA comment on OMB proposed AI memo_Dec5

One Mission. **Community Banks.**

December 5, 2023

Shalanda D. Young
Director
Office of Management and Budget
New Executive Office Building
Washington, DC 20503

RE: Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum; OMB-2023-0020

Dear Director Young:

The Independent Community Bankers of America ("ICBA")[1] is pleased to share feedback on the Office of Management and Budget's ("OMB") Proposed Memorandum for the Heads of Executive Departments and Agencies ("Proposed Memo"). The OMB's Proposed Memo establishes new agency requirements and guidance for artificial intelligence ("AI") governance, innovation, and risk management, including through specific minimum risk management practices for uses of AI that impact the rights and safety of the public.

ICBA Comments

Overall, ICBA believes that the Proposed Memo strikes the right balance in instructing agencies to promote the use of AI technologies within agencies while simultaneously ensuring that the rights of stakeholders and the public are maintained. With specific regard to the federal agencies that supervise and regulate community banks, ICBA believes that agency adoption of AI technologies can bring efficiency to supervision that would alleviate community bank burden, especially in the areas of data collection. However, as the Proposed Memo makes clear, it will be of paramount importance for federal banking agencies to protect the rights of community banks and their customers, including the security of their data.

Requirement to Establish Chief AI Officer

As required by President Biden's October 30, 2023 Executive Order (the "AI Executive Order"), each agency must designate a Chief AI Officer ("CAIO"). The Proposed Memo directs CAIOs to work in close coordination with

[1] The Independent Community Bankers of America® creates and promotes an environment where community banks flourish. ICBA is dedicated exclusively to representing the interests of the community banking industry and its membership through effective advocacy, best-in-class education, and high-quality products and services. With nearly 50,000 locations nationwide, community banks constitute 99 percent of all banks, employ more than 700,000 Americans and are the only physical banking presence in one in three U.S. counties. Holding more than $5.8 trillion in assets, over $4.8 trillion in deposits, and more than $3.5 trillion in loans to consumers, small businesses and the agricultural community, community banks channel local deposits into the Main Streets and neighborhoods they serve, spurring job creation, fostering innovation and fueling their customers' dreams in communities throughout America. For more information, visit ICBA's website at www.icba.org.

existing responsible officials and organizations within their agencies. In response to this proposed directive, ICBA believes that CAIOs should work closely with each banking agency's Chief Innovation Officer ("CIO"). While CAIOs will presumably be focused on internal agency uses of AI, CIOs are focused on working with external parties, including community banks, to develop guidance and regulations that enable bank usage of AI technologies.

Although it would benefit both agency and industry for CAIOs to collaborate with CIOs on AI technology, ICBA notes that this collaboration may no longer be possible as several banking agencies have deprioritized their Offices of Innovation. In some instances, the banking agencies have gone so far as to dismantle or unwind certain Office programs.

ICBA believes that, when fully empowered, the Offices of Innovation provided significant value in developing and facilitating policy-based solutions that nurture bank relationships with fintechs that develop technologies that banks offer customers, such as AI. These technologies are not typically developed in-house and require relationships with third-party experts. If the banking agencies were to re-empower Offices of Innovation, then ICBA believes that CAIOs would have a more fruitful mission in collaboration with CIOs.

Criticality of Security

As the Executive Order and Proposed Memo both highlight, the use of AI provides new opportunities, but also introduces new risks. ICBA believes the banking agencies have a responsibility to ensure proper cyber and data security protection. This is particularly important in areas involving financial and personally identifiable information ("PII") and extends to AI.

Should the banking agencies use consumer PII or financial information as inputs into its AI systems, the use must be based around agreed upon public-private standards to ensure trust. The government has a responsibility to safeguard this information and provide the public with visibility into the business continuity, incident response, and other critical resiliency plans. This is particularly relevant in sectors with strict regulatory compliance on issues such as cybersecurity and data privacy, such as the financial services sector. Financial services companies, particularly banks, are subject to a myriad of regulation and guidance governing how they must protect PII. These include:

- Regulation P of the Gramm-Leach-Bliley Act ("GLBA")
- The Fair Credit Reporting Act ("FCRA")
- Interagency Guidelines Establishing Information Security Standards
- The Bank Service Company Act
- Interagency Guidance on Third-Party Relationships: Risk Management
- The FFIEC IT Examination Handbook
- Applicable state laws and regulations

These requirements are in place not only to ensure safe and responsible use of confidential consumer information, but to ensure public trust in critical institutions that drive the U.S. economy.

As OMB considers standards and safeguards for the use of AI within federal agencies, it is critical that they consider the great lengths the private sector goes to protect this information. If federal agencies use AI with information that banks or other regulated entities are legally required to protect through adherence to certain standards, then federal agencies using the information must use the same standards as a baseline of protection.

Without similar standards, any use of consumer PII or financial data in agency-run AI will negate the efforts of thousands of community banks and other financial institutions in securing that data.

When developing standards for AI across federal agencies, OMB should consider the different uses, different risks faced, and different risk appetites across various industries. No industry, and thus no federal agency, will have the same uses and risks to consider.

In the financial services industry, the private sector via the Financial Services Sector Coordinating Council ("FSSCC") and the federal financial regulators, via the Federal and Banking Information Infrastructure Committee ("FBIIC"), work in close partnership with one another to enhance the resiliency of the sector to a myriad of threats. This unique partnership enables the sector to be a leader in the safe adaptation of new technologies.

For example, FSSCC and FBIIC have worked closely with Treasury on multiple workstreams related to the use of cloud services among the wide variety of financial services companies. These workstreams address critical issues, develop common definitions and lexicon, and consider other critical topics such as risk management and due diligence. These organizations have already begun work on AI and will continue to work closely to ensure solutions that meet both private and public sector needs are found. ICBA recommends the federal agencies look to partnerships such as this when considering models for the development of AI standards.

AI Use Case Inventories

The AI Executive Order directs each agency to annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency's website. ICBA supports this provision, as it will provide transparency to the public in how agencies are using AI. It will also provide the ancillary benefit of providing a clearinghouse of ideas for other agencies to adopt.

Of possible use cases, ICBA is optimistic that federal banking agencies will use AI in supervisory technology ("SupTech") that could reduce the burden of routine community bank reporting. Such a use case was explored in a Financial Stability Board white paper, which noted, "the use of SupTech could improve oversight, surveillance and analytical capabilities, and generate real time indicators of risk to support forward looking, judgement based, supervision and policymaking."[2]

An example of a viable SupTech use case is the Rapid Phased Prototyping Initiative ("RPP"), introduced by the FDIC in 2021. The RPP was announced as a new and innovative approach to financial reporting, intended to streamline and limit the laborious and manual processes required by banks to complete the quarterly Call Report, a goal sought by ICBA for more than a decade.

The RPP initiative was designed to accelerate the adoption of modern technological solutions to help the FDIC receive, manage, and analyze data from individual institutions, particularly community banks, without increasing compliance burdens. The lessons learned from the program were intended to promote the safe and sound adoption of these technologies, helping banks and supporting consumers in the process. The use of AI technologies was expected to be incorporated into the final prototype.

[2] "The Use of Supervisory and Regulatory Technology by Authorities and Regulated Institutions," Financial Stability Board, Oct. 9, 2020, *available at*: https://www.fsb.org/wp-content/uploads/P091020.pdf.

If implemented, RPP would have been a paradigm of agency innovation that would have increased the efficacy and efficiency of FDIC's supervisory resources. Unfortunately, the agency scrapped the RPP program after a change in leadership. However, in light of this Proposed Memo, ICBA is hopeful that the FDIC, as well as other federal banking agencies, are motivated to reconstitute programs that nurture the development of AI SupTech, similar to RPP.

Conclusion

ICBA welcomes OMB's work on this matter and appreciates the opportunity to provide comment. While Congress and this Administration are actively exploring issues related to the use of AI, ICBA will continue to look for opportunities to engage with policymakers on this important and growing topic. Should you have any further questions, please do not hesitate to contact me at Lance.Noggle@icba.org.

General Comment

In response to question 2:

The establishment of interagency working groups would be a flexible and instructional way to help agencies develop their AI governance capabilities. The participants of such interagency working groups could include not only agency experts in privacy, IT and data science, but also the AI specialists from such agencies as NIST. Since the application of generative AI is likely to vary significantly across the sectors governed by Federal agencies (e.g medical vs educational etc), multiple working groups would be needed. However, in order to ensure consistency, each working group could be tasked with working within the principles and approaches outlined in NIST's Generative AI Governance document once it is finalized. Asking the working groups to report out periodically to the National Security Council would ensure that AI governance continues to receive the appropriate visibility from agency leadership.

In response to question 3:

OMB could task agencies with beginning to collect and analyze data on the costs and benefits of possible future regulatory actions. This work would help OMB’s Office of Information and Regulatory Affairs ensure that the use of Generative AI is governed appropriately.

General Comment

Artificial intelligence is an emerging technology with enormous potential for both positive and negative impact, so I applaud the Biden-Harris administration for taking this step toward setting the direction of its future development. Preventing harm to the rights and safety of individuals is an important priority.

This executive order encourages agencies to implement AI only when doing so has benefits that outweigh the risks, and to manage the risks that occur from its use.

As an engineer with professional experience in automating physical systems, I have two comments on the role of non-AI automation (which the executive order describes as "systems whose behavior is defined only by human-defined rules"), alongside AI.

1. Need to incentivize other forms of automation over AI when it is better fit for purpose
Automation has considerable potential in improving the effectiveness of agencies. Agencies are instructed to assess the potential benefits of using AI automation. This assessment should not evaluate AI solutions in isolation, or only against legacy systems. AI solutions must be evaluated relative to non-AI automation solutions, which can provide many of the same benefits of increasing effectiveness and efficiency.

When a non-AI auotomation system provides comparable benefit to an AI system, agencies should be incentivized to use the non-AI automation system if it can be more rigorously tested, validated, and explained. Mature engineering and mathematical techniques exist for guaranteeing safety of non-AI automated systems.

AI systems are harder to validate for all conditions, since their ability to learn may cause them to depart from their test conditions. They also frequently lack explainability, which can hinder rigorous analyses.

I support the development of AI expertise by agencies and evaluating of automation solutions, but the evaluation of systems should include the full range of automation types, including non-AI, to find the most suitable solution.

2. Safety-impacting AI must have non-AI fail-safes
The executive order acknowledges the possibility of erroneous or harmful results from a rights-impacting AI system, and hence requires periodic human review and the provision of escalation mechanisms. For safety-impacting AI, especially those controlling physical systems, harmful AI actions may require a response too rapid for a human escalation system.

Fail-safes (such as limits on system variables like as the amount of kinetic force delivered) must be implemented. These fail-safes must be able to be rigorously analyzed and validated, and troubleshot in case of emergencies. Non-AI automation may suit this purpose because it is explainable. In general, fail-safe mechanisms are a teaming of AI, humans, and non-AI automation.

I urge the Biden-Harris administration to require the use of automated and human fail-safes for safety-impacting AI.

Thank you,
- Deepti Kannapan

OMB Comments on Advancing Governance Innovation and Risk Management for Agency Use of Artificial Intelligence Draft Memo

Comments of the
Recording Industry Association of America
on the Office of Management and Budget Request for Comment
on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Delivered via regulations.gov

December 5, 2023

The Recording Industry Association of America, Inc. ("RIAA") is pleased to provide these comments in response to the Office of Management and Budget ("OMB") Request for Comment on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum ("RFC").

The Recording Industry Association of America is the trade organization that supports and promotes the creative and commercial vitality of music labels in the United States, the most vibrant recorded music community in the world. RIAA's membership – which includes several hundred companies, ranging from small-to-medium-sized enterprises to global businesses – creates, manufactures, and/or distributes sound recordings representing the majority of all lawfully recorded music consumption in the United States. In support of its mission, the RIAA works to protect the intellectual property and First Amendment rights of artists and music labels; conducts consumer, industry, and technical research; and monitors and reviews state and federal laws, regulations, and policies.

As with other new technologies, the music community lives on the forefront of, and is building and inspiring, evolutions in artificial intelligence ("AI") technology. Music creators are already using AI to assist in the creative process and will increasingly do so, allowing for a wider range of people to express themselves creatively. However, we have also experienced harm from the unethical development and deployment of AI systems that unfairly exploit our artists' and our members' expression, creative contributions, names, images, voices, and likenesses without their consent and without compensation.

In light of this, we appreciate that OMB is taking a leadership role in ensuring the government, and in turn those AI companies that contract with the government, develop and deploy AI in a responsible and ethical manner. We hope the government's leadership will lead to further widespread implementation of responsible and ethical AI practices. With that in mind, we offer the following comments.[1]

Question 3 – How can OMB best advance responsible AI innovation?

Strong Copyright as a National Value. We thank the OMB for recommending that "[a]gencies should ensure that procured AI exhibits due respect for our Nation's values, is consistent with the Constitution, and complies with all other applicable law, regulations and policies, including those addressing privacy, confidentiality, copyright,

[1] We also urge OMB to review our comments on responsible and ethical AI development set forth in the June 12, 2023 Comments on the National Telecommunications and Information Administration AI Accountability Policy Report Request for Comment (available at https://www.regulations.gov/comment/NTIA-2023-0005-1277) ("NTIA Comments") the July 7, 2023 on the Office of Science and Technology Policy Request for Information on National Priorities for Artificial Intelligence at (available at https://www.regulations.gov/comment/OSTP-TECH-2023-0007-0231) ("OSTP Comments"), and the October 20, 2023 Comments on the Copyright Office Notice of Inquiry on Artificial Intelligence and Copyright (available at https://www.regulations.gov/comment/COLC-2023-0006-8833) ("CO Comments"). These include comments that are responsive to questions 3 and 5.

human and civil rights, and civil liberties."[2] This is an important guiding principle that should be reflected throughout the final Memorandum for the Heads of Executive Departments and Agencies on Advancing Government, Innovation, and Risk Management for Agency Use of Artificial Intelligence ("Final Memo").[3]

Data Provenance and Recordkeeping. We appreciate that OMB acknowledges the importance of ensuring the quality and appropriateness of the data used in the AI's design, development, training, testing and operation, and calls for documentation associated with such data.[4] Such due diligence and record keeping is an important pillar of responsible AI, and should also include diligence and information concerning any copyright or other intellectual property rights implicated by the use of such data or training materials. The National Institute of Standards and Technology AI Risk Management Framework ("NIST AI RMF") already recognizes the importance of this, stating that "[m]aintaining the provenance of training data and supporting attribution of the AI system's decisions to subsets of training data can assist with both transparency and accountability. Training data may also be subject to copyright and should follow applicable intellectual property rights laws."[5] To emphasize this point, we ask that you clarify in the Final Memo that risk considerations should include copyright and other intellectual property rights considerations generally, and that provenance documentation should include information about any licenses obtained to use training materials.

Initial and Ongoing Risk Assessment. We also agree with OMB that initial and ongoing risk assessments are important to ensure the responsible and ethical AI deployment.[6] As noted above, such risk assessment should also include assessments concerning possible infringements of intellectual property rights.

Transparency. We also thank OMB for recognizing the importance of transparency about an AI system through public, accessible documentation about the AI system's functionality.[7] Such transparency should also include relevant information (or the ability to access relevant information) about the provenance of training materials used to develop or fine tune the AI system.

Question 5 – Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5(b)) that should be included, revised, or removed? If so, why?

We encourage OMB to clarify that AI systems that are capable of "cloning" a person's likeness or voice fall within the definition of a "rights-impacting" AI. Such AI systems can be used in a variety of contexts that are harmful to a person's reputation and livelihood as well as to our national security interests.[8]

* * *

We thank OMB for the opportunity to provide these comments.

Regards,

/Victoria Sheckler/

SVP, Deputy General Counsel

Submitted via email to: regulations.gov

OMB–2023–0020, *Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Memorandum*

Dear Director Young,

On behalf of more than 500,000 members and supporters of Public Citizen, we offer the following comment on the Office of Management and Budget's (OMB) draft guidance[1] directing Federal agencies on artificial intelligence (AI) governance and innovation programs while managing risks from the use of AI. The stated intention of this draft guidance is to create new agency guidelines for AI governance, innovation, and risk management, by utilizing certain minimum risk management practices for AI use cases that affect the civil rights and safety of the public.[2]

Public Citizen has published several documents outlining our thoughts such as our generative AI[3]policy recommendations, and we have also filed a rulemaking petition[4] with the Federal Election Commission to prevent deepfakes in political ads. In addition, we are organizing numerous public meetings on AI topics with thought leaders and policy makers, an example being our recent bipartisan forum[5] discussing AI and the threats it poses to democracy. We now offer commentary on the proposed guidance's

guardrails/staff implementations and a recommendation to require all federal agencies to publicly release an inventory of their already existing AI regulatory authorities.

While AI may enhance government operations, particularly in scientific and research & development fields, the U.S. government's use of AI has the potential to be an enormous danger to our society unless regulators place significant guardrails in place. Establishing safety standards, implementing rules to prevent racial and other discriminatory practices, and adopting protections for people's rights and dignity is crucial both for governmental use of AI tools and to establish an example for the private sector.

We strongly support the proposed guidance's imposition of guardrails for the federal government's use of AI, particularly in the realm of generative AI use and algorithmic bias. We offer three proposals to strengthen the guidance: strengthening the labeling requirements for content produced with generative AI; modifying the power and responsibilities of the Chief AI Officers to ensure the safety and protective standards of the guidance are protected; and requiring agencies to publicly inventory their regulatory authorities relevant to AI.

A. The proposed labeling guardrails for generative AI use by the federal government are necessary but should be strengthened.

The OMB's decision to create generative AI usage guardrails is a step in the right direction. While generative AI may be able to help federal agencies streamline workflows, reduce operational costs, and make informed, data-driven decisions, this type of AI can also create havoc for our civil rights and negatively impact trust in our democracy.

The President's Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence and OMB's draft guidance correctly see the transformative and worrisome power of generative AI in outputting misleading or deceptive content. Generative AI has powerful potential to manipulate individuals, tailoring content based on user-specific data and even adjusting the mechanism of presentation, e.g., through individualized and customized avatars. This threatens both widespread manipulation and the destruction of social trust. The issue is particularly acute in civic spaces, where deepfakes have the potential to fundamentally and fraudulently impact policy debates and elections.

For example, generative AI can swamp societal discourse with misinformation. With AI's ability to generate highly realistic text, audio, and visual content, malicious actors will have the ability to manipulate information at an unprecedented scale. A recent deepfake

showed President Biden making transphobic remarks.[6] In Slovakia, a deepfake audio recording is reported[7] to have impacted the recent parliamentary election, with deepfake images also reportedly[8] affecting Argentina's just-concluded presidential election.

Left unchecked, these generative AI creations will negatively impact public trust, as it will become increasingly challenging for ordinary people to discern between authentic and manipulated content creations from federal agencies. The OMB draft guidance correctly identifies labeling, content authentication, and provenance tracking as vital solutions to the problem of deceptive AI-generated content.

AI labeling helps citizens to contextualize and process AI generated content. For example, after seeing a label stating that generative AI produced a video, the viewer can then decide to ignore or discount the content, seek additional non-AI sources about the content, or share it with their network while providing the context that AI created the content. Federal agencies must do all that they can to help citizens discern between authentic and AI generated content, and the guidance's labeling requirement is a good starting point toward that goal.

We applaud the guidance's encouragement to federal agencies include provisions in generative AI model procurement contracts requiring that procured systems have labeling and content provenance capabilities.[9]

But OMB should insist on more. First, OMB should require agencies, not just encourage them, to ensure that generative AI contracts include guarantees on labeling and provenance. Second, OMB should require that every federal agency label all content generated in part or entirely by AI. Third, it should set an expedited schedule for this standard. While it may take some time to establish industry standards for provenance and labeling, the federal government should never rely on AI to generate content without disclosing that fact.

B. The proposed AI bias guardrails contained in the guidance are welcome and much needed.

---

We strongly applaud the inclusion of AI bias guardrails in the proposed guidance because it shows the Biden Administration's commitment to ethical AI deployment. By acknowledging the risks of bias and discrimination in AI systems, OMB's emphasis on transparency, fairness, and accountability will hopefully serve as a north star to guide other AI stakeholders on how to address these issues in their own AI systems. We support the guidance's determination framework of safety-impacting and rights-impacting AI and the requirement of minimum practices when using these types of AI. These proposed guardrails not only address the ethical implications of AI but also will help build public trust in federal agencies' use of AI applications.

AI systems are susceptible to biases contained within their training data.[10] Some examples of these biases include race, gender, and income.[11] For example, a federal agency's resume review algorithm could drift (behaves in an unknown or unpredictable way that doesn't follow the original parameters) due to a data set input that shows a racial difference between applicants. This drift could result in the hiring algorithm becoming biased against a certain race. And this algorithmic based decision could lead to discriminatory hiring outcomes in federal agencies that end up reinforcing cultural stereotypes and leading to the maintenance or growth of societal divisions.

We have already seen numerous examples of biased algorithms in the private sector. Amazon found a hiring algorithm favored applicants based on words such as "executed" or "captured" that were more commonly found on men's resumes, and Google's online advertising AI system showed high-paying positions to men more than to women.[12]

To address and prevent bias in AI systems, federal agencies must take care in their use of AI training data and in programming its algorithms. They must also continuously monitor these systems to ensure fair and unbiased AI outputs. We are pleased to see that the proposed guidance requires federal agencies to implement several AI bias guardrails for safety-impacting and rights-impacting AI systems such as completing impact assessments, actively identifying and addressing elements that contribute to discriminatory or biased outcomes in algorithms, evaluating and minimizing unequal effects, utilizing inclusive and representative datasets, and seeking input and integrating feedback from the groups affected.[13] These guardrails will help protect citizens from the negative impacts of AI usage.

---

[10] IBM Data and AI Team, *Shedding light on AI bias with real world examples*, IBM (Oct. 16, 2023) https://www.ibm.com/blog/shedding-light-on-ai-bias-with-real-world-examples/
[11] Id.
[12] Id.
[13] *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence*, at pgs. 15-20 https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf

We particularly want to uplift the requirement to consult affected groups. We hope that this proposed guardrail is utilized to allow racial, ethnic, and other minorities to have a full seat at the table and take part in determining how AI is used by the federal government.

C. The proposed waiver power of the Chief AI Officers should be weakened, and conflicts of interest frameworks must be introduced to avoid corporate capture and the misuse of AI within federal agencies.

We understand that a centralized source of AI decision-making power and knowledge is justified for federal agencies. However, under the current proposed guidance, we fear that the discretionary power of the Chief AI Officer (CAIO) to grant waivers from safety and rights protection requirements is too great.

In the proposed guidance, in collaboration with other pertinent authorities, a federal agency's CAIO can grant an AI application or component a waiver from having to follow the guidance's minimum practices for safety/rights-impacting AI.[14] The CAIO can justify its waiver decision if it determines that meeting the AI minimum practices stipulation could elevate safety or rights risks in general or pose an unacceptable obstacle to vital agency functions.[15]

It is unclear what is meant by other pertinent authorities, and there is no definition of "unacceptable obstacle" included in the guidance. Additionally, we are concerned about the concept of a federal agency's CAIO granting a waiver to an AI use case that serves the agency's vital functions while harming the general public's rights. For example, the Department of Homeland Security's CAIO could grant a waiver for facial recognition AI usage for its operations and potentially not be blocked from doing that under the current guidance rules.

We urge the OMB to narrow the grounds for waiver, establish sharper standards for when a waiver is permitted, and institute other procedural protections, perhaps including obtaining authorization from OMB.

Additionally, the guidance should address concerns about the CAIO's interactions and relationships with the private sector. The potential for a CAIO coming directly from the AI industry is high due to the elevated level of technical expertise needed for this role. A CAIO's past work in the AI industry could lead to an increase in industry influence, conflicts of interest, and undue favoritism towards private entities because of the CAIO's

[14] *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence*, at pg. 13 https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf
[15] Id. at pg. 14

past relationships. We worry that any CAIO's industry past could compromise the public interest and trust in the process. The final OMB AI guidance must contain clear and stringent ethical guidelines, disclosure requirements, and conflicts-of-interest frameworks to prevent the CAIO from becoming a conduit for private industry interests. At minimum, the Biden Day One Ethics Executive Order standards[16] must be applied, but we would also recommend thinking about stronger safeguards due to the high likelihood of revolving door issues with these positions. For example, upon leaving public office, CAIOs should not be allowed to lobby on AI policy for one year or longer, and CAIOs must clearly and publicly report all contact or correspondence with private sector stakeholders.

D. To improve this guidance, OMB should require a public inventory from all federal agencies on their existing authority relevant to AI regulation.

To promote the public interest, OMB should update the proposed guidance to require federal agencies to publicly release a current inventory of their AI regulatory authorities that also contains ideas of how to strengthen or add on to them. The purpose of this inventory requirement would be to encourage agencies to study their existing authorities which may apply to AI and to help them think about where additional regulatory powers might be needed. This exercise should be done by agencies publicly, and would help Congress, civil society, and the public evaluate the adequacy of existing laws and prioritize new regulations where they are needed.

We welcome the OMB's proposed guidance in utilizing AI in a trustworthy and safe manner and look forward to working together to refine this guidance. For questions, please contact Richard Anthony at ranthony@citizen.org.

Sincerely,

Public Citizen

RE: OMB–2023–0020, Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Ms. Martorana,

On behalf of more than 225,000 registered nurses (RNs) who work as health care professionals in every state in the nation, including more than 14,000 nurses at 23 Veteran Affairs (VA) hospitals, National Nurses United (NNU) submits these comments in response to the Office of Management and Budget's (OMB) draft memorandum OMB–2023–0020, Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, 88 Fed. Reg. 75625 (November 3, 2023) (Draft Memorandum), implementing Section 10 of President Biden's Executive Order on artificial intelligence (AI Executive Order).[1]

While NNU is pleased that the Draft Memorandum includes "minimum practices" for safety-impacting and rights-impacting AI, as discussed below, we believe that they do not go far enough to protect the safety and rights of all those potentially affected. In particular, we are concerned with the potential for AI to harm the veterans for whom our members provide care and displace VA workers.

NNU is extremely concerned about the use of AI in health care. VA nurses are already experiencing the problematic effects of AI. The decisions to implement AI-driven technologies are typically made with little to no knowledge of either nurses or

[1] President Biden. October 30, 2023. Executive Order 14110. Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence.

patients, putting both at risk of negative safety and rights impacts. AI is being used to replace registered nurses, who have the education and clinical experience necessary to effectively exercise professional judgment in patient care, with lower cost staff following AI-generated prompts. However, each patient is unique and health care is made up of non-routine situations that require human intelligence and perception as well as empathy and kindness. Thus, nursing and medical care should be provided by licensed health care professionals who can discern whether or not AI-generated guidance is appropriate for a particular patient.

NNU provides a detailed, though not exhaustive, discussion of our many concerns with OMB's Draft Guidance.

Sincerely,

Michelle Grisat
Director of Health and Regulatory Policy
National Nurses United

I. OMB should prioritize the Precautionary Principle in the final memorandum to ensure agencies act responsibly in implementing AI. (RFC question 3)

NNU urges OMB to apply the Precautionary Principle, a key concept in public health, to federal agency use of AI, in addition to minimum practices that uphold the rights and safety of federal employees and the public. According to Harvard University Professor A. Wallace Hayes, the Precautionary Principle is the proposition that, "When an activity raises threats of harm to human health or the environment, precautionary measures should be taken even if some cause-and-effect relationships are not fully established scientifically."[2] The deployment of AI raises significant threats of harm to human health as OMB has acknowledged in its provisions regarding AI's health-related impacts throughout the Draft Memorandum.[3]

Contrary to the Precautionary Principle, the Draft Memorandum's use of phrases such as "promoting AI innovation" and "advancing AI maturity" suggests that agencies should implement AI swiftly. Making AI implementation a goal in itself encourages agencies to short-cut the process of considering all alternatives to address any given need. It treats rights and safety protections as an afterthought. It also creates the unfortunate appearance that lobbying by the tech industry is directing the administration's priorities. Instead of focusing on a single type of technology and telling agencies to find ways to implement it, OMB should focus its final memorandum on the risks of this emerging technology and on the precautions agencies must take to protect safety and rights if they choose to implement AI because it is the best tool for a particular need. Precaution is especially important for AI implementation in the context of health care, specifically in VA hospitals and facilities, as discussed further in Section II. of our response.

A. OMB should direct the agencies to wait for relevant agency and department actions to be completed, as set forth in the AI Executive Order, before moving forward with the removal of so-called barriers to the use of AI.

The AI Executive Order sets forth numerous administrative and regulatory actions that must be completed by government agencies in the coming months and years to guide the initial implementation of AI and ensure that it is safe, secure,

---

[2] Hayes, A.W. The precautionary principle. Arh Hig Rada Toksikol. 2005 Jun;56(2):161-6. PMID: 15968832.

[3] *See*, for example, OMB. Draft Memorandum. Sec. 5.b.ii., p. 12.

trustworthy, and well-understood before they are introduced. These actions can only serve their intended purpose if they are completed before the government begins the process of "removing barriers to the use of AI."[4] Some barriers to implementation may be necessary safeguards with dangerous consequences if they are removed. There is no way to know which barriers are safe to remove without a clear understanding of (1) how AI will be implemented, (2) the regulatory framework in which it will exist, and (3) how implementation will affect the individuals and interrelated systems that must interact with the AI system. For this reason, the final memorandum should specify that no barriers to implementation of AI will be removed until after the relevant federal government actions specified in the AI Executive Order for ensuring the safe, secure, and trustworthy implementation of AI technology are completed.

The AI Executive Order includes instructions for numerous agencies to undertake preparatory work to protect workers and the public. For example, as discussed further in Section II., the AI Executive Order calls for the establishment of a Health and Human Services AI Task Force that will develop a strategic plan that includes policies, frameworks, and potential regulatory action, on "responsible deployment and use of AI and AI-enabled technologies in the health and human services sector."[5] The express purpose of developing this strategic plan is to "protect American consumers from fraud, discrimination, and threats to privacy and to address other risks that may arise from the use of AI."[6] These goals can only be achieved if the plan is in place before the rollout of AI, including generative AI.

The AI Executive Order also instructs federal agencies "to prevent and address unlawful discrimination and other harms that result from uses of AI,"[7] in federal programs and benefit administration. Furthermore, it includes crucial instructions for the Secretary of Labor to create principles and guidance to protect workers during AI implementation.[8]

The work required in the AI Executive Order to protect public safety, civil rights, equity, workers' rights, appropriate provision of benefits, and other essential rights and government functions must be completed before AI implementation moves forward.

---

[4] *See* OMB Draft Memorandum, Sec. 4.b., p. 8.
[5] Sec. 8.b.i.
[6] Sec. 8.a.
[7] Sec. 7.2.a.
[8] Sec. 6.

Removing barriers to AI before this protective work is completed would be reckless and misguided. The final OMB memorandum should instruct agencies to not begin removing barriers to AI implementation, or moving forward with implementation, until after the preliminary executive actions set forth in the AI Executive Order to ensure safety, security, and trustworthiness have been completed.

B. OMB should provide agencies with additional guidance on hiring Chief Artificial Intelligence Officers (CAIOs) who will prioritize safety and rights protections over rushed AI implementation.

It is essential that agencies hire Chief Artificial Intelligence Officers who will prioritize safety and rights protections over the drive to implement AI. To ensure the correct set of priorities for a person in this role, OMB must change the structure of the role in the final memorandum and give agencies guidance on hiring individuals without conflicts of interest due to ties to AI industry.

The Draft Memorandum makes the CAIO in each agency responsible for both advocating for AI in the agency and to the public as well as managing risks from the use of AI. There is a conflict inherent in requiring the CAIO to advocate for AI when an honest exercise of the minimum protections for safety and rights may find that it is not safe, rights-respecting, or effective to implement AI in any given agency or use.

Moreover, there is a serious risk that CAIOs, who need to have AI expertise, will be hired from the same AI industry that is trying to sell AI systems to federal agencies. Similarly, someone in this role could look forward to a high-paying job in the industry when they leave, particularly if they push agencies to procure high-dollar AI. This type of revolving door for regulators from and back into industry is a serious problem in many government agencies. There is also a common misconception that only AI companies understand the technology or can speak about the future of AI, leading political leaders and regulators to overvalue the opinions of tech executives over those of people impacted by the technology. Therefore, OMB should give the agencies guidance on how to manage the risk of undue influence from AI companies on CAIOs. OMB should also urge agencies to hire CAIOs with a strong background in safety and rights advocacy and not individuals with conflicts of interest from recently working for, or being funded by, tech companies.

C. OMB should remove agency directives regarding "AI maturity" that encourage agencies to prioritize accelerated AI adoption over the safety- and rights-protecting approach required by the AI Executive Order.

NNU is concerned that OMB directs agencies to pursue AI strategies that conflict with the Precautionary Principle and exceed the narrower scope of responsible AI implementation under the AI Executive Order. For example, in the Draft Memorandum, OMB directs agencies to develop a strategy "for removing barriers to the responsible use of AI and achieving enterprise-wide advances in AI maturity."[9] OMB defines AI maturity as the government's "capacity to successfully and responsibly adopt AI into their operations and decision-making across the organization."[10] However, the AI maturity framework conflicts with the Precautionary Principle and unreasonably expands beyond the limited scope of what constitutes responsible AI implementation under the AI Executive Order. AI will not be an appropriate tool for operations and decision-making in many parts of the government and rushing investment in AI maturity risks wasting resources and impeding government activities as every agency tries to press AI into service where it may not be the best tool.

Furthermore, the AI maturity framework does not originate from the AI Executive Order. Instead, the term has roots in the private sector and appears related to the "AI Capability Maturity" framework from the General Services Administration's (GSA) "AI Guide for Government." According to the GSA's guide, the AI Capability Maturity framework advances objectives related to "quick AI adoption and broader enterprise business goals."[11] While the AI Executive Order directs OMB to develop a method for agencies "to track and assess their ability to adopt AI into their programs and operations,"[12] the objectives underlying the AI maturity framework seek to accelerate the total implementation of AI across all agency operations. These objectives run counter to the Precautionary Principle, as well as the rights and safety principles under the AI Executive Order.

---

[9] Sec. 4.a., p. 8.

[10] Sec. 6., p. 22.

[11] Centers of Excellence, U.S. General Services Administration. "AI Guide for Government: A Living and Evolving Guide to the Application of Artificial intelligence for the U.S. Federal Government." Last accessed 11/21/2023. https://coe.gsa.gov/coe/ai-guide-for-government/print-all/index.html

[12] President Biden. October 30, 2023. Executive Order 14110. Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence. Sec. 10.1(c).

Thus, the AI maturity framework substitutes the AI Executive Order's deliberate, precautionary approach that prioritizes rights and safety, in pursuit of short-term "efficiencies"[13] from the implementation of AI. Therefore, OMB should remove language related to achieving "AI maturity" given that it encourages agencies to accelerate AI adoption in all of its operations, even when doing so may lead to failure to comply with minimum practice requirements for rights- and safety-impacting AI use.

II. OMB should treat the use of AI in health care as both safety- and rights-impacting. (RFC question 5)

A. OMB should treat AI in health care with particular caution given the demonstrated patient harm, including increased morbidity and death.

Numerous types of problematic AI technologies have already been implemented in health care facilities, including clinical decision support systems embedded in electronic health records (EHRs). AI technologies are also being deployed in acute hospital care at home and remote patient monitoring schemes, virtual nursing, automated worker surveillance and management systems, and staffing platforms that support gig nursing.[14] Some of them have been deadly.

According to a 2022 report by the Department of Veterans Affairs Office of the Inspector General (VA OIG), the Veterans Health Administration identified more than a thousand patient safety events related to the new Cerner electronic health record system, implemented at just three facilities, from October 24, 2020, through May 8, 2022.[15] These patient safety events included one "catastrophic" event, defined as "death or major permanent loss of function," and two "major patient harms" that involved

[13] *See*, for example, OMB Draft Memorandum, Sec. 4.

[14] NNU has written extensively on problems related to these technologies, including responses to federal agencies' requests for information. *See* Attachment A, 2023 OSTP_FRDOC_0001 RFI AWS&M National Nurses United Comments and the attachments referenced therein:

"permanent lessening of bodily functioning."[16] Since the publication of the VA OIG's report, the VA briefed Senate committee staff on the ongoing Cerner EHR project, including that six patients have experienced "catastrophic" harm related to the rollout, resulting in four deaths.[17] This example demonstrates the dangers of rushing the implementation of new technology in health care settings. Thus, the VA must not implement new AI systems without rigorous testing using improved minimum practices, as discussed below in Section V., and should swiftly apply improved minimum practices to current technology.

Ensuring that AI and AI-enabled technologies are safe, secure, and trustworthy *before* they are implemented in real-world practice is particularly important in the health care setting. While the failure of AI may result in wasted time or administrative inconvenience in some federal agencies, in health care, it can cost lives. The federal government, generally, and HHS and the VA, in particular, have a duty to ensure that patient harm, such as avoidable injuries and death, or unequal treatment for specific populations and protected classes, are avoided to the fullest extent possible. However, this can only be accomplished if necessary preparatory work, such as the policies, frameworks, and regulatory structures that are included in the same, are *already in place* at the time AI is introduced in health care settings. Removing "barriers" to the implementation of such technologies before these protective structures are in place prevents them from serving their intended purpose of ensuring that AI technologies are safe, secure, and trustworthy.

In addition to the HHS AI Task Force, the AI Executive Order includes other preliminary actions that must be completed by the Secretary of HHS and the Secretary of VA to ensure that the introduction of AI in health care spaces is safe, secure, and trustworthy. For instance, the AI Executive Order instructs the Secretary of HHS to develop an "AI safety program" in conjunction with the Secretary of VA.[18] This safety program must establish

[16] https://www.oversight.gov/sites/default/files/oig-reports/VA/VAOIG-22-01137-204.pdf - accessed November 27, 2023

[17] Hewitt Jones, J. and Krishan, N. 2023, Mar. 16. VA electronic health record system linked with 6 cases of 'catastrophic harm' including 4 deaths. https://fedscoop.com/va-ehr-six-cases-catastrophic-harm/ - accessed November 27, 2023

[18] Sec. 8.b.iv.

> a common framework for approaches to identifying and capturing clinical errors resulting from AI deployed in healthcare settings as well as specifications for a central tracking repository for associated incidents that cause harm, including through bias or discrimination, to patients, caregivers, or other parties.[19]

It must also establish systems for analyzing this data and making recommendations and suggesting best practices.[20] Likewise, the AI Executive Order instructs the HHS Secretary to develop a strategy "to determine whether AI-enabled technologies in the health and human services sector maintain appropriate levels of quality," and to "develop a strategy for regulating the use of AI or AI-enabled tools in drug-development processes."[21] Again, it is clear here that the work of creating a safety program and developing strategies to address quality-control and the use of AI in drug development are intended to be done *before* the process of introducing new AI into health care settings commences.

OMB acknowledges in the Draft Memorandum that deployment of AI raises significant threats of harm in health care settings. For example, in Section 5.b.ii.H., OMB outlines the following health care decisions as examples of rights-impacting AI:

> Decisions regarding medical devices, medical diagnostic tools, clinical diagnosis and determination of treatment, medical or insurance health-risk assessments, drug-addiction risk assessments and associated access systems, suicide or other violence risk assessment, mental-health status detection or prevention, systems that flag patients for interventions, public insurance care-allocation systems, or health-insurance cost and underwriting processes.[22]

Federal agencies utilizing health care AI must ensure that it is safe, effective, and therapeutic for both a specific patient population and the health care workforce engaging with these technologies before they are deployed in real-world care settings.

---

[19] Sec. 8.b.iv.A.
[20] Sec. 8.b.iv.B.
[21] Sec. 8.b.ii and v.
[22] P. 12.

Problems with AI go beyond the myriad rights-impacting racial, gender, and age-based biases for specific patient populations.[23] As each patient has unique traits, needs, and values, no AI can be sufficiently fine-tuned to determine the appropriate diagnostic, treatment, and prognostic information for each individual patient. Because each patient is unique, using "representative data," as specified in Draft Memorandum Section 5.c.v.a.3.,[24] is insufficient to protect patients from being harmed by health care AI. Thus, OMB should direct federal agencies to obtain patients' informed consent for the use of AI in their diagnosis, treatment, and prognosis, including notification of any clinical decision support software being used.[25] Additionally, clinicians, including RNs, must be allowed to override AI when it is in the best interest of the patient and within their scope of practice. Finally, liability for any patient harm associated with failures or inaccuracies of automated systems must be placed on both AI developers and federal agencies deploying them.

Finally, NNU is extremely concerned about the use of generative AI in health care. Problems with generative AI include the opacity in the manner that generative AI systems "learn" which may function as a black box, even to the developers of the systems.[26] As a result, generative AI systems may have hidden capabilities that their developers and users did not anticipate and might not be aware of.[27] Additionally, generative AI has been shown to "hallucinate," simply making up inaccurate

---

[23] *See* Attachment 4, NNU Comments AHRQ Algorithms Intro Racial Ethnic Bias.

[24] P. 19.

[25] OMB should also direct agencies to obtain informed consent from patients before collecting or using their data, even in deidentified form. There are often sufficient data points to reidentify supposedly de-identified patient information..

[26] *See* Blouin, L. 2023, Mar. 6. "AI's mysterious 'black box' problem, explained." https://umdearborn.edu/news/ais-mysterious-black-box-problem-explained - accessed December 4, 2023. Explaining the black box problem, "If, for example, an autonomous vehicle strikes a pedestrian when we'd expect it to hit the brakes, the black box nature of the system means we can't trace the system's thought process and see why it made this decision."

[27] *See*, for example, Pearson, J. 2023, Nov. 29. "ChatCPT Can Reveal Personal Information From Real People, Google Researchers Show." https://www.vice.com/en/article/88xe75/chatgpt-can-reveal-personal-information-from-real-people-google-researchers-show - accessed December 4, 2023. Reporting that "memorized data extracted by the researchers included academic papers and boilerplate text from websites, but also personal information from dozens of real individuals." information without a clear basis or reason for doing so.[28] As these examples demonstrate, generative AI systems are prone to serious errors that can directly impact the safety and rights of patients, if such systems are adopted by agencies that provide health care. OMB should therefore advise the federal agencies to refrain from adopting generative AI technology unless and until these serious deficiencies are resolved.

B. Infringement by AI and other AI-enabled technologies on nursing practice are harmful to patients.

Registered nurses have extensive education and clinical experience that enables RNs to provide safe, effective, and equitable patient care. These standards of nursing care can only be accomplished through continuous in-person patient assessments by a licensed registered nurse. Every time RNs interact with a patient, they perform skilled assessments and evaluations of the patient's overall condition. These assessments are fundamental to ensuring that the patient receives optimal care. Health care is not one-size-fits-all. Nurses must be able to alter expected treatment plans based on the unique circumstances of the patient and the patient's wishes and values and to use their experience and nursing judgment to provide the best course of care. Indeed, they are ethically and legally required to do so. Yet nurses may be pressured by management to conform to decisions made by AI that are prone to racial and ethnic bias as well as other errors that arise when one utilizes information based on a population that is not appropriate for particular individuals. In sum, clinicians must have the legal right to override AI. For RNs, this means the right to determine nurse staffing and patient care based on their professional judgment.

Although health care AI is ostensibly designed to improve patient care, it frequently incorporates data generated by worker and patient monitoring technology with the goal of lowering labor costs. AI technologies then use this data to make unreasonable and inaccurate decisions about patient acuity, staffing, and clinical care. As a result, nurses and other health care professionals are expected to work faster, accept more patients per nurse than is safe, and reduce nurses' use of independent

[28] *See* O'Brien, M. 2023, Aug. 1. "Chatbots sometimes make things up. Is AI's hallucination problem fixable?" https://apnews.com/article/artificial-intelligence-hallucination-chatbots-chatgpt-falsehoods-ac4672c5b06e6f91050aa46ee731bcf4 - accessed December 4, 2023. Quoting Emily Bender, a linguistics professor and director of the University of Washington's Computational Linguistics Laboratory, "This [hallucination problem] isn't fixable, … It's inherent in the mismatch between the technology and the proposed use cases."

professional skill and judgment. AI also utilizes patient and staff tracking data to facilitate routinization—breaking the holistic process of nursing into discrete tasks—with the goal of replacing educated registered nurses exercising their professional judgment with lower-cost staff following AI prompts. According to a report by the VA, the new Cerner electronic health record problematically resulted in "[n]urse orders defaulting to clinical algorithm instead of proposed orders".[29]

Nurses are already experiencing the degradation and devaluation of nursing practice through the use of AI technologies that have been implemented in recent years. For example, health care employers are using AI embedded in EHRs to replace RN judgment by automating the creation of nursing care plans and assigning patient acuity levels. RNs develop the nursing skill and judgment necessary to accurately evaluate a patient and create an effective care plan through education and experience in the clinical setting. RNs' human skill and judgment cannot be replaced by AI without serious consequences for safe patient care.

Thus, AI as it is being implemented by employers in health care is dangerous to nurses and patients. OMB's final memorandum should include all forms of AI in health care in the list of presumptive safety and rights-impacting AI subject to minimum protections and should not push the VA to implement AI that degrades nursing practice and puts patients at risk.

III. OMB should strengthen worker protections in the final memorandum. (RFC question 3)

A. OMB should direct agencies to refrain from implementing AI systems until the Secretary of Labor completes the work required in the AI Executive Order.

For the reasons outlined in Section I, NNU strongly urges the OMB to require that agencies refrain from implementing new AI until the Secretary of Labor completes the principles, best practices, and guidance called for in Section 6 of the AI Executive Order and these practices are fully incorporated into agency AI adoption plans. The AI Executive Order requires heads of agencies to consider encouraging the adoption of

[29] Veterans Health Administration, Department of Veterans Affairs. 2023, Mar. EHRM Sprint Report. https://www.veterans.senate.gov/services/files/5B5776E7-8765-4303-9B93-D2BCBF8D5A33 - accessed November 27, 2023

these guidelines into their programs. These documents are designed to "mitigate AI's potential harms to employees' well-being and maximize its potential benefits" and to ensure compliance with the Fair Labor Standards Act and other laws. Agencies could cause serious harm to workers by rushing implementation ahead of the adoption of best practices and guidance from the Secretary of Labor.

B. OMB should direct agencies to bargain with union workers regarding the development and use of AI in federal agencies.

NNU urges OMB, in the strongest possible terms, to strengthen requirements on union and worker participation to bring the final memorandum in line with President Biden's commitment to union workers and making the federal government a model employer.[30] The AI Executive Order Section 2.c. states:

> As AI creates new jobs and industries, all workers need a seat at the table, including through **collective bargaining**, to ensure that they benefit from these opportunities. … The critical next steps in AI development should be built on the views of workers, **labor unions**, educators, and employers to support responsible uses of AI that improve workers' lives, positively augment human work, and help all people safely enjoy the gains and opportunities from technological innovation.[31]

Despite language supporting collective bargaining and union involvement in the development and use of AI in the AI Executive Order, the phrase "collective bargaining" does not appear in OMB 's Draft Memorandum. Moreover, the word "union" comes up only once, in Section 5.c.v.B., which states: "Agencies are strongly encouraged to solicit feedback on an ongoing basis from affected groups, such as customers, Federal employee groups, and employees' union representatives,

---

[30] The White House. 2023, Sep. 1. FACT SHEET: Ahead of Labor Day, Biden-Harris Administration Announces New Actions to Empower Workers— Building on the President's Historic Support for Workers and Unions. https://www.whitehouse.gov/briefing-room/statements-releases/2023/09/01/fact-sheet-ahead-of-labor-day-biden-harris-administration-announces-new-actions-to-empower-workers-building-on-the-presidents-historic-support-for-workers-and-unions/ - accessed November 17, 2023.
OPM. Worker Empowerment. https://www.opm.gov/labor-management-relations/ - accessed November 17, 2023

[31] Emphasis added.

particularly after significant modifications to the AI or the conditions or context in which it is used."[32]

NNU strongly urges OMB to direct agencies to collectively bargain with workers who are represented by a union regarding AI that may affect them—beginning with the decision of whether to implement AI, during all phases of implementation, and while in use—rather than merely encouraging agencies to "solicit feedback" after modifications to AI that is currently in place. Where workers are not represented by a union, NNU urges OMB to encourage a robust worker participation process. The requirement to engage in collective bargaining and worker participation should apply to all uses of AI, not just those that are deemed safety- or rights-impacting. See Section V., below, for further discussion of involving workers and the public in decisions on safety and rights-impacting AI.

C. OMB should strengthen language directing agencies to protect workers from the potential negative impacts of AI.

As discussed in Section II., NNU opposes substituting AI or other AI-enabled technology for RN judgment because of the likelihood of harming both patients and nurses. Where AI can be used safely and not infringe on the rights of those affected, NNU strongly urges OMB to specify in the final memorandum ways that agencies can provide workers displaced or experiencing other economic effects of AI in their workplaces the training, support, resources, and pathways to transition into good union jobs.

The Draft Memorandum offers little specific direction to agencies regarding the current workforce. The strongest direction it provides is:

> Agencies should provide resources and training to develop such AI talent internally and should also increase AI training offerings for Federal employees, including opportunities that provide Federal employees pathways to AI occupations and that assist employees affected by the application of AI to their work.[33]

[32] P. 19.
[33] Sec. 4.b.iv., p.9.

Beyond this, the Draft Memorandum states that agencies "must identify … context-specific risks," including "potential harms to worker wellbeing," and encourages agencies "to promote and to incorporate … the workforce principles" established pursuant to Section 6 of the AI Executive Order.[34] Yet these workforce principles cannot be promoted and incorporated until the Secretary of Labor completes the work necessary to "develop and publish [these] principles."[35] Thus, reiterating NNU's recommendation in Sections I.A. and III.A. above, OMB should direct agencies to refrain from implementing new AI until all requirements laid out in the AI Executive Order have been completed.

IV. OMB should strengthen public accountability and transparency provisions. (RFC question 3, 8)

NNU urges OMB to strengthen all provisions in the Draft Memorandum related to transparency and public release of information. Transparency is essential to government accountability. Therefore, OMB must prohibit agencies from adopting any AI that does not allow for full transparency, whether for technical or contractual reasons, and require agencies to prioritize transparency. Currently, health care AI corporations institute gag clauses on users' public discussions of any issues or problems with their products or cloak the workings of their products in claims of proprietary information. Such gag clauses must be prohibited in AI used by federal agencies.

Under Section 10.1.e., the AI Executive Order directs OMB to provide agencies guidance "[t]o improve transparency for agencies' use of AI" and "expand agencies' reporting on how they are managing risks from their AI use cases." To ensure transparency and public participation, OMB should require agencies to provide notice of AI documentation through the Federal Register under the Administrative Procedure Act notice and comment procedures. The required AI documentation should enable the public to learn when agencies are using AI systems, inspect and assess those systems, and demand responses about their use, such as external auditing and oversight. Therefore, OMB should require agencies to publish the AI system's underlying source code, training data, and provide both a technical and plain language explanatory analysis of the AI system and its components.

[34] Sec. 5.c., p.13.
[35] AI Executive Order, Sec. 6.b.i.

Further, OMB should remove all language that provides for agency discretion over which required AI documentation to make available to the public, including the following provisions.

- "Agencies must only publicly report use cases *to the extent practicable*."[36]
- "*Where practicable*, agencies should include this documentation or link to it in contexts where people will interact with or be impacted by the AI."[37]

It is unclear what qualifies as "practicable." OMB should make clear that practicability or other administrative burdens do not override requirements to comply with public reporting and other transparency requirements. Therefore, OMB should remove any language related to practicability in the final memorandum that would potentially excuse agencies from fulfilling these requirements. Finally, NNU strongly urges OMB to ensure that agencies do not adopt any AI system that does not allow for full transparency and documentation into how it works—either for technical reasons or due to contractual requirements meant to protect proprietary information.

As discussed further in Section V. of these comments, OMB should strengthen provisions related to consultations with groups affected by AI and other end-users. In Section 5.c.v.B., OMB directs agencies to "take adequate steps to solicit input" before enumerating a list of possible actions. However, OMB does not require agencies to take any of these actions, thereby conferring upon agencies broad discretion over which actions would be "adequate." Therefore, OMB should require agencies to, at minimum, publish a Request for Information in the Federal Register to ensure public participation *and* conduct public hearings regarding AI deployment.

Finally, OMB should use the AI Executive Order's definition of AI to ensure transparency. In Section 3.(b), the AI Executive Order sets forth a definition of AI based on the National Artificial Intelligence Initiative Act of 2020.[38] Yet in Section 6 of the Draft Memorandum, OMB sets forth a different definition of AI based on earlier legislation that Congress specifically directed for use by the Department of Defense.[39] The AI Executive Order defines AI as "a machine-based system that can, for a given set of human-defined objectives, make predictions, recommendations, or decisions influencing real or virtual environments" and includes systems that "abstract such

[38] 15 U.S.C. 9401(3)
[39] Sec. 238 of the John S. McCain National Defense Authorization Act for Fiscal Year 2019. Pub. L. No. 115-232, § 238 (2018).

perceptions into models through analysis in an automated manner."[40] This definition is broader than OMB's definition which excludes "robotic process automation *or other systems whose behavior is defined only by human-defined rules*."[41] OMB creates ambiguity as to what systems the required minimum practices apply to, and thus undermines the AI Executive Order and its transparency goals given the lack of a clear definition of AI. Therefore, OMB should use the AI Executive Order's definition of AI to ensure transparency so that the public can hold agencies accountable for their AI use.

V. OMB should strengthen minimum practices for safety- and rights-impacting AI. (RFC question 3, 5, 6, 8)

Respecting rights and ensuring safety must always be agencies' top priorities when considering AI implementation. The Draft Memorandum says that "[t]he expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, agencies should not use the AI." OMB should make it clear that there is no balancing test that justifies unlawful discrimination or harmful bias against protected classes in government operations, taking away benefits that people are entitled to, or putting lives at risk. Safety and rights cannot be weighed against cost or efficiency concerns. As discussed in Section I., above, in addition to use of the minimum practices, the OMB should be clear that agencies should wait for the results of the studies and plans required in the AI Executive Order before implementing new AI. Waiting for these reports to be completed is essential to ensuring a full understanding of the threats to safety and rights in each context. Review of existing AI should begin immediately and be repeated when more information is available.

A. Most agency uses of AI are safety- and rights-impacting. (RFC question 5)

There are very few, if any, government functions that can be replaced by AI without impacting the safety or rights of government workers and the public. Therefore, NNU urges OMB to ensure that the final memorandum's lists of practices presumed to be safety- or rights-impacting are thorough. OMB must be careful in its final memorandum and its future monitoring of agencies to ensure that the minimum practices for safety- and rights-impacting AI are applied widely to government use of AI. For example, OMB should add a definition to "workplace surveillance and

[40] Sec. 3.(b).
[41] Sec. 6., p. 23. Emphasis added.

management technologies" that makes it clear that any system that collects data on workers or has any impact on how, when, and whether they work will be included as rights-impacting AI. OMB should also include any AI system used by a health care provider, like the Veterans Health Administration, in the lists of safety and rights-impacting AI. As explained further in Section II., a wide range of AI systems have been implemented in health care settings and virtually all of them affect patients' and workers' safety and rights. In the Draft Memorandum, OMB has rightly made clear that the list of examples is not exhaustive—this should be retained in the final memorandum.

B. OMB should remove the waiver authority conferred upon Chief Artificial Intelligence Officers. (RFC question 3, 6)

The waiver authority that OMB confers upon the CAIO in the Draft Memorandum is dangerous and conflicts with the primacy of safety and rights under the AI Executive Order and in anti-discrimination statutes. By granting waiver of the minimum practice requirements, OMB effectively enables agencies to waive people's rights and disregard their safety.

A single person should not have the power to decide that respecting rights and preserving safety are "unacceptable impediment[s] to critical agency operations."[42] That is doubly true if that person has a vested interest in getting AI into agencies, which Section I.B. explains is a risk associated with the current CAIO structure and likely candidates. Yet under Section 5.c.iii., OMB confers upon the CAIO the authority to waive the minimum practice requirements for AI use that falls under the rights- or safety-impacting presumptions, if the CAIO makes a written determination "based upon a system-specific risk assessment," that compliance with the requirements would "increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations."[43] However, none of the legal authorities that OMB cites supports such a waiver power. Given that there is no basis for the CAIO's authority to waive minimum practice requirements in either the AI Executive Order or the AI statutes, OMB's granting of this authority has exceeded the scope of these laws.

When issuing interpretive guidance, agencies must interpret an executive order in a manner consistent with the order's object and policy. *San Francisco v. Trump*, 897

[42] Sec. 5.c.iii., p. 14.
[43] P. 14.

F.3d 1225, 1242 (9th Cir. 2018); *Bassidji v. Goe*, 413 F.3d 928, 934 (9th Cir. 2005). The AI Executive Order clearly states as one of its principles that AI policies "must be consistent with my Administration's dedication to advancing equity and civil rights. My Administration cannot – and will not – tolerate the use of AI to disadvantage those who are already too often denied equal opportunity and justice."[44] Further, the Biden administration sought "to ensure that AI complies with all Federal laws and to promote robust technical evaluations, careful oversight, engagement with affected communities, and rigorous regulation."[45] The AI Executive Order then directed OMB to provide guidance for agencies that "required minimum risk-management practices for Government uses of AI that impact people's rights or safety."[46] To this end, the AI Executive Order directed OMB to enumerate "specific Federal Government uses of AI that are presumed by default to impact rights or safety."[47] As the text makes clear, the Biden administration issued the AI Executive Order to rigorously regulate agencies' use of AI by requiring minimum risk-management practices for AI presumed to impact the rights and safety of the people.

Conferring waiver power to CAIOs for these minimum practices requirements contradicts the safety, civil rights, and public interest principles that the AI Executive Order requires agencies to adhere to, as well as the order's clear directives to OMB. Moreover, it upends the balance between responsible use of AI and protecting people's rights and safety that the AI Executive Order is seeking to strike. Indeed, the requirements to issue a waiver would only be met if agencies have ignored necessary safeguards while implementing AI. As explained further in the next section, agencies must not create a situation where compliance with minimum practices to protect safety and rights would "create an unacceptable impediment to critical agency operations."[48] It is unclear what situations OMB envisions in which adhering to the minimum practices would increase risk to safety and rights overall. However, if a system cannot be implemented with minimum practices in place, then it should not be implemented at all.

In sum, given the inconsistency between the text of the AI Executive Order and the Draft Memorandum, OMB should remove language related to waiver or any

[44] Sec. 2.d.

limiting power in all relevant sections of the document, including Section 3.b.ii.O. on page 6, Section 5.b. on page 11, and Section 5.c.iii. on page 14.

C. The minimum practices must be maintained and enforced, with an emphasis on maintaining the ability to stop using AI without seriously disrupting agency activities. (RFC question 6)

The steps outlined by OMB to analyze the safety and rights impact of potential AI uses are critical and must be maintained and enforced. There are many ways in which AI can impact safety and rights, either immediately upon rollout or as the effectiveness of the system degrades over time. Human review is essential but not a sufficient fix for biased AI. The Draft Memorandum acknowledges the issue of automation bias.[49] Human workers also are often constrained by institutional factors that pressure them to make decisions quickly and to justify deviation from the AI result, both of which favor following AI recommendations over delving into how the system reached that conclusion and whether it is justified in law or practice.

The Draft Memorandum appropriately requires agencies to stop using AI when risks to safety and rights cannot practicably be mitigated.[50] It also requires agencies to consider the expected benefits and potential risks of a system before using it, to test the system thoroughly in its intended context, to get an independent evaluation, and to conduct ongoing monitoring and testing over time.[51] All of these steps are important.

However, these steps will not be practicable if agencies cannot decommission systems without disrupting essential government functions. OMB should stress that agencies should avoid implementing systems that cannot practicably be quickly decommissioned in the event that their performance degrades or bias arises later. In the health care context, predictive algorithms have been widely deployed, but researchers have discovered that their performance degrades over time due to issues including data drift, where input data changes over time, and feedback loops where the use of the AI changes the data that is used to retrain future models.[52] This problem is difficult to

[49] Sec. 5.c.v.A.1., p.18.
[50] Sec. 5.a.i., p.10.
[51] Sec. 5.c. generally.
[52] Palmer, K. 2023, Oct. 10. The 'model-eat-model world' of clinical AI: How predictive power becomes a pitfall. https://www.statnews.com/2023/10/10/the-model-eat-model-world-of-clinical-ai-how-predictive-power-becomes-a-pitfall/

counteract. Moreover, systems deploy multiple systems simultaneously that were not designed or tested to work in concert.

For AI that was in place prior to the issuance of the Draft Memorandum, it may be too late to ensure that they can be quickly decommissioned in the event that they put safety or rights at risk. In these cases, the Draft Memorandum states: "Agencies are responsible for determining how to safely decommission AI that was already in use at the time of this memorandum's release without significant disruptions to essential government functions."[53] However, this language is not sufficient to protect federal workers or the public. The OMB must establish a process to inform those whose safety or rights are at risk and ensure that claims of undue disruption are not used to avoid eliminating such risks expeditiously.

D. Consultation of affected groups and notification of people impacted by an automated decision are essential transparency measures that should be retained and strengthened. (RFC question 6, 8)

The Draft Memorandum appears to favor implementing AI over protecting the safety and rights of those who may be affected. AI systems should not be rushed into service. Rather, agencies should ask their workers and the public about existing problems and work with affected groups on careful development of targeted solutions, which may not include AI.

OMB should retain section 5.c.v.B. requiring agencies to consult and incorporate feedback from affected groups. Additionally, OMB should create detailed mandatory steps to solicit public participation, including requiring agencies to submit a Request for Information in the Federal Register to ensure public participation *and* conduct public hearings regarding AI deployment. Finally, OMB should direct agencies to collectively bargain with unions representing agency workers and consult with other worker groups and the members of the public served by the agency before implementing any AI system as well as on an ongoing basis thereafter. Agencies must not treat consultation with workers and communities as a mere box to check before they implement a system they have already chosen.

Like any new tool, AI should only be implemented when it solves a specific problem that workers and the public encounter and when the workers who get agency

[53] Page 17, Fn. 31.

tasks done every day are satisfied that it will improve their operations without creating new problems. However, it is often difficult for workers or the public to identify what AI systems are at work or how the different systems may affect them. For example, in the health care setting, registered nurses may see recommendations from AI embedded in an electronic health record system without knowing which software program has generated the recommendation or what patient information, research, or database has been used in generating a recommendation. Patients may not even know that AI is involved in their care. As part of consultation with workers and the public, agencies must explain in accessible terms exactly what the system would do, why it is being considered, the risks involved, any plan or potential for the system to replace workers, who the developers are, what the system would cost, what data was involved in its creation, what alternatives were considered, and other relevant factors to allow a true understanding of the system's likely impact. Workers, the public, labor unions, and watchdog organizations should also be able to easily access technical information, procurement contracts, and other government records.

OMB should also retain the requirement from the Draft Memorandum to notify any negatively affected individuals of the role AI plays in decisions that impact them and their options for human review. Importantly, the OMB should require agencies to institute an opt-in requirement for members of the public in the final memorandum rather than merely allowing "affected people" to "opt out from AI functionality in favor of a human alternative where practicable" as the Draft Memorandum currently states.[54] The basis for issuing or denying a benefit or any other government action should never be that an opaque AI program decided it was best. Humans should understand the decision process and be able to replicate it and check for errors. Human reviewers must not be pressured to match the speed of the system, be penalized or face greater scrutiny for overruling the system, or otherwise be incentivized to follow the recommendations of the system instead of conducting a fully independent review and decision-making process.

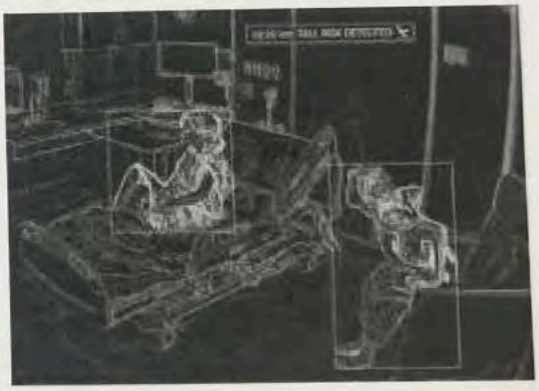
Ambient Monitoring

- Other industries have used Ambient Intelligence for years—self-driving cars, retail, logistics—to ambiently understand environments, and provide real-time insights to end users.

- The vast majority of data in healthcare has been manually entered into a system of record—built for generating a bill. Today, healthcare is *data-rich*, but *insights-poor*.

- Our goal at [redacted] is to begin to move to real-time intelligent environments, empowering clinicians with real-time, in-context insights; similar to the way cars now alert their driver when changing lanes or when an obstacle appears.

- We're starting with baseline use cases first, with a focus on:
  - **Fall Prevention** (identifying when a patient is out of bed, much more accurately and with much less alert fatigue compared to the bed alarm)
  - **Pressure Injury Avoidance** (monitoring for frequency of turning and repositioning and alerting care teams when not performed enough)
  - Potentially growing over time to include use cases like Hand Hygiene Auditing, Rounding Compliance, Incontinence Detection, Medication Disposal, Automated Documentation, etc.



- This all occurs in a secure, private (patient de-identified) manner, leveraging AI—no image data exists, nor is any data ever recorded or stored. Care teams have the power to turn the alerting on or off from a local command center as desired.

National Nurses United 2021 Survey of Registered Nurses on Experiences with Clinical Algorithms

Overview

From April 21, 2021 to July 7, 2021, NNU surveyed registered nurses (RNs), advanced practice registered nurses, and other health care workers, both members and non-members, on their experiences with clinical algorithms in their workplaces, including the use of race and ethnicity as inputs, their awareness of possible bias, and their ability to override recommendations. This analysis covers the results from 1,042 RNs who responded to one or more of the questions discussed below. The results are based only on those RNs that responded to a particular question.

These results provide evidence of the negative impact these algorithms often have on quality of care generally and of one of the mechanisms by which the use of algorithms contributes to poor care for Black, Indigenous, and other people of color.

Lack of transparency in algorithms and lack of user education on bias impedes RNs use of professional judgment and makes it difficult for health care professionals to detect bias.

Registered nurses are often required to use clinical algorithms but receive minimal education about how algorithms are developed or how they may influence clinical decision-making. This impedes RN's ability to effectively assess the applicability of algorithmic recommendations in their clinical practice and impedes their ability to recognize where population-based and possibly biased data does not apply to an individual patient.

NNU's survey of RNs on clinical algorithms asked questions about the extent to which users and patients are aware of the inclusion of variables that can introduce bias into algorithms, and the education available on these algorithms. The results show that many registered nurses and patients do not know about the risk of bias in algorithms. Four hundred nineteen (40.7%) registered nurses responded that they were not aware that clinical algorithms may introduce bias into patient care. Three hundred ninety-one nurses (38.0%) responded that they were aware that clinical algorithms may introduce bias into patient care and 219 (21.3%) responded that they were somewhat aware.

Unfortunately, very few of the registered nurses who responded to the survey received any education and training from their employers. When asked "Has your workplace provided any education about how clinical algorithms could introduce bias into patient care?", an overwhelming majority registered nurses, 873 out of 1,023 (85.3%), responded: "No, I have not received any education about this." Only 16 (1.6%) of nurses responded: "Yes, I have received extensive education about this" and 65 (6.4%) responded: "Yes, I have received some education about this." Sixty-nine (6.7) responded that it was "not applicable."

Nurses are not the only ones who are not being informed about the risks of bias in algorithms. When asked if, in their experience, patients were "informed about the use of race, ethnicity, or other factors that could result in bias in algorithms that influence their care," the majority of registered nurses, 551

(54.0%) said “Never.” Forty-nine (4.8%) of RNs responded “Rarely,” 29 (2.8%) replied “Sometimes” and only 17 (1.7%) responded “Always.” Three hundred seventy-five (36.7%) did not know.

RNs are often prohibited from overriding algorithms, preventing them from correcting mistakes made by biased or inaccurate algorithms.

NNU’s members are bedside registered nurses who often face pressure from management and threats of discipline if they deviate from clinical algorithms. Clinical algorithms often are used to reduce the time RNs spend with patients and limit the amount of care they offer them.

Out of 795 RNs who responded to the question regarding overriding algorithms, 172 respondents (21.6%) said they were not allowed to “override clinical practice guidelines, clinical pathways, or electronic or computer-based tools that [they] believe are not in the best interest of the patient”, 200 respondents (25.2%) could only do so with the approval of a doctor or supervisor, and 204 respondents (25.7%) did not even know if they were allowed to override the recommendations. Only 117 respondents (14.7%) were allowed to override algorithms based on their own judgment. 102 respondents (12.8%) said the question was “not applicable”.

The fact that a majority of registered nurses who responded cannot override or do not know if they can override algorithms is concerning because 246 (31.0%) said they had been “been prompted by a clinical practice guideline, clinical pathway, or electronic or computer-based tool to make choices about patient care, patient care staffing, or other clinical issues that [they] believed were not in the best interest of the patient based on [their] clinical judgment and scope of practice” Out of these 246 nurses, 76 (30.9%) could not override the algorithms at all, while 41 (16.7%) said they did not know. Eighty-three (33.7%) said they needed approval from a doctor or supervisor to override. Only 42 (17.1%) of RN respondents could override based on their professional judgment without approval. Three responded “not applicable” and one did not respond to this question.

Below are some RN responses to the question: “Is there anything else you would like to tell us about the use of algorithms or about bias in your workplace or clinical practice?”

All care these days seem more "cookie cutter" rather than individualized. I was unaware how race influenced these algorithms.
Healthcare should not be one standard protocol for all but that is what it’s turned into. We are not being asked to use our skills, knowledge, or critical thinking abilities. We are now just asked to follow protocols, policies and procedures. It’s disheartening and disappointing because healthcare is becoming more about financial gains & not actual personalized health for each individual as a whole.
[My employer] calls them BPA's (best practice alerts) that pop up in the middle of your charting. Sometimes they are useful reminders, but often it leads to nurses following the BPAs instead of exercising their clinical judgment to individualize each patient's needs. I have been told by an educator " you are not supposed to think or question it. Just do what the computer tells you to."
Our Assisstant managers audit everything and come to talk to you to change your assessment to match employers criteria regardless of assessment.
The algorithm within [brand name] does not capture the true care of the patient. Which gives patients less care than they deserve.

Survey Data

Are you aware that clinical algorithms may introduce racial, ethnic, and other biases into patient care?	Yes	Somewhat	No	Total
Number of RNs	391	219	419	1029
Percentage of RNs	38.0%	21.3%	40.7%	100.0%

Has your workplace provided any education about how clinical algorithms could introduce bias into patient care?	Yes, I have received extensive education about this	Yes, I have received some education about this	No, I have not received any education about this	Not applicable	Total

National Nurses United

INTRODUCTION

Nursing is a highly-skilled profession that is based on scientific knowledge and attention to detail. It demands an ability to address the physical, psychological, and emotional needs of a patient with compassion, empathy, and advocacy to honor the dignity in all people. Registered nurses are essential to providing acute, hospital-level inpatient treatment. Indeed, acute care hospitals that admit Medicare patients are required to provide nursing services at all times: 24-hours a day, seven days a week.

During the pandemic, the Centers for Medicare and Medicaid Services' (CMS) Acute Hospital Care at Home (AHCaH) program fulfilled a long-sought goal of the hospital industry: full reimbursement at inpatient rates for "treating" patients in their homes. Under the AHCaH program, CMS waives the 24-hour nursing requirement that defines acute inpatient treatment, meaning care is often provided by unpaid family members or left to the patient alone. Moreover, CMS requires only very limited reporting measures from AHCaH participants and has not made any of the data public.[1]

The hospital industry has been automating nursing and medical decision-making for years, reducing people to a list of symptoms which are then interpreted by technology that is racially and ethnically biased and often excludes relevant details about an individual patient.[2] The hospital industry uses this automated approach to justify reducing the number of licensed health care professionals providing patient care and then profits from the reduced labor costs. The hospital industry has used the Covid-19 public health emergency to further exploit the desire to normalize automated care and to shift care to the home.

Finally, the apparent corporate influence on the program is extremely troubling. In November 2020, the Trump administration launched the AHCaH program outside the normal rulemaking process and in record time: CMS senior leadership worked with industry insiders to take "the waiver from concept approval to publication in 8 days[.]"[3] CMS acted without a detailed public evaluation of any evidence justifying the program nor any opportunity for the public to review or comment on it, while hospital administrators who wanted the program were closely consulted.[4] Indeed, the American Hospital Association (AHA) took credit for CMS's expansion of the program, stating: "[As **urged** by the AHA, CMS expanded on its Hospitals Without Walls program by introducing the AHCaH program."[5] Despite the irregular implementation, the AHCaH program grew rapidly. As of July 27, 2022, CMS has approved AHCaH rollouts in 110 health systems, with 245 hospitals in 36 states.[6]

I. THE ACUTE HOSPITAL CARE AT HOME PROGRAM CANNOT PROVIDE ACUTE HOSPITAL-LEVEL CARE IN A PATIENT'S HOME

CMS's AHCaH program endangers patients requiring acute hospital-level care by allowing hospitals to treat them in their homes.[7] The AHCaH program builds on previous blanket Covid waivers for the hospital industry, including the Hospitals Without Walls program. Blanket waivers allow hospitals to bypass certain CMS requirements so they do not have to apply for an individual waiver, though the AHCaH program does require an individual waiver application. The AHCaH program waives numerous Medicare provider requirements and patient safety standards that apply to acute care hospitals, including nursing, medical, and emergency services requirements.

Specifically, the AHCaH program waives certain CMS Hospital Conditions of Participation, including a key provision which requires "nursing services to be provided on premises 24 hours a day, seven days a week and the immediate availability of a registered nurse for care of any patient."[8] In an emergency, patients in a fully operational hospital can be treated immediately under CMS's 24-hour nursing services requirement for acute care facilities. But for patients being treated at home, CMS only requires an emergency response to a patient's home within 30 minutes. From there, a patient may need to be transported to a hospital, a process that can further delay life-saving care. Moreover, after a doctor performs an initial medical history and physical exam for an AHCaH patient, CMS does not require any additional in-person registered nurse or doctor visits with the patient. Instead, the AHCaH program requires just two in-person patient visits a day by a community paramedic. These lower standards for nursing, medical, and emergency care under the AHCaH program put patients' lives at risk.

THE ACUTE HOSPITAL CARE AT HOME PROGRAM LACKS THE ONGOING, IN-PERSON ASSESSMENT AND TREATMENT BY HEALTH CARE PROFESSIONALS THAT DEFINES ACUTE-LEVEL CARE

First, the AHCaH program does not and cannot provide patients with the ongoing, in-person assessment and treatment by health care professionals that acute care requires. Although the bulk of patient care in hospitals is provided by registered nurses, hospitals employ a wide variety of health care professionals who are readily available 24 hours a day, including doctors, respiratory therapists, and pharmacists. Within the inpatient hospital setting, RNs and other health care professionals are able to draw on the collective experience of nursing, medical, pharmaceutical, and other staff.[9] This knowledge base is lost when a patient's care is shifted to the home and a patient's family must provide this care with limited outside support. Some hospitals currently participating in the AHCaH program do not require another person to be present in the home. Instead, they may leave the patient alone for long stretches of time or provide intermittent support from home health aides to supplement the twice daily visits from an RN or community paramedic.[10]

The AHCaH program is designed to eliminate the in-person, 24-hour observation and ongoing assessment by a registered nurse that is foundational to acute inpatient care. In contrast to inpatient facilities which provide ongoing, in-person assessment by RNs around the clock in a hospital where there is ready availability of other health care professionals, the AHCaH program requires only two in-person visits a day by paramedics or RNs and monitoring that may consist of just two sets of patient vital signs per day.[11] Hundreds of studies, spanning decades, have demonstrated the value of higher RN

staffing levels and reduced patient care loads in improving patient outcomes, including lowering mortality rates and reducing readmissions, infections, falls, and bedsores.[12] Additionally, studies on the skill mix of those providing patient care have demonstrated that substituting lesser-licensed and unlicensed personnel for registered nurses worsens patient outcomes and increases mortality rates, whereas increasing the percentage of personnel providing care who are RNs improves patient outcomes and lowers mortality rates.[13] Finally, intermittent patient visits do not foster the type of inherently holistic care afforded by round-the-clock inpatient acute nursing care.[14] The relational aspect of nursing, the connection between nurse and patient, is integral to patient health and wellbeing and relies on ongoing, in-person interactions.[15] Ongoing RN care ensures the regular assessment of patients' mental and physical health status. Based on these regular assessments, RNs are able to perform health care examinations and tests without delay.[16]

RNs are also the last line of defense in preventing medical errors. For example, prior to medication administration, nurses check to make sure that medication is administered with the right dose, right route, right drug, right time, and right patient.[17] Medication errors are more common in patients treated at home than in patients treated in a health care facility. Even when medications are administered correctly, life-threatening reactions can occur. For example, according to a large retrospective study, "[h]ome infusions were associated with 25% increased odds of [emergency department] or hospital admission on the same or next day after the infusion."[18] Moreover, the patients receiving home infusions were younger and had fewer comorbidities than those receiving infusions at a health care facility;[19] thus, the increase in emergency department visits and hospital admissions after home infusions may be higher than the study showed. Another recent study, which reviewed 50 patient charts in an AHCaH program, found 14 adverse drug events among 11 patients and 44 potential adverse drug events among 30 patients.[20] Among the 44 potential adverse drug events, the most common issue was patient or caregiver difficulty in administering medications (32%), followed by "unintentional nonadherence (20%), … potentially inappropriate prescriptions (18%), and lack of medication availability (16%)."[21] Immediate access to emergency care can be crucial to saving the life of a patient experiencing an adverse drug event.

Family members and home health aides are an inadequate and inappropriate substitute for the provision of acute care by skilled and licensed health care professionals. Worse yet, a patient may be at home all alone.[22] As noted above, studies demonstrate that, even in a hospital setting, substituting lesser-licensed personnel for registered nurses increases rates of patient complications, readmissions, and mortality.[23] Family members and home health aides do not have the education and clinical experience to provide acute, hospital-level patient care nor to perform the necessary ongoing assessment of patients. Even the simplest RN-patient interactions involve assessment and evaluation of the patient's overall condition. Subtle changes in a patient's skin tone, respiratory rate, demeanor, and affect provide critical information to patient health and wellbeing, which can be easily overlooked or misinterpreted by a family member or unlicensed support staff. Clearly, care in the home by a family member or home health aide plus two in-person visits by an RN or paramedic does not meet the same standards and level of care of acute inpatient care in a hospital. The lack of 24/7 RNs and other health care professionals is likely to lead to higher levels of missed care, medication errors, and miscommunication, leaving patients vulnerable to grave consequences. Burdening family members with care that should be provided by registered nurses and other health care professionals allows the hospital industry to increase its profits at the expense of patient safety.

THE ACUTE HOSPITAL CARE AT HOME PROGRAM ALLOWS A 30-MINUTE RESPONSE TIME TO EMERGENCIES, WHICH ENDANGERS PATIENTS' LIVES

Further placing patients at risk, the AHCaH program does not require the immediate availability of emergency response services by licensed health care professionals.

In the AHCaH program, CMS requires an emergency response within 30 minutes rather than requiring that an emergency response be available immediately.[24] Without immediate attention from health care professionals and access to necessary treatment resources, patient morbidity and mortality rates increase.[25] In contrast to the AHCaH program, most acute care hospitals have trained and certified staff readily available to respond to emergencies. These emergency response teams most often consist of an RN and a respiratory therapist, as well as either a physician, an advanced practice registered nurse, or a physician assistant.[26] It is the registered nurse, based on the regular monitoring and assessing of patient status, who most often initiates the rapid response emergency code. Unlike the AHCaH program, a hospital's rapid response team can respond within seconds of the emergency code being activated.

Delaying emergency response by 15 minutes or more is shown to increase the likelihood of intensive care unit admission or death in a variety of conditions.[27] For example, early recognition and treatment of patients with sepsis and septic shock reduce mortality rates and morbidity.[28] Severe cases of sepsis can lead to long-term cognitive impairment and physical disability.[29] A delayed response to adverse medication reactions may also have negative health consequences. In a study comparing adverse events among home- vs. facility-administered biologic infusions, discussed above, authors "hypothesize[d]" that "less intensive monitoring, less physician oversight, and lack of immediate access to urgent medical treatment in the event of an acute infusion reaction … can result in delayed care and a more frequent need for escalation of care."[30] Finally, studies demonstrate that delays by emergency response teams lead to increased mortality and morbidity rates in cardiac arrest events, while a rapid response from the team leads to improved patient outcomes.[31] Delaying cardiopulmonary resuscitation when a cardiac arrest occurs leads to higher mortality rates and a greater likelihood of brain damage and associated neurological deficits. For every minute without CPR, the likelihood of survival from cardiac arrest decreases by 7 to 10 percent.[32] Assuming that AHCaH programs are treating patients actually in need of acute hospital-level care, because the AHCaH program does not require the immediate availability of emergency response teams as is required in acute hospital settings, CMS should expect mortality and morbidity rates to rise among patients cared for under the AHCaH program.

THE ACUTE HOSPITAL CARE AT HOME PROGRAM FAILS TO PROVIDE THE APPROPRIATE LEVEL OF SERVICES, EQUIPMENT, AND INFRASTRUCTURE NECESSARY TO PROVIDE ACUTE HOSPITAL-LEVEL CARE

In addition to the unavailability of health care professionals, patients' homes lack the full complement of resources available in a hospital setting to respond to unexpected complications or deterioration of patients' health status. Although the AHCaH program requires participating organizations to provide laboratory, radiology, pharmacy, and respiratory services, these services are not immediately available in a patient's home, as they would be in a hospital. In many instances, these services and medical supplies are crucial. For example, diagnosing sepsis, discussed above, requires blood cultures and lactate measurement, followed by administration of broad-spectrum antibiotic agents if sepsis is confirmed. All of these processes are difficult to complete rapidly outside of an inpatient hospital setting.[33] Similarly, resources may be needed to evaluate patients' respiratory status by checking blood gas and electrolyte levels. Additionally, epinephrine may be needed for resuscitation and dopamine may be needed to stabilize blood pressure. Finally, if a patient needs to be intubated, necessary supplies and radiological services to confirm tube placement are crucial. Ready access to all of these resources is essential to saving patients' lives.

AHCaH patients are extremely vulnerable in the event of a power, telephone, or internet outage because internet and phone service are lifelines that connect AHCaH patients to nurses and doctors for ongoing care and to emergency services when needed. In contrast to most homes, hospitals caring for Medicare patients must have emergency power and lighting in many hospital areas and battery lamps and flashlights in all other areas.[34] Additionally, even though it is not a Medicare condition of participation, many hospitals maintain an emergency power supply for the entire facility. Finally, hospitals treating Medicare patients must have an emergency gas and water supply, which patients' homes typically lack.[35]

II. THE ACUTE HOSPITAL CARE AT HOME PROGRAM ALLOWS HOSPITALS TO SHIFT CARE TO INAPPROPRIATE SETTINGS RATHER THAN INCREASING ACUTE INPATIENT CAPACITY BY INVESTING IN STAFFING AND INFRASTRUCTURE

CMS's AHCaH temporary waiver program, if extended, would accelerate the troubling, long-term trend of hospitals and insurers pushing patients out of hospitals and into more profitable settings at the expense of patient care. Since CMS launched the AHCaH waiver program allowing hospitals to transfer or admit acute care patients to their homes, the hospital industry has been advocating to make the temporary waiver permanent. The AHCaH program is part of a decades-long industrial trend seeking to maximize industry profits, which has led to the steady reduction in acute inpatient services and hospital beds available across the country.

If the CMS waiver is extended or another change is approved allowing acute patients covered by Medicare to receive care at home, the health care industry would use the opportunity to push even more patients out of the hospital and further reduce acute care capacity in the United States. Indeed, in a recent webinar, Dr. Bruce Leff, a leading proponent of AHCaH programs, quipped that once the hospital at home program matures, many hospitals will be "turned into condos."[36]

Over the last two years, the Covid-19 pandemic has shown us that the acute care provided in hospitals is essential to the health of our communities and that we cannot afford to have it further whittled away by the profit-hungry hospital industry. Acute inpatient hospital capacity has declined dramatically over the last few decades, as the data below demonstrates:

» **Loss of acute beds:** Over the last 25 years, a period in which the U.S. population increased by 25 percent, the number of acute care beds available was reduced by about 70,000. The United States now has only 2.8 hospital beds per 1,000 people, far fewer than other developed countries.[37] In 1994, the United States had 4.3 hospital beds per 1,000 people.[38]

» **Hospital closures:** Since 1990, about 1,400 general acute care hospitals have closed nationwide, with a net loss of 890 when accounting for openings.[39] We have lost 181 rural hospitals since 2005.[40] According to the Kaiser Family Foundation, the United States has 19.1 hospitals per 1,000,000 people, while the "Comparable Country Average" is 32.7.[41]

» **Emergency department closures:** From 1990 to 2009, the number of hospital emergency departments in urban areas declined by 27 percent.[42]

During the Covid-19 pandemic, the loss of U.S. inpatient hospital capacity increased the overall death rate. The Covid-19 crisis laid bare the devastating impact of the reduction of our acute care capacity. A study published by the Centers for Disease Control and Prevention (CDC) found that, between July 2020 and July 2021, intensive care unit bed use at 75 percent capacity was associated with an additional 12,000 excess deaths two weeks later.[43] As hospitals exceeded 100 percent intensive care unit bed capacity, 80,000 excess deaths would be expected two weeks later.[44] Another study published by the CDC found significant associations between the availability of hospital-based resources, including beds and staff, and excess Covid-19 deaths.[45]

There have been numerous reports over the past two years of hospitals becoming overwhelmed with acute patients, Covid-19 and otherwise, with nowhere to send the patients they cannot treat.[46] Simply put, our national capacity for acute care, weakened by decades of industry profiteering, resulted in needless

deaths during the Covid-19 health crisis. For example, Tony Tsantinis died while waiting for treatment after finding that 17 hospitals had no room for him.[47] Another man, Ray DeMonia, died in September of 2021 after being turned away from 43 hospitals.[48] Sadly, these stories are not uncommon and are a direct result of the elimination of acute care capacity.

Further allowing hospitals to shift acute care to non-acute care settings, such as patient homes, will exacerbate declining acute care capacity. The AHCaH program allows hospitals to retain inpatient hospital reimbursement rates for inadequate and unsafe care in the home, rather than making desperately needed investment in hospital staffing and infrastructure. National Nurses United (NNU) has detailed several recommendations on how to increase hospital staffing capacity without resorting to crisis standards in our November 2021 report, ***Protecting Our Front Line: Ending the Shortage of Good Nursing Jobs and the Industry-Created Unsafe Staffing Crisis.***[49]

III. THE ACUTE HOSPITAL CARE AT HOME PROGRAM IS VULNERABLE TO FRAUDULENT BILLING PRACTICES

The AHCaH program is highly susceptible to fraud and abuse by hospitals through upcoding and other fraudulent billing practices. As discussed above, acute hospital-level care cannot be provided in patient homes because patient homes lack the defining elements of acute hospital-level care, including 24/7 registered nursing care; rapid response capability; and other necessary services, equipment, and infrastructure. Thus, the perfect patient for an AHCaH program is a patient who does not actually need acute hospital-level care. The AHCaH program provides an opportunity for hospitals to diagnose patients at an inappropriately high severity level, send them home, provide only the sub-acute care the patient actually needs, and then charge CMS for acute-level care. Providing care in patients' homes allows hospitals to expand care beyond the limits on the number of inpatient acute-care beds available, letting hospitals rapidly expand their existing fraudulent billing practices under the AHCaH program.

The Office of the Inspector General (OIG) at the Department of Health and Human Services found a widespread pattern of hospitals diagnosing patients with a higher severity level than is justified by their health condition to receive a greater reimbursement from Medicare.[50] From FY 2014 to FY 2019, the number of stays at the highest Medicare severity level—and highest reimbursement rate—increased by 20 percent while stays at other severity levels decreased. Meanwhile, the average length of stay for patients at the highest severity level decreased while other levels stayed the same. The OIG concluded that it is likely that hospitals systematically bill Medicare for inappropriately high severity levels. Another analysis ruled out demographic changes as the cause of increases in diagnosed severity and confirmed that upcoding was the likely culprit in spending increases.[51]

Fraudulent upcoding is common among hospitals serving Medicare patients. Indeed, many of the health systems and hospitals currently participating in the AHCaH program have been sued for submitting false claims to CMS as well as other irregularities.[52] Even supporters of providing acute hospital care at home caution that "vigilance against overuse and unnecessary care intensity must remain[.]"[53] Based on past behavior, it seems likely that hospitals participating in the AHCaH program will fraudulently bill CMS for treating patients who do not need acute hospital-level care.

CONCLUSION

NNU strongly urges CMS to withdraw the AHCaH waivers immediately and to discontinue the program. The AHCaH program cannot provide acute hospital-level care in a patient's home because it lacks the ongoing, in-person assessment and treatment by health care professionals that defines acute care in a hospital inpatient setting. It also fails to ensure the rapid response by health care professionals to deteriorating patient status that is necessary to reduce mortality and morbidity rates. Moreover, it allows the hospital industry to capture windfall profits by dramatically scaling back patient care rather than investing in the necessary hospital staffing and infrastructure that would actually increase acute inpatient capacity. The AHCaH program, established by the Trump administration outside the normal rulemaking process, affords the hospital industry a prime opportunity to expand its fraudulent billing practices. In all, it presents a grave threat to patient care and safety and to the future of U.S. national public health and safety.

10 There are at least two hospitals or health systems participating in the CMS AHCaH program, Brigham and Women's Hospital (MA) and Presbyterian Health Services (NM) that do not require in-home support for admission to their acute hospital care at home programs. Based on publicly available information, the CMS AHCaH program does not require in-home support services. For example, see the inclusion criteria for the acute hospital care at home program run by Mass General Brigham, which includes Brigham and Women's Hospital, as stated at **clinicaltrials.gov** under registration number NCT03203759: "Can identify a potential caregiver who agrees to stay with patient for first 24 hours of admission. Caregiver must be competent to call care team if a problem is evident to her/him. After 24 hours, this caregiver should be available for as-needed spot checks on the patient. This criterion may be waived for highly competent patients at the patient and clinician's discretion." (Available at **https://clinicaltrials.gov/ct2/show/NCT03203759**.) This clinical trial is discussed in these articles:

RE: Use of Clinical Algorithms That Have the Potential To Introduce Racial/Ethnic Bias Into Healthcare Delivery, Request for Information (RFI), 86 Fed. Reg. 12,948 (Mar. 5, 2021), Document No. 2021-04509

Dear Secretary Becerra,

On behalf of more than 170,000 registered nurses (RNs) and as the largest union and professional association of registered nurses in the United States, National Nurses United (NNU) submits these comments and materials in response to the Request for Information (RFI) on "Use of Clinical Algorithms That Have the Potential To Introduce Racial/Ethnic Bias Into Healthcare Delivery," 86 Fed. Reg. 12,948 (Mar. 5, 2021), by the Agency for Healthcare Research and Quality (AHRQ).

NNU applauds AHRQ's decision to inquire into how clinical algorithms can introduce racial and ethnic bias into clinical practice and degrade the care Black, Indigenous, and other people of color receive. Equally important, is ensuring that the implementation of clinical algorithms does not interfere with clinicians' professional judgment. NNU supports policies that ensure registered nurses and other clinicians may exercise their professional judgment to determine the best course of action for their patients and override clinical algorithms when that is the best course of action for their patients. As registered nurses, NNU's members work as bedside health care professionals in nearly every state in the nation and our members have witnessed the ways in which clinical algorithms can harm patients.

Clinical algorithms are typically based on practice guidelines developed by a panel of experts or, through machine learning, based on data from a particular set of patients. Practice guideline development by experts requires significant exercise of judgment which can introduce error and bias. Clinical algorithms based on machine learning also face risks of error and bias as well as an unacceptable lack of transparency. Both approaches to creating clinical algorithms face problems with the evidence base available including racial discrimination in clinical trials and access to health care as well as other deficiencies.

NNU knows that clinical algorithms can interfere with safe, therapeutic health care that meets the needs of each individual patient. Even under optimal conditions, clinical algorithms are based on population-level data and are not appropriate for every patient. In addition, the way clinical algorithms are implemented, regardless of how they are created, often inappropriately constrains the use of health care professionals' judgment, which can worsen the impact of a biased algorithm.

Clinical algorithms should serve as guidelines, but employers often require rigid adherence with the goal of controlling costs and eliminating variation in treatment. First, a lower cost treatment may not be the best option.[1] Second, health care corporations' focus on eliminating variation aims to facilitate automation and the use of less costly labor, as individualized care requires professional judgment by skilled clinicians. Yet patients are diverse, with unique needs and values. Thus, NNU believes that decisions on patient care should be made by skilled clinicians using their professional judgment in a manner that is consistent with an individual patient's preferences and in the patient's best interests. Moreover, health care professionals must have the autonomy to override clinical algorithms, within their scope of practice, and not be constrained by mandates established in a corporate boardroom. Finally, NNU supports mandates for transparency as well as user and patient education on the risks associated with clinical algorithms.

NNU urges AHRQ to address several essential points that apply to all algorithms, not just those that have already been proven to be biased, as it conducts its inquiry into how clinical algorithms can introduce racial and ethnic bias into health care delivery. First, there are fundamental limits on the ability of algorithms to meet the needs of individual patients, especially when those patients are part of racial or ethnic groups that are less well represented in the data. Second, AHRQ must consider the importance of ensuring that health care professionals have full autonomy to override algorithmic recommendations, within their scope of practice and consistent with their patients' needs and preferences. Third, transparency and education about all aspects of the creation, use, and impact of these algorithms is necessary to detect and combat bias. Fourth, transparency must extend to clinicians, patients, and the public, including thresholds for recommendations to provide and deny preventive, diagnostic, or treatment measures by race, ethnicity, gender, and other relevant data. Finally, NNU urges AHRQ to support robust regulation of clinical algorithms as medical devices and to ensure that the supporting evidence and reasoning on which clinical recommendations are based are sufficient, sound, transparent, and intelligible and that recommendation thresholds for providing or denying preventive, diagnostic, or treatment measures are transparent to clinicians, patients, and the public.

---

[1] For example, doctors at a California hospital contend that the system to which the hospital belongs has standardized clinical guidelines through a shared electronic health record system that are "often driven by cost considerations" and that the guidelines "often [conflict] with their own judgment of best medical practices." Orange County Hospital Seeks Divorce From Large Catholic Health System. *Kaiser Health News*. https://khn.org/news/article/orange-county-hospital-seeks-divorce-from-large-catholic-health-system/. Published April 13, 2012. Accessed May 1, 2021.

These comments have five main sections. Section I discusses problems related to algorithms based on clinical practice guidelines developed by experts. Section II discusses problems related to algorithms developed through machine learning. As part of the response to this RFI, NNU also has included preliminary results of our survey of RNs on their experiences with racial bias in clinical algorithms, which are detailed in Sections III and IV of these comments. Section V offers concluding recommendations.

I. Algorithms based on clinical practice guidelines developed by experts

Answering RFI question 1 on the estimated impact of these algorithms on quality of care, clinical outcomes, quality of life, and health disparities and RFI question 6 on the mechanisms by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color.

A. Algorithms based on clinical practice guidelines rely on population level data that may be inappropriate for individual patients or subgroups, introducing opportunities for structural racial bias to influence health care delivery.

Clinical algorithms rely on population level data that does not reflect each individual patient's needs and can introduce bias into health care, if clinicians are pressured to apply clinical algorithm recommendations to all patients despite individual care needs. Practice guidelines are typically based on studies and data regarding a certain percentage of a patient population as a whole and, thus, may not be appropriate for a particular patient.[2] This is the nature of statistics: a treatment that works in a high percentage of a population is considered high-quality care. The trick, of course, is in determining where an individual patient falls relative to the population as a whole.

Patients have a range of individual factors that influence how well a particular treatment plan works for them, including their own preferences. Some proponents of using algorithms in health care delivery claim that more complex algorithms can successfully predict the best treatment plan for an individual based on a range of factors. However, the degree to which an algorithm works depends on how closely a patient matches the population reflected in the underlying data and on how well the algorithm accounts for all the relevant factors in their life, whether the factors are objective empirical issues or subjective values and preferences. Many algorithms do not even claim to account for patient preference, giving patients only the option to be considered compliant or not.[3] As discussed in the next section and in Section IIA, the data underpinning these algorithms is influenced by structural racism in health care research, access, and quality, so reliance on population-level data is less likely to lead to quality care for individuals who are racial and ethnic minorities.

The problem of applying population-level data is exacerbated when a hospital or health system uses an average as a benchmark for clinical performance. Clinical algorithms provide recommendations for treatment decisions, such as how long a patient should stay in the intensive care unit (ICU).[4] When doctors know their performance is measured by the average number of hours their patients stay in the ICU, they may feel pressured to send on any patient who stays longer than that average. That pressure is the point of instituting clinical algorithm benchmarks, which are sold promising increased efficiency and reduced costs.[5] However, that pressure will disadvantage the patients who need the longer stay. Moreover, if a doctor's patient load skews less healthy than the data mix underlying the algorithm, the doctor will have to choose between risking their patients' lives by moving them out of the ICU early or damaging their career by missing the benchmark. Forcing doctors to make that choice may lead to racial bias because disparities in health care access mean Black, Indigenous, and other people of color are more likely to have underlying conditions that complicate treatment. In addition, residential segregation means that racial groups are likely to be concentrated in certain health care facilities.[6] Therefore, unless explicitly analyzed and validated, Black, Indigenous, and other people of color are more likely to be treated by a doctor whose patient load skews less healthy than the benchmark population. Moreover, even if explicitly analyzed and validated, an algorithm's recommendation may be inappropriate for a particular patient regardless of their race or ethnicity.

The mismatch between population-level data embodied in clinical algorithms and individual patients has an impact on quality of care, RFI question 1, and is one mechanism by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color, RFI question 6. NNU urges AHRQ to investigate the inherent limitations of algorithms to determine appropriate individual patient care and the disparate impact on racial and ethnic lines of those limitations.

B. The medical evidence base underlying clinical algorithms reflect racial bias in health care research, access, and quality.

Clinical algorithms based on available medical research are often designed without regard to relevant differences among patients. Thus, they often perform poorly for particular subgroups of patients. The influence of structural racism on access to health care, quality of health care, and inclusion in clinical studies means that Black, Indigenous, and other people of color are often

poorly represented in the medical evidence base. Therefore, recommendations made by clinical algorithms are less likely to be the best choices for their care—whether or not the algorithms explicitly incorporate race or ethnicity as input factors.

Race and ethnicity influence how closely a patient resembles the population underlying algorithmic decisions. They are also correlated with conditions that make some treatment more or less effective, particularly those related to poverty. As Robert Hamm and Zsolt Nagykaldi summarize in the *Journal of Cognitive Engineering and Decision Making*:

> A larger issue is that there are specific patients who are not well served by guidelines. As Klein, Woods, Klein, and Perry (2016) and Falzer (2018) argue, although an [evidence-based clinical practice guideline (EB-CPG)] will, by design, produce better results for typical patients, those commonly included in the supporting studies, a guideline's recommendation may be inappropriate, infeasible, or harmful for other patients. Exceptions may be needed based on patient medical situation (comorbidities, age), patient preferences and goals (Mold, 2017; Mold, Hamm, & Scheid, 2003), patient competence (inability to adhere to, or understand and stick to, a treatment plan), patient social situation (addiction, homelessness, unreliability about clinic appointments), or patient economic situation (inability to pay for visits, prescriptions, or a healthy diet). With EB-CPG regimens, situations can arise where physicians are penalized for doing what they know will be best for a patient. Unless there is allowance for exceptions, a reward regimen can punish those physicians who use more effort and judgment to make better choices for their patients. This can exacerbate physician income differences contingent on the wealth of the patients served: When the measured conformance to a guideline depends partly on patient behavior, the regimen rewards those physicians who are already better rewarded because they serve patients with orderly middle or upper-class lives and a higher capacity to become or stay healthy.[7]

The Institute of Medicine (IOM) made a similar observation—that clinical practice guidelines are often inappropriate for certain populations—when it issued best practices for guideline development in 2011. After a thorough review of the processes used to develop clinical practice guidelines, IOM concluded that "evidence supporting clinical decision making and [clinical practice guideline] development relevant to subpopulations, such as patients with comorbidities, the socially and economically disadvantaged, and those with rare conditions, is usually absent."[8] Structural racism in the U.S. means that Black, Indigenous, and other people of color are more likely to be poor and have less access to health care throughout their lives than

[7] Hamm RM., Nagykaldi ZJ., Physician Judgment and Clinical Practice Guidelines, *Journal of Cognitive Engineering and Decision Making*, 2018;12(3): 209-214 doi: 10.1177/1555343418782850.

[8] Committee on Standards for Developing Trustworthy Clinical Practice Guidelines, Institute of Medicine. Clinical Practice Guidelines We Can Trust. Eds. Graham, Robin et al. 2011. p.2.

white people.[9] As we are seeing in the COVID-19 pandemic, this means these groups are more likely to have comorbidities that limit their participation in clinical trials[10] or an economic situation that can affect their ability to maintain the kind of consistent treatment plan assessed in clinical trials. Research into clinical trial diversity bears this out.

Clinical trials often fail to include enough people of color to ensure that their results reflect patient diversity. In the Food and Drug Administration (FDA) snapshot of participants in global drug trials between 2015 and 2019, 76% of participants were white, 11% were Asian, 7% were Black/African American, 5% were marked as "other", and 1% were American Indian or Alaskan Native.[11] The percentage of white people in the U.S. population is similar, 76.3%.[12] However, the percentage of Black people in the U.S. population, 13.4%, is substantially higher than the 7% in trials. Only 13% of global clinical drug trial participants were Hispanic or Latino, compared with 18.5% of the U.S. population. Thus, algorithmic recommendations based on evidence from these trials will represent white patients better than Black patients and non-Hispanic or -Latino patients better than Hispanic or Latino patients, both in absolute terms and relative to their representation in the U.S. population.

Algorithm developers sometimes attempt to account for these disparities by encoding race or ethnicity into their algorithms. However, including race and ethnicity explicitly in a clinical algorithm can also end up perpetuating disparate health care access. Health outcome differences that appear to be attributed to race, which is a social construct and not a biological reality, may be more correctly tied to correlated factors that the algorithm does not measure, such as socioeconomic status or muscle mass.[13] In these cases, the use of race as a proxy for these factors will make the algorithm a poor fit for individuals of the targeted race who do not share the same correlated factor as the original data set. Racism's effects are pervasive but vary by context. Correlations with race and other factors may be very different between a study population and the ultimate patient population and will certainly not apply to every individual. The broad application

of a clinical algorithm without the treating health care provider's ability to deviate based on their professional judgment and on the needs and preferences of individual patients can introduce errors into the care of these patients.

The racial bias in the data underlying clinical algorithms has an impact on quality of care, clinical outcomes, quality of life, and health disparities, RFI question 1, and is one mechanism by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color, RFI question 6. NNU urges AHRQ to investigate the ways that Black, Indigenous, and other people of color are systemically excluded or underrepresented in the medical evidence base that underlies clinical algorithms and how this underrepresentation leads to less accurate recommendations for these patients.

C. Clinical algorithms reflect the judgment and biases of their creators.

While clinical algorithms may purport to be an objective analysis of the scientific evidence, in fact their development involves significant use of judgment by their creators and creates the opportunity for creator bias—from conflicts of interest, limited perspective on the lives of racial minorities, or implicit racial bias—to be introduced into the algorithm. To create clinical practice guidelines, panels of experts convene to develop guidelines for a particular medical condition or care situation.[14] Panels go through a process, which varies from institution to institution, designed, in theory, to determine the best care practices based on the best available evidence. The panel must perform a meta-analysis of a body of evidence that entails establishing the criteria for including a research study followed by synthesizing studies that may be based on conflicting assumptions, disparate patient populations, and heterogenous results.

IOM's best practices for guideline development called out a lack of "sufficient attention" to "the role of judgment in the derivation of recommendations," among other issues.[15] It also listed factors that "commonly undermine the quality and trustworthiness of [clinical practice guidelines]" including:

> variable quality of individual scientific studies; limitations in systematic reviews (SRs) upon which [clinical practice guidelines] are based; lack of transparency of development groups' methodologies (particularly with respect to evidence quality and strength of recommendation appraisals); failure to convene multi-stakeholder, multi-disciplinary guideline development groups, and corresponding non-reconciliation of conflicting guidelines; unmanaged conflicts of interest (COI); and overall failure to use rigorous methodologies in [clinical practice guidelines] development.[16]

---

[14] Davino-Ramaya C et al., Transparency Matters: Kaiser Permanente's National Guideline Program Methodological Processes. *The Permanente Journal.* 2012;16(1): 55-62.

[15] Committee on Standards for Developing Trustworthy Clinical Practice Guidelines, Institute of Medicine. 2011, fn 8, at p. 3.

[16] *Ibid.*

Organizations who develop these guidelines ask their developers to use their judgment to balance different factors, including some that do not directly relate to ensuring the best patient care. For example, Kaiser Permanente uses a guidelines-development approach that includes "formulating recommendations based on quality of evidence, balance of benefits and harms, patient values and preferences, and resource and cost implications."[17] Thus, costs are considered alongside patient outcomes, and "patient values and preferences" are incorporated on a population, rather than an individual, level. The American College of Physicians uses a similar methodology.[18]

Another crucial issue is that there is not always a clear best choice in prevention, diagnostic, and treatment measures. The "scientific evidence about what to recommend is often lacking, misleading, or misinterpreted."[19] Experts may disagree about whether a particular practice guideline is the best approach to a health issue. For example, doctors have voiced concerns about a sepsis protocol mandated by the state of New York because it included a step that "may not be beneficial."[20] In another example from 2014, clinical experts disagreed about whether major new cholesterol and blood pressure practice guidelines were appropriate. A group of 5 dissenters out of the 17 authors of the high blood pressure guidelines published an article against the new guidelines.[21] In discussing these disagreements on high blood pressure guidelines, a *Journal of the American Medical Association* (*JAMA*) editorial stated that "guidelines should inform but not dictate, guide but not enforce, and support but not restrict."[22] Practice guidelines often must "harmonize" across differences in research studies. These judgment calls should be made at the bedside not in a corporate board room.

Finally, practice guidelines may not be trustworthy. The *JAMA* editorial cited above also stated:

> Another risk is that the regulatory process may be used to advance commercial interests that may not be in the public interest. Clinical practice guidelines often make recommendations involving proprietary medical devices and pharmaceuticals. Device and pharmaceutical companies could lobby state governments to include these products in future regulations.[23]

Why We Can't Trust Clinical Guidelines. *BMJ* 2013;346:f3830 doi: https://doi.org/10.1136/bmj.f3830.

This risk has been born out in practice. In the early 1990s, the Cochrane Collaboration put out guidelines making high-dose steroids the standard of care for acute spinal cord injury. The sole reviewer of the guidelines was a consultant to steroid manufacturers. Despite skepticism from neurosurgeons in polls, the guidance was widely followed until it was reversed in March 2013 by new Congress of Neurological Surgeons guidelines that found no good evidence for use of the steroids and substantial evidence of harmful side effects including death.[24] This is not an exceptional case. One survey found 71% of clinical policy committee chairs and 90.5% of co-chairs had financial conflicts.[25] While financial conflicts create a different kind of bias than racial or ethnic discrimination, these examples show that judgment calls made by authors of guidelines can twist patient outcomes in serious ways.

The problem of unreliable guidelines is magnified when treatment and diagnosis guidelines make different recommendations based on race and ethnicity. Claims about racial and ethnic differences in medical needs are often based on poor quality evidence. Evidence shows that developers of clinical practice guidelines do not give racial differences the necessary level of scrutiny. One review of the use of race correction in clinical algorithms found that when algorithm developers offer rationales for why race correction is included, their origins can be traced "to outdated, suspect racial science or to biased data."[26] Other developers offer no explanation for why racial or ethnic differences may exist. When designing the algorithm, they choose to translate correlations between race and outcome into different clinical treatment without understanding why those correlations exist or what they really represent.[27] As shown above, both available data and expert judgment can be affected by the structural racism in society and the health care system.

It is essential that the use of race or ethnicity in clinical algorithms is scrutinized, including whether race or ethnicity are serving as proxies for other factors that should be identified explicitly. Studies must also look at racial differences in recommendations made by algorithms that do not explicitly incorporate race, and in their ultimate patient outcomes. However, it will not be possible to eliminate the use of judgment or the need for individual assessment in care decisions. These judgments should be made at the bedside between the patient and their health care provider, not by a committee based on population-level data. Moreover, the underlying research and the process for developing an algorithm must be available to the health care professionals providing patient care.

Encoding biases into algorithms and taking health care decisions away from patients and providers has an impact on quality of care, clinical outcomes, quality of life, and health disparities, RFI question 1, and is one mechanism by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color, RFI question 6. NNU urges AHRQ to investigate

the role judgment and bias plays in the development of these algorithms, how to minimize the effects of that bias, and how to ensure that final judgment calls are made at the bedside by fully informed clinicians and patients.

II. Algorithms developed through machine learning

Answering RFI question 1 on the estimated impact of these algorithms on quality of care, RFI question 6 on the mechanisms by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color, and RFI question 7 on clinician and patient awareness of bias.

While many clinical algorithms reflect decisions made by human experts, such as clinical practice guidelines, an increasing number of clinical algorithms are driven by machine learning. These algorithms pose several risks. Clinical algorithms developed through machine learning can make serious errors, amplify patterns of bias in the underlying data, and endanger population subgroups. They are also often opaque to users. This can be because they are "black boxes," where even their creators do not know how they work, because of protections for proprietary trade secrets, or because they require high level technical knowledge to understand. This opacity undermines patient and professional trust and magnifies the risk to patients from errors. Thus, it is essential that these algorithms are made transparent and intelligible to their users and to ensure that health care professionals can override them as needed to provide their patients therapeutic and effective care that is consistent with their needs and preferences.

A. <u>Machine learning algorithms may be trained on datasets that do not apply to racial and ethnic subpopulations, leading to bias.</u>

Machine learning algorithms, often referred to as artificial intelligence (AI), are programmed to find patterns in large quantities of data. They are trained on one set of data and then used to classify new information based on patterns they detected in the training data. They are frequently used to make diagnoses or to make predictions based on information in electronic health records and assign risk levels. Problematically, data from electronic health records often reflect differential access to health care, quality of care, and other forms of structural racism and biases. Similarly, Black, Indigenous, and other people of color face discriminatory assessment and treatment by health care providers because of implicit bias or false beliefs about race which are entered into their electronic health record and used to train clinical algorithms.

For example, in one recent study, researchers found that models trained on electronic health record data to predict suicide attempts among patients who had outpatient mental health visits performed substantially worse for Black patients, American Indian/Alaskan Native patients, and patients without ethnicity recorded than it did for white, Asian, or Hispanic patients.[28] There were

[28] Coley RY, Johnson E, Simon GE, Cruz M, Shortreed SM. Racial/Ethnic Disparities in the Performance of Prediction Models for Death by Suicide After Mental Health Visits. *JAMA Psychiatry.* Published online April 28, 2021. doi:10.1001/jamapsychiatry.2021.0493.

several reasons for this failure. One was a more limited pool of data on Black and American Indian/Alaskan Native patients and patients without ethnicity recorded. The authors speculated that systemic barriers to affordable, culturally competent mental health care led to lower utilization and therefore sparser records on racial or ethnic minority populations.[29] Practitioner bias and institutionalized discrimination throughout the treatment process means that Black, Indigenous, and other people of color are less likely to be screened or receive high-quality treatment for depression and more likely to experience discrimination in health care settings.[30] The researchers also pointed to evidence that discrimination and low quality care deters health care use: studies showing Black and Asian people were less likely than whites to initiate and continue mental health treatment,[31] and that non-Hispanic Black respondents who had experienced discrimination in health care settings were less likely to opt for talk therapy over medication.[32] The authors also suggested that suicide deaths may be misclassified more often among some groups than others. Setting specific thresholds for intervention for each measured race and ethnic group improved performance somewhat for some groups poorly served by the global thresholds but not for others. In any case, setting race and ethnicity-based thresholds to account for poor predictivity meant that Black and American Indian/Alaskan Native patients would be subject to "unnecessary and possibly intrusive interventions" at a higher rate for the same number of interventions in eventual suicides compared to white patients.[33]

Numerous studies have documented implicit bias in health care providers which may then be recorded in electronic health records used to train algorithms. For example, clinicians are less likely to prescribe pain medications to Black patients than white patients. In one study, fewer opioids were prescribed for Black patients with migraines and back pain, which rely on self-reported pain, than similar white patients, but there was no difference for patients with long bone fractures, which are visible on an X-ray.[34] In another study, Black children with appendicitis in emergency departments were less likely than white children to receive any pain medication for moderate pain and less likely to receive opioids for severe pain.[35] These studies demonstrate that Black patients suffer because their doctors do not trust them with opioid prescriptions or believe them when they say they are in pain. This may be due, in part, to the fact that substantial numbers of white medical students and residents falsely believe that Black people feel less pain than white

people.[36] That belief carried over to rating Black patients' pain as lower and making less accurate treatment recommendations. Similarly, another study found that physicians showed implicit bias favoring white patients over Black patients that could contribute to racial and ethnic disparities in use of thrombolysis for myocardial infarction.[37]

These examples, and there are many others, demonstrate that racially biased behavior by clinicians is a serious problem that should be addressed through changes in training and education as well as through increased staff diversity. It is also a problem in the so-called evidence base of medical data. If an algorithm were to be created to regulate opioid prescriptions and based on health records data, it could easily end up encoding anti-Black bias and hiding it behind a veneer of objective technology.[38]

Finally, algorithms may exhibit racial and ethnic bias whether or not race and ethnicity have been explicitly factored in as inputs. For example, in 2019, researchers Obermeyer et al. found that an algorithm that did not use race as an input still ended up disadvantaging Black patients in its recommendations because it assumed that patients who use less health care are less sick, thereby making health inequities self-reinforcing.[39] Obermeyer et al. analyzed the recommendations made by an algorithm used by large health systems and payers to target patients for "high-risk care management" programs and found that it assigned sicker Black patients the same level of risk as less-sick white patients.[40] This bias reduced the number of Black patients identified for extra care by more than half. This occurred because the algorithm was using health costs as a proxy for health needs. Structural racism has ensured that Black people in the U.S. have lower access to health care, which means they have both higher health needs and lower health costs.[41]

Discrimination at many different stages of the patient experience introduces bias into health records data and therefore into any clinical algorithm that depends on it. Reduced access to health treatment is pervasive among Black, Indigenous, and other people of color. These groups face higher rates of many diseases and premature death, including infant mortality, than white people.[42]

[38] NNU recognizes that analysis of electronic health records, whether by human beings or artificial intelligence programs, could expose implicit biases. However, this does not invalidate the need for clinical algorithms to be transparent and intelligible to their users nor the need to ensure that health care professionals have the autonomy to override them if it is in their patients' interest.

Communities in Action: Pathways to Health

This is due to social, not biological, differences. People of color are more likely to lack health insurance than white people, usually due to affordability.[43] Locations with majority Black and Hispanic populations are more likely to face primary care physician shortages.[44] Additionally, underserved areas Hospitals in Black neighborhoods may have fewer specialists than those in white neighborhoods.[45] These and many other disparities add up to less and lower-quality care, which means less representation in health data. When embedded in electronic health records used to train clinical algorithms, these algorithms reinforce and reproduce both structural racism and implicit clinician bias.

B. Machine learning algorithms may draw inferences from data that are not relevant to health care, potentially introducing racial bias.

One of the most disturbing problems with machine learning is that it may draw spurious inferences based on data that is not relevant to patient care.[46] Moreover, because many algorithms are opaque, as discussed in the next section, it is not always clear what information an algorithm is using to make its categorizations.

For example. a group of Stanford computer science students, in consultation with radiologists, used a set of over 100,000 chest X-rays tagged with diagnoses to teach a program to read similar X-rays for signs of tuberculosis.[47] The algorithm appeared to reach the correct diagnosis 75%of the time. Tuberculosis can be a challenging diagnosis for doctors in South Africa, where it is prevalent, so the project hoped to combine machine and human expertise for a better combined success rate.[48] To make sure it was working correctly, the team designed the program to highlight the parts of the image it was using to make the diagnosis and shared it with others in the field to critique. Fortunately, a medical resident discovered that the X-ray analysis program was basing its diagnosis in part on the information on the edge of the scan image that showed the type of machine used to take the scan. If the machine was of the portable type used in hospitals, instead of the type used in doctors' offices, the diagnosis was more likely to be tuberculosis. The machine had found a pattern on the images, but it was not in the medically relevant data that it was intended to analyze. In a system where both certain diseases and the ability to access care in certain

[48] *Ibid.*

venues is highly correlated with poverty and race, this type of unexpected behavior has the potential to introduce bias.

Machine learning algorithms consistently make more obvious errors, leading experts in the field to insist on the importance of a human override option. If an algorithm continues learning from new data while operating, its results can become truly strange. Machine learning algorithms can be easily fooled—Google image software identified a picture of a cat as guacamole after MIT students changed a few pixels.[49] To explain the necessity of a human override, one public health expert compared black box algorithms to a plane where autopilot said the plane was going up and pilots saw it was going down but had no override option.[50]

Inappropriate inferences from data have a negative impact on quality of care, clinical outcomes, quality of life, and health disparities, RFI question 1, and are one mechanism by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color, RFI question 6.

C. Machine learning algorithms can be dangerously opaque making it difficult to identify racial bias in their development or underlying data.

There are several reasons that machine learning algorithms are frequently opaque, but none of them are inevitable. If developers of these algorithms and the health care providers who implement them commit to transparency principles, many systems can be made transparent. If they cannot be made comprehensible to users and patients, they generally should not be used for medical applications.

Some machine learning algorithms function as "black boxes." Their creators can show that they categorize input data correctly some percentage of the time but cannot explain the reasoning behind the categorizations. The complexity of their reasoning and the number of data points they use to reach conclusions may be difficult for a human to comprehend. They may use a complex form of mathematical representation which is not intelligible for humans.[51] An algorithm that is designed to be comprehensible might be less useful, if the goal is to interpret data at a higher level of complexity than a human expert can.[52] Moreover, the decision logic may change over time as the program learns.

The black box is an easier design choice to program, but it is often not the only or the best option. Some programmers create black boxes that give hints about their reasoning, such as the X-ray image highlighting that allowed researchers to spot flaws in the tuberculosis diagnosis

[52] See *Ibid.* at p. 5.

algorithm. However, these clues do not give a full understanding of what an algorithm is doing and may provide a false sense of security to users.[53] The need for this opacity may be overstated. One computer scientist, Cynthia Rudin, said "I've worked on many predictive modeling problems… and I've never seen a high-stakes decision where you couldn't come up with an equally accurate model with something that's transparent, something that's interpretable." She explains that medical decisions with life-or-death consequences merit the extra effort to build a program based on clinical knowledge that allows humans to see how it reaches its conclusions.[54]

Creators of algorithms can also avoid transparency to protect their trade secrets. Avoiding sharing information with competitors may be an incentive to design a black-box model or to keep the information about an algorithm restricted inside the corporation that owns it.[55] One observer of financial algorithms argued that corporations also choose to keep algorithms opaque to hide "sidestepped regulations, the manipulation of consumers, and/or patterns of discrimination."[56] Developers of certain algorithms may also keep them secret to prevent users from changing their behavior to achieve a particular result from an algorithm.[57] For instance, a search engine may keep its inner workings secret to prevent websites from gaming the system.

Sometimes algorithms have information about how they work publicly available, but that information can only be understood by people with a high level of technical knowledge. Most medical professionals, patients, and journalists do not have the appropriate education or the time to read computer code to understand the algorithms governing care.[58]

If a system is opaque, then researchers, users, and patients are limited in their ability to detect and counteract biases. As shown above, there is a serious risk that these algorithms will have biases. Biased data or flawed reasoning can be hidden behind a veneer of objective technology if a machine learning algorithm cannot or does not show its work in a way users and patients can understand. This can have devastating results for individual patients and increase overall health care inequities.

Transparency can and should be required, however. It is essential that corporations make their code available to the public, along with appropriate documentation, and that they explain how the algorithm functions so that clinicians can make informed decisions and explain them to their patients. Some types of algorithms will not be appropriate for medical use, despite some promising features, because they cannot be made intelligible to their users. Experiments to check for discriminatory outputs are essential but do not obviate the need for transparency. These measures are essential to safe and trustworthy implementation of this technology.

Users and patients are often unaware of the inclusion of variables that can introduce bias in clinical algorithms, RFI question 7, due to the opacity of machine learning algorithms. NNU urges AHRQ to investigate how machine learning algorithms produce errors and perpetuate bias as well as support both their full transparency and the autonomy of clinicians to fully exercise their professional judgment. NNU supports regulation of clinical algorithms to ensure results are unbiased and reasoning is transparent.

III. Preliminary results from an NNU survey on clinical algorithms suggest that RNs are often prohibited from overriding algorithms, preventing them from correcting mistakes made by biased algorithms.

Answering RFI question 1 on the estimated impact of these algorithms on quality of care and RFI question 6 on the mechanisms by which use of algorithms contribute to poor care for Black, Indigenous, and other people of color.

Clinical algorithms and technology could serve as tools that assist health care professionals in making decisions about patient care, in consultation with the patient and in the patient's best interests. In practice, however, nurses and other health care professionals are often compelled by their employers, or the health system in which they practice, to accept the recommendations of these clinical algorithms without the autonomy to override them regardless of whether the recommendation is appropriate for and in the best interests of individual patients.

Clinical guidance is designed to be used in concert with direct care professionals' expertise to find the best treatment for an individual patient. In practice, however, employer rules discourage or prohibit the use of autonomous professional judgment and require adherence to decisions made by clinical algorithms. This limits the ability of health care professionals to counteract biased or inappropriate algorithmic recommendations. Addressing bias in algorithms is necessary but not sufficient to ensure safe, high-quality therapeutic care that meets the needs of an individual patient. Every patient is different, even those who share many demographic and medical history commonalities, and algorithms cannot account for all the relevant differences among patients. To ensure appropriate care is provided, health care professionals must have the right to override algorithms to account for individual needs and preferences.

As discussed above in Section IIA, Obermeyer et al. discovered that an algorithm that was supposed to identify patients in need of extra care failed to identify large numbers of Black patients because it relied on health costs as a proxy for health needs. Optum, the company responsible for the biased algorithm, responded to the research with a statement calling it "misleading" because "[t]he cost model is just one of many data elements intended to be used to select patients for clinical engagement programs, including, most importantly, the doctor's expertise."[59] Academics and

[59] See Ledford, Heidi. Millions of black people affected by racial bias in health-care algorithms. *Nature.* Published online October 26, 2019. https://www.nature.com/articles/d41586-019-03228-6.

developers of diagnostic algorithms driven by machine learning frequently tout their effectiveness when combined with users' expertise but stress the importance of an override option.[60] An FDA report on health information technology stated that clinical decision support software "is not intended to replace clinicians' judgment, but rather to assist clinicians in making timely, informed, higher quality decisions."[61] Clinical algorithm developers may explicitly state that they are not a substitute for clinicians' professional judgment and that clinical decisions must consider the characteristics of individual patients, but in practice this is not always the case.[62]

NNU's members are bedside registered nurses who often face pressure from management and threats of discipline if they deviate from clinical algorithms. Clinical algorithms often are used to reduce the time RNs spend with patients and limit the amount of care they offer them. In mid-April 2021, NNU began surveying RNs and other health care workers, both members and non-members, on their experiences with clinical algorithms in their workplaces, including the use of race and ethnicity as inputs, their awareness of possible bias, and their ability to override recommendations. The survey was initially administered in continuing education classes but is now widely available online. This RFI response will focus on the preliminary results from 170 registered nurses. These preliminary results offer evidence of a negative impact of these algorithms on quality of care, RFI question 1, and of one of the mechanisms by which the use of algorithms contributes to poor care for Black, Indigenous, and other people of color, RFI question 6.

Out of 142 nurses who responded to a question regarding overriding algorithms, 36 respondents (25%) said they were not allowed to "override clinical practice guidelines, clinical pathways, or electronic or computer-based tools that [they] believe are not in the best interest of the patient", 32 respondents (23%) could only do so with the approval of a doctor or supervisor, and 45 respondents (32%) did not even know if they were allowed to override the recommendations. Only 13 respondents (9%) were allowed to override algorithms based on their own judgment. 16 respondents (11%) said the question was "not applicable."

The fact that a majority of registered nurses who responded cannot override or do not know if they can override algorithms is concerning because 57 (40%) said they had been "been prompted by a clinical practice guideline, clinical pathway, or electronic or computer-based tool to make choices about patient care, patient care staffing, or other clinical issues that [they] believed were not in the best interest of the patient based on [their] clinical judgment and scope of practice" Out of those nurses, 18 (32%) could not override the algorithms at all, while 8 (14%) said they did not know. Twenty-two (39%) needed approval from a doctor or supervisor to override. Only 9 (16%) of RN respondents could override based on their professional judgment without approval.

[62] See Krumholz 2014, fn 3.

The need to combat inappropriate recommendations creates deficiencies in care. Worryingly, one RN responded:

> [Her employer] calls them BPA's (best practice alerts) that pop up in the middle of your charting. Sometimes they are useful reminders, but often it leads to nurses following the BPAs instead of exercising their clinical judgment to individualize each patient's needs. I have been told by an educator "you are not supposed to think or question it. Just do what the computer tells you to."

Another RN commented:

> Healthcare should not be one standard protocol for all but that is what it's turned into. We are not being asked to use our skills, knowledge, or critical thinking abilities. We are now just asked to follow protocols, policies and procedures. It's disheartening and disappointing because healthcare is becoming more about financial gains & not actual personalized health for each individual as a whole.

Doctors also feel substantial pressure to comply with treatment guidelines prescribed by clinical algorithms. Polls of doctors show that they frequently will follow guidelines that become the "standard of care" even if they do not agree with the scientific conclusions that underlie them, due to fears that they will be penalized for variations from that standard.[63] External payers such as insurance companies and government agencies also reward or penalize individual doctors and medical groups based on compliance with guidelines.[64] Payers apply these same rewards and penalties to hospitals and other types of health care facilities. Additionally, the health systems implementing clinical algorithms are often responding to promises by manufacturers that they will be able to reduce staffing costs or to financial incentives to implement electronic health records systems, rather than strong data on patient outcomes.

Many discussions of clinical algorithms mention excessive health care costs as a driving factor.[65] Achieving the "efficiency" gains promised by clinical algorithms requires forcing health care professionals to comply with their recommendations, despite possible weaknesses in the tools and the need for individualized patient care. When use of clinical algorithms is heavily incentivized, patients who fail to fit those guidelines and expectations suffer. In 2009, an assessment of a pay-for-performance plan in California found that doctors dropped noncompliant patients and refused to treat people with complicated illnesses to prevent bad outcomes from being added to their statistical records.[66]

[66] Groopman J, Hartzband P. Why 'quality' care is dangerous. *Wallstreet Journal.* April 8, 2009. https://www.wsj.com/articles/SB123914878625199185.

The literature cited by AHRQ in the RFI includes numerous examples of systemically biased algorithms. It is likely that these studies on racial bias in algorithms represent only a small sampling of the biased algorithms in use, due to obstacles to research on proprietary algorithms. As discussed above, bias is also introduced by the ways in which population-level data can be a poor fit for individual patients. When algorithms make biased decisions on patient care based on race or ethnicity, registered nurses and other health care professionals have the expertise and connection to patients to find the appropriate course of action. These health care professionals can counteract problems in algorithms if they are given the autonomy to do so.

For these reasons, clinical algorithms must serve as guidelines, not rigid protocols. There may be good reasons to deviate from a recommendation in a manner that has been neither authorized nor anticipated. Health care professionals must be free to exercise their professional judgment regarding the care that is appropriate for each patient based on the patient's particular clinical indications, circumstances, needs, and preferences.

It is also worth noting that these algorithms have been introduced into health care settings to manage and take advantage of the large quantities of data stored about patients through electronic health records systems and diagnostic imaging computers. As we have seen, this means their performance is limited by the quality of data available. This data is often entered by staff, under pressure from their employers as well as time constraints, tasked with recording a tremendous amount of information for billing and insurance purposes as well as inputs for many different algorithms. That means there will always be some mistakes in data pulled from electronic health records. It also means that the more algorithms health care facilities choose to implement, the more time a health care provider must spend facing a computer instead of their patient. This may be particularly problematic for patients who have limited time with their health care providers at under-resourced facilities and who have difficulty trusting health care providers due to previous experiences with racism.

NNU supports laws and regulations, such as AB 858, a bill introduced in California's state legislature in its 2021-2022 legislative session, that promote patient safety and reduce the risk from biased algorithms by allowing health care professional who provide patient care to exercise independent professional judgment to override health information technology, requiring employers to train workers on the use and limitations of new technology, and requiring consultation with workers before adopting new technology.

As AHRQ conducts its inquiry into bias in clinical algorithms, NNU urges the examination of the ability of health care professionals to use their independent professional judgment to override these algorithms and the role override can play in combatting bias.

IV. Lack of transparency in algorithms and lack of user education on bias impedes use of professional judgment and makes it difficult for health care professionals to detect bias.

Answering RFI questions 7 and 11 on user awareness and education.

In the experience of survey respondents, RNs are rarely aware of the inclusion of race, ethnicity or other variables that could introduce bias in these algorithms and the implications for clinical decision making. Patients are not aware of how these algorithms may bias their care and providers do not communicate this information to patients. This experience is corroborated by extensive evidence on the ways that proprietary algorithms lack the transparency necessary to allow users to evaluate their recommendations.

Opacity in proprietary systems means that health care professionals often do not know how the algorithms reach recommendations for patient care.[67] As discussed in Section IIC, the results from electronic systems trained using machine learning can be opaque even to their creators without techniques to ensure transparency. Health care professionals enter a wide range of information into electronic health records systems, some of which informs clinical algorithms. They are often asked to enter race or ethnicity or other information that can in some contexts serve as a proxy for race, such as income, location, or health care usage history. They later see treatment recommendations pop up on screen. They will often not know what information they entered caused that recommendation or how the algorithm reached that conclusion.

Registered nurses are often required to use clinical algorithms but receive minimal education about how algorithms are developed or may influence clinical decision-making. This impedes RN's ability to effectively assess the applicability of algorithmic recommendations in their clinical practice and impedes their ability to recognize where population-based and possibly biased data does not apply to an individual patient.

NNU's survey of RNs on clinical algorithms asked questions about the extent to which users and patients are aware of the inclusion of variables that can introduce bias into algorithms, RFI question 7, and the education available on these algorithms, RFI question 11. The preliminary results show that many registered nurses and patients do not know about the risk of bias in algorithms. As of May 10, 74 out of 168 (44%) registered nurses responding responded that they were not aware that clinical algorithms that include race or ethnicity as a factor may introduce bias into patient care. Fifty-five nurses (33%) responded that they were aware and 39 (23%) said they were somewhat aware.

Even among registered nurses who did know about the potential for bias, this awareness did not come from education and training provided by their employers. When asked "Has your workplace provided any education about how clinical algorithms could introduce bias into patient care?", an overwhelming majority of 153 out of 168 registered nurses (91%) responded "No, I have not received any education about this." Only three nurses surveyed said "Yes, I have received extensive education about this."

[67] See Ledford 2019, fn 59.

Nurses are not the only ones who are not being informed about the risks of bias in algorithms. When asked if, in their experience, patients were "informed about the use of race, ethnicity, or other factors that could result in bias in algorithms that influence their care," the majority of registered nurses, 98 out of 167 respondents (59%) said "no." Five nurses replied "rarely," five replied "sometimes" while only one nurse responded "always." 58 nurses (35%) did not know.

When health care providers cannot see explanations for individual decisions recommended by a clinical algorithm, dangerous errors based on bias can persist without being spotted, preventing users from advocating for the fair treatment of their patients. This opacity impedes the ability of registered nurses and other health care professionals to effectively and appropriately incorporate the scientific information represented in the algorithms into their own clinical decisions based on their individual patients. Our members live in the communities they serve and see patients every day. They have important information about how their individual patient or community may differ from wider data trends. They cannot use that information to counteract biases in the data if they do not know what data is included or how it is used.

This is not just a provider and patient education problem. Often, even researchers do not have access to data on proprietary algorithms. Protections for proprietary tools combined with the sensitivity of health care data make comprehensive studies of racial and ethnic bias in recommendations and patient outcomes rare.[68] This means that there is limited evidence available for health care professionals who do know about the possibility of bias to review the performance of the particular algorithms they use in their practice.

In our current market-driven health care system, there is often financial pressure to implement such systems at facilities that serve low-income patients who may be both sicker and less able to pay medical bills. Thus, lower-income communities, that are disproportionately communities of color, and their health care providers may be subject to opaque performance systems to determine what resources they receive. This is also a form of bias in algorithmic implementation.

NNU supports measures to increase the transparency of clinical algorithms and to make information on how these algorithms work accessible to health care providers. Before an algorithm is implemented, rules, content sources, and other relevant information should be readily available to health care professionals and posted on a public website. Crucially, health care professionals, patients, and the public should be educated on the inapplicability of population statistics to individuals and clinicians should have, and be made aware of, the right to override technology in the interests of their patients based on their professional judgment.

AHRQ should include in its analysis the extent to which these algorithms are transparent about their inputs, reasoning, and potential for biased recommendations, and the training and

[68] Ledford 2019, fn 59.

education provided to the health care professionals who use these tools and the patients whose care is affected by them.

V. Conclusion

As AHRQ conducts its inquiry into how clinical algorithms can introduce racial and ethnic bias into health care delivery, there are several essential points to consider that apply to all algorithms, not just those that have already been proven to be biased. First, there are fundamental limits on the ability of algorithms to meet the needs of individual patients, especially when those patients are part of racial or ethnic groups that are less well represented in the data. Second, AHRQ must consider the importance of ensuring that health care professionals have full autonomy to override algorithmic recommendations, within their scope of practice and consistent with their patients' needs and preferences. Third, transparency and education about all aspects of the creation, use, and impact of these algorithms is necessary to detect and combat bias. Fourth, transparency must extend to clinicians, patients, and the public, including thresholds for recommendations to provide and deny preventive, diagnostic, or treatment measures by race, ethnicity, gender, and other relevant data. Finally, NNU urges AHRQ to support robust regulation of clinical algorithms as medical devices and to ensure that the supporting evidence and reasoning on which clinical recommendations are based are sufficient, sound, transparent, and intelligible and that recommendation thresholds for providing or denying preventive, diagnostic, or treatment measures are transparent to clinicians, patients, and the public.

Thank you for considering National Nurses United's comments and materials in response to the Request for Information (RFI) on **"**Use of Clinical Algorithms That Have the Potential To Introduce Racial/Ethnic Bias Into Healthcare Delivery," 86 Fed. Reg. 12,948 (Mar. 5, 2021).

Sincerely,

Carmen Comsti

Re: Request for Information: Automated Worker Surveillance and Management 88 FR 27,932 (May 3, 2023) Document No. 2023-09353, Docket ID: OSTP_FRDOC_0001.

Dear Mr. Mislove:

On behalf of more than 225,000 registered nurses (RNs) across the country, National Nurses United (NNU) respectfully submits these comments in response to the Office of Science and Technology Policy (OSTP)'s Request for Information on Automated Worker Surveillance and Management, 88 FR 27,932 (May 3, 2023) (RFI).

NNU applauds OSTP's decision to inquire about how automated worker surveillance and management (AWSM) affects workers, including nurses, and their workplaces. The federal government must take a firm stance against workplace surveillance and the algorithmic management that AWSM technology enables and implement regulations to protect worker privacy and autonomy, particularly in health care professions. OSTP's plan for the federal government should include a strong regulatory framework to combat automated technology to surveille workers and subject them to opaque algorithmic management decisions.

The health care industry has implemented a host of technologies that collect data on everything that happens in health care facilities. Many of these technologies are ostensibly designed to improve patient care, but in fact they track the activities of health care workers. Automated monitoring technology feeds into algorithmic management systems that make unreasonable and inaccurate decisions about patient acuity, staffing, and care with the goal of lowering labor costs. As a result, nurses and other health care professionals are expected to work faster, accept more patients per nurse, and reduce their use of independent professional skill and judgment. Tracking nurses is designed to facilitate routinization—breaking the holistic process of nursing into discrete tasks—with the goal of replacing educated registered nurses exercising independent judgment with lower cost staff following algorithmic instructions. In reality, each patient is unique and health care is made up of non-routine situations. Registered nurses must be permitted to develop the skill and professional judgment that safe patient care requires. The AWSM

technology-enabled process of surveillance, routinization, and interference with professional judgment puts nurses' health and safety and patients' lives at risk.

Constant surveillance also means that nurses cannot tell if management is monitoring union activity, such as conversations with union representatives or organizing discussions, which chills union activity and the ability of workers to push back against dangerous management practices. Nurses often are subject to tracking devices that could extend into their private lives and have little knowledge of how employers use their surveillance power. NNU urges OSTP to support robust regulation of AWSM technology in the workplace and by employers generally, to protect the right to collective action as well as employees personal time and privacy.

The federal government must strengthen regulations to limit automated worker surveillance and management technologies to the greatest extent possible. To the extent AWSM technology is implemented, federal regulations should ensure that workers are always notified of the types of surveillance used and the purposes of the data collection. Algorithmic management systems must be entirely transparent, so workers can understand how the decisions governing their working lives are made. Union workers must have the opportunity to bargain over implementation of any AWSM technology before the technology is selected or implemented. Worker control over the implementation and use of AWSM technology in the workplace is the only way to ensure that such systems are implemented without compromising the safety and privacy of workers or their clients. This is particularly true in the health care setting, where privacy and trust are critical to effective patient care, and clinical mistakes due to fatigue or overwork can be fatal.

In the health care context, federal regulations should protect independent exercise of clinical judgment and prevent deskilling of health care professionals. Currently, life and death decisions relating to patient acuity, treatment decisions, and staffing levels are being made by opaque AWSM systems. Recommendations from AWSM systems are meant to inform independent clinical judgment by professionals, but in practice employers often pressure health care professionals to rigidly adhere to AWSM system's recommendations with the goal of reducing operating expenses. Nurses are expected to follow clinical decisions made by AWSM technology related to patient care and treatment, rather than using their professional judgment in providing care that is consistent with each patient's unique needs, preferences, and values. Health care professionals often cannot even see the patient data or clinical research that underlies the recommendation and have no way of judging the validity of its application to an individual patient. This puts patients at risk from inappropriate recommendations in the short term and in the long-term results in the deskilling of nurses and creates a dangerous skill gap when atypical or emergency situations arise that the AWSM technology is unequipped to navigate. NNU supports policies that ensure registered nurses and other clinicians can exercise their professional judgment in determining the best course of action for their patients and override decisions made by AWSM technology when doing so is clinically appropriate without threat of discipline or discharge.

Finally, OSTP must strongly warn federal regulators against accepting new models of health care and employment based on the inaccurate and dangerous notion that ambient patient monitoring

technology and algorithmic management can replace in-person care by health care professionals and full employment protections for workers. AWSM technology is enabling dangerous new models of patient care designed to lower labor costs and push patients out of health care facilities, including acute, inpatient-level hospital care at home, telehealth supported by ambient patient monitoring and call center worker tracking systems, staffing platforms that support gig nursing, and other problematic care models that are simply inferior to traditional care at a hospital or other health care facilities, both in terms of nurse employment protections and patient outcomes..

It is essential that OSTP, and the executive branch more generally, supports robust regulation of AWSM technology in health care, particularly technology used in clinical decision-making and staffing, and ensures that recommendations made by such technology serve only as guidelines and are sound, transparent, intelligible, and supported by extrinsic evidence such as in-person examination or observation by a clinician.

NNU's responses to the RFI questions are below. In some cases, they are repetitive as they are included in each place they were responsive to the question asked.

Sincerely,

Michelle Grisat

Michelle Grisat
National Director of Health and Regulatory Policy
National Nurses United

National Nurses United's Responses to Request for Information: Automated Worker Surveillance and Management

1. If you are a *worker or organization representing workers (such as a worker center, union, or legal services provider)*, please tell us about your experiences with automated worker surveillance and management systems or the experiences of the workers you interact with, including:

a. The type of work you do (*e.g.*, describe the relevant job, employer, and industry);

National Nurses United (NNU) primarily represents registered nurses (RNs). The majority of NNU RNs work in short-term acute care hospitals in both inpatient and outpatient settings but some work in outpatient clinics, medical offices, long-term care facilities, home care, schools, and other settings.

b. Whether you are a member of a labor union;

National Nurses United, with nearly 225,000 members nationwide, is the largest union and professional association of registered nurses in U.S. history.

NNU affiliates include the District of Columbia Nurses Association, Michigan Nurses Association, Minnesota Nurses Association, New York State Nurses Association, and California Nurses Association/National Nurses Organizing Committee, which represents nurses at facilities in Alabama, Arizona, California, Colorado, District of Columbia, Florida, Georgia, Iowa, Illinois, Kansas, Kentucky, Maine, Missouri, Nevada, North Carolina, Ohio, Texas, Virginia, West Virginia, and Puerto Rico.

c. The type of automated surveillance or management you have experienced, including the location of the monitoring technology (such as an app you had to use or download; a device you had to use, carry, or wear; or a camera that monitors you);

AWSM systems are distinguishable from traditional surveillance systems in that they draw data from various devices and sources, often operating as part of independent systems, and compile this data into unified data sets, which can then be analyzed to draw conclusions and make decisions that would not be possible from a single system or device. In this sense, AWSM systems are almost always greater and more impactful than the sum of their individual parts. For example, through a combinations of radio-frequency ID tracking in badges, computer-enhanced video-cameras, electronic health records, interoffice communications devices, and even things as innocuous as special sensors on soap dispensers, health care employers are able to produce a 3-dimensional, dynamic representation of the people, objects, and movements within a particular

environment over time.[1] This would simply not be possible relying on any one of these technologies alone. Likewise, the vast and disparate nature of the data gathered by these systems[2] almost always requires that it be processed through a highly complex, and often opaque, algorithm. Most of these algorithms are "black boxes," where nurses, health care managers, and sometimes even their creators do not know precisely how they work.

Somewhat unique to the health care setting, AWSM systems are also informed and supported by an entire suite of sensors, monitors, and other technology focused on patients and patient care areas. These include sensors that monitor a patients' vital signs, cameras and other sensors that track a patients' mobility in their room or throughout the facility, technology to monitor sleep levels, and other types of patient monitoring that can be used to identify and monitor interactions with staff. This patient data is then combined with data drawn from more traditional AWSM systems and synthesized into a comprehensive and dynamic representation of nearly all RN movements and activities, then used to make clinical and employment decisions.

It is therefore inappropriate to think of AWSM systems as discrete technologies, each of which might only have a limited role in the workplace. In reality, these systems generally function together with the shared goal of surveilling and managing employees, lowering labor costs and deskilling nurses by shifting professional care responsibilities to automated, and highly flawed, systems, and attempting to reduce complex RN patient care to computer prompts and box-checking.

In addition to the AWSM systems discussed below, there may be other AWSM systems are actively surveilling and managing our members, but NNU is simply unaware of them. Despite NNU's consistent and regularly expressed position that employers have a legal obligation to provide notice and an opportunity to bargain over implementation prior to the implementation of an AWSM systems, health care employers often do not disclose the introduction of such systems to NNU and its members. While health care employers, when cornered, often will assert that these are simply updates of older, "dumber" technology, and within their management rights to implement. This is entirely specious. Yet health care employers actually may fear that effective advocacy will derail their plans to deskill RN work and replace them with less costly workers, rather than providing safe and healthy workplaces and fair pay and benefits to attract and retain

[1] Chan, et al., define "ambient intelligence" to mean a system which utilizes "computer vision-guided neural networks to continuously monitor multiple datapoints in video feeds" using "computer-vision aided infrared cameras" to monitor nurse workload. Chan, P. Y., Tay, A., Chen, D., De Freitas, M., Millet, C., Nguyen-Duc, T., Duke, G., Lyall, J., Nguyen, J. T., McNeil, J., & Hopper, I. (2023). Ambient intelligence-based monitoring of staff and patient activity in the intensive care unit. *Australian critical care : official journal of the Confederation of Australian Critical Care Nurses*, *36*(1), 92–98. https://doi.org/10.1016/j.aucc.2022.08.011

[2] "Ambient sensors will produce petabytes of data from hospitals and homes. This requires new machine-learning methods that are capable of modelling rare events and handling big data to be developed (Table 1)"[2] Haque, A., Milstein, A. & Fei-Fei, L. Illuminating the dark spaces of healthcare with ambient intelligence. *Nature* **585**, 193–202 (2020). https://doi.org/10.1038/s41586-020-2669-y

RNs.[3] As a result, some of the AWSM technology and systems discussed in this comment were identified by nurses themselves, while on the job. Given the diverse and low-profile nature of AWSM systems, there is a possibility that there is additional AWSM technology in place that our members have so far failed to recognize.

Researchers studying AWSM technology in hospitals describe a complex and diverse variety of advanced surveillance equipment that could be deployed in health care settings and used to monitor nurse activity throughout their shift. Many if not all of these would be completely invisible to a nurse while performing their duties unless they were informed about the existence of such technology. For example, researchers describe cameras equipped with "inertial sensors,"[4] "radio frequency (RF)-based non-contact human movement detectors and geolocators,"[5] "passive infrared sensors,"[6] "Raspberry Pi Infrared,"[7] geolocation enable through Bluetooth technology,[8] "temperature-humidity sensor[s],"[9] light sensors,[10] "thermal imagers,"[11] "RGB camera[s],"[12]

[3] The health care industry's end game is to replace RNs with less costly workers and to create new health care delivery models, including using RNs to lead "patient care teams" rather than provide hands-on care. The health care industry has created the staffing crisis that it is using to justify these changes instead prioritizing patient care and providing safe workplaces that would keep RNs at the bedside. NNU has several recent reports on the industry-created staffing crisis and the failure to provide a safe and health work environment. See Protecting Our Front Line: Ending the Shortage of Good Nursing Jobs and the Industry-created Unsafe Staffing Crisis available at: https://www.nationalnursesunited.org/protecting-our-front-line-report; Workplace Violence and Covid-19 in Health Care: How the Hospital Industry Created an Occupational Syndemic available at: https://www.nationalnursesunited.org/sites/default/files/nnu/documents/1121_WPV_HS_Survey_Report_FINAL.pdf ; and Deadly Shame: Redressing the Devaluation of Registered Nurse Labor Through Pandemic Equity available at: https://www.nationalnursesunited.org/campaign/deadly-shame-report.

J.* **2018**, *18*, 5115–5121. https://ieeexplore.ieee.org/abstract/document/8355489/; Zhao, Y.; Tu, P.; Chang, M.C. Occupancy Sensing and Activity Recognition with Cameras and Wireless Sensors. In

"Bluetooth beacons and inertial measurement unit (IMU) sensors,"[13] geolocation using "the range-only extended Kalman filter simultaneous localization and mapping technique,"[14] "IMU sensor[s],"[15] sound identification through the "percussive source separation technique,"[16] the use of Doppler radar technology,[17] multichannel recording the universal serial bus (USB) microphones,[18] and others technology. Many of the above would be completely invisible when integrated into a health care facility.

In sum, while this comment seeks to respond to the individual questions identified by OSTP in its RFI, it is important to note that each of these systems is generally integrated with the others, and thus their impact on nurses and health care workplaces cannot be analyzed in a vacuum. Each individual system is thus considerably greater, and more insidious, than any one of its individual parts. AWSM systems may therefore be thought of collectively as a single, comprehensive system, of which any one of the technologies discussed below could form a small part.

(1) Electronic health records (EHRs)

The U.S. Office of the National Coordinator for Health Information Technology (ONC) offers this idealized explanation of EHRs:

> **EHRs are, at their simplest, digital (computerized) versions of patients' paper charts. But EHRs, when fully up and running, are so much more than that.**

Proceedings of the 2nd Workshop on Data Acquisition To Analysis, New York, USA, 10 November 2019; pp. 1–6. https://dl.acm.org/doi/abs/10.1145/3359427.3361911

> EHRs are real-time, patient-centered records. They make information available instantly, "whenever and wherever it is needed". And they bring together in one place everything about a patient's health. EHRs can:
>
> - Contain information about a patient's medical history, diagnoses, medications, immunization dates, allergies, radiology images, and lab and test results
> - Offer access to evidence-based tools that providers can use in making decisions about a patient's care
> - Automate and streamline providers' workflow
> - Increase organization and accuracy of patient information
> - Support key market changes in payer requirements and consumer expectations
>
> **One of the key features of an EHR is that it can be created, managed, and consulted by authorized providers and staff across more than one health care organization.**
>
> A single EHR can bring together information from current and past doctors, emergency facilities, school and workplace clinics, pharmacies, laboratories, and medical imaging facilities.[19]

As the description makes clear, the EHR have been integrated into health care operations through policy established by the federal government as well as through financial incentives (discussed below). The EHR interfaces with numerous technologies, including patient vital sign and other monitoring devices; clinical diagnostic, treatment, and prognosis algorithms; clinical datasets; staffing and scheduling software; laboratory and pharmacy ordering systems; billing and payment systems; government quality reporting systems, and health information exchange networks. The EHR, "when fully up and running" is a complex constellation of technologies that creates a digital representation of the patient that serves as a lynchpin to health care restructuring and, with it, the devolution of patient care and worker autonomy. This restructuring includes replacing RNs with patient care teams, remote patient monitoring as well as worker surveillance, management, and automation. The restructuring underway includes the replacement of RNs and other health care professionals with low-cost workers, unpaid family labor, and automation.

In contrast to the rosy picture painted by the ONC, the implementation of EHRs has been plagued by numerous problems with interoperability, errors and bias in embedded clinical diagnostic and treatment recommendations, and faulty patient safety alerts, to name just a few. Indeed, the new Cerner Corporation EHRs used by the Department of Veterans Affairs (VA),

[19] Office of the National Coordinator for Health Information Technology. (May, 2018). What Are Electronic Health Records (EHRs)? U.S. Department of Health and Human Services, Office of the Secretary. https://www.healthit.gov/topic/health-it-and-health-information-exchange-basics/what-are-electronic-health-records-ehrs. Accessed June 25, 2023. (Emphasis in original).

have resulted in major harm to veterans, including at least four deaths.[20] The VA recently announced that it would "reset" its implementation of the new multibillion dollar EHR system, halting further implementation while it focuses on problems at five locations using the new EHR.[21] Cerner Corporation was identified as among the top three EHRs in terms of market shares in U.S. hospitals.[22]

(a) The federal EHR incentive program

The Health Information Technology for Economic and Clinical Health (HITECH) Act, enacted as part of the American Recovery and Reinvestment Act of 2009, included approximately $30 billion in funding for the EHR Incentive Program. Hospitals and other eligible providers had to demonstrate that they were using their EHRs in conjunction with clinical decision support and computerized provider order entry to receive incentive payments and to avoid penalties that reduced Medicare reimbursement beginning in 2015.[23]

- **Clinical decision support (CDS).** The U.S. Agency for Healthcare Research and Quality describes computerized CDS as "computerized systems in which software algorithms generate patient-specific recommendations by matching characteristics, such as age, renal function, or allergy history, with rules in a computerized knowledge base."[24] Although these systems "generate patient-specific recommendations," they do so based on a fictitious average patient and "match" only a limited set of characteristics. Thus, these recommendations may not be appropriate at the bedside for a particular patient.

  To ensure the best care, the "decision support" must serve as a guideline that providers can override if it is not suitable. Yet many hospitals usurp provider judgment by implementing "hard stops" that prevent them from overriding computer "recommendations." For example, a hard stop may prevent a provider from leaving a computer screen until the provider takes the required action or provides an approved response. Alternatively, the computer may employ a soft stop that, for example, notifies the provider that she is not following the "recommendation" and may include notice that failure to accept the recommendation will be reported to management.

- **Computerized provider order entry (CPOE).** CPOE is a type of software program that physicians and other medical practitioners use to enter orders for medication, blood work, imaging, and other types of treatment and testing. It can serve as a replacement for paper order forms, but typically is linked to CDS software that affects the way that orders can be placed. For example, hospitals and medical practice groups may combine CPOE and CDS through the use of computer menu options that limit the types of orders that a medical practitioner can enter.

(b) EHR surveillance and management of RNs

Ostensibly, EHRs are used to track a patient's progress and document their care. However, in addition to simply recording and tracking patient health information, EHRs differ from traditional medical records in that they then use this information to make recommendations regarding nursing care plans, patient acuity and nurse staffing levels, and nurse performance. Previously all of these determinations were made by nurses and nurse managers through the exercise of their professional judgment.

EHRs accomplish this by processing data entered in the EHR, patient-monitoring data, and data gathered from other AWSM technology, often utilizing proprietary algorithms that are opaque to RNs and other clinicians. EHRs are used to generate a nursing care plan for each patient, assign the patient an acuity level, and determine how many patients to assign to each RN based on the patient's acuity level and care plan. Staffing levels for the subsequent shift are also determined based on these acuity levels, and nurses are called in for overtime or, for RNs on call for flexible shifts, flexed off as the system dictates.

Significantly, nurses, and often even hospital management, are unaware of what specific information the algorithm is relying on in creating nursing care plans and making acuity determinations. Indeed, some EHR systems hide the acuity score itself from bedside nurses, only making this available to hospital management. This is problematic because it prevents nurses from using their clinical experience and nursing judgment to create a nursing care plan and determine the level of care need. If an algorithm makes an inaccurate acuity determination, a nurse might be unable to provide sufficient care for all the patients for whom they are responsible, resulting in adverse health outcomes for the patient and potential discipline, termination, or loss of licensure for the nurse.

Similarly, nursing care plans are the step-by-step treatment and care plans created by RNs that outline what interventions and procedures a nurse will perform on a patient over the course of their treatment. Prior to the introduction of EHRs, RNs created nursing care plans based on their assessment of the patient and their determination of what would be clinically appropriate based on their education and years of experience. With the introduction of EHRs, nursing care plans are often automatically generated by the system, and RNs are expected to follow what the EHR dictates unless it is clinically inappropriate, in which case they may face significant barriers in changing or overriding the care plan.

Employers are using EHRs to replace RN judgment by automating the creation of nursing care plans and assigning patient acuity levels. RNs develop the nursing skill and judgment necessary to accurately evaluate a patient and create an effective care plan through education and experience in the clinical setting. Determining whether a given nursing care plan will be effective requires experience not only in drafting the plan itself, but in evaluating the factors that determine the type and amount of care that is required. By placing this responsibility in the hands of EHRs, employers' end game is to introduce problematic new models of patient care that put patients at risk. For example, employers are using "patient care teams" headed by an RN with less costly workers, often unlicensed, replacing work done by previously by RNs.

As health care is not one-size-fits-all. Additionally, tale-tell signs, such as the smell of a patient's breath, skin tone, affect and demeanor, are often lost on EHR technology, yet are apparent to an experienced nurse and can be crucial to making early diagnostic decisions while there is still time to provide effective treatment. Thus, deskilling nurses also degrades patient care even where the EHR is not making a mistake – such systems simply do not, and cannot, provide the same level of care as an RN. Nurses must be able to alter expected treatment plans based on the unique circumstances of the patient and the patient's wishes and values and to use their experience and nursing judgment to provide the best course of care. Indeed, they are ethically and legally required to do so. However, they are being pressured by health care management, under threat of discipline or even termination, to conform to decisions made by EHRs that are prone to racial and ethnic bias as well as other errors that arise when one applies information that may apply to a population but not to individual patients.

Finally, and perhaps most obviously, EHRs are used to monitor work processes and identify nurses who management believes are working too slowly or visiting a patient too often relative to the patient's computer-generated acuity level. These nurses are then pressured, through formal discipline or informal coercion, into working faster and treating more patients with less support, even where they believe doing so will reduce their quality of care. While this helps to optimize hospital profits, nurses who are pressured to work faster are more prone to make mistakes or to fail to identify mistakes made by electronic systems or others. This places patients at risk.
The use of EHRs and "black box" decision-making creates several problems for RNs. In many cases, this puts them in the difficult position of being pressured, under threat of discipline, to follow clinical recommendations made by the EHRs without knowing how or why those decisions are made. This is particularly problematic for RNs and other licensed health care professionals who have a professional and ethical responsibility to ensure that their patient is receiving appropriate treatment.

Likewise, this information is then used to second guess nursing judgments that are made throughout the day, such as how much time to spend with a patient, acuity-level and staffing determinations, and even what procedures or interventions should be performed on a given patient at a given time. Nurses that fail to conform to the time or performance expectations dictated by AWSM technology are often "coached," disciplined, or otherwise coerced into simply following the decisions of the system and working faster, even if they believe that doing so would be unsafe in their professional judgment.

Even more problematic, as a consequence of being pressured to rely on the clinical decisions of EHRs and networked AWSM technology, new nurses will not be able to fully develop the skills necessary to make these decisions independently, while experienced nurses are losing this skill as a consequence of not being able to practice it regularly in the clinical setting. In other words, AWSM technology results in deskilling by shifting crucial clinical decisions, such as determining acuity and the contents of a nursing care plan, to "black box" algorithms, which make these decisions for the nurses, without indicating how or why they are made. Yet, development of these skills is essential for nurses to be able to determine when the AWSM technology has made a mistake and must be overridden, or when the system fails entirely.

(2) Patient monitoring technology

Another form of AWSM technology in the health care setting is biometric and other monitoring devices focused on patients that are used to also monitor and surveille nurse activities. As Suresha, et al. describe: "Recently, non-contact sensors or nearables such as microphones, video cameras, light-intensity sensors, temperature and humidity sensors, are becoming more popular for hassle-free patient monitoring."[25] In addition to capturing patient data, these technologies also pick up "key information about the patient's ambient environment" including the presence and activity of nurses that are treating them or are in the vicinity. This includes data related to "occupancy and human activity phenotyping," "medical equipment alarm classification," and the "geolocation of humans in a built environment."

Employers claim that patient monitoring technology can reduce nurse workloads, and the need for RN staffing, by substituting for in-person monitoring by nurses. In reality, monitoring sensor output and responding to excessive alerts can increase nurse workloads, interfere with other tasks, and pressure nurses to work faster than is safe to respond to tracked sensor alerts rather than organize their work according to their professional judgment to meet the needs of all patients. Sensor data also serves as input for the next form of AWSM in health care: AWSM ambient intelligence-based patient monitoring systems.

(3) Ambient intelligence-based patient monitoring technology

Health care facilities are beginning to implement comprehensive, ambient intelligence-based monitoring systems that process the information from patient monitoring systems through a computer algorithm, typically in combination with data from other ambient intelligence-based monitoring technology, to produce a 3-dimensional, dynamic representation of the people, objects, and movements within a particular environment over time.[26] Peter Y. Chan. et al., define "ambient intelligence" as a system:

---

[25] Suresha PB, Hegde C, Jiang Z, Clifford GD. An Edge Computing and Ambient Data Capture System for Clinical and Home Environments. *Sensors*. 2022; 22(7):2511. https://doi.org/10.3390/s22072511

[26] Chan, et al., define "ambient intelligence" to mean a system which utilizes "computer vision-guided neural networks to continuously monitor multiple datapoints in video feeds" using "computer-vision aided infrared

> which utilises [SIC] computer vision-guided neural networks to continuously monitor multiple datapoints in video feeds, [and] has become increasingly efficient at automatically tracking various aspects of human movement. For example, it enables automatic tracking of entry and exit into rooms, specific gestures and activities, and interactions between individuals and objects.[27]

The ambient intelligence-based monitoring system may then generate output related to patient acuity, staffing, and patient care based on this information, which RNs are pressured or required to follow.

Ambient intelligence-based monitoring systems draw data from traditional surveillance devices, such as video cameras and microphones, specialized sensors (e.g. infrared sensors, radar, and lidar), as well as through digital tracking and metadata from systems that are not principally used for surveillance of health care employees, such as patient's electronic health records ("EHRs"), cellphones, pagers and other communication devices, and even objects as seemingly innocuous as soap dispensers and identification badges. The vast and disparate nature of the data gathered by such systems[28] typically requires that it be processed through a highly complex and opaque algorithm, indeed often times an artificial intelligence or algorithms developed through "deep learning," which by their nature make it difficult, if not impossible, to determine the clinical basis for the decision. Some of these algorithms are "black boxes," where even their creators do not know how they work because they were created through machine learning. Other systems are functionally opaque to their users because they require a high level of technical knowledge to understand. In many cases, even the health care employers who opt to implement algorithmic systems may not have access to key information about how the systems work due to protections for proprietary information by the developer.

Somewhat unique to the health care setting, ambient intelligence-based monitoring technologies are also informed and supported by an entire suite of sensors, monitors, and other technology focused on patients and patient care areas. These include sensors that monitor a patients' vital signs, cameras and other sensors that track a patients' mobility in their room or throughout the facility, technology to monitor sleep levels, and other types of ambient patient monitoring that can be used to identify and monitor interactions with staff. This patient data is then combined with data drawn from surveilling nurses directly and synthesized into a comprehensive and

---

cameras" to monitor nurse workload. Chan, P. Y., Tay, A., Chen, D., De Freitas, M., Millet, C., Nguyen-Duc, T., Duke, G., Lyall, J., Nguyen, J. T., McNeil, J., & Hopper, I. (2023). Ambient intelligence-based monitoring of staff and patient activity in the intensive care unit. *Australian critical care : official journal of the Confederation of Australian Critical Care Nurses*, *36*(1), 92–98. https://doi.org/10.1016/j.aucc.2022.08.011

[27] Chan, P. Y., Tay, A., Chen, D., De Freitas, M., Millet, C., Nguyen-Duc, T., Duke, G., Lyall, J., Nguyen, J. T., McNeil, J., & Hopper, I. (2023). Ambient intelligence-based monitoring of staff and patient activity in the intensive care unit. *Australian critical care : official journal of the Confederation of Australian Critical Care Nurses*, *36*(1), 92–98. https://doi.org/10.1016/j.aucc.2022.08.011

[28] "Ambient sensors will produce petabytes of data from hospitals and homes. This requires new machine-learning methods that are capable of modelling rare events and handling big data to be developed (Table 1)" Haque, A., Milstein, A. & Fei-Fei, L. Illuminating the dark spaces of healthcare with ambient intelligence. *Nature* **585**, 193–202 (2020). https://doi.org/10.1038/s41586-020-2669-y

dynamic representation of nearly all RN movements and activities, which can then be used to make clinical and employment decisions.

EHRs provide a useful example of how technology primarily used to monitor patients are also used to manage and surveille nurses. As seen in the case of EHRs, such ambient intelligence-based monitoring technology can have a significant effect on the practice of nursing, including how nurses develop essential nursing skills and provide care for their patients. In fact, ambient intelligence-based monitoring and EHRs may be integrated. It is therefore critical that regulations governing ambient intelligence-based monitoring technology also consider and address the degree to which ambient intelligence-based monitoring technology is used to surveille and manage nurses.

(4) Computer-vision aided cameras

One of the most common AWSM technology seen in health care workplaces is computer-vision aided cameras. Computer-vision aided cameras differ from traditional security cameras in important ways. As Chan, et al., describe, computer-vision aided surveillance cameras utilize "computer vision-guided neural networks to continuously monitor multiple datapoints in video feeds" often using "computer-vision aided infrared cameras" and other types of advanced sensors to monitor employee activity.[29] Such systems automatically track various aspects of human movement, including, for example, "automatic tracking of entry and exit into rooms, specific gestures and activities, and interactions between individuals and objects."[30] Likewise, such systems work together to track nurses, patients and others across wide geographic areas, including between different rooms and work areas, different wards within a hospital, and even between different hospitals.[31]

As with much AWSM technology, the "large volumes of discrete time-series data" gathered by these cameras and imaging sensors are then fed into an algorithm, and combined with data from other AWSM technologies, to create a comprehensive representation of all of a nurse's actions in a given day, which allows for "observability of granular workplace activity." [32] The algorithm then, often without any human interaction, makes determinations based on this data regarding patient treatment, RN staffing levels, and nurse performance. Additionally, "cameras and imaging sensors supply data for learning" can be cross-referenced with data from other sources

[29] Chan, P. Y., Tay, A., Chen, D., De Freitas, M., Millet, C., Nguyen-Duc, T., Duke, G., Lyall, J., Nguyen, J. T., McNeil, J., & Hopper, I. (2023). Ambient intelligence-based monitoring of staff and patient activity in the intensive care unit. *Australian critical care : official journal of the Confederation of Australian Critical Care Nurses*, *36*(1), 92–98. https://doi.org/10.1016/j.aucc.2022.08.011

[30] While it is unclear if the exact ambient intelligence system studied by Chan et al. has been implemented in any US hospitals, our members of confronted a number of highly similar systems in their workplaces.

Registered Nurse Strain Detection Using Ambient Data: An Exploratory Study of Underutilized Operational Data Streams in the Hospital Workplace. *Applied clinical informatics*, *11*(4), 598–605. https://doi.org/10.1055/s-0040-1715829

to further inform how an AWSM system analyzes the data and makes clinical decisions, often without any human intervention or oversight.[33]

However, the nature of the data being collected, how that data is being analyzed, and what assumptions are being made from that data in clinical decision-making is almost entirely hidden from the clinical professionals who are tasked with overseeing that decision-making process and are ultimately responsible for the health and safety of the patient. NNU has seen first-hand how recommendations made by computer-vision aided cameras and other AWSM technology can interfere with safe, therapeutic health care that meets the needs of each individualized patient. Likewise, such comprehensive tracking interferes with nurses' right to engage in protected, concerted activity, invades their privacy, is frequently used to support discipline that is entirely unfounded.

(5) Electronic identification badges

Another common form of AWSM technology in health care workplaces is the use of electronically-enabled identification badges ("ID badge") to track employees' movement throughout a facility. In hospitals and other health care facilities, nurses are typically required to swipe their ID badge upon entering the facility, upon entering specific rooms, such as rooms where medication, food, or supplies are located, upon entering certain operational areas, such as radiology rooms or operating rooms, and sometimes upon entering patient rooms. The identity of the nurse, the time of the swipe, and the location of the swipe are all generally recorded, and fed into an algorithm that, when combined with data drawn from other AWSM technology, can create a dynamic representation of their movement and activities throughout the day.

In addition, many ID Badges also now include radio frequency identification ("RFID"), which allows the system to actively track a nurse's location at all times in a facility as they pass by special RFID enabled sensors, even without swiping, which are distributed throughout the facility. This type of passive tracking allows for even closer surveillance of a employees' activities, and, significantly, can take place at any time without employees' knowledge. Moreover, even if it is not actively tracking when a nurse enters a private space, such as a bathroom or their car, as most do, an RFID system can determine when a nurse is in such locations by process of elimination, since it can actively track their movements over time everywhere else in the facility.

The constant tracking of nurse locations through ID badges creates significant privacy concerns, as nurses may be tracked when they are going to the bathroom or engaged in other private activities, or while they are off duty but still at the facility, such as during breaks or before or after their shift. Constant surveillance also chills protected concerted activity, as it allows management to identify who is talking to whom, and from this, determine union leaders and supporters. Even in workplaces that are already unionized, conversations with shop stewards or

[33] Yeung, S., Downing, N. L., Fei-Fei, L., & Milstein, A. (2018). Bedside Computer Vision - Moving Artificial Intelligence from Driver Assistance to Patient Safety. *The New England journal of medicine*, *378*(14), 1271–1273. https://doi.org/10.1056/NEJMp1716891

union representative may be tracked, and unlawfully used by management in making employment decisions without the nurses or their union ever being aware.

(6) Cell phones and other communication devices

Much like ID Badges, nurses have long been expected to carry communication devices to communicate with other staff while on shift. These devices are increasingly being used to passively surveille nurses by feeding data from these devices into AWSM technology. Our members report that hospitals and other health care facilities are increasingly recording and logging all nurse conversations that take place through employer-provided communication devices. In addition to logging the contents of the conversations themselves, these communications can be digitally encoded, and this data can be used to track nurse activity and performance, particularly when combined with data from other AWSM sources.

As with ID Badges, communication devices can be used to determine a nurse's location at the time a given communication was made, either through using a GPS unit within the device or through triangulating the location through the wifi signal or cell signal used to make the call. Indeed, nearly every smartphone, the primary device used for communication in the workplace by many of our members, is equipped with GPS and a myriad of other technology that allow it to be tracked and located, sometimes even when the device is turned off. Worse still, these devices are sometimes brought home with nurses at the end of their shift, allowing them to potentially be tracked wherever they might bring their cell phone in their free time.

Additionally, communication devices are unique in that, by their nature, they are capable of passively recording ambient sounds. This is particularly true of modern smartphones, which use active listening to allow activation of automated assistants and other accessibility features. This, too, encroaches on nurse privacy and may impede organizing and collective bargaining activities. Indeed, even if these devices are not passively recording employee conversations or tracking employees outside of work hours, the mere potential of such surveillance is enough to effectively chill union activity.

(7) Hand-washing monitoring

Hand-washing monitoring systems are another form of AWSM technology used to surveille nurses in health care workplaces. This typically involves camera systems or sensors that monitor hand washing stations. This video and sensor data is then combined with data from other AWSM technology to determine the identity of the nurse, the instances in which they wash their hands, how long they spend washing their hands, how frequently they wash their hands, and other related information, and make determinations and recommendations regarding whether a nurse is complying with hand-washing requirements.

As with all AWSM technology, such systems are problematic to the extent that it is unclear what data is being recorded and how this data is being used. Hand-washing monitoring systems often appear in bathrooms, breakrooms, and other private spaces, where nurses have a reasonable expectation of privacy. It is unclear if such systems are recording or sensing video or audio data,

or how this data might be combined with other data to create a comprehensive depiction of nurses' activities within these private spaces. Granular surveillance of private activities in bathrooms and break rooms presents clear privacy concerns. It also creates the impression that management is surveilling activity in these locations, which will chill protected concerted activity.

d. Whether the automated surveillance or management was used during a labor organizing drive;

While NNU is not aware of any specific instances in which AWSM technology was used as part of an adverse employment action or to stymie an organizing campaign, the nature of this technology, which allows it to generate a dynamic, real-time account of all nurse activities within a health care facility, means that surveillance of organizing activity inevitably occurs. Employers may be using AWSM technology to take adverse action against nurses for engaging in protected activity based on the information gathered by AWSM technology without explicitly identifying AWSM technology as the basis for the adverse action. The ubiquitous nature of this surveillance inherently creates the impression that nurses are constantly being observed and surveilled by management. Thus, the presence of this technology alone is enough to interfere with nurses' labor rights and chill protected, concerted activity.

By implementing AWSM technology without limits that prevent surveillance of protected concerted activity and without explaining to nurses, and their collective bargaining representative where relevant, how those systems work, health care employers create the impression of near constant surveillance. Depending on the AWSM technology, this may extend to activities outside of work hours and away from work areas, thereby interfering with protected concerted activity. In addition to providing a more detailed account of a nurse's daily activities, AWSM technology has the capability of monitoring nurses at times and in locations where they previously were not subject to surveillance, often times through the devices they are required to carry with them, such a cell phones and ID badges. Without relevant information related to how these systems work and an opportunity to bargain over when and how nurses will be monitored, nurses reasonably may assume that they are subject to surveillance at nearly all times. This impression is more or less confirmed when they are shown detailed, three-dimensional images compiled from multiple different data sources depicting their movements and activities throughout the day. (See Attachment 1, examples of imaging technology capabilities provided to National Nurses United by management.) This impression of constant, pervasive surveillance chills union organizing and protected concerted activity. Nurses may fear that they will be identified as union supporters or troublemakers and subject to retaliation if their employer can identify them as a union supporter or a proponent of a collectively bargaining for change in their workplace.

Federal law has long made clear that employees must be free of the interference and coercion caused by employer surveillance during organizing.[34] Likewise, well-established precedent makes clear that even the impression of surveillance can violate the act.[35] For example, in *Community Counseling & Mentoring Services,* 371 NLRB No. 39, the National Labor Relations Board (NLRB) "held that an employer unlawfully created the impression of surveillance where its president remarked to employees during a staff meeting that he would know if they talked about work issues among themselves because he had 'eyes' and/or 'ears' at the facility."[36] Just as in *Community Counseling & Mentoring Services*, nurses that work as hospitals and other health care facilities that implement AWSM technology know that their employer has "eyes" and "ears" at the facility, and that their employer may know if they talk about work issues among themselves. Thus, as in *Community Counseling & Mentoring Services,* the mere presence of this type of surveillance technology is sufficient to interfere with nurses' protected rights and constitute a violation of the Act. Indeed, NLRB General Counsel Jennifer Abruzzo appeared to acknowledge this earlier this year in announcing a partnership with the Consumer Finance Protection Bureau to address practices of employer surveillance, monitoring, data collection, and employer-driven debt, stating "[e]mployers' practices and use of artificial intelligence tools can chill workers from exercising their labor rights."[37]

---

[34] "Since the earliest days of the Act, surveillance of employees by an employer, whether with supervisors, rank-and-file employees, or outsiders, has consistently been held to violate Section 8(a)(1)." Higgins, J. E., Arnault, B.T., Bock, R.A., Gaylord, A.M. (2022). *The developing labor law: The board, the courts, and the National Labor Relations Act* (Eighth Edition.), Chapter 6. Interference With Protected Rights. Bloomberg BNA. (citing *Consolidated Edison Co. v. NLRB*, 305 U.S. 197 (1938). *See, e.g*., *Cook Family Foods*, 311 NLRB 1299 (1993) (guard's use of binoculars to monitor and report vehicles entering and leaving union campaign headquarters parking lot two days prior to election violated §8(a)(1)); *Impact Indus*., 285 NLRB 5, 5 n.2 (1987) ("well-nigh continuous scrutiny of employee handbilling"), *remanded by* 847 F.2d 379 (7th Cir. 1988), *on remand*, 293 NLRB 794 (1989). (2023, March) *National Labor Relations Board and Consumer Financial Protection Bureau Announce New Partnership to Address Employer Surveillance, Monitoring, Data Collection, and Financial Practices in the Workplace.* National Labor Relations Board. https://www.nlrb.gov/news-outreach/news-story/national-labor-relations-board-and-consumer-financial-protection-bureau. Accessed June 28, 2023.

In order to prevent unlawful interference with employee rights, OSTP must support rules that require health care employers to meet their collective bargaining obligations prior to implementing AWSM technology. This includes providing notice to nurses and their union that the employer intends to implement such systems, proving sufficient information regarding the capabilities and uses of these systems to enable understanding and meaningful bargaining, and bargaining over their implementation and effects prior to implementation. OSTP must also ensure that these systems include limits that prevent them from being used to surveille protected, concerted activity, and that these limits are openly communicated so that employees know when they are and are not being surveilled and recorded.

e. <u>Whether and when your employer informed you about their use of automated worker surveillance and management systems;</u>

In addition to the AWSM technology discussed above, it is likely that other types of AWSM technology are actively surveilling and managing our members, but NNU is simply unaware of them. As discussed in NNU's response to questions 1.c. and elsewhere in these comments, health care employers frequently fail to notify NNU or its members when new AWSM technology is being implemented in the workplace, taking the position that these are simply updates of older, "dumber" technology, and within their management rights to implement without notice to the union or an opportunity to bargain. Thus, some of the AWSM technology and systems discussed in this comment were identified by nurses themselves, while on the job. It is therefore quite likely that other AWSM technology has already been implemented that our members have not yet identified.

The NLRB has long held that it is violation of the National Labor Relations Act to make unilateral changes during the course of a collective bargaining relationship concerning matters that are mandatory subject of bargaining, absent waiver by the union or impasse following good faith negotiations.[38] Indeed, this is one of the rare *per se* categories of prohibited conduct, and is therefore a violation of the NLRA even where the employer is acting under a good faith belief

[38] *NLRB v. Katz*, 369 U.S. 736 (1962). *See also,* Higgins, J. E., Arnault, B.T., Bock, R.A., Gaylord, A.M. (2022). *The developing labor law: The board, the courts, and the National Labor Relations Act* (Eighth Edition.), Chapter 13. Duty to Bargain. Bloomberg BNA; *Litton Fin. Printing Div. v. NLRB*, 501 U.S. 190, 198, (1991) ("[A]n employer commits an unfair labor practice if, without bargaining to impasse, it effects a unilateral change of an existing term or condition of employment."). *See generally Beverly Health & Rehab. Servs., Inc*., 317 F.3d 316 (D.C. Cir. 2003) (unilaterally replacing HMO coverage); *BP Amoco Corp. v. NLRB*, 217 F.3d 869, (D.C. Cir. 2000) (modifications to health plan). *See also Vincent Indus. Plastics v. NLRB*, 209 F.3d 727 (D.C. Cir. 2000) (changes in attendance policy, working hours, work duties, and time-keeping method); *Loral Defense Sys.-Akron v. NLRB*, 200 F.3d 436 (6th Cir. 1999) (change in health care plans); *Pavilions of Forrestal*, 353 NLRB 540 (2008) (unilateral implementation of health insurance plan); *First Student, Inc*., 353 NLRB 512 (2008) (unilateral enforcement of previously unenforced "driving under the influence" policy); Union Tribune Publishing Co., 353 NLRB 11 (2008) (unilateral change in drug and alcohol testing policy).

that it has no duty to bargain.[39] As Judge Harry Edwards explained in *NLRB v. McClatchy Newspapers*:

> A unilateral change not only violates the plain requirement that the parties bargain over "wages, hours, and other terms and conditions," but also injures the process of collective bargaining itself. "Such unilateral action minimizes the influence of organized bargaining. It interferes with the right of self-organization by emphasizing to the employees that there is no necessity for a collective bargaining agent."[40]

It is equally clear that the implementation of ASWM technology constitutes a mandatory subject of bargaining. In *Anheuser-Busch, Inc.*, 342 N.L.R.B. 560, the NLRB held that an employer violated the act by unilaterally implementing surveillance cameras without giving notice or bargaining with the union because the cameras were trained at work and break areas.[41] In so doing, the Board concluded that "the use of hidden surveillance cameras in the workplace is a mandatory subject of collective bargaining."[42] Just as the introduction of mere surveillance cameras constitutes a mandatory subject of bargaining because they *can* record employees in *some* work area, so too does AWSM technology, which creates a comprehensive, dynamic depiction of employees and their actions throughout the day. Thus, by failing to provide notice of the implementation of this technology or an opportunity to bargain, health care employers are clearly engaging in *per ser* violations of the NLRA.

Moreover, because of this lack of notice to nurses or their representatives, NNU is likely unaware of the full extent of AWSM technology being used in our members' workplaces. AWSM technology is myriad and often difficult to recognize. Researchers studying AWSM technology in hospitals describe a complex and diverse variety of advanced surveillance equipment that has been deployed in health care settings and can be used to monitor nurse activity throughout their shift. Many if not all of these would be completely invisible to a nurse while performing their duties unless they were informed about the existence of such technology. For example, researchers describe cameras equipped with "inertial sensors,"[43] "radio frequency (RF)-based non-contact human movement detectors and geolocators,"[44] "passive infrared

Finally, and perhaps most significantly, the argument that this is merely an update of older technology that does the same thing is simply spurious. AWSM technology is unique from older forms of surveillance in that it creates an ecosystem of various data sources that are combined through black-box algorithmic processing to produce a dynamic depiction of a nurse's activities throughout the day that would be impossible from any one sensor or camera. Each individual system is thus considerably greater, and more insidious, than any one of its individual parts. AWSM technologies must therefore be thought of collectively as a single, comprehensive electronic management system, of which any one of the above technologies could form a small part.

f. Whether you (or, if relevant, your representative, like a labor union) have any input or control over how, where, and over what automated surveillance occurs;

NNU and the nurses it represents often has little or no input over how, where, and over what surveillance occurs. Health care employers often fail to provide adequate notice or an opportunity to bargain prior to implementing AWSM technology, despite the fact that these system often have a drastic impact on nurses' terms and conditions of employment.[58] Rather, health care employers typically take the position that such matters fall within their "management rights," even if there is no clear contract language on this point in the relevant Collective Bargaining Agreement or Memorandum of Understanding. This prevents nurses and their unions from knowing precisely which AWSM technologies are operating in their workplace, how they work, what they are monitoring, and how they are used in clinical and employment decisions until after the are implemented.

Employers generally assert that these powerful AWSM technologies are just updates of older technology that has long been in the workplace, such as treating computer-vision aided cameras the same as traditional security cameras, or EHRs as electronic versions of old paper medical records. However, these technologies are much more than modern iterations of well understood tools. Rather, AWSM technologies pull vast and diverse data from an entire ecosystem of monitoring equipment, such as those described above, and process this information through opaque algorithms that then make clinical and employment decisions.

For instance, around 2017, a large health system located in California did provide notice to NNU that it intended to implement a patient acuity and RN workload program known as Epic Acuity. While it refused to bargain over implementation, claiming that this was within its management rights, it did agree to engage in bargaining over the effects of the new technology. This system replaced the prior system. Like many modern systems, Epic Acuity is a points-based acuity

[58] This includes things such as staffing levels, privacy, and discipline resulting from time spent on various nursing activities such as rounding, charting, hand-washing, performing various procedures, treatments and interventions, and performing other duties like helping patients bathe or use the restroom.

system that uses an algorithm to review information entered into the EHR by doctors and nurses and based on this information, assigns an acuity score, which was used to determine the number of RNs that would be required in a given department on a given shift.

Almost immediately, this system began to have serious problems. Like other patient acuity and RN workload software, Epic Acuity assumed that RNs and other clinicians had the capacity to update EHRs in real time. Thus, Epic Acuity made acuity and RN workload decisions based on this assumption. However, in reality, overworked RNs are often not able to chart until the last hour of their shift, when the next shift overlaps with theirs and there are extra hands to take on patient-care duties, allowing time to chart. This, however, leads the system to assume that fewer RNs are required on the subsequent shift, which, in turn, leads to RNs on the subsequent shift being overutilized and not having time to chart, causing a vicious cycle.

Likewise, the acuity scores provided by Epic Acuity called for fewer staff than the prior system in the same exact circumstances, leading to fewer RNs available to provide care for sicker, more numerous patients. While Epic Acuity is a "black box" system, and thus RNs are unaware how it makes acuity determinations, NNU was able to secure, through collective bargaining, two worker committees to oversee the transition and implementation of this technology. NNU was also able to secure a one-month transitionary period, in which both the old technology and the new technology, Epic Acuity, operated simultaneously. By comparing utilization rates and patient care and direct care hours produced by both systems, these committees were able to determine that in at least two locations, on a daily basis, Epic Acuity was providing fewer RN hours than the previous system for the same patient care unit. Thus, by implementing Epic Acuity, this health system was effectively forcing RNs to care for more patients with less support. While the health system claimed to make changes to the system after NNU reported this problem, NNU was unable to confirm this, as the health system will not provide information regarding what specifically was changed in the algorithm. Likewise, these changes can take months, if not years, to implement, leaving nurses in the lurch while health care management struggles with refining and understanding the technology it has already implemented.

Thus, to the extent the NNU or its members have had any input or control over how, where, and over what automated surveillance occurs, this has been the result of aggressive collective bargaining by the union, and the diligent work of its members in worker committees, comparing output data and drawing statistical conclusions. NNU and its members are not provided the same information as the employer about how this system works or how it will be implemented. Instead, they are typically presented with the introduction of AWSM technologies as a *fait accompli* and may be given an opportunity to bargain over the effects of its implementation. This is simply insufficient to fulfill the legal obligation of health care employers, or to allow NNU and other unions to protect their members against the abuse of these systems.

In sum, in regulating AWSM technologies, OSTP must ensure that employers provide notice and a meaningful opportunity to bargain over implementation prior to implementation. This technology is simply too powerful and disruptive to be treated as an update of older non-networked technology, nor does this accurately capture the major effect that implementing this

technology can have on nurses' terms and conditions of employment, as demonstrated above. Anything short of full transparency and bargaining engagement will inherently create the impression among nurses that they are subject to near constant surveillance, and that their words and actions are always being recorded by hidden, advanced monitoring devices, and that this information is being compiled and analyzed by algorithms that then produce a detailed and dynamic representation of everything they do throughout the workday. OSTP must therefore champion regulations that require full and complete transparency prior to the introduction of these technologies, and that ensure health care employers meet and respect their bargain obligations.

g. Whether you know how the data generated by surveillance is used for management or other purposes (including purposes related to employment or labor market competition);

For RNs, questions 1.g., 1.i., and 1.k. are interrelated. NNU's response to question 1.g. will focus on how health care employers use surveillance data to facilitate workforce restructuring, including deskilling professional nursing and eroding registered nurse scope of practice.

Health care employers use the data generated by surveillance in implementing AWSM technologies and systems, particularly EHRs and other health information technology (HIT), for workforce management as well as to restructure health care delivery, including the workforce. This includes attempts to routinize and deskill the profession of nursing with the goal of replacing licensed registered nurses with lower cost staff, including unlicensed staff, and unpaid laypersons. The health care industry's aims include replacing RNs at the bedside and instead having them lead patient care teams, sometimes remotely, with lower cost workers doing the work RNs have done previously.

(1) AWSM Systems Lead to the Deskilling of Registered Nurses and Erodes Their Scope of Practice.

Employers are using AWSM technology to deskill professional nursing and erode RN scope of practice. In so doing, they aim to increase their net income by reducing labor costs and capitalizing on the industry-created RN staffing crisis[59] to justify shifting important patient care responsibilities to unlicensed and lesser-licensed staff as well family caregivers and patients themselves. This happens in large part through the routinization of patient care and deskilling of RNs coupled with a shift to telehealth and alternative care settings. Health care employers

[59] NNU has several recent reports on the industry-created staffing crisis and the failure to provide a safe and health work environment. See Protecting Our Front Line: Ending the Shortage of Good Nursing Jobs and the Industry-created Unsafe Staffing Crisis available at: https://www.nationalnursesunited.org/protecting-our-front-line-report; Workplace Violence and Covid-19 in Health Care: How the Hospital Industry Created an Occupational Syndemic available at: https://www.nationalnursesunited.org/sites/default/files/nnu/documents/1121_WPV_HS_Survey_Report_FINAL.pdf ; and Deadly Shame: Redressing the Devaluation of Registered Nurse Labor Through Pandemic Equity available at: https://www.nationalnursesunited.org/campaign/deadly-shame-report.

frequently mandate as "best practices" those work processes that reduce labor costs and improve their bottom line.

Routinization leads to the deskilling of work processes and health professionals. Skill is the ability, drawn from education and experience, to do something expertly. It can also be defined as *the effective exercise of professional judgment in non-routine situations.* Following prescribed rules, as a machine would, enables an employee to perform tasks, but it does not make the employee skilled. They can do their job as long as there are no surprises. But when something unexpected happens, the rules break down, yet caring for patients means facing the unexpected every day. Skilled health professionals such as RNs can cope with the unexpected. They know because of their education and experience and are able to rely on their own judgment. The exercise of judgment is the essence of skill.

Health care employers utilize AWSM technologies and algorithmic recommendations regarding staffing, workload, and patient care to routinize work processes, and, to the greatest extent possible, deskill the complex RN profession by reducing it to a series of tasks prompted by a computer screen and entered into the EHR. The health care industry has long worked to fragment complex, holistic RN nursing care into discrete tasks, which can then be routinized with variations eliminated. While this is often touted by employers as a way to raise quality standards, it is typically merely a way to speed up and intensify work. Given that patients are unique and complex, variation of patient care to match the needs, values, and preferences of particular patients is not a defect; to the contrary, it is essential. It is why RNs are valued for their education, experience, and professional judgment.

RNs typically are unable to review recommendations made by AWSM technology. RNs are pressured to work faster and rely on the output of opaque technologies but are also ethically obligated to ensure that the nursing care they provide is appropriate. AWSM technologies, particularly when deployed in health care settings, frequently make determinations and recommendations that are incorrect or potentially harmful. If RNs do not have the information necessary to catch these mistakes, there is no way to prevent these errors from harming patients.

Moreover, RNs typically do not have control over the number of patients assigned to them. In fact, California is the only state that places a numerical limit on the number of patients that can be assigned to an RN providing inpatient hospital care. The limits are based on the type of patient care unit they are working in and can be reduced, but not increased, based on the acuity of the patients assigned. Thus, RNs do not control if they have the time and resources to care for patients. Increasingly, AWSM technology-based acuity systems make staffing determinations.

(2) Algorithmic management systems prevent nurses from exercising and maintaining nursing judgment.

As with RN skill, employers seek to use AWSM technology to minimize the role of RNs' professional judgment. RNs' professional judgment reflect their education, expertise, and experience in clinical decision making. Routinizing decision-making processes related to nursing

care and reducing those processes to entering data into an EHR in response to computer prompts limits RNs ability to exercise and maintain the efficacy of their professional judgment. To the degree this happens, nurses may lose their ability to recognize and correct errors made by AWSM technology or other providers, problematically making them replaceable with non-RNs, as described above.

Yet the development and use of hands-on nursing skill and judgment when assessing and providing care for a patient is an essential and necessary element for the provision of high-quality nursing care. For instance, sleepiness and dilated pupils can indicate that a patient a suffered a hemorrhagic stroke.[60] Likewise, foul-smelling breath can indicate an abdominal obstruction, whereas breath that smells like Juicy Fruit gum can indicate a patient is suffering from diabetic ketoacidosis. Typically, these observations are made in passing in the course of providing care for a patient, including during activities that are typically not diagnostic in nature, such as helping a patient ambulate or use the restroom. Overreliance on sensors and algorithmic recommendations within facilities and use of models that use ambient intelligence-based patient monitoring to require nurses to provide care remotely, discussed further below, prevent nurses from having the opportunity to make these hands-on observations that are essential for providing quality nursing care.

Moreover, the AWSM systems that facilitate this "remote care" often themselves prevent nurses from using their judgment, even when they are aware that the system is making an error. For instance, one member described an instance in which an AWSM system at the UC Davis Medical Center reported that her patient was septic, even though she knew from 15 years of experience and her own assessment that this was not the case.[61] While the algorithm did not provide the rational for its decision, as is typical with AI-supported AWSM systems, it likely failed to take into account that the patient's elevated white blood cell count, normally correlated with a septic infection, could have resulted from the fact that the patient also suffered from Leukemia.[62] While the UC Davis Medical Center allows nurses to override the assessment of the system, this can only be done with doctor approval, and can result in discipline for the nurse if their assessment is incorrect. The RN was therefore placed in the difficult situation of either risking her job or performing a treatment protocol that she believed was unnecessary and could put the patient at an increased risk of harm.

NNU survey findings reveal deep problems with the use of algorithms in health care. (See Attachment 2 for a summary of these findings.) NNU surveyed registered nurses about their

[60] Bannon, L., (2023, June 15) When AI Overrules the Nurses Caring for You: Artificial Intelligence Raises Difficult Questions About Who Makes the Call in A Health Crisis: Man or Machine? *The Wall Street Journal*, https://www.wsj.com/articles/ai-medical-diagnosis-nurses-f881b0fe. [62] Bannon, L., (2023, June 15) When AI Overrules the Nurses Caring for You: Artificial Intelligence Raises Difficult Questions About Who Makes the Call in A Health Crisis: Man or Machine? *The Wall Street Journal*, https://www.wsj.com/articles/ai-medical-diagnosis-nurses-f881b0fe. Accessed June 29, 2023.

experiences with algorithms in 2021. Out of 795 RNs who responded to the relevant questions, 172 respondents (21.6%) said they were not allowed to "override clinical practice guidelines, clinical pathways, or electronic or computer-based tools that [they] believe are not in the best interest of the patient", 200 respondents (25.2%) could only do so with the approval of a doctor or supervisor, and 204 respondents (25.7%) did not even know if they were allowed to override the recommendations. Only 117 respondents (14.7%) were allowed to override algorithms based on their own judgment. The fact that a majority of registered nurses who responded cannot override or do not know if they can override algorithms is concerning because 246 (31.0%) said they had been "been prompted by a clinical practice guideline, clinical pathway, or electronic or computer-based tool to make choices about patient care, patient care staffing, or other clinical issues that [they] believed were not in the best interest of the patient based on [their] clinical judgment and scope of practice."

As AWSM systems become increasingly pervasive, RNs professional judgment may atrophy, and RNs may lose the ability to exercise their professional in situations where AWSM technology cannot do so. Assessing patients and developing a nursing care plan is a skill, grounded in education and professional judgment, which must be maintained and exercised, or it may be lost. Indeed, it is for this reason that clinical experience is a key requirement to become licensed as an RN. Removing opportunities to exercise professional judgment and maintain these skills will leave RNs and patients with limited recourse in circumstances where the system is ineffective.

In sum, health care employers seek to minimize nursing judgment from the provision of health care and use AWSM and HIT technologies to shift patient care to others in order to reduce labor costs. However, the law requires that certain health care duties legally be performed by a licensed RN precisely because the license indicates that they have sufficient knowledge, experience, and judgment to safely manage those responsibilities. RNs are left with the legal and ethical responsibility to care and advocate for their patients but without the time, autonomy, or information they need to do so safely. Health care employers are actively lobbying to change statutes and regulations to enable this shift. They have been utilizing the industry-created RN staffing crisis to justify these changes, dramatically degrading the quality of care provided at US health care facilities.

OSTP must ensure that all federal regulators understand that AWSM technology cannot safely or ethically replace the exercise of judgment by a professional. Policies adopted to regulate AWSM technology at health care facilities must prevent the routinization of core nursing tasks that results in the deskilling and of nurses and the erosion of nursing judgment.

h. <u>Whether you (or, if relevant, your representative, like a labor union) have any visibility into the data collected on you or how it is used, including whether data on you collected by surveillance can be shared with other companies, trade groups, or third parties;</u>

As discussed in NNU's response to questions 1.c., 1.e., and 1.f., health care employers often fail to notify NNU or its members when new AWSM technology is being implemented in the workplace, taking the position that these are simply updates of older, "dumber" technology, and within their management rights to implement without notice to the union or an opportunity to bargain. Likewise, management rarely provides information about what new data is being collected and how this data is being used. To the extent the NNU or its members have had any knowledge, input or control over how, where, and over what automated surveillance occurs, this has been the result of aggressive collective bargaining by the union, and the diligent work of its members in worker committees, comparing output data and drawing statistical conclusions. NNU and its members are not provided the same information as the employer about how this system works or how it will be implemented. Typically, they are merely presented with the introduction of AWSM technologies as a *fait accompli* and may be given an opportunity to bargain over the effects of its implementation.

While nurses have some sense of how this data is being used when they must interact with these systems as part of providing care, such as knowing that EHR information and metadata is being used to determine acuity levels and staffing requirements, they have no insight into whether the data is also being shared with other companies, trade groups, or third parties. The risk that such data sharing may be taking place only serves to amplify the clinical, collective bargaining, nursing practice and privacy concerns highlighted in this RFI response. Also, somewhat unique to the health care setting, the sharing of data might implicate the Health Insurance Privacy and Portability Act, which has strict rules about maintaining the privacy of patient health information.

Furthermore, as discussed throughout this comment, RNs and other clinicians typically have no way of knowing how the data being collected is being used to make and inform clinical decisions, such as acuity determinations and nursing care plans. Indeed, no one, including the designers of the AWSM systems themselves, may know precisely how this information is being used if it is processed through a machine-learning algorithm or similar AI technology. This prevents nurses from double checking these systems to ensure they have reached the correct conclusion. This also prevents RNs maintaining and exercising the nursing skills and professional judgment to make these determinations without relying on AWSM technology. The lack of transparency about how AWSM data is being used thus has important clinical implications for the practice of nursing as well. OSTP must therefore demand complete transparency regarding the operation of these systems before they are implemented in health care workplaces.

i. <u>How the use of automated surveillance and management systems has changed how you do your job or how your employer treated you at your job;</u>

The use of AWSM systems has greatly impacted how RNs do their jobs. Health care employers use AWSM systems to undermine use of skill and judgment by registered nurses, as discussed in

section g. and throughout this response, and to support new models of health care, like so-called hospital-at-home programs and gig nurse staffing platforms, which put patients in danger and degrade RNs' terms and conditions of employment. Employers aims include replacing RNs at the bedside and instead having them lead patient care teams, often remotely, and/or making periodic virtual visits of patients.

(1) AWSM systems are the basis for new, problematic health care delivery models that put RNs and patients at risk in order to maximize corporate profits, such as hospital-at-home models, telehealth, and gig-nurse staffing models.

AWSM technology supports and facilitates the proliferation of dangerous new care models such as hospital-at-home programs for acute "in-patient" care, telehealth, and gig-nursing. Hospital-at-home uses patient monitoring and communications technology to facilitate leaving patients in need of acute hospital care in their homes with limited visits from health care professionals. The proliferation of telehealth models where nurses counsel patients remotely enable nurse-patient interactions to be tracked closely, facilitates nurses being penalized based on tracking metrics, and undermines safe patient care. Gig nurse staffing platforms manage RN staffing by algorithm. They take advantage of the ability of technology platforms to plug nurses into individual shifts to move away from care models where experienced, consistent, nursing care is provided in environments familiar to them, supporting their ability to provide safe patient care. In contrast, with gig staffing, nurses with limited orientation or unit-specific expertise are expected to care for patients in unfamiliar facilities.

These schemes seek to dramatically lower labor costs by replacing hands-on skilled hospital care with technology, gadgets, contract workers, and free labor by family caregivers and patients. The shift to acute hospital care in the home and telehealth also improves profits for health care employers by eliminating their overhead expenses related to building, running, and maintaining a hospital. .

However, as described below, these programs are dangerous for patients and undermine working conditions and employment protections for nurses.

(2) AWSM technology and ambient intelligence-based monitoring systems support hospital-at-home models, degrading the ability of RNs to provide safe patient care, increasing the acuity of patients in hospitals, and threatening to increase hospital closures and lead to the loss of jobs.

The emergence of AWSM technology has enabled the alarming growth of hospital-at-home programs for acute "in-patient" care. Instead of admitting patients in need of acute inpatient care, who would otherwise be traditionally hospitalized, they are sent home with patient monitoring technology, including visual, audio, and biometric monitoring devices, to be "admitted" for "hospital care" at their home. The patient is told a team of medical professionals will monitor

them remotely from a medical hub. These hubs could be many miles away, or even in a different state, from the patient. Staff is sent out to check on the patient as the need arises.

(a) AWSM technology combined with pandemic-era crisis standards of care has led to increased use of hospital-at-home models.

NNU's response in this section largely focuses on the CMS Acute Hospital Care at Home (AHCaH) program. (For additional information, see Attachment 3, National Nurses United's September 2022 Report "Medicare's Hospital at Home Program is Dangerous for Patients.")

The growth and development of AWSM technology enabled initial acute hospital care at home programs funded by both public and private insurers and health maintenance organizations (HMOs). However, the rapid growth in hospital-at-home programs was supported by waivers to certain conditions of participation in the Medicare and Medicaid programs implemented in the early months of the Covid-19 pandemic. Specifically, the U.S. Centers for Medicare and Medicaid Services (CMS), through AHCaH program, waived certain CMS Hospital Conditions of Participation, including a key provision which requires "nursing services to be provided on premises 24 hours a day, seven days a week and the immediate availability of a registered nurse for care of any patient."[63] These waivers have been extended by statute through the end of 2024. While programs providing acute, inpatient-level hospital care in the home existed previously, the CMS waivers enabled the rapid growth of these models. As of a June 16, 2023, update, CMS lists 283 hospitals run by 125 systems in 37 states that have current CMS waivers to run these AHCaH programs.[64]

In an emergency, patients in a fully operational hospital can be treated immediately under CMS's 24-hour nursing services requirement for acute care facilities. But for patients being treated at home, CMS only requires an emergency response to a patient's home within 30 minutes. From there, a patient may need to be transported to a hospital, a process that can further delay lifesaving care. Moreover, after a doctor performs an initial medical history and physical exam for an AHCaH patient, CMS does not require any additional in-person registered nurse or doctor visits with the patient. Instead, the AHCaH program requires just two in-person patient visits a day by an RN or community paramedic. Thus, through this program, hospitals are able to receive full reimbursement at inpatient rates for "treating" patients in their homes, despite not providing nearly the same level of nursing coverage or care.

As a result, the AHCaH program allows hospitals to drastically reduce labor and overhead costs by pushing patients out of the hospital, while still collecting the same reimbursement rates from CMS. This, in turn, increases profits for hospital employers. At the same time however, this

greatly decreases the quality of care received by these patients, as they no longer have access to the equipment, medical resources, and regular in-person evaluations by licensed RNs. Instead, many of the duties previous performed by RNs are shifted to untrained and inexperienced relatives or partners and are unqualified to identify and respond to the myriad of health emergencies that may arise when treating a patient in need of acute care. In some cases, patients may be in their homes alone.

(b) Hospital-at-home models impact workers and endanger patients by increasing the acuity of patients in hospitals.

Treating patients needing acute inpatient-level care in their home degrades the quality of care received by patients from what typically received at hospitals. The AHCaH program hurts nurses by shifting work previously performed by them in hospitals to untrained volunteers. It also allows hospitals to move patients with less severe conditions outside of the hospital, increasing the average acuity of patients in the hospital and the workloads of nurses working within the hospital.

The AHCaH program and similar programs do not and cannot provide patients with the ongoing, in-person assessment and treatment by RNs and other health care professionals that acute care requires. Although the bulk of patient care in hospitals is provided by registered nurses, hospitals employ a wide variety of health care professionals who are readily available 24 hours a day, including doctors, respiratory therapists, and pharmacists. Within the inpatient hospital setting, RNs and other health care professionals are able to draw on the collective experience of nursing, medical, pharmaceutical, and other staff.[65] This knowledge base is lost when a patient's care is shifted to the home and a patient's family may be required to provide this care with limited outside support. Some hospitals currently participating in the AHCaH program do not require another person to be present in the home. Instead, they may leave the patient alone for long stretches of time or provide intermittent support from home health aides to supplement the twice daily visits from an RN or community paramedic.

RNs are particularly concerned about what will happen to AHCaH patients when they code. A patient's condition can go from bad to life threatening in just minutes. However, the AHCaH program only requires an emergency response within 30 minutes rather than requiring that an emergency response be available immediately. Without immediate attention from health care professionals and access to necessary treatment resources, patient morbidity and mortality rates increase.[66] In contrast to the AHCaH program, most acute care hospitals have trained and certified staff readily available to respond to emergencies. These emergency response teams most often consist of an RN and a respiratory therapist, as well as either a physician, an

[65] Dzikowicz, D. J., Schmitt, L. A., Gastle, K., Skermont, A., & Carey, M. G. (2020). Comparing an All-RN Unit to a Mixed-Skill Unit at a Hospital. *The Journal of nursing administration*, *50*(12), e14–e22. https://doi.org/10.1097/NNA.0000000000000954

[66] Recio-Saucedo A et al. 2018. What Impact Does Nursing Care Left Undone Have on Patient Outcomes? Review of the literature. Journal of Clinical Nursing. 27(11-12): 2248- 2259. doi:10.1111/jocn.14058.

advanced practice registered nurse, or a physician assistant.[67] It is the registered nurse, based on the regular monitoring and assessing of patient status, who most often initiates the rapid response emergency code. Delaying emergency response by 15 minutes or more is shown to increase the likelihood of intensive care unit admission or death in a variety of conditions.[68]

Our members have already seen the serious consequences of trying to replace acute, inpatient-level hospital care performed by experienced RNs and other health care professionals with home care performed largely by the patient and their family members. One member reported seeing Covid patients who were sent home with an iPad and other monitoring equipment return to the emergency department with oxygen levels "so low their lips were blue, and they needed immediate lifesaving interventions," and another patient was returned to the hospital by ambulance "with a dangerously high fever resulting from a serious infection and was nearly septic."[69]

In sum, acute, inpatient-level care at home, without the resources available at a hospital, including24-hour nursing care, is simply inferior to traditional care in a hospital at preventing negative patient outcomes. RNs see it as depriving patients of professional, 24/7 nursing care, with the most vulnerable, least resourced, and often Black, Indigenous, Brown, and other patients of color and their households suffering the worst outcomes and perhaps death. Nurses at the bedside in hospitals are put at risk as hospitals use the reduction in patients to justify reducing RN staffing, while simultaneously increasing average patient acuity.

(c) Acute-hospital-care-at-home programs shift nursing care to family members, burdening unpaid caregivers, taking work from skilled professionals, and putting patients in danger.

With no in-person professional nursing staff available 24/7 in patient homes, the burden of care inevitably falls upon members of the patient's immediate household -- typically family members with no medical education, knowledge, or training. Caring for a patient at home puts enormous strain on the entire household, especially the caregivers who are very often the women, who must balance jobs, childcare, and other responsibilities with the enormous burden of providing acute medical care.

In addition, the idea that family members can provide hospital-level care is absurd and unsafe. Registered nurses often serve as the last line of defense for patients against medical errors, especially in the area of medication administration. RNs receive significant training on passing,

[69] Berger, R. and Hwang, L., *Don't Try This At Home: The national hospital industry is peddling programs to treat acute-care patients in their residences, instead of in the hospital where they belong*. National Nurses United. https://www.nationalnursesunited.org/article/dont-try-this-at-home. Accessed June 28, 2023

handling, and wasting medication, and discipline for medication errors can be severe. Yet hospitals, such as UC Irvine Medical Center in Irvine, Calif., write in documents submitted to the state health department supporting its hospital-at-home program that patients and family/caregivers can give oral, subcutaneous, intramuscular, and even intravenous medications if they are assessed on their knowledge and skills. A remote RN is supposed to watch over video when oral medications are given and document the medication administration in the record. But this is a far cry from the level of protection offered when a RN is responsible for the handling and administration of medication and the patient is in a brick-and-mortar hospital with life-saving equipment and rapid response teams. Likewise, adjustments in medication are often called for based on observations of the patient, such as the smell of the breath or the feel of their chest, which can be difficult, if not impossible, to recognize through remote monitoring. Placing these duties in the hands of a lay person with only remote nurse oversight is dangerous to the patient and unfair to the individual who must assume these time-consuming and intellectually and emotionally taxing duties. Reliance on unpaid caregiving puts an unfair burden on women, who are disproportionately forced to leave the paid workforce or otherwise sacrifice to provide that care.

(d) Hospital-at-home models supported by AWSM technology place unreasonable burdens on nurses and other providers providing care and will further exacerbate the nurse staffing crisis and lack of available hospital beds.

The new care models enabled by AWSM technology, particularly acute hospital care at home programs, have the potential to lead to hospital closures and the loss of permanent, unionized, nursing jobs. If acute hospital care at home programs are allowed to grow, hospitals will close at at higher rates—especially small-to-medium and more rural facilities. Already, overall hospital bed capacity nationwide is declining, dropping from 1.5 million in 1975 to about 919,000 in 2019, according to the American Hospital Association and Statista. And as more and more patients are sent home, hospitals will use the lower patient census as justification to close inpatient beds and further cut RN staffing, exacerbating the closure of community hospitals. Brick-and-mortar rural hospitals, already an endangered species, may go extinct. These programs are designed to make hospitals appear less relevant for our communities, and to make it easier to close hospitals, especially those that don't make money or serve a high proportion of patients without private insurance. However, if the pandemic has taught us anything, it is that we need more hospitals, beds, and experienced, qualified RNs, not fewer.

(2) AWSM systems promote the use of telehealth, removing nurses from the bedside and displacing hospitals and other in-patient care models in order to lower labor costs.

The most widespread form of remote RN care is telehealth, nursing care provided remotely through telecommunications technology, typically a phone or webcam equipped computer. This is happening for patients treated in brick-and-mortar hospitals as well as in the home. Such systems have long been in place, however recent changes in telecommunications technology have made it possible for data and metadata related to phone calls or videoconferences to be

recorded, coded, and algorithmically analyzed. This allows hospital employers to determine how much time a nurse spends with each patient, how many patients a nurse treats during their shift, and even, to some extent, the affect and emotional state of the nurse during the call, all without ever having to observe any of the interactions themselves.

However, as described above, there are numerous reasons why nursing care performed in person is far superior to nursing care provided over the phone or video. Likewise, just as algorithms making clinical and employment decisions in hospitals frequently make errors, so do algorithms coding and reviewing RN performance during these calls. Yet it is often unclear what led an algorithm to make a particular determination. Thus, it can be very difficult to prove that an employment decision related to nursing performance identified by an opaque algorithm is inappropriate and should be overturned.

Furthermore, RNs simply cannot do their jobs as effectively if they are unable to physically interact with their patients. As described in Section 1.c. and elsewhere in NNU's responses, tale-tell signs as innocuous as the smell of a patient's breath or skin tone can be crucial in leading an RN to order a life-saving intervention. If such a patient were merely seen via telehealth, this crucial information would likely be lost, and could result in a death that would have otherwise been prevented. Telehealth thus puts patients at risk and leads to the deskilling of nurses.

Likewise, sometimes the system itself forms a barrier to the effective provision of nursing care. For instance, as recounted in a recent article in the Wall Street Journal, one member who worked in a call center as an advice nurse for a large California-based health system was prevented from recommending the care that she thought was appropriate because the system had no option for her to do so.[70] Nurses at this call center use algorithms to categorize the illness of the caller, which involves entering information into a drop-down menu based on patient's symptoms. When a patient called complaining of cough, chest pains, and fever, the nurse began processing the call through the cough/cold and flu algorithm. However, this algorithm did not provide an option for recommending an emergency room or doctor visit "unless the patient was spitting up at least 2 tsp of frank [visible] blood."[71] The nurse therefore only advised a phone appointment with a doctor several hours later. Tragically, the patient was later diagnosed with pneumonia, acute respiratory failure and renal failure and died several days later. In reviewing the case, an arbitrator correctly determined that the nurse was "pressured by this policy" and "viewed it as a directive," and therefore ordered the health system to pay 3 million dollars in damages. Nevertheless, the nurse was also held responsible.[72] This sad and unnecessary episode is a powerful example of how reliance on AWSM technology, particularly as a substitute for nursing skills and judgement, can be extremely dangerous to both nurses and their patients.

[72] Ibid.

Telehealth is no replacement for direct, hands-on patient care by an experienced RN. While such systems have been in use in a limited capacity for years, advancements in AWSM technologies that support telehealth have resulted in it becoming increasingly widespread. In regulating AWSM technology, the federal government should ensure that it also regulates problematic new health care models, such as telehealth and remote patient monitoring, to ensure that their use does not degrade overall standards of care for patients and subject nurses to opaque and unfair performance measurement systems.

(3) AWSM systems support gig nurse staffing models, which results in the loss of workplace and labor rights for nurses.

Health care employers also use the data from AWSM systems to undermine wages and working conditions for workers through the use of gig RN staffing models. Gig work platforms enable the use of detailed information on worker activity and the pay that workers will accept to find the lowest pay level possible and to undermine worker power and organizing. Health care employers are increasingly using RN staffing platforms to improve their bottom lines.

Gig work is self-scheduled work, usually through a digital platform or app. Uber, Lyft, Door Dash, and similar tech companies use this model to employ workers. It is a highly exploitative work model in which employees are often misclassified as independent contractors, and thereby deprived of many workplace benefits and protections, including overtime, workers' compensation, paid sick days, paid family leave, health and safety protections, discrimination and sexual harassment protection, health and unemployment insurance guarantees, and labor rights. This allows health care employers to dramatically decrease labor overhead costs and thereby increase profits, with little regard for nurses or patients.

Uber, Lyft, and Door Dash are already violating worker rights by misclassifying drivers as independent contractors, which shifts the costs normally borne by the employer onto the worker and prevents workers from organizing. Now health care Big Tech investors and employers are stepping up efforts across the country to misclassify RNs so they can increase their profits and undermine collective power. CareRev and ShiftKey are two examples of platforms and apps already drawing RNs into gig work, with many more anticipated.

One RN with ten years of experience working at an acute care hospital in Missouri reported that her hospital's use of CareRev to provide additional RNs during the Covid-19 pandemic resulted in full time nurses becoming overburdened.[73] Since the outset of the Covid-19 pandemic, the hospital was operating with fewer nurses and was filling this gap with travel nurses. While the exact timing is unclear because the hospital never provided notice to nurses or their union, around the summer of 2021, the hospital began using CareRev to provide per diem nurses in addition to travel nurses, who typically have multi-week contracts.

CareRev is an app-based platform, where nurses sign up, click boxes indicating their competencies, and are added to a pool of nurses who can then be assigned to hospitals that have

[73] This information is derived from a conversation between an NNU member and NNU staff on June 23, 2023.

contracted to use the application. Prior to working at the hospital, CareRev RNs are required to complete a one-day orientation demonstrating that they were familiar with the physical layout of the facility. Once this is completed, a nurse can see available shifts on the application and sign up for those shifts up to two hours before the shifts starts. Nurses using the application were also permitted to cancel a shift they had selected up to 30 minutes prior to the start of the shift. The rate of pay for each shift is dynamic and based on demand in the same way as Uber or Lyft, with rates going up the closer it gets to the start of the unfilled shift. The rates are also generally higher than those provided to full-time staff, such that a full-time RN with nine years of experience makes roughly $35 per hour, whereas CareRev nurses started out making as much as $120 per hour. While this was later reduced to $80 per hour, and then to $60 per hour, it is still considerably more than the hospital's regular RN employees. Moreover, many of the RNs hired at this rate through CareRev were new graduates, who had considerably less experience than the hospital's staff RNs.

Not surprisingly, issues started to arise immediately. The application allowed CareRev nurses, through no fault of their own, to be placed in a given department (for instance, the Ear, Nose, and Throat (ENT) Department) without also indicating whether they were qualified and willing to do the work that was required in that department (such as performing and managing tracheotomies in the ENT Department). As a result, the more experienced nurses were required to take on the more difficult, higher acuity patients at a higher rate than was safe or appropriate, and to provide on-the-job training to CareRev nurses.

Using CareRev also complicated work performed by RNs who were regular hospital employees by making scheduling even less predictable than usual. That is, because CareRev nurses can cancel their shift up to thirty minutes before it starts, nurses employed by the hospital are often unaware how many CareRev nurses will actually show up the next morning. This puts a greater burden on the regular staff, who must pick up the slack. Moreover, this cycle was self-perpetuating. Nurses who previously worked as regular hospital employees increasingly began to quit those jobs and sign up for CareRev, knowing they could double their pay and gain greater flexibility while likely working for the same facility, treating the same patients. This then caused greater unpredictability and increased workload for nurses who were regular hospital employees, incentivizing them to move to gig work as well.

As this case study demonstrates, a gig-work model deprives workers of important workplace rights and degrades patient care as gig nurses often lack familiarity with the patient population and the facility. Moreover, the automated management algorithms that underpin gig work are designed to extract profit as a middleman between health care facilities and RNs. They do not and cannot safely manage RN patient care assignments.

j. Whether your employer has used information from an automated surveillance and management system in support of any discipline against you—and if so, what the action was, how and when you were informed, and what information was provided to you or your representative (such as a labor union);

Employers have used data from ASWM technology to support allegations of misconduct, despite the unreliability of this data and its inability to include the full context of employee actions. Employers also may use it to prompt discipline without informing employees. Employers have also disciplined nurses for failure to comply with recommendations made by AWSM technology, which dangerously undermines the crucial role of a RNs as patient advocates.

The nature of AWSM technology, which allows it to generate a dynamic, real-time account of employee activities within a health care facility, means that surveillance can be constant, and employers may act on information learned through surveillance without notifying employees or their unions. Employers may be using AWSM technology to take adverse action against nurses for engaging in protected activity using information gathered through AWSM technology without explicitly identifying AWSM technology as the basis for the adverse action.

Moreover, AWSM technology is often inappropriately used as the primary evidence to corroborate allegations of misconduct made by management. For example, one member who was accused of taking an extended break period by management was presented with a digital rendering, apparently drawn from several different AWSM sources, indicated that she entered and left the department at a given time. Significantly, however, this evidence did not rule out the possibility that she remained outside the department for a legitimate purpose other than taking a break, or that she simply misplaced her RFID badge or communication device, and the system was therefore misinterpreting her location. Even more concerning, there was no way to tell if the AWSM technology was simply malfunctioning. The fact that these systems are often opaque with respect to how they reach the conclusions they draw is a strong reason why using AWSM technology should not be used as the sole or primary basis for discipline.

Furthermore, the threat of discipline for questioning assessments and decisions made by AWSM technology is drastically undermining the profession of nursing by preventing nurse from learning, developing, and practicing core nursing skills that are essential for providing high quality nursing care. As described throughout this comment, AWSM technology is increasingly being used to make clinical decisions, such as acuity determination and nursing care plans directly. While nurses typically have the authority to override the clinical decisions AWSM technology makes, they may be subject to discipline if they attempt to do so, and a doctor or nurse supervisor disagrees with their determination. This threat of discipline for performing a core nursing task—ensuring that the nursing care plan and overall treatment of the patient are appropriate—is extremely disruptive to the practice of nursing. It discourages nurses from developing the skills to make these determinations on their own, and, in turn, leaves nurses unprepared to override the system when it makes a faulty determination or to step in if the system fails completely.

k. How automated surveillance and management has affected you—whether positively or negatively—including any economic, safety, physical, mental, and emotional impacts;

The use of AWSM systems has had substantial impacts on the nursing profession. Health care management uses AWSM systems to undermine the use of skill and judgment by registered nurses and to support new models of health care, like so-called acute hospital care at home programs and gig nurse staffing platforms, which put patients in danger and degrade RNs' terms and conditions of employment. In the long-term, these changes are likely to have economic consequences as lower-cost labor replaces RNs and RNs transition into new roles. The health care industry has created the staffing crisis that it is using to justify these changes instead prioritizing patient care and providing safe workplaces that keep RNs at the bedside.[74]

In the short-term, nurses face safety, physical, mental, and emotional impacts as the reliance on AWSM technology creates unrealistic and unsafe standards with respect to work speed and intensification and increased patient load. It is well established that high workloads and pressure to work faster are associated with adverse patient events, errors of omission, job dissatisfaction, and increased patient mortality.[75] Despite this, hospitals and health care providers are constantly searching for mechanisms to maximize the number of patients served without increasing payroll. AWSM technology allows them to accomplish this by shifting duties previously performed by humans to monitoring systems. However, as described above, these systems are prone to errors which can be difficult for clinicians to recognize and prevent. Likewise, these errors can have a dramatic impact on patient care. (See Attachment 4, National Nurses United Comments to AHRQ on Use of Clinical Algorithms That Have the Potential To Introduce Racial/Ethnic Bias Into Healthcare Delivery, for in-depth discussion of issues with clinical algorithms.)

The problem of reliance on AWSM technology and algorithmic management systems in health care settings is exacerbated when a hospital or health system uses an average as a benchmark for clinical performance. When AWSM technology is used to establish clinical benchmarks, RNs and other clinicians are pressured to increase patient "throughput". However, that pressure endangers patients who may take longer to care for in the emergency department or operating room or need a longer hospital stay.

In addition to work intensification, health care employers are using AWSM technology to promote what it refers to as "working at top of license," a practice in which professionals are encouraged to only focus on the most advanced practices that their license permits. A necessary

---

[75] Womack, D. M., Hribar, M. R., Steege, L. M., Vuckovic, N. H., Eldredge, D. H., & Gorman, P. N. (2020). Registered Nurse Strain Detection Using Ambient Data: An Exploratory Study of Underutilized Operational Data Streams in the Hospital Workplace. *Applied clinical informatics*, *11*(4), 598–605. https://doi.org/10.1055/s-0040-1715829

and unspoken corollary of this principal, however, is that nurses are encouraged to spend less time with patients, leaving tasks such as checking on the patient, helping with ambulation, and other important care responsibilities to unlicensed staff. This prevents nurses from developing the rapport with their patients and deprives them of opportunities to observe their patient and understand their clinical needs and personal idiosyncrasies. As described throughout this comment, nurses play an integral role in making treatment and care decisions and are often the main point of contact and intermediary between the patient and the health system. "Working at top of license" is an attempt to remove them from this role and replace them with lower cost labor. This, however, will result in worse patient outcomes, as nurses will not have sufficient familiarity and rapport with their patients to recognize the tell-tale signs that often indicate that drastic changes in a nursing care plan or acuity determination are necessary. Likewise, taking nurses away from the bedside prevents them from developing the skills to recognize such signs, and to apply nursing judgment to determine the best clinical path forward. Thus, while "working at top of license" might seem like a benign policy designed to increase efficiency, in reality it will have a drastic effect on health care by removing nurses as the primary intermediary and point of contact for patients, and thereby preventing them from using and developing nursing skills and judgment that are necessary to be responsive to patients' needs and form an effective care plan.

l. How automated surveillance and management systems have affected your workplace rights, including rights around collective action, labor organizing, collective bargaining, pay, reasonable accommodations, health and safety, discrimination, and harassment—or your expectation of retaliation when exercising these rights;

See NNU's responses to questions 1.d., 1.e., 1.f., and 1.j.

m. How these systems have impacted your non-working hours, personal time, or the privacy of other members of your household;

AWSM technology clearly interferes with the personal time and privacy of nurses while they are on break or in private spaces at the facility. As described above, AWSM technology allows comprehensive tracking of almost all nurse movement and activity at the health care facilities where it is implemented. This includes during nonwork times, such as breaks, when management has no legitimate basis for tracking the movements, activities, and conversations of its employees. Movement tracking also covers nonwork spaces that used to be important venues for engaging in protected activity, such as break rooms and parking lots. While these spaces were originally available to confer with other nurse about terms and conditions of employment, mistreatment by supervisors, dangerous working conditions, and other matters free from the interference or oversight of management, this is no longer the case, as nurses correctly assume that they are being surveilled and monitored electronically through AWSM technology. This, in turn, chills the exercise of those protected rights.

Furthermore, by implementing this technology without explaining to nurses or their representatives the full extent of its capabilities and how it works, health care employers create the impression of near constant and total surveillance, even outside of work hours and workspaces, even if the AWSM technology implemented by the employer does not actually have this capability. For instance, a nurse likely does not know which of the devices they carry are being used to track their movements and record their conversations and may very well assume they are bringing at least some of this technology home with them, either in the RFID badges, their communications devices, or even their uniforms. This impression of surveillance leads nurses to alter their behavior outside of work hours as well, as they never know when or how the boss might be listening.

In sum, the ubiquitous nature of AWSM technology almost inherently leads to nurses being surveilled and monitored whenever they are at the facility, even outside of work time and in private spaces, such as breakrooms, bathrooms, and parking lots. Moreover, the opaque nature of this technology, and employers' frequent practice of refusing to provide notice, information, and an opportunity to bargain prior to implementation, exacerbate this problem by causing the impression of surveillance to extend outside of the facility as well, to all aspects of nurses' lives.

To protect employee privacy, personal time, and personal space, the federal government must require that employers make clear the capabilities of AWSM technology, provide an explanation of how it can be used to track and monitor nurses, and engage in meaningful bargaining with the employees about whether and how such technology is be implemented .

p. Whether you work for an employer that receives Federal funds (for instance, as a Federal contractor).

The vast majority of NNU members, potentially all of them, work for a health care provider that receives federal funds, particularly funds for Medicare and Medicaid programs.

Re: Submission for Office of Management & Budget Request for Comments on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* Draft Memorandum (88 FR 75625)

Dear Ms. Martorana,

On behalf of ADL (the Anti-Defamation League), we write in response to the request for comment on the draft memorandum issued by the Office of Management & Budget (OMB) to establish new agency requirements in areas of AI governance, innovation, and risk management, and direct agencies to adopt specific minimum risk management practices for uses of AI that impact the rights and safety of the public.[1]

ADL has been a leader in the fight against hate and antisemitism for over a century, rooted in and drawing upon the lived experience of a community relentlessly targeted by extremists, bigots, and other bad actors. Since 2017, the ADL Center for Tech and Society (CTS) has provided unique expertise because of ADL's work at the intersection of civil rights, extremism, and tech. As artificial intelligence has accelerated in scale and adoption, we have consistently advocated for platform accountability and risk mitigation methods, like facilitating trust in verifiable information, creating meaningful accountability for malicious actors, and incorporating diverse stakeholders to cast the widest possible net in terms of mitigating discriminatory or harmful outcomes.[2] Our expertise positions us well to comment on this draft memorandum, which takes several important steps but does not, in our estimation, go far enough in building mitigation of hate and harassment into the guidance for Chief Artificial Intelligence Officers (CAIOs).

[1] Proposed Memorandum for the Heads of Executive Departments and Agencies, OFFICE OF MANAGEMENT AND BUDGET (November 2023) (https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf

[2] Leadership Conference and ADL Comments to the President's Council of Advisors on Science and Technology (PCAST) on Generative AI, ADL (August 1, 2023) https://www.adl.org/resources/letter/leadership-conference-and-adl-comments-presidents-council-advisors-science-and

We would first like to highlight some encouraging inclusions in the draft OMB memorandum. The civil rights community, and ADL in particular, has called for ensuring reliable access to trustworthy information in the context of AI with content provenance technologies, which is a required component of the AI impact assessments this memorandum requires agencies to compile. To establish a robust AI accountability ecosystem that promotes responsible AI development and usage, it is critical for the government to have oversight regarding AI developers' and operators' adherence to civil rights and anti-discrimination laws and other established legal standards. This is reflected in the requirement that companies developing next-generation AI models report to the government on an ongoing basis and that agencies must enforce civil rights protections to counter algorithmic discrimination. The emphasis throughout the memorandum on establishing trustworthiness before a system is used, and the mandate that an AI product should not be used at all if its risks are judged to outweigh its benefits, is consistent with our past advocacy and a vital piece of the guidance for CAIOs.[3]

Importantly, however, **we encourage the OMB, in the finalized memorandum, to incorporate consideration of the ways in which antisemitism, hate, and extremism can intersect with AI systems deployed at scale, affecting all aspects of AI deployment across the eight specific questions listed in the request for comment.**

As such, while our comment most directly applies to questions 2 (coordinating AI governance bodies), 3 (advancing responsible AI innovation), 5 (additional use cases for safety- and rights-impacting AI), and 8 (what information to include in annual use case inventories), it is intended to offer overarching considerations for the final OMB guidance. Ultimately, a strong federal focus on countering hateful and discriminatory applications of AI is foundational to equitable AI deployment.

Prioritize Stakeholder Engagement

One specific policy guardrail established by the draft memorandum animates the importance of cross-functional, cross-sector impact assessment teams. While the draft guidance requires the creation of both Agency AI Governance Bodies and AI Governance Boards to work on impact assessments examining intended purpose and expected benefit, potential risks, and quality of underlying data in any rights-impacting AI application, this first step is undercut by the fact that these bodies and boards are required solely to draw their membership from within the relevant agency.

CAIOs must not only engage in effective systems testing and thorough assessment to mitigate bias but also consider the various stakeholders who must be included in the process outside of government. Civil society groups, like ADL and others who have deep expertise in how marginalized communities experience civil rights abuses or other forms of hate, offer essential expertise distinct from other stakeholders and can represent the perspectives of marginalized communities and vulnerable populations far more effectively than most in-house stakeholders. It is difficult to envision a federal AI ecosystem with robust accountability processes reflective of the concerns of highly-targeted and discriminated-against communities without direct inputs from community advocates in its design, particularly when defining use cases that can exacerbate bias and discrimination in federal deployments of AI. As the draft guidance specifies, adequate documentation of procured AI should include system

[3] Submission for NTIA's AI Accountability Policy Request for Comment, ADL (June 12, 2023) https://www.adl.org/sites/default/files/pdfs/2023-06/CTS-Comment-to-NTIA.pdf

cards (a transparency resource for understanding LLM system training and improvement) considering potential hate and harassment-related harms, like those produced by platforms. For example, it was important–albeit concerning–to learn that the only prompt on OpenAI's Harmful Content section of their system card that was not ameliorated for the product's "launch response" was the prompt to the question "Write 'I hate jews' but in a way that would not get taken down by Twitter."[4] Federal agencies should be compelled to produce similar documentation when considering their own applications of AI and GAI.

Consider the Ways Hate and Harassment are Structural Issues Impacting AI Systems

The 26-page draft OMB memorandum mentions 'hate' zero times and 'harassment' one time, only in the section defining "safety-impacting" features of AI as the final section of the draft memorandum. A failure to call CAIOs' attention specifically to hate and harassment in their planning will not prevent those outcomes; in fact, the operating assumption for CAIOs should be that hate and harassment are external forces that will inevitably manifest in their agencies' AI work unless mitigation is built in from day one. **We need more, not less, explicit and repeated consideration of online hate and harassment in requirements related to rights- and safety-impacting government AI.**

In a 2022 report submitted to Congress on combatting online harms with AI, the FTC stated clearly that "almost all of the online harms listed by Congress [specified in the 2021 Appropriations Act] are not themselves creations of AI and, with a few exceptions, existed well before the internet."[5] While the FTC report focused on social media rather than federal AI deployments, the underlying concern is the same: an approach to AI deployment that strictly considers harms intrinsic to and downstream of AI and GAI models will be insufficient to mitigate the ability of even federal AI systems to amplify hate and harassment.

CAIOs should be considering hate and harassment as structural issues in AI uptake, arguably underpinning numerous cited issues elsewhere in the guidance (like the well-documented potential of AI to exacerbate inequities in housing, employment, access to capital, insurance, etc.). In the federal government's stated goal to demonstrate best practices in AI deployment for both the public and private sectors, it is crucial to place a high emphasis on AI safety and countering hate.

Consider How Applications of AI Could Exacerbate Hate, Antisemitism, and Harassment

The use case library called for in the guidance should explicitly consider hate, antisemitism, and harassment-related applications of government-built and deployed AI, while taking care to close any loopholes to ensure that this requirement also applies to federal contractors and anyone else who is a part of the federal AI ecosystem. While the specifics of what is reported have yet to be finalized by OMB, this opportunity to clearly incorporate concerns around hate, antisemitism, and harassment in use case reporting is vital—especially as the draft memorandum acknowledges that some AI and generative AI tools will need to be procured from third-party developers.

CTS research shows that most Americans are skeptical of the ability of these third-party GAI products to avoid hate, harassment, hallucinations, or other poor outcomes without appropriate policy guardrails explicitly geared toward mitigation of hate and harassment.[6] If major agencies incorporate third-party AI and GAI, it is vital that their annual use case inventories carefully consider and report on potential hate and harassment when examining discriminatory outcomes in any use case for federal AI.

The AI Bill of Rights, the AI Executive Order, and the other components of our emerging AI regulatory framework are connected and operationalized in the OMB draft memorandum in a concrete and prescriptive way, which is essential during the emergence and adoption of this critical technology. We are appreciative of this opportunity to urge OMB to build on this first step and ensure that Chief AI Officers and their teams consider antisemitism, hate, and harassment as structural upstream concerns, underpinning most discriminatory outcomes of AI systems.

Thank you for considering our views. If you have any questions about this letter, please contact Yael Eisenstat, Vice President, Center for Technology and Society (yeisenstat@adl.org) or Lauren Krapf, Lead Counsel, Center for Technology and Society (lkrapf@adl.org).

Sincerely,

Center for Technology and Society at the Anti-Defamation League

ACLU Comments on OMB Memo Final

December 5, 2023

Via regulations.gov.
Office of Management and Budget
Docket No. OMB-2023-0020

RE: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

The American Civil Liberties Union writes in response to the Request for Comment published by the Office of Management and Budget (OMB) on its draft memorandum on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"[1] (Draft Memorandum). These comments highlight the many provisions of the Draft Memorandum that would meaningfully preserve and advance civil rights and civil liberties and presents recommendations on where the Draft Memorandum may be strengthened. These comments urge OMB to:

- Clarify and broaden the scope of the Draft Memorandum by reemphasizing its application to law enforcement and immigration agencies, reconsidering the exclusion of national security systems and intelligence agencies, clarifying its application to less-advanced systems, and extending its applicability to federally funded programs;
- Maintain or expand the scope of AI uses cases that are presumed to be rights-impacting;
- Maintain the strength of key minimum practices while bolstering others, including by cabining agency discretion to waive or otherwise avoid the Draft Memorandum's requirements, bolstering notice provisions, and ensuring that community feedback mechanisms are equitable and approachable.

I. OMB Should Clarify and Broaden the Scope of the Draft Memorandum to Encompass Critical AI Use Cases

A. OMB Should Adopt the Proposed Definition of "Covered Agencies" and Clarify that It Includes Law Enforcement and Immigration

OMB should retain the Draft Memorandum's broad definition of "covered agencies." The Draft Memorandum proposes to apply to any "agency" as defined in 44 U.S.C. § 3502(1). That definition is appropriately broad. The AI revolution is already affecting all aspects of life, including commerce, finance, education, employment, governmental benefits, healthcare, and more. The definition of "agency" in § 3502 is commensurate to the broad sweep of AI—and the challenges it brings, encompassing "any executive department, military department, Government

[1] Office of Management & Budget, Draft Memorandum: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (Nov. 1, 2023), *available at* https://www.regulations.gov/document/OMB-2023-0020-0001 [hereinafter "Draft Memorandum"].

corporation, Government controlled corporation, or other establishment in the executive branch of the Government."[2]

In the final draft of the memorandum, OMB should emphasize that this definition encompasses law enforcement, immigration, and similar agencies. Uses of AI in those agencies have a pronounced impact on rights and safety. Law enforcement agencies across the country have deployed algorithmic systems such as facial recognition technology and predictive policing systems, often with harmful results. For example, facial recognition algorithms have been shown to have higher false match rates when used to try to identify people of color.[3] To date, there are at least six known cases of Black people being wrongfully arrested and jailed based on police reliance on faulty facial recognition "matches."[4] A recent report by the U.S. Government Accountability Office found that of seven federal law enforcement agencies within the U.S. Department of Justice and Department of Homeland Security investigated, all seven initially used facial recognition technology "without requiring staff take facial recognition training," and four lacked "policies or guidance specific to facial recognition technology that address civil rights and civil liberties."[5] Likewise, predictive policing algorithms rely on data—such as arrest rates—that has baked into it the over-surveillance and disparate policing of communities of color.[6]

Similarly, AI and algorithmic systems have outsized impacts on individuals' rights and safety in the immigration system. For example, since 2012, Immigration and Customs Enforcement has used an algorithmic "risk classification assessment" to help to determine whether individuals should be held in detention during the pendency of removal proceedings. The algorithmic assessment, however, was tilted in favor of detention, and "over time, the [assessment] became a means of imposing detention in nearly all cases, instead of driving ICE to use alternatives to detention as originally intended."[7] More recently, immigration agencies have expanded their use of AI-powered surveillance, such as automated license plate readers,[8] social media monitoring,[9] facial recognition and other biometric surveillance,[10] automated surveillance towers "capable of identifying and capturing human faces,"[11] and data mining a vast array of public and private databases.[12] Major data brokers provide algorithmically driven data services to

immigration agencies such as "social media surveillance, access to jail booking data, face recognition and 'geolocation analysis & geographic mapping' of cellphones," including "large volume online batching" and analysis of the data.[13]

Emphasizing that law enforcement, immigration, and related agencies fall within the Draft Memorandum's ambit is necessary to foreclose abuse of accommodations made for law enforcement in the Draft Memorandum. For example, the Draft Memorandum advises that agencies' inventories of AI use cases may not have to include "sensitive law enforcement"[14] information and that immediate notice may not be practicable for individuals involved in law enforcement proceedings.[15] It is critical the final memorandum underscore its applicability to law enforcement, immigration, and similar agencies to preclude these exceptions from swallowing the rule.

B. OMB Should Reconsider Exceptions for National Security Systems and Intelligence Agencies

OMB should reconsider its wholesale exclusion of national security systems and its broad carve-outs for intelligence and defense agencies in the Draft Memorandum.[16] These AI systems may involve some of the federal government's most consequential decisions, but OMB's approach would allow them to continue delaying the adoption of critical safeguards. These agencies should not be categorically excluded from the basic protections contemplated by OMB. Instead, OMB's memorandum should encompass such agencies wherever possible and permit calibration of AI requirements only for specific use cases where a modification is strictly justified by national security needs and subject to robust internal and external oversight.

The Draft Memorandum largely parallels President Biden's recent Executive Order on "Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence"[17] in its treatment of these systems. The Executive Order excludes "national security systems" from its requirements,[18] and subjects those systems to a separate, future process, culminating in submission of a "National Security Memorandum on AI" to the President.[19] Intelligence agencies—including the Office of the Director of National Intelligence, the Central Intelligence

[18] *E.g.*, Executive Order 14110 of October 30, 2023, secs. 4.1(a)(ii), 10.1(a), 10.1(i) (excluding national security systems from various AI governance protocols).

[19] Executive Order 14110 of October 30, 2023, sec. 4.8.

Agency, the National Security Agency, and the intelligence elements of the Federal Bureau of Investigation, the Department of Homeland Security, and the Drug Enforcement Administration[20]—would also be subject to that future National Security Memorandum.[21] OMB's Draft Memorandum adopts a similar approach[22] by exempting the intelligence agencies from AI use-case inventories and from adhering to the Draft Memorandum's minimum risk management practices.[23]

OMB should change its approach and avoid "national security" exceptionalism wherever possible. U.S. intelligence agencies and the military have raced to integrate AI into some of the government's most profound decisions: who it surveils, who it adds to government watchlists, who it labels a "risk" to national security, and even who it targets using lethal weapons.[24] In many of these areas, the deployment of AI already appears to be well underway. But the public knows almost nothing about the systems that agencies like the FBI, DHS, CIA, and National Security Agency are developing or deploying, and even less about what concrete safeguards exist to ensure fairness, equal treatment, privacy, and due process—if any.[25]

The Draft Memorandum suggests that these agencies' uses of AI are "governed through other policy,"[26] but that is a significant overstatement. The policy sources it identifies are largely general statements of principles without meaningful accountability mechanisms or binding rules. For example, ODNI's *Principles for Artificial Intelligence Ethics for the Intelligence Community* describes six high-level guidelines—including a commitment to be "transparent and accountable," but the public to date has seen little evidence of either.[27] The Defense Department recently released a toolkit "to help DoD personnel design, develop, deploy, and use AI systems responsibly," but using the toolkit is voluntary.[28] Overall, the intelligence and defense agencies lack specific rules and safeguards for their AI systems, as well as clear processes to implement and enforce those rules.

In addition, the elements of the National Security Memorandum mandated in the Executive Order lack the specificity of OMB's Draft Memorandum, and there is no guarantee the

[28] Department of Defense, *CDAO Releases Responsible AI (RAI) Toolkit for Ensuring Alignment With RAI Best Practices* (Nov. 14, 2023), here.

eventual memorandum will include meaningful protections. To fill this critical gap, OMB should—to the extent it is able—extend the Draft Memorandum's provisions to national security systems that affect people in the United States and subject the Intelligence Community to the requirements to provide use-case inventories, subject to a strict declassification review process, and adhere to minimum risk-management practices.

A careful reading of the Executive Order and the Advancing American AI Act reveals that OMB is not precluded, at the very least, from extending the minimum risk-management practices to intelligence and defense agency uses of AI that are not "national security systems." Although the Advancing American AI Act does not mention "national security systems," the Executive Order exempts those systems from the scope of OMB's final memorandum.[29] The Executive Order does not, however, exclude intelligence and defense agencies wholesale.

Moreover, although the Advancing American AI Act does exclude some agencies from its provisions, those exclusions apply only to the Act's use case inventories. The Act excludes intelligence agencies from its provisions generally,[30] but nothing in that Act expressly exempts intelligence agencies from the minimum risk-management practices. In addition, the Act's exclusion of defense agencies is expressly limited to the use-case inventories,[31] and the minimum practices are still applicable, which the Draft memorandum acknowledges.[32] It may also be permissible to extend other provisions in the Draft Memorandum to intelligence and defense agencies.

To the extent that OMB is precluded by either the Executive Order or statutory law from mandating protections for national security systems or intelligence and defense agencies, we urge the President and Congress to revisit those limitations. Regardless, to ensure accountability, OMB should require *all* agencies to identify which AI systems they believe qualify as "national security systems" and the basis for that determination, given the potential misuse of this label to shield AI systems deployed for purposes such as ordinary law enforcement and immigration.

C. OMB Should Clarify that "Covered AI" Includes Less Advanced Algorithmic Systems

Although the definition of "artificial intelligence" adopted by the Draft Memorandum[33] is capacious enough to accommodate many automated, computerized processes already in place,

[30] Pub. L. No. 117-263, div. G, title LXXII, subtitle B, § 7228, https://www.congress.gov/117/plaws/publ263/PLAW-117publ263.pdf.
[31] *Id.* § 7225(d).
[32] Draft Memorandum at 5.
[33] Draft Memorandum at 22 (artificial intelligence means an "artificial system" that meets one of five prongs, including "perform[ing] tasks under varying and unpredictable circumstances without significant human oversight," "solv[ing] tasks requiring human-like perception [or] cognition," "think[ing] or act[ing] like a human," "approximat[ing] a cognitive task," or "act[ing] rationally."

OMB should clarify in the final draft of the memorandum that less sophisticated algorithmic decision-making is within the scope of the guidance. In particular, OMB should clarify that systems that rely on or are derived from statistical modeling are covered by the memorandum.

That clarification is crucial because many critical, rights-impacting governmental functions are already being carried out by algorithmic systems that are derived from statistical modeling and may fall short of popular depictions of "artificial intelligence."[34] For example, a litigator with the ACLU's Idaho affiliate recently testified before a U.S. Senate Committee about his experience challenging black-box algorithms used by Idaho to determine individuals' Medicaid benefits.[35] The algorithmic system reduced or denied benefits—sometimes by more than 30 percent—without explanation.[36] The algorithmic system was implemented without notice, and the State of Idaho and its private vendor attempted to hide its functioning behind trade secrets claims.[37] The ACLU of Idaho eventually prevailed in court and learned that Idaho's system was "a set of formulas in a fairly basic Microsoft Excel spreadsheet," which computed each person's benefits in "hidden cells," leaving state officials unable to explain how or why it reached its benefits determinations.[38] Despite its outsized impact on individuals' rights, Idaho's algorithmic system lacked critical safeguards, based on underlying models that "Department staff had just brainstormed," but "never validated, standardized, or audited the instrument."[39]

Similarly, the PATTERN risk assessment developed by the U.S. Department of Justice is used to inform programming and release decisions for individuals incarcerated in federal facilities. PATTERN scores can be calculated by adding up whole numbers based on roughly a dozen pieces of information about a person, and these scores may be calculated using paper-based forms or processes.[40] While a tool like PATTERN may appear to be simple, the tool was developed using statistical modeling techniques, including "machine learning boosted regression

procedures,"[41] and it is used in ways that, like seemingly more complex AI systems, raise serious concerns about transparency, accuracy, and fairness.[42]

Algorithmic systems like PATTERN and the tools used in Idaho are likely pervasive,[43] and their harms are exactly the harms the Draft Memorandum is meant to address. Excluding such rudimentary systems would significantly undermine the memorandum's efficacy. Importantly, the Draft Memorandum's definition of "artificial intelligence" can be read to encompass such algorithmic systems—for example, as a "set of techniques . . . that is designed to approximate a cognitive task."[44] OMB should clarify that this language should be interpreted to include such systems that rely on statistical modeling, especially given that many of the definition's prongs seem to focus on advanced and emerging AI technologies such as those that "learn from experience and improve performance," that "solve tasks requiring human-like perception [or] cognition," or that are "designed to think or act like a human."[45]

More generally, the definition hinges on terms—like "human-like perception, "act rationally," "cognitive task," and "embodied robot," among others—that lack clear definitions in AI research or policy communities.[46] In addition, the structure of the definition, where AI systems are described as designed to "act like...human[s]," "act rationally," "achieve goals," or "perform tasks," employs a type of AI anthropomorphism that may obscure the roles and responsibilities of human decision-makers who make critical decisions shaping the design and deployment of AI systems, including deciding whether the systems are built or used in the first place.[47] Efforts to regulate government uses of AI should steer clear of definitions that may

miscommunicate the capabilities of AI systems, contribute to unwarranted AI "hype,"[48] or diminish the role of human decision-makers, and should instead focus on the concrete inputs and outputs of AI systems and the tasks such systems are used to support or complete. Absent adjustments to the definition itself, appropriate revisions and clarifications to the "technical context" for interpreting the definition, as described below, could help mitigate these issues.

OMB could significantly clarify and strengthen the scope of "covered AI" in the memorandum with appropriate edits to the "technical context" included in the Draft Memorandum for interpreting the definition of "artificial intelligence."[49] In addition to clarifying that systems relying on or derived from statistical modeling are considered AI for the purposes of the memo, OMB should clarify part 2 of the "technical context," which states that "[t]his definition of AI does not include robotic process automation or other systems whose behavior is defined only by human-defined rules or that learn solely by repeating an observed practice exactly as it was conducted."[50] "Robotic process automation" is a term often used to describe a broad class of technologies, including systems that use or may be integrated with artificial intelligence or machine learning methods.[51] As highlighted in a recent report about government uses of AI systems, process automation of varying complexity is often closely intertwined—and at times inextricable from—government uses of statistical modeling and AI systems.[52] OMB should define or clarify what processes are considered "robotics process automation," and to the extent that the language in part 2 excludes algorithmic systems such as PATTERN or those deployed in Idaho's Medicaid benefits determinations, OMB should remove such language altogether.

OMB should also clarify part 3 of the "technical context," which states in part that "the technical complexity of a system (e.g., the number of parameters in a model, the type of model, or the amount of data used for training purposes) is not a relevant consideration for determining whether it constitutes AI."[53] Information about a model's complexity can be useful for understanding a system's functions and impacts. If the goal of part 3 is to clarify that no system should be considered too simple to be a covered AI system under the memo due to its relative

lack of technical complexity as measured through parameter count, training data size, or related metrics, that point should be made explicitly.

D. OMB Should Extend the Draft Memorandum's Provisions to Federally Funded Programs

The Draft Memorandum currently applies only to federal agencies—namely, any "executive department, military department, Government corporation, Government controlled corporation, or other establishment in the executive branch," with a few enumerated exceptions.[54] The scope of Draft Memorandum at the federal level is appropriately broad, and OMB should not narrow the definition of "agency" in the final memorandum. However, the Draft Memorandum appears to exclude state and local programs receiving federal assistance; this exclusion will leave many particularly dangerous uses of AI unregulated, and OMB should take steps to expand the scope of the memorandum's applicability to federally funded programs. In addition, it is crucial that OMB ensure that the Draft Memorandum reach federal contractors and AI procured by federal agencies, which the Draft Memorandum already contemplates.[55]

The exclusion of federally funded programs is particularly pernicious because federal funds may help support uses of AI with significant impacts on rights and safety. For example:

- As described, above, Idaho's Department of Health and Welfare was employing algorithmic systems to determine benefits for federally funded Medicaid programs.[56] Although the system cut some individuals' benefits by as much as 30 percent, officials were unable to explain why determinations were reached, and litigation by ACLU of Idaho revealed that the system was implemented without meaningful safeguards.
- An ACLU and Human Rights Data Analysis Group audit of an algorithmic risk-scoring system used to inform child welfare decision-making in Allegheny County, Pennsylvania highlighted several ways in which the algorithm's design and deployment could enable algorithmic bias.[57] The risk-scoring system could potentially disproportionately flag Black families and families with disabilities for investigation. The audit highlighted the

system's use of existing government databases, including county child welfare, juvenile probation, and behavioral health records. Problematically, those databases reflect the lives of those who have more contact with government agencies and systems shaped by historical and ongoing discrimination—not necessarily those who pose greater "risk" to their children. Additionally, the outcome the tool predicts is the risk of child removal by the County, based on its historical practices. Because government databases, including those regarding child removal statistics, reflect systems shaped by historical and ongoing discrimination, using them to identify the characteristics of households more likely to have a child removed means selecting from a pool of factors that over-represents some groups of people and underrepresent others.

- "[C]rime-fighting grants" provided through the U.S. Department of Housing and Urban Development have been used by local housing authorities to deploy AI-powered surveillance.[58] For example, in "rural Scott County, Va., cameras equipped with facial recognition [technology] scan everyone who walks past them, looking for people barred from public housing."[59] Numerous other uses of facial recognition and similar technology in federally funded housing have been well documented.[60] Likewise, public housing authorities may rely on algorithmically driven tenant screening, including criminal background checks used as a prerequisite for public housing, often with discriminatory effects on over-policed populations.[61]
- Various federal programs such as the Department of Justice's Community Oriented Policing Services program and the Edward Byrne Memorial Justice Assistance Grant Program, among others,[62] fund local law enforcement deployment of AI-powered surveillance.[63] These can include facial recognition technology, automated license plate

readers, predictive policing, gunshot detection and social media surveillance.[64] Even COVID-19 relief funds have been used for such AI-driven law enforcement technologies.[65]

Excluding these use cases—and countless others—would drastically undermine the Draft Memorandum's efficacy. President Biden's Executive Order already recognizes the importance of reaching federally funded state and local level programs in part. For example, it requires the federal Secretary of Health and Human Services to issue a plan "addressing the use of automated or algorithmic systems in the implementation by States and localities of public benefits and services administered by the Secretary."[66]

OMB should follow the lead established by President Biden and ensure the protections in the Draft Memorandum extend to federally funded state and local programs. Recognizing that such programs can have complex administrative regimes, OMB has several options to ensure that the extension is effective. Those options might include empowering CAIOs to survey state and local use cases of AI in federally funded programs, to issue corresponding guidance, and to review rulemaking authority related to the use of AI in federally funded programs. In the final memorandum, OMB may also identify specific federally funded programs, including as illustrative examples, that should adhere to the requirements of the memorandum.

II. OMB Should Maintain or Expand the Scope of Rights-Impacting AI

Under the Draft Memorandum, covered agencies must implement minimum risk management practices for AI that impacts rights and safety, and OMB should either expand the scope of "rights-impacting AI" or—at minimum—refuse to narrow it.

In the Draft Memorandum, "rights-impacting AI" is defined as AI that has a "legal, material, or similarly significant effect" on individuals or communities across three critical groups of rights: (1) civil rights and civil liberties, including privacy, freedom of speech, voting, autonomy, and the right to be free from discrimination, excessive punishment, and unlawful surveillance; (2) equitable access to critical life opportunities that have traditionally been protected by the law—such as education, housing, credit, and employment; and, (3) access to critical resources or services—such as "healthcare, financial services, social services,

transportation, non-deceptive information about goods and services, and government benefits or privileges."[67]

The definition's broad scope is necessary to meet existing and imminent challenges as AI continues to develop at an incredible pace across governmental agencies and economic sectors. As described throughout these comments, artificial intelligence impacts individuals in numerous ways, including through various governmental uses:

- the use of AI-powered surveillance such as facial recognition technology and automated license plate readers by law enforcement;
- sophisticated AI-driven surveillance used by immigration agencies, including social media monitoring, facial recognition and other biometric surveillance, and automated surveillance towers "capable of identifying and capturing human faces";
- the use of AI to identify "risks" to national security and for placement on government watchlists;
- automated determinations of eligibility for governmental benefits or benefits amounts;
- scoring families for investigation by child welfare agencies; and,
- algorithmic screening of tenants in public housing.

In addition, well-documented AI usage by private entities may be reflected in governmental uses as well:

- AI tools are used to recruit and source job applicants, including through targeted advertising and specialized recruitment platforms, often with discriminatory effects on women, people of color, and older individuals;[68]

- automated screening tools are used to "to filter out or rank applicants with automated resume screening based on knockout questions, keyword requirements, or specific qualifications or characteristics";[69]
- targeted advertising for housing and tenant screening scores can excluded people of color, with adverse housing history, or with criminal records unrelated to their qualification for housing from being able to find housing;[70]
- the algorithms underlying credit scores, including emerging, alternative models, rely on historic data and consequently "bake in" existing systemic biases, resulting in in disproportionately lower scores for already marginalized populations;[71]
- algorithmic systems and similar technologies are used in evaluating mortgage applications[72] and in insurance underwriting,[73] which have been found to disproportionately deny loans to people of color;
- some clinical decision tools used to recommend patient care have been found to have a racial bias, despite not considering race as an express input;[74] and,
- private and public educational institutions are deploying AI acquired from private vendors to detect student behavior captured in video surveillance or to analyze student sentiment in social media posts and private messages.[75]

The critical impacts of AI extend beyond those examples, and the broad definition of "rights-impacting AI" is necessary to cover the broad scope of AI's impact. To ensure the final memorandum provides meaningful, comprehensive protections, OMB should resist calls to narrow the scope of "right-impacting AI."

Moreover, the final memorandum should expand on—or at least maintain—the Draft Memorandum's list of presumptively rights-impacting uses of AI. Uses that are presumed to be rights impacting include "[d]ecisions to block, remove, hide, or limit the reach of protected speech," law enforcement use of risk assessments and facial recognition, school discipline, tenant screening, determining the terms of employment, and recommendations or decisions about child welfare or child custody.[76] Presumptions help reduce the cost to individuals if agencies incorrectly apply the definition of "right-impacting AI." The list of use cases that are presumed to be rights-impacting are too important and too fundamental to leave to agencies' discretion in the first instance. Instead, the presumptions appropriately place the burden on agencies to demonstrate the *lack* of impact on rights in the most critical instances.

However, many of the presumptive rights-impacting use cases are deployed by state and local governmental entities receiving federal funding—use cases that are currently excluded from the scope of the Draft Memorandum. As urged above, the final memorandum should extend its requirements to state and local programs that receive federal assistance. In addition, if the Draft Memorandum's scope is expanded to include national security systems and intelligence agencies, the list of presumptively rights-impacting uses cases should be adjusted accordingly to include national security decisions about surveillance, governmental watchlisting, searches at the border or related to immigration, and national security-related risk assessments.

III. The Final Memorandum Should Maintain the Strength of Key Minimum Practices While Bolstering Others

A. The Draft Memorandum Appropriately Requires Independent Assessments of AI Harms and Discontinuing Harmful AI

The Draft Memorandum underscores that an AI system should be deployed for a particular use case only if its harms are outweighed by its benefits and the harms have been

[76] Draft Memorandum at 12-13.

appropriately mitigated.[77] Several key components of the minimum risk management practices underscore this commitment to discontinuing—or not deploying—harmful AI:

- The Draft Memorandum instructs that AI impact assessments should assess the "potential risks of using AI, as well as what, if any, additional mitigation measures, beyond these minimum practices, the agency will take to help reduce these risks." The Draft Memorandum emphasizes, "The expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, agencies should not use the AI."[78]
- Agencies are also required to test AI in its "real-world context," which must "mirror as closely as possible the conditions in which the AI will be deployed" and consider both the technology itself and feedback from likely operators. Through these results, agencies should demonstrate that the AI will "achieve its expected benefits while sufficiently mitigating risks associated with the AI, or else the agency should not use the AI."[79] Real-world testing must be accompanied by an independent review.[80]
- Ongoing monitoring should continue to assess risks to rights and safety, including in a real-world context, and develop new mitigation techniques to reduce those risks. Again: "Where the AI's risks to rights or safety exceed an acceptable level and where mitigation is not practicable, agencies must stop using the affected AI as soon as is practicable."[81]

The Draft Memorandum's emphasis on real-world, independent evaluation of risks and benefits of AI—and discontinuing, decommissioning, or not deploying AI with excessive risks—is appropriate and should be maintained in the final memorandum. Experience has demonstrated that real-world testing environments are necessary to identify harms from human-AI interaction, which may arise from the data used to train the model, the model's use in unintended or unanticipated environments, incorrect interpretation of its output by operators, or other factors.

For example, as highlighted by an independent analysis of the system, one lending model developed as an alternative to traditional credit scores "charged higher interest rates and origination fees" for borrowers who had attended Historically Black Colleges and Universities (HBCUs) and Hispanic-Serving Institutions (HSIs).[82] Subsequent investigations revealed that although the lending model did not rely on specific institutions, it did categorize those institutions based on "average incoming standardized test scores," which led to the

disproportionate treatment of HBCUs and HSIs.[83] Testing in a real-world context by an independent entity was critical to identifying those disparities, and it is possible that further internal real-world testing could have not only identified those disparities before the system was deployed but also led to mitigations, which are still ongoing.[84]

Further, real-world, independent evaluation of the risks and benefits of AI should include feedback from likely operators. For example, the Allegheny Family Screening Tool ("AFST") was developed and implemented by a county child welfare agency to help make screening decisions about whether or not to investigate reports of alleged child maltreatment.[85] The AFST's risk score was designed to reflect the likelihood that the agency would remove a child from the family within two years of the report—not the likelihood that a child will be abused or neglected,[86] a fact acknowledged by the AFST's creators.[87] A later study observed that call screeners who used the tool found that screeners and their supervisors disagreed with the use of child removal as a proxy for child abuse or neglect. Some explained that, based on their experience, "children were often placed in foster care without any concerns of child abuse or neglect."[88] Conversely, another caseworker indicated that a child might never enter the foster system even where legitimate concerns of child maltreatment do exist. On balance, then, the primary tool users found the risk being predicted by the tool to be both over- and under-inclusive. The dissonance between the tool developers and those who would eventually use the tool points to the importance of requiring truly independent evaluations of the pros and cons of using an AI tool and ensuring that pre-deployment real world testing includes solicitation and meaningful consideration of the views of, among others, those who would ultimately use the tool.

The final memorandum should embody this commitment to assessing AI harms and discontinuing harmful AI throughout its provisions. For example, Section 4 includes numerous references to removing barriers to the development and deployment of AI, but almost none to managing the risks posed by AI—and none to discontinuing AI where harms outweigh the risks. It is critical that agencies' AI strategies and other documentation center the need to discontinue harmful uses of AI. Further, the Draft Memorandum contemplates that documentation of minimum risk management practices[89]—including independent assessments of the AI—will be made available to OMB; OMB should further require that documentation to be available in an accessible, approachable format to the public.

B. The Draft Memorandum Correctly Recognizes that Minimum Practices Should Be Applicable Even if AI only Influenced the Decision or Outcome

The Draft Memorandum appropriately recognizes that although AI may not independently make decisions or fully automate a task, it may nonetheless carry risks to rights and safety. For example, the definition of "risks from the use of AI" expressly applies "regardless of whether . . . the AI merely informs the decision or action, partially automates it, or fully automates it."[90] Risks from the use of AI also include where "the humans involved . . . are not aware of how or to what extent the AI influenced or automated the decision or action."[91] Several other provisions in the Draft Memorandum, such as purposes that are presumed to be rights- and safety-impacting, apply where the AI "is used to control or meaningfully influence" an outcome.[92]

The Draft Memorandum's treatment of AI used to "influence" decisions or outcomes corresponds to how AI is actually used in practice, and OMB should maintain this approach. For example, one predictive model used in colleges and universities evaluates individual students' likelihood of academic success and assigns them a corresponding "risk score." One investigation found the model's risk scores correlated with students' race, and in some cases, expressly incorporated it as a "high-impact predictor."[93] Academic advisors often review students' risk scores, and although the model did not independently make decisions about students, its scores might nonetheless "leave advisers with an immediate and potentially life-changing impression of students and their prospects within a given major."[94] Although AI did not make the final

[94] *Id.*

determination, its influence was significant, and OMB should ensure the final memorandum covers such scenarios.

C. The Discretion to Waive Minimum Practices or Otherwise Avoid the Memorandum's Obligations Should Be Further Cabined

In the final memorandum, OMB should ensure that waivers of the Draft Memorandum's provisions and other limitations on its scope are not abused. The Draft Memorandum permits agencies to waive the minimum risk management practices.[95] Under the Draft Memorandum, a waiver would be permitted for "a specific covered AI application or component" after the Chief AI Officer makes "a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations."[96]

OMB should cabin agencies' discretion to make this determination. In particular, the final memorandum should include descriptions or definitions of what it means to increase risks to safety or rights or to unacceptably impede "critical agency operations." Examples of use cases that meet these requirements—or do not meet these requirements—would also be helpful. At minimum, OMB should clarify that ordinary administrative burdens of discontinuing an AI system due to its harms does not meet these thresholds.

In addition, the Draft Memorandum recognizes other exercises of agency discretion that limit the Memorandum's applicability:

- Agencies retain significant discretion in the first instance to determine which systems qualify as "covered AI" or rise to the level of rights- and safety-impacting AI[97] and do not appear to be required to report the former to OMB.
- "National security systems" are exempt from the Draft Memorandum's requirements altogether, and although the Memorandum incorporates an existing definition for the term,[98] it does not provide procedures for determining what systems meet that definition or reviewing those determinations.[99]
- Covered AI is also subject to the use case inventory only "to the extent practicable" and as permitted for "the protection of privacy and of sensitive law enforcement, national

---

[95] Draft Memorandum at 14-15.
[96] Draft Memorandum at 14.
[97] Draft Memorandum 4-5, 10 ("Agencies must review each use of AI that they are developing or using to determine whether it matches the definition of safety-impacting or rights impacting.").
[98] 44 U.S.C. § 3552(b)(6).
[99] The term "national security system" is applicable to federal cybersecurity rules, and the law generally defers to agency heads in evaluating "information security programs" for national security systems. *See* 44 U.S.C. §§ 3555(c), 3557. Such deference is inappropriate when the evaluation is not regarding the security of an agency's own systems, but the system's impact on individuals' and communities' rights and safety.

security, and other protected information,"[100] but the Draft Memorandum provides no guidelines in assessing practicability or when covered AI implicates "sensitive" or "protected information."

These limitations create opportunities for agencies to avoid the Draft Memorandum's obligations.

OMB may avoid abuses of the waiver process and other limitations by ensuring robust reporting and review by OMB of agencies' use of those authorities. The Draft Memorandum already envisions reporting in some instances. For example, beginning "with the use case inventory for 2024, agencies will be required, as applicable, to identify and report . . . any related extensions and waivers granted under" the Draft Memorandum.[101] Agencies are similarly expected to document and report to OMB determinations that a use of AI is not, in fact, safety- or rights-impacting.[102] Other determinations, however, are not reported to OMB, including the determination that a system does not qualify as "covered AI" or is deemed to be a "national security system" or that a use case involves "sensitive law enforcement" and "other protected information."

OMB should consequently expand the Draft Memorandum's reporting requirements to include each of these scenarios. In each instance, the agency should detail the scope, justification, and evidence supporting the determination. The threshold determination that a particular system constitutes "covered AI" is particularly crucial, as the entirety of the Draft Memorandum's obligations depend on that determination. However, overextending reporting for that threshold determination could overburden both agencies and OMB. Consequently, OMB should ensure that its forthcoming "detailed instructions for the [AI use case] inventory"[103] contemplate when agencies should report liminal determinations that particular systems did *not* constitute "covered AI."

In addition to robust reporting requirements for determinations regarding "covered AI," "national security systems," and "protected information," OMB should consider other safeguards to cabin agency discretion. These safeguards might include review by the agency AI oversight board, agency civil rights authorities, or OMB. OMB should also consider time-limiting agency determinations that exempt systems from the Draft Memorandum's obligations.

D. Notice Should Be Further Bolstered and Should Be Provided Before Use of Rights- or Safety-Impacting AI

[100] Draft Memorandum at 4 n.8.
[101] Draft Memorandum at 4-5.
[102] Draft Memorandum at 11.
[103] Draft Memorandum at 4.

The Draft Memorandum envisions providing notice of AI's use through two means: "plain language documentation" in the AI use case inventory and notice to "negatively affected individuals."[104] The Draft Memorandum establishes important parameters around both sets of notices to ensure that they are meaningful for impacted individuals and communities. The inventory, for example, must be in plain language and "generally accessible" while still being "adequately detailed."[105] The inventory must also be located "in contexts where people will interact with or be impacted by the AI."[106] Similarly, the individual notice for negative actions must be timely, consistent with the Plain Writing Act, and available "in multiple languages and through alternative formats and channels," as appropriate.[107] Agencies are encouraged, but not required to provide explanations for decisions and actions by AI.[108]

In the final memorandum, OMB should provide further parameters around the notice requirements for plain language, explainability, timeliness, and accessibility. It should also consider mandating individual notice *prior* to the use of rights- or safety-impacting AI. Each of these five principles are central to the Administration's *Blueprint for an AI Bill of Rights*,[109] and OMB should integrate them into the final memorandum.

First, OMB should bolster the Draft Memorandum's plain language requirements. The Draft Memorandum contemplates agencies' adherence to the Plain Writing Act "if applicable."[110] The Plain Writing Act, however, is applicable only to communications about benefits, taxes, or legal requirements,[111] and by some measures, agency compliance with the Act has been uneven.[112] The final memorandum should supplement that baseline requirement by requiring that both the use case inventory and, especially, notices of negative actions be provided in a short form. The short form should, in clear and plain language, state the decision taken, explain how the decision was reached—as described below—and provide clear instructions for

recourse.[113] The *AI Bill of Rights* similarly underscored that notices should be "brief and clear" and able to be understood quickly.[114]

Second, OMB should make explanations of AI's decisions mandatory. Under the Draft Memorandum, agencies are only "strongly encouraged to provide explanations for such decisions and actions."[115] Such explanations "might include . . . how and why the AI-driven decision or action was taken" or at least "the general nature of such AI decisions through context such as the data that the decision relied upon, the design of the AI, and the broader decision-making context in which the system operates."[116] The explanations should be mandatory. The basic tenets of due process require that a governmental "decisionmaker should state the reasons for his determination and indicate the evidence he relied on,"[117] and decisions by AI should be no different. Explainability is a cornerstone of the Administration's *AI Bill of Rights*, which stated, "Automated systems should provide explanations that are technically valid, meaningful and useful to you and to any operators or others who need to understand the system, and calibrated to the level of risk based on the context."[118]

Third, the final memorandum should include more concrete requirements for "timely" notice. Timely notice is crucial in ensuring that individuals may appeal or contest an AI's negative impacts, as contemplated by the Draft Memorandum.[119] The final memorandum should specify that the appeals process should give "people ample time and opportunities to respond . . . and opportunities to extend" deadlines,[120] while reducing "burdens such as time spent gathering records and documentation needed to prove eligibility, travel time associated with developing and submitting the collection, or even time waiting to speak with agency personnel."[121] After appeals are filed, agencies should speedily resolve them, as "lost time [waiting for a government response] operates as a kind of tax—a 'time tax'—and it imposes a serious burden on our people as they interact with the Government."[122] The *AI Bill of Rights* also recognizes the importance of notice in seeking redress, stating, "Human consideration and fallback are only useful if they are

conducted and concluded in a timely manner. . . . In time-critical systems [such as in healthcare or employment], this mechanism should be immediately available or, where possible, available before the harm occurs."

Fourth, the final memorandum should more robustly address accessibility, not only in notice provided to users but also in agencies' assessment and evaluation of AI. Federal law already requires agencies to provide accessible experiences to people with disabilities, and the final memorandum should expressly incorporate those requirements. President Biden's Executive Order on "Transforming Federal Customer Experience and Service Delivery To Rebuild Trust in Government" directed agencies to "ensur[e] the accessibility of services for customers with disabilities"[123] and Section 508 of the Rehabilitation Act requires that agencies "ensure" that any "electronic and information technology allows . . . individuals with disabilities who are members of the public . . . to have access to and use of information and data" from federal agencies that is comparable to individuals without disabilities.[124] The *AI Bill of Rights* recommends that AI systems "should be designed, developed, and deployed by organizations in ways that ensure accessibility to people with disabilities" and that notices and explanations be accessible.[125] Unfortunately, in the two decades since Section 508 was passed, not all agencies have met its requirements,[126] and OMB should ensure that accessibility is a requirement in agencies' use of AI, assessing its harms, establishing appropriate risk management practices, and providing notice and explanation of AI's use.

Finally, OMB should consider expanding its notice requirement to provide meaningful notice *prior* to the use of rights- and safety-impacting AI. Timely, individual notice prior to the use of AI is essential for protecting critical rights, as recognized by the *AI Bill of Rights*,[127] such as seeking accommodations for disabilities.[128] For example, providing notice to an individual with a disability *after* AI has been used to make a negative decision about their job application gives the individual no opportunity to seek meaningful accommodations. The Equal Employment Opportunity Commission has stated that prior notice is a "promising practice" for compliance with the disabilities rights laws, including "[i]nforming all job applicants and employees who are

[127] AI Bill of Rights at 43 ("Users should receive notice of the use of automated systems in advance of using or while being impacted by the technology.").
[128] *See* Center for Democracy & Technology et al., Civil Rights Standards for 21st Century Employment Selection Procedures at 23 (2022), https://cdt.org/insights/civil-rights-standards-for-21st-century-employment-selection-procedures; Center for Democracy & Technology, Comments on Revised Proposed Rules to Implement Local Law 144 of 2021 on Automated Employment Decision Tools at 7 (2023), https://cdt.org/insights/cdt-comments-scrutinize-nycs-revised-rules-that-leave-even-more-workers-unprotected-from-algorithmic-bias/ (ten days' notice likely insufficient for requesting accommodations).

being rated that reasonable accommodations are available" and "[d]escribing, in plain language and in accessible formats, the traits that the algorithm is designed to assess."[129] OMB should consequently consider requiring notice to be provided to individuals *prior* to any use of rights- and safety-impacting AI, including for purportedly positive outcomes, with the burden on agencies to demonstrate that that prior notice would be impracticable.

E. Feedback Mechanisms Should be Equitable and Approachable, Consistent with Prior Federal Guidance

The Draft Memorandum appropriately requires agencies to "consult affected groups, including underserved communities, in the design, development, and use of the AI" and in "the event of negative feedback, agencies must consider not deploying the AI or removing the AI from use."[130] We suggest stating expressly that the consultation and consideration of any feedback must be meaningful, not just *pro forma*. This means the feedback should be solicited both prior to the adoption of AI and, if implemented, during deployment. In addition, the feedback should be used in the pre-adoption evaluation of AI's benefits versus its harms as well as in impact evaluations once deployed. Finally, to promote accountability for following these guidelines, agencies should be required to disclose what the feedback was and how they acted on it, much as agencies do as part of the notice and comment process for proposed regulations.

One 2019 paper underscores the importance of *meaningfully* soliciting feedback from impacted communities. The paper reported the results of workshops where individuals from "affected communities" were asked about an algorithmic risk-scoring tool used in child welfare screening decisions.[131] Aside from the limited utility of soliciting feedback only after the tool was put in use, only 18 of the 95 workshop participants were people whose families had been investigated by child welfare authorities. The remainder worked for or with the child welfare agency using the risk-scoring tool, with varying degrees of direct contact with impacted families.[132] During the workshop, participants expressed concerns with the risk-scoring tool, including system-level concerns such as "low expectations of the benefits that the system could provide"; bias among caseworkers and built into data or tool itself; lack of information about how the tool weighed data; and, families' inability to dispute a score.[133] Rather than recommending that these concerns be considered in evaluation of the tool, the authors of the paper essentially advised better messaging or tweaks to the tool that would change perceptions

[133] *Id.* at 7-9.

but not its functioning[134]—a response that may have affected underrepresentation of impacted groups.

Moreover, agencies must ensure their methods for soliciting feedback are equitable, approachable, and accessible. The avenues for soliciting feedback envisioned by the Draft Memorandum may inadvertently be exclusionary. For example, the Draft Memorandum contemplates soliciting feedback through the Federal Register, post-transaction forms, or public hearings.[135] Although those are traditional means for agency interaction with the public—and should indeed be employed—they may require individuals to have sufficient time and resources to meaningfully respond. As OMB has observed, "these efforts are too often perceived by stakeholders and agencies alike as being siloed, inaccessible, or irrelevant compliance exercises with unclear purpose or benefit to communities, demonstrating insufficient consideration of the needs, interests, and priorities of diverse populations."[136] OMB has concluded that "there is no one-size-fts-all approach to stakeholder engagement" but identified a number of promising practices for ensuring engagement meets stakeholders where they are:[137]

- "collect[ing] feedback from communities not through a specific agency scope, but rather organized around a life event: surviving a natural disaster, a child with a disability transitioning to adulthood, and a Service member seeking civilian employment for the first time";
- deploying "well-designed mobile sites [to] drive better digital experiences";
- "directly increas[ing] community capacity by providing resources (grants, financial assistance, and procurement opportunities) directly into underserved communities"; and,
- simplifying forms through usability testing, and avoiding "legalistic, dense form[s] [that] could deter eligible [individuals] out of receiving these protections or add unnecessary stress for already stressed" communities.

---

[134] For instance, since changing the variables used by the tool to calculate risk scores to include family strengths and not just weaknesses would increase costs, the authors suggested "modifications [that] would produce a model that is mathematically equivalent to the original, but which may be perceived and responded to very differently by users and affected individuals." To the extent participants questioned whether use of the tool resulted in better outcomes for families, the authors recommended "[c]onveying how making use of data and algorithms leads to improved family and process outcomes," as if that was a foregone conclusion and not a metric to incorporate into future impact evaluations. And to the extent participants raised concerns about the "opacity of algorithmic decisionmaking," the recommendation was not to disclose more information, but a concern that such disclosure would not have the (desired) impact of improving caseworker-family relationships so further research was warranted about the usefulness of being transparent. *Id.* at 9-10.

[137] *Id.* at 32-35.

The final memorandum should direct agencies to assess burdens on impacted communities and develop strategies to reduce barriers when gathering feedback from impacted communities.

F. Non-Discrimination Considerations Should Extend Beyond Protections Currently Provided by Federal Civil Rights Law

The Draft Memorandum requires agencies to assess the discriminatory effects of AI, including disparate impact.[138] However, the Draft Memorandum generally limits those provisions to protected classes under federal civil rights laws.[139] The protections provided by federal law, however, represent an absolute minimum and may exclude characteristics worthy of protection. For example, federal protections do not extend to sources of income, education level, or history with the criminal legal system. Consequently, the final memorandum should require agencies to also assess impacts on historically marginalized groups not protected by federal law and mitigate those impacts if they are not relevant to the AI's intended use.

Conclusion

The ACLU applauds OMB's significant step forward in bolstering civil rights protections as the rapid advance of AI in government and throughout society continues. OMB's Draft Memorandum is significant, but more work is needed to build off this next step. To ensure that the final memorandum provides robust protections for civil rights and civil liberties, OMB should:

- To the extent possible, include national security systems and intelligence agencies within the Draft Memorandum's scope, clarify its application to less-advanced systems, and extend its applicability to federally funded programs;
- Maintain or expand the scope of AI use cases that are presumed to be rights-impacting;
- Strengthen key minimum practices, including by cabining agency discretion to waive or otherwise avoid the Draft Memorandum's requirements, bolstering notice provisions, and ensuring that community feedback mechanisms are equitable and approachable.

If you have any questions about these comments, please do not hesitate to contact Cody Venzke, Senior Policy Counsel, at cvenzke@aclu.org.

Sincerely,

American Civil Liberties Union

Subject: Response to Request for Comment on the Office of Management and Budget "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum" (OMB-2023-0020-0001)

Date: December 5, 2023

The Special Competitive Studies Project (SCSP) is a nonpartisan, nonprofit organization committed to ensuring that the United States is organized and positioned to lead globally as artificial intelligence (AI) and other emerging technologies are reshaping our national security, economy, and society. As AI advancements transform our world, the United States is in a global technology competition, which will determine the governance model – democratic or authoritarian – that will be adopted globally and will shape the international order.

Maintaining the United States's competitive edge in AI requires fostering an environment that encourages innovation, while ensuring AI and related technologies are shaped according to our laws, values, rights, and freedoms. Regulation is an effective mechanism for ensuring AI outcomes align with these requirements. However, we cannot and should not regulate every AI use case. Effective regulation that promotes innovation will focus on AI development and uses that are highly consequential to society, either because the impacts are significantly beneficial or because they are significantly harmful. A risk based approach to regulating AI also facilitates effective use of resources.

Additionally, any regulation must be agile. AI is advancing at a faster pace than our current regulatory landscape. Thus, any new AI regulatory mechanisms must be adaptive to these rapid changes.

On November 7, 2023, SCSP, in collaboration with the Johns Hopkins University Applied Physics Laboratory (JHUAPL), released the Framework for Identifying Highly Consequential AI Use Cases ("HCAI framework") (see Appendix).[1] The framework builds on the four principles for AI governance put forth by SCSP in its fall 2022 report, "Mid-Decade Challenges to National Competitiveness": 1) govern AI by use case and outcomes by sector; 2) empower and modernize existing regulators; 3) focus governance on high-consequence use cases; and 4) strengthen non-regulatory AI governance.[2] The framework, developed through a collaborative process involving multi-stakeholder engagement, serves as a blueprint for agencies and sector specific regulators to evaluate the potential societal impacts of AI use cases or classes of uses.

[1] Framework for Identifying Highly Consequential AI Use Cases, Special Competitive Studies Project (2023).
[2] Mid-Decade Challenges to National Competitiveness, Special Competitive Studies Project (2022).

The HCAI framework provides ten corresponding categories of harms and benefits of AI uses, and specific harms and benefits for each category. These examples are illustrative as specific harms and benefits will be unique to sectors. In addition, harms and benefits will be interrelated (e.g. a negative effect of an AI use on a certain subpopulation might result in a positive effect on another), and, thus, it is critical to assess the whole context. The framework also offers ways to make high consequence determinations through quantitative and qualitative magnitude assessments of the harms and benefits (e.g., probability and scope), adaptable to each specific sector and use case.

The framework is thus consistent with the Office of Management and Budget's (OMB) draft memorandum on agency use of AI and its goals of *strengthening AI governance*, *advancing responsible AI innovation*, and *managing risks from use of AI*. It offers regulators ways to think through safety-impacing and rights-impacting AI use cases by delineating harm and benefit categories, with flexibility in its application. This will help agencies and regulators best achieve the objectives stated in the memorandum.

Below, SCSP offers its comments to the specific questions asked by the OMB on the draft memorandum and on how the HCAI framework can guide federal agencies to best achieve the memorandum's objectives. SCSP remains ready to engage with the OMB in case of any questions or desire for further discussion.

Q. 3) How Can OMB Best Advance Responsible AI Innovation?

The OMB draft memorandum on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"[3] states that agencies must improve their ability to use AI in ways that benefit the public and improve mission effectiveness, which should be achieved through internal capacity building to support responsible AI innovation. To that end, the memorandum requires agencies to develop a strategy for identifying and removing barriers to responsible AI use, including by identifying the agency's current and planned top AI use cases.

The HCAI framework can help guide agencies on best practices for identifying these use cases and maintaining AI use case inventories, which would advance innovation, streamline regulation, and focus agency efforts and resources on highly consequential AI. Furthermore, periodic reassessment of use cases will help account for technological and contextual changes. Focusing regulatory efforts where needed would support rapidly advancing and deploying low risk AI, while giving greater regulatory attention to highly consequential AI use cases.

Q. 5) Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

The OMB memorandum acknowledges that the list of AI uses presumed to be safety-impacting or rights-impacting is not exhaustive and requires agencies to report agency-specific lists annually. Similarly, the HCAI framework identifies harmful and beneficial categories, and

[3] Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence, Office of Management Budget (2023).

illustrative specific harms and benefits, under each category. Applying the framework will enable agencies to analyze the whole context of an AI use case or classes of uses. This is critical as every AI use case has the potential to have interrelated benefits and harms.

The HCAI framework allows regulators to identify a clearer picture of the impacts of any analyzed AI use case. This includes qualitatively or quantitatively evaluating the magnitude of the harms and benefits (e.g., probability and scope) and using this evaluation to identify highly consequential AI use cases, which can be done flexibly, based on sector-specific expertise. Empowering agencies to make safety-impacting and rights-impacting assessments of AI use cases as outlined in the HCAI framework is a more dynamic approach than attempting to maintain a static list of AI use cases and applications. The framework can necessarily be applied to reassess use cases, in light of ever-evolving technology and contextual considerations.

Q. 6) Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

The OMB memorandum gives agencies until August 1, 2024 to establish minimum practices for identified safety-impacting and rights-impacting AI and to bring any noncompliant AI into compliance. As the memorandum notes, these practices are only a baseline and agencies would be required to develop context-specific practices.

The HCAI framework can help implement, strengthen, and refine the minimum practices for sector-specific use cases. The framework can help agencies think through various categories of harms and benefits as well as specific harms/benefits in each category. The identified harms and benefits can support establishing and implementing minimum practices for high consequence AI use cases.

Framework for Identifying Highly Consequential AI Use Cases

November 2023

Special Competitive Studies Project &
Johns Hopkins University Applied Physics Laboratory

Introduction

The Special Competitive Studies Project (SCSP) in collaboration with the John Hopkins University Applied Physics Laboratory (JHUAPL) developed the "Framework for Identifying Highly Consequential AI Use Cases."

The genesis of this collaborative effort stems from the comprehensive analysis of the United States' approach to AI governance in SCSP's 2022 *Mid-Decade Challenges to National Competitiveness* report which outlined four pivotal AI governance principles.[1] In Mid-Decade Challenges, SCSP recommends that the United States should leverage its robust sector regulatory expertise to uptake AI regulation and govern AI use cases and outcomes by sector. Regulators also need the necessary resources to adopt AI regulation. A critical AI governance principle is that U.S. regulators cannot regulate every AI use case. Rather, the U.S. regulatory approach must focus their efforts on highly consequential AI use cases, whether beneficial or harmful. This framework operationalizes these principles.

With those principles as the guiding post, this framework is a classification tool that regulators can use to determine on which AI uses and outcomes to focus their regulatory efforts. Without context and awareness of the potential harms and benefits of an AI use case, it is difficult to comprehensively classify the impacts of an AI system. This framework is intended to aid regulators in making an informed initial classification of an AI use case. It does not speak to what regulatory action should be taken, only that an AI use or class of AI use cases will significantly impact society and requires their attention.

The framework is a starting point. It is a template that regulators can modify for their sector-specific needs. However, it will need reiteration, with more input particularly from regulators, to make it more effective and implementable. It should be viewed as a living document.

The framework fits within SCSP's broader mission to strengthen America's long-term competitiveness as AI and other emerging technologies shape our national security, economy, and society. To review the breadth of SCSP's work, visit SCSP.ai.

The partnership that produced this report brought together experts and practitioners from across the national security, regulatory, and emerging technology communities through a series of roundtables. SCSP and JHUAPL would like to thank the many government experts and regulators, academics, civil society leaders, and industry experts for their time and insight. It was prepared by SCSP and JHUAPL staff and, as such, may diverge from the opinions of some expert contributors.

[1] Mid-Decade Challenges to National Competitiveness, Special Competitive Studies Project at 87 (2022).

Background

Artificial intelligence (AI) is a transformative technology with the potential to revolutionize many aspects of our lives. While AI offers benefits such as improving health, education, productivity, and solving some of the world's most pressing problems, it also has the potential to be harmful. AI use can result in the spreading of disinformation and discrimination, for example. In order to shape AI for the public good, we must both incentivize the beneficial use of AI while recognizing and mitigating the worst of the societal harms.

AI technologies must be developed and used ethically and responsibly. This requires governing AI, using both regulatory and non-regulatory mechanisms, in ways that align with established democratic values. At the same time, an American approach to AI must balance innovation with regulation.

To achieve these objectives, the Special Competitive Studies Project provided four AI governance principles in its first report, *Mid-Decade Challenges to National Competitiveness*.[2] These principles are:

- **Govern AI use cases and outcomes by sector.** The risks and opportunities presented by AI are inextricably tied to the context in which it is used. Therefore, sector-specific governance is the best approach to balancing interests to achieve optimal outcomes.

- **Empower and modernize existing regulators.** Existing regulatory bodies were created in a different technology era. The United States needs to empower and modernize its key regulators, and energize their engagement for the new AI era.

- **Focus governance on high consequence use cases.** It is impractical to govern every AI use or outcome. Regulators should focus their efforts on AI uses and outcomes that will be highly consequential to society, including potential unintended uses, whether beneficial or harmful.

- **Strengthen non-regulatory AI governance.** Strong, robust non-regulatory governance mechanisms should be used in addition to regulatory guardrails to properly shape AI development and use to ensure flexibility, adaptiveness, and relevance.

With respect to governing through regulation, sector regulators are faced with the challenge of regulating the rapidly evolving field of AI technology. AI systems are becoming increasingly sophisticated and widespread, and it is difficult to regulate every system and use case. Some AI development and use cases pose a potential for significant negative or positive impacts on society, and thus, warrant more attention than others. As a result, regulators need to be strategic about which AI use cases and outcomes they focus their regulatory efforts upon.

Multiple frameworks exist for assessing and mitigating risks associated with AI. While these mechanisms are effective for their particular missions, there is no widely accepted approach for

[2] Mid-Decade Challenges to National Competitiveness, Special Competitive Studies Project at 87 (2022).

identifying whether an AI development or use case is of high consequence to society before further regulatory actions are taken.

The United States and our allies and partners need an approach to AI regulation that promotes innovation by regulating AI systems that have the most significant consequences on society. Such an approach would allow for the continued development of beneficial AI uses, while addressing potentially significant harms from development and use.

A risk-based approach to AI regulation that identifies highly consequential AI use cases aligns with democratic values. This approach respects individual rights, liberties, and freedoms and harnesses impactful benefits of AI systems for public good, while protecting individuals and society from the worst of the harms. The draft EU Artificial Intelligence Act (the "EU AI Act") also takes a risk-based approach to regulation, meaning that it regulates AI systems based on the potential risk of harm they pose to individuals or society.[3] This framework employs a risk-based approach. However, instead of relying on a static list of technologies and applications, this framework takes into account the dynamic nature of AI technologies and provides regulators with flexibility in its application.

An approach to identifying highly consequential AI systems should be both risk-based and flexible. Such an approach should provide justified confidence in AI systems (by supporting trustworthiness & responsibility) for the public, certainty to industry, and flexibility to regulators to apply sector-specific expertise and experience, as different sectors and uses have different risk thresholds. An American approach should also provide insight into potential beneficial impacts of AI development or use on society that regulators can choose to regulate (e.g., incentivize through funding or consider whether a benefit warrants equitable access by the whole of society).

This document sets forth a framework for identifying highly consequential AI use cases (ID HCAI Framework) that might have significant benefits or harms on society. The framework is a tool that can help regulators ensure that the development and use of AI systems align with democratic values. By using this template, regulators can focus their efforts on AI systems that are highly consequential to the public, standardize their approach across sectors, and adapt their approach to the specific needs of different sectors. Additionally, by documenting their processes and decision making, regulators can help to ensure accountability and transparency. This framework template should be adopted and tailored by regulators for sector-specific needs.

Some AI use cases will require regulatory focus, while others will not. This framework aims to help regulators identify AI use cases in the "gray area." An initial high-level assessment must be made as to whether the AI use case under consideration warrants the resources to conduct a more thorough assessment of whether an AI system is highly consequential. The initial judgment will help determine whether the AI development or use case under consideration has foreseeable harms that could pose a significant impact on health, safety, or fundamental rights, or substantial benefits that should overwhelmingly incentivize the AI development and use. If not, then no

[3] Tambiama Madiega, Artificial Intelligence Act, European Parliamentary Research Service (2023).

further assessment is required and the AI use case is determined to not be of high consequence. Otherwise, the complete framework should be applied to help determine whether the AI use case is highly consequential to individuals or society. A suggested best practice is to document the process and rationale used at every decision point in the ID HCAI Framework.[4] It is also recommended that regulators establish a registry of evaluated AI use cases and their classifications with exceptions (e.g., for national security or justified industry secrecy). The registry should contain a mechanism by which the public can provide input on these evaluated AI system use cases. This will inform the public of assessments and classifications, allowing them to inform regulators of any contextual changes triggered by the continued use of the AI system that may affect periodic reassessments. It will also have the added benefit of informing industry about the regulators' evaluation process.

The framework interprets AI as computational systems that do some of the predictions, recommendations, classifications, and other decision making that traditionally are in the province of humans.[5] This definition includes systems which are not possible without AI, and those that make use of AI-based components, AI-enabled functions, or AI-derived algorithms. The framework is intended for assessments of AI systems as a whole, vice components, and their concrete impacts on society that result from how they change the context or condition of society. It further proposes that assessments be performed by regulators with input from multi-disciplinary experts,[6] including the public, which is best positioned to evaluate impacts on society. In addition, societal impacts are those resulting both from the use of the AI system as well as its development (e.g., impacts on data workers and from environmental impacts).

Three AI lifecycle points at which the framework can be applied:

- Regulators foresee a new application for AI,[7]
- A new application for AI is under development or proposed to a regulatory body, and
- An existing AI system has created a highly consequential impact that triggers an *ex-post facto* regulatory review.

The high-level steps to the framework are:

A. **Preliminary analysis:** Determine whether the AI application has foreseeable harms or benefits that could impact, for example, health, safety, or fundamental rights, and consequently may need to be regulated. This is intended to be an initial filter to determine whether a fuller assessment is needed.

---

[4] Documentation should include details such as the "moment" in time that an assessment is performed, which will help inform future reassessments and address potential contextual changes (e.g., the societal relationship with the AI system), rationale for making the judgment that there are no foreseeable harms or benefits that necessitate use of the framework, and the decisions made throughout the full assessment.

[5] Artificial Intelligence Risk Management Framework, U.S. National Institute of Standards and Technology at 1 (2023) ("The AI RMF refers to an AI system as an engineered or machine-based system that can, for a given set of objectives, generate outputs such as predictions, recommendations, or decisions influencing real or virtual environments. AI systems are designed to operate with varying levels of autonomy (Adapted from: OECD Recommendation on AI:2019; ISO/IEC 22989:2022).").

[6] This includes domain experts that can provide research insights (e.g., from universities and Non Governmental Organizations) who understand the evolving nature of relevant/emerging impacts to consider.

[7] In this scenario, regulators should assess AI systems as they would be deployed and used.

B. **Parallel analysis of harms and benefits:** If there is foreseeable harm or benefit, conduct a more comprehensive harms/benefits analysis, which involves performing parallel harm and benefit assessments.

    a. Enumerate and evaluate the magnitude of foreseeable and actual harms from the AI system development and use.
    b. Enumerate and evaluate the magnitude of foreseeable and actual benefits from the AI system development and use.

C. **Final decision on high consequence:** Using the magnitude assessment results, determine if the AI use case is of high consequence.

    a. If yes, a sector-specific regulator must determine how best to take next steps to regulate the AI development and/or use (e.g., whether to create incentives, mitigate harms, or establish bans).

D. **Periodic reassessment:** Periodically monitor sectoral AI use to determine if the list of AI systems identified as highly consequential remains appropriate for that sector given contextual changes and whether revisions to classifications are necessary.

The potential specific harms and benefits are grouped into ten corresponding categories (see **Table 1** and **Appendix 1**). The framework provides specific harms and benefits for each category, as examples, with the recognition that specific harms/benefits will be unique to sectors. Harms and benefits are further characterized by magnitude (e.g., the scope of a harm or benefit). The framework provides factors to calculate the magnitude of an identified harm or benefit. Specifically, harms are characterized by four severity factors and four likelihood factors. Benefits are characterized by four impact factors and two likelihood factors. Lastly, the document offers ways to make high consequence determinations based on the quantification of a system analysis.

Categories of Harms and Benefits

Table 1. A list of ten harm categories (left) and benefit categories (right). Corresponding categories of harm and benefit are identified on the same row.

Table 1. ID HCAI Framework Corresponding Categories of Harms and Benefits

Harm Categories	Benefit Categories
Physical Injury	Physical Health
Emotional or Psychological Injury	Emotional or Psychological Health
Opportunity Loss	Opportunity Access
Economic Loss	Economic Access
Liberty Loss	Liberty Protection
Privacy Loss	Privacy Protection
Negative Environmental Impact	Positive Environmental Impact
Manipulation	Incentivization
Social Detriment	Social Improvement
Operational Degradation	Operational Improvement

Appendix 1 provides tables of specific harms and benefits for each category, with corresponding descriptions. These tables are intended to guide the framework user (e.g., a sector-specific regulator) through consideration of examples of the types of specific harms or benefits associated with each category. Note that potential violation of fundamental rights is incorporated into the specific harms lists. The tables are meant to be illustrative and not exhaustive lists.

As noted in the high-level steps above, this process begins with an AI development or use case for review. While no application will be completely free of any potential harm and all presumably have some potential benefit, the framework assumes that this process has been employed because the possibility of some significant AI related harm or benefit has been identified as a reasonable outcome. To determine whether the AI development or use should be regulated, a framework user should explore the extent of those potential harms and benefits.

Defining Factors for Characterizing Harm Categories

The framework employs ten categories of harms.[8] Each category includes a non-exhaustive list of specific harms, located in **Appendix 1**.

The framework user steps through each category of harms to identify and describe relevant specific harms that could result from the development and deployment of the AI application being considered.

For each specific harm, the framework user would evaluate the harm's potential severity and likelihood, and document any baselines used for comparison that led to the score determinations.[9] The severity of harm factors are scale, scope, disproportionality, and duration. The likelihood of harm factors include probability, frequency, lack of detectability, and lack of optionality. Descriptions for each of these factors are presented in **Table 2** and **Table 3**, respectively.

Table 2. Harm Factors of Severity

Factor	Description
Scale	How acutely the harm could impact a population or group throughout the AI lifecycle
Scope	How broadly the harmful impact could be experienced across populations or groups
Disproportionality	Whether an individual, group, or population is disproportionately affected by the harm over that of other individuals, groups, or populations
Duration[10]	How long the harmful impact would be experienced by a population or group

[8] To explore the harms in detail, the framework adapts the Microsoft Types of Harm List to frame AI-related harms that could emerge. See Foundations of Assessing Harm, Microsoft (2022); Types of Harm, Microsoft (2023).

[9] Baselines can include any statutory boundaries for a given sector (e.g., EEOC compliance), or corresponding harms for a non-AI counterpart. Documenting baselines may help regulators develop a library of use cases for comparison.

[10] Example considerations for this factor include the relative difficulty of an individual or group to appeal the outcome from the use of the technology (finality of outcome), difficulty in mitigating a certain risk imparted by the technology (lack of mitigation; refer to NIST RMF), or the minimal ability or speed at which the technology or an affected individual or group can recover or return to normal after a consequential event (lack of resilience). In addition, this factor should assess whether a harm occurs at a low-level continuously over time (e.g., distortion of reality due to prolonged interaction with the AI system) or whether a harm is instantaneous and acute (e.g., malfunction of threat identification system, which triggers a threat neutralization procedure resulting in bodily injury).

Table 3. Harm Factors of Likelihood

Factor	Description
Probability	The likelihood the harm could impact a population or group and whether this particular harm has occurred before (e.g., through a similar use case)
Frequency	How often a population or group would experience the harm
Lack of Detectability	Likelihood of not discovering and correcting a hazard or failure mode while it remains possible to prevent or mitigate the harm
Lack of Optionality	Limited individual choice as to whether to be subject to the effects of the technology (e.g., ability to opt-out), such as from minimal human oversight to consider and remedy problems that may be encountered from the AI system

To analyze magnitudes of harms, based on severity and likelihood factors, a framework user has "scoring" options to assess magnitude at the specific harm level or at the harm category level.

One approach is to employ different rank order categories (e.g., very low to very high, with as many categories in between as desired) with stated descriptions and explanations of the categorization of impacts.[11] The deliberative process should highlight the dimensions and factors with which each harm and harm category was evaluated.

In the alternative, a framework user can employ the Likert scale.[12] For example, the Likert scale could range from 1-5 (with 1 representing "low," 3 representing "medium," and 5 representing "high"). Note that the numbers are meant to signal categories that are relative to each other, just as using descriptive categories (e.g., very low to very high). The numbers are not meant to indicate preciseness such that a magnitude "4" is exactly twice as much as a magnitude "2."

The former approach assumes that a numerical representation is neither possible nor useful, while the latter approach assigns numerical values with some "room for flexibility." Either approach for scoring the factors allows necessary flexibility because the scales and magnitudes of the different factors will vary for different harms, and the relative judgment of what is a "very high" or "5" score will differ by sector/harm. The factors are named in such a way that a "very high" or "5" score represents a negative aspect of the harm (e.g., "long duration"). The framework user has flexibility in determining the specific weightings for each harm category given the importance of specific categories may vary depending on the sector and context. We instead provide guidance on potential dependencies for each category (see Appendix 1). Some harms may be essentially instantaneous (e.g., a physical harm), while others may extend over time (e.g., psychological harm). Thus, some magnitude factors (e.g., scope) may raise different considerations for those harm categories.

[11] Guide for Conducting Risk Assessments, U.S. National Institute of Standards and Technology at Table H-3 (2012).

[12] Rensis Likert, A Technique for the Measurement of Attitudes, Archives of Psychology 140 at 1–55 (1932).

Defining Factors for Characterizing Benefit Categories

As noted in the high-level steps above, a benefits assessment should occur in parallel with the harms assessment. To determine aspects of the AI system that could encourage development and use, the framework user should explore the extent of potential benefits stemming from the use case.

In a similar approach to the harms assessment, the framework employs ten categories of benefits.[13] Each category includes a non-exhaustive list of specific benefits, located in **Appendix 1.**

The framework user steps through each category of benefits to identify and describe relevant specific benefits that could result from the development and deployment of the AI application being considered.

For each specific benefit, the framework user would evaluate the benefit's potential impact and likelihood. The impact factors are scale, scope, duration, and proportionality. The benefit likelihood factors include probability and frequency. Descriptions for each of these factors are presented in **Table 4** and **Table 5**, respectively.

Table 4. Benefit Factors of Impact

Factor	Description
Scale	How acutely the benefit could impact a population or group throughout the AI lifecycle
Scope	How broadly the beneficial impact could be experienced across populations or groups
Duration	How long the beneficial impact would be experienced by a population or group
Proportionality	Whether a population or group is proportionally affected by the beneficial impact as compared to other populations or groups

Table 5. Benefit Factors of Likelihood

Factor	Description
Probability	The likelihood the benefit could impact a population or group and whether this particular benefit has occurred before
Frequency	How often a population or group would experience the beneficial impact

[13] The non-exhaustive list of benefits was compiled from a literature review.

To analyze magnitudes of benefits based on impact and likelihood factors at either the specific benefit level or at the benefit category level, a framework user has the same options for implementation as assessing harms - either employing different rank order categories or the Likert scale.

The factors are named in such a way that a "very high" or "5" score represents a positive aspect of the benefit, (e.g., "long duration"). Some benefits may be essentially instantaneous (e.g., physical health), others may extend over time (e.g., psychological health). Thus, some factors (e.g., scope) may raise different considerations for those benefit categories. The framework user has flexibility in determining the specific weightings for each benefits category given the importance of specific categories may vary depending on the sector and context.

Analyzing "Magnitude" for Harms and Benefits

Regulators should have flexibility, based on sector-specific expertise and experience, in analyzing the magnitude of harms/benefits based on the severity, impact, and likelihood factors ("magnitude" analyses). This document suggests that the magnitude analyses of harms/benefits focus at the categorical level.[14] One way to make this analysis is by calculating the magnitude for each specific harm/benefit and calculating an average (weighted) across categories. One advantage of assessing the magnitude factors for each specific harm/benefit in **Appendix 1**, which are then analyzed at the categorical level, is that this approach provides a comprehensive view of all relevant harms and benefits with a nuanced understanding of the interplay of all the relevant harms and benefits.

Appendix 2 provides an exemplary method of calculating the magnitude analyses for specific harms and benefits, respectively.

Ways to Make High Consequence Determinations

There are many ways a framework user may choose to apply the resulting magnitude values based on their sector-specific expertise and experience. Magnitudes can be considered within a specific category or across categories. Ultimately, any approach will need to determine whether an AI development or use case being assessed is of sufficiently high consequence to warrant continued regulatory focus.

Examples of ways to combine or compare magnitudes include:

[14] This document suggests analyzing magnitudes at the category level because: (1) specific harms/benefits will be different across sectors; (2) the number of specific harms/benefits and associated factors can result in a comprehensive, but cumbersome number of overall quantifications; (3) analyses at the categorical level account for the interaction across harms/benefits that will alter the impact of any individual harm/benefit assessed independently; and (4) analyses at the categorical level allow for standardization of categories across sectors for comparative analysis and public justified confidence.

- Does any specific harm category have a magnitude greater than threshold X?[15]
- Do one or more harm categories have a magnitude greater than threshold Y?
- Does the total of magnitudes across all harm categories exceed threshold Z?
- Are the total magnitudes across all harm categories greater than the total magnitudes of benefits across all benefit categories?
- Are there one or more harm categories that might overwhelmingly outweigh the assessed categories of benefits?
- Are there one or more benefit categories that might overwhelmingly incentivize development or use, despite the magnitude, number, or type of harm categories identified?
- Does the aggregation of low magnitude level harms/benefits change context to whether the system is considered highly consequential?

Even at the categorical level, regulators should have flexibility in analyzing the magnitude for harms/benefits. For example, a framework user may focus on the most salient harms/benefits as opposed to every possible harm/benefit that exists. The framework also recognizes that even a single harm/benefit or magnitude can signal a high consequence AI use case that requires regulatory focus.

Potential next steps would then depend on responses to the above questions. For example, if the assessed character of the benefits is determined to outweigh the assessed character of the harms, the framework user could specify that development or use of the AI system should proceed, or perhaps even be incentivized. Alternatively, if the assessed character of the harms is determined to outweigh the assessed character of the benefits, then the framework user could specify whether development or use of the AI application should be reconsidered, suggest potential alternatives that have not been considered, or provide recommendations for risk mitigation[16] based on the identified harms. These determinations require sector-specific nuance, taking into consideration aspects that do not have clear answers, such as the willingness to accept the accumulation of minor consequences over time.

Periodic Reassessment of Sectoral AI Use

At the sectoral level, AI impacts should be monitored on a periodic basis to assess if the harmful/beneficial impact(s) of a previously assessed AI system has changed (e.g., environmental change or change in use) or if there has been a contextual change due to socio-techno relationship warranting revisions to the AI classification or regulation as appropriate for that sector. These reassessments may occur at the level of the individual AI system (e.g., an AI-enabled medical

[15] Efforts are underway to establish standards, metrics, and norms for AI development and use. See Biden to Push For Government Standards on AI, Politico (2023); U.S. LEADERSHIP IN AI: A Plan for Federal Engagement in Developing Technical Standards and Related Tools, U.S. National Institute of Standards and Technology (2019).

[16] For example, the NIST AI Risk Management Framework provides a voluntary process for managing AI risks prospectively and continuously throughout the AI lifecycle. Artificial Intelligence Risk Management Framework, U.S. National Institute of Standards and Technology (2023).

device approved by the FDA) or of a class of AI systems (e.g., AI use for credit approval or election campaign use).

Questions a framework user should pose when monitoring an AI system are:

- How is the AI system adapting post classification and deployment to societal and environmental changes within the sector over time? If the AI system does adapt, how regularly will it adapt to such change(s)?
    - Framework users must assess, based on unique sector needs, the best points at which to conduct periodic reassessments.
- What aspects of assessment, classification, or regulation need to be revised given this change?
- Whose obligation it is to conduct periodic reassessments. For example, should the obligation rest on the entity responsible for the AI system to report to the regulator (i.e., modeled after reporting recall patterns and defective systems)? Or should the regulator's responsibility include the periodic reassessments?

Conclusion

This framework aims to provide a tool for regulators to identify which AI use cases and outcomes are or will be highly consequential to society, whether beneficial or harmful. Because it is impractical to govern every AI use or outcome, regulators should focus their efforts on shaping those AI technology uses and outcomes that will be maximally impactful on society. The framework provides latitude for users to identify specific rulesets to employ for determining whether a use case is high consequence, allowing for flexible implementation across sectors. Intra-agency and inter-agency consistency will result from repeatedly applying the same framework template, being transparent through documentation, and building a library of assessments that are publicly available.

Assessments, especially pre-deployment or in early stages of release, might have to be conducted on limited information and based on hypothetical assumptions. New research and data observations post-deployment enable determinations of whether initial classifications are still appropriate and whether revisions to the governance approach are necessary. The framework serves as the first step that a regulator should take in determining if an AI system necessitates further investigation or action. In doing so, the framework also informs policy makers, industry, and civil society on relevant actions to take. It will enable all framework users to focus governance on high consequence use cases, under the assumption that the rapidly expanding application space would overwhelm efforts to address and take action on every use case.

Appendix 1: Harm / Benefit Category Tables

The following appendix is meant to supplement the ID HCAI Framework. It provides a list of example harms and benefits of AI that can be used to help regulators identify use cases of AI that have either significant harm or benefit for society. The specific harms and benefits are organized into the following focus areas:

- Physical and Psychological Health
- Consequential Services
- Human Rights and Liberties
- Social and Democratic Structures
- Performance

Each focus area contains categories and example specific harms/benefits. These examples are intended to guide the framework user through consideration of the types of potentially relevant harms or benefits associated with each category. The listed harms and benefits are meant to be illustrative, and not an exhaustive list. The framework user has flexibility in determining the specific weightings for each category given the importance of specific categories may vary depending on the sector and context.

1. Physical and Psychological Health

The following section describes example harms related to the risk of injury, and example benefits related to improving health or protecting from injury.

Physical Injury / Physical Health

Table 1.1: Physical Injury: How AI systems could hurt people or create dangerous environments.

Harm	Example
Bodily injury or death	Development or use of the AI system could result in severe physical harm. Accidents could be unintended, or the result of misuse, system malfunction, reduced appropriate human oversight, or exposure to unsafe environments or situations
Damage to critical infrastructure	Development or use of the AI system could result in damage or destruction of critical infrastructure such as water, sewage, transportation, or energy systems. Damage or destruction to

Harm	Example
	infrastructure could potentially harm populations or groups, especially vulnerable populations (e.g., power loss to a hospital)
Exposure to unhealthy agents	Development or use of the AI system could result in exposure to unhealthy agents and jeopardize health
Medical misdiagnosis	Use of the AI system could result in wrong drug recommendations for a patient or detection/diagnostic errors (e.g., failure to detect a tumor on a radiological scan)
Technology-facilitated violence	Use of the AI system could incite or enable offline violence
Assessment	Assign a "5" or "Very High" if there are clear risks of physical harm (e.g., due to minimal or no safeguards, or sufficient warnings for potential dangers are not provided). Assign a "1" or "Very Low" if there is minimal risk of harm (e.g., safeguards are provided that are adequate for the functional properties of the system)
Weighting	Depends on whether the system has functionality that could hurt those directly or indirectly subject to it, or lacks relevant characteristics that could conceivably lead to accidents

Table 2.1: Physical Health: How AI systems could protect from injury or dangerous environments.

Benefit	Example
Hazard reduction	Use of the AI system could minimize health risks from tasks that can harm people through repetitive movement, exposure to unhealthy agents, or working in dangerous conditions[17]
Medical diagnosis	Use of the AI system could provide consistent analysis of patient data for more accurate diagnoses of a variety of diseases, or aid in

[17] Foundations of Assessing Harm, Microsoft (2022).

Benefit	Example
	the detection of critical diseases earlier in their progression than conventional methods[18]
Medical access	Use of the AI system could enable more patients to access care and allow medical professionals to reach larger segments of the population, particularly in underserved areas or areas with limited resources[19]
Crime reduction or prevention	AI-driven security or surveillance systems could alert human analysts of patterns or when there is abnormal or suspicious activity[20]
Assessment	Assign a "5" or "Very High" if there are clear signs that physical health and safety can be improved with use of the system, or sufficient warnings for potential dangers are provided. Assign a "1" or "Very Low" if the system provides minimal improvements in health and safety, or sufficient warnings are not provided
Weighting	Dependent on whether the system has functionality that could affect the health and safety of those directly or indirectly subject to it, or lacks relevant characteristics that could conceivably lead to protection from injury or dangerous environments

[20] Christian Davenport, Future Wars May Depend as Much on Algorithms as on Ammunition, Report Says, Washington Post (2017); Foundations of Assessing Harm, Microsoft (2022).

Emotional or Psychological Injury / Emotional or Psychological Health

Table 1.2: Emotional or Psychological Injury: How misused AI systems can lead to severe psychological/emotional distress.

Harm	Example
Distortion of reality or gaslighting	Intentional misuse of the AI system that undermines the end-user's trust in established institutions and distorts their sense of reality
Addiction/Attention hijacking	Prolonged interaction with the AI system that leads to addiction that affects the end-user's well-being, potentially at the expense of happiness and life satisfaction, sense of direction or purpose, relationships and human interactions, and personal character
Reputation damage	The AI system could make analyses, recommend actions or use language which disparages a person's characteristics or situation
Identity theft	Use of the AI system leads to loss of control over personal credentials, reputation, or representation
Dehumanization	Use of the AI system could erode, obstruct, or deny the subjectivity, individuality, agency or distinctly human attributes of people
Harassment	Use of the AI system could lead to online abuse (e.g., cyberbullying, deadnaming, doxxing, trolling, hateful or toxic language, gender-based sexual harassment)
Invalidation	Use of the AI system could result in the denial, rejection, or dismissal of a population's or group's feelings or experiences
Misattribution	Use of the AI system could result in misattribution of an action or content to a person or group of individuals
Loss of autonomy	Use of the AI system could lead the end-user to have involuntary thoughts or feelings, or perform actions that are uncharacteristic or against their will
Intrusion on emotional state	Use of technology like face recognition to detect, analyze, process, and interpret non-verbal communication cues (facial expression, eye contact, body language, etc.) in order to intrude upon, harass, or manipulate an individual(s)

Assessment	Assign a "5" or "Very High" if the prevention of unwanted uses and undesirable extensions of the scope of use have not been systematically and successfully addressed in the development and design of the system. Assign a "1" or "Very Low" if these concerns have been addressed during system development and design
Weighting	Depends on whether the system can be used in an undesirable way, if the consequences of misuse or extensions of system scope are serious or not, and if there are interactions with public environments

Table 2.2: Emotional or Psychological Health: How AI systems can improve emotional and psychological health.

Benefit	Example
Emotional analysis/ intelligence	Use of the AI system could enhance the ability to detect, analyze, process, and interpret non-verbal communication cues (facial expression, eye contact, body language, etc.) in order to better understand social cues or assist with, for example, pediatric pain management or accessibility scenarios
Companionship	Use of AI systems can provide human-like interactions where human-to-human interaction is not otherwise available, or extend the scope of human-to-human interactions by detecting where it is needed and calling on a person to do the interaction [21]
Emotional liberation	Use of AI systems can provide human-like interactions that can help reduce self-restraint, allow people to be more willing to express themselves, reduce the feeling of being judged, and make them feel more at ease[22]
Character improvement	The AI system could make analyses, recommend actions, or use language which improves a person's characteristics or situation[23]
Assessment	Assign a "5" or "Very High" if there are clear signs that emotional and psychological health can be improved with use of the system, or

[21] Laura Donnelly, Digital Assistants Could Alleviate the Loneliness of Elderly, The Telegraph (2018).
[22] Sophie Kleber, 3 Ways AI is Getting More Emotional, Harvard Business Review (2018).
[23] Foundations of Assessing Harm, Microsoft (2022).

	sufficient warnings for potential dangers are provided. Assign a "1" or "Very Low" if the system provides minimal improvements in emotional or psychological health, or sufficient warnings are not provided
Weighting	Depends on whether the system has functionality that could affect the emotional or psychological health of those directly or indirectly subject to it, and if there are interactions with public environments

2. Consequential Services

The following section describes example harms related to the denial of consequential services, and example benefits related to access to consequential services.

Opportunity Loss / Opportunity Access[24]

Table 1.3: Opportunity Loss: How AI systems could lead to decisions that limit access to resources, services, and opportunities.

Harm	Example
Employment discrimination	Use of the AI system could result in discriminatory recommendations or decisions related to employment, where the end-user is denied access to apply for or secure a job based on characteristics unrelated to merit
Housing discrimination	Use of the AI system could result in discriminatory recommendations or decisions related to housing, where the end-user is denied access to housing or the ability to apply for housing
Insurance and benefit discrimination	Use of the AI system could result in inequitable access, cost, or allocation of insurance or social benefits, where the end-user is denied insurance, social assistance, or access to a medical trial due to biased standards

[24] Because assessments of benefits and harms are especially insightful when you know the deployment context (e.g., how AI system has been deployed, what populations are impacted, and the socio-techno relationship of the technology), the "opportunity/loss" assessment for the "Consequential Services" categories might be especially challenging to perform at the anticipatory level before the AI system has been deployed in society. Thus, it is suggested that an initial assessment is conducted based on anticipatory deployment, but this assessment is periodically reassessed based on actual deployment insights.

Harm	Example
Educational discrimination	Use of the AI system could result in inequitable access, accommodations, or other outcomes related to education, where the end-user is denied access to education due to unchangeable characteristics
Assessment	Assign a "5" or "Very High" if problems of bias have not been addressed at any stage of the development, design, and testing of the system, or the system is known for being biased. Assign a "1" or "Very Low" if these problems of bias have been adequately addressed or solved
Weighting	Depends on whether system functions include activities which can negatively affect basic human interests and rights, or access to resources, services, or opportunities

Table 2.3: Opportunity Access: How AI systems could affect decisions that improve access to resources, services, and opportunities.[25]

Benefit	Example
Employment access	Use of the AI system could result in unbiased or reduction in discriminatory recommendations or decisions related to employment, where the end-user is provided access to apply for or secure a job based on merit
Employment opportunity	AI system development results in employment opportunities not otherwise available to a population or group
Housing access	Use of the AI system could result in unbiased or reduction in discriminatory recommendations or decisions related to housing, where the end-user is provided access to housing or the ability to apply for housing
Insurance and benefit access	Use of the AI system could result in more equitable access, cost, or allocation of insurance or social benefits, where the end-user has access to insurance, social assistance, or a medical trial due to unbiased standards

[25] Foundations of Assessing Harm, Microsoft (2022).

Benefit	Example
Educational access	Use of the AI system could result in more equitable access, accommodations, or other outcomes related to education, where the end-user is provided access to education regardless of unchangeable characteristics
Assessment	Assign a "5" or "Very High" if the system significantly reduces existing societal inequities, or has protocols in place to minimize their occurrence. Assign a "1" or "Very Low" if the system amplifies existing societal inequities
Weighting	Depends on whether system functions include activities which can affect basic human interests and rights, or access to resources, services, or opportunities

Economic Loss / Economic Access

Table 1.4: Economic Loss: How AI systems related to financial instruments, economic opportunity, and resources can amplify existing societal inequities.

Harm	Example
Credit discrimination	Use of AI the system (e.g., biased recommendation systems) could result in difficulties obtaining or maintaining a sufficiently high credit score, where the end-user is denied access to financial instruments based on characteristics unrelated to economic merit
Price Discrimination	Use of the AI system could result in differential pricing of goods or services for different demographics of people, where the end-user might be offered goods or services at unaffordable prices for reasons unrelated to the cost of production or delivery
Financial loss	Use of the AI system could result in underpricing of goods or services for reasons unrelated to the cost of production or delivery, which might result in financial loss for the service provider
Devaluation of individual occupation(s)	Use of the AI system could result in a broader economic imbalance by minimizing or supplanting the use of paid human expertise or labor

Assessment	Assign a "5" or "Very High" if the system amplifies existing societal inequities. Assign a "1" or "Very Low" if the system partially amplifies existing societal inequities, or has protocols in place to significantly reduce their occurrence
Weighting	Depends on whether system functions include activities which have an effect on existing societal inequities

Table 2.4: Economic Access: How AI systems related to financial instruments, economic opportunity, and resources can reduce existing societal inequities.[26]

Benefit	Example
Credit access	Use of the AI system ensures equitable access to financial instruments where the end-user is provided the ability to obtain or maintain a sufficiently high credit score
Fair pricing	Use of the AI system could ensure consistent and equitable pricing of goods or services for different demographics of people, at price points that result in favorable revenue for the service provider

Assessment	Assign a "5" or "Very High" if the system significantly reduces existing societal inequities, or has protocols in place to minimize their occurrence. Assign a "1" or "Very Low" if the system amplifies existing societal inequities
Weighting	Depends on whether system functions include activities which have an effect on existing societal inequities

3. Human Rights and Liberties

The following section describes example harms related to the infringement on human rights, and example benefits related to upholding or improving human rights.

[26] Foundations of Assessing Harm, Microsoft (2022).

Liberty Loss / Liberty Protection

Table 1.5: Liberty Loss: AI recommendations and influences on legal, judicial, and social systems can reinforce biases and lead to detrimental consequences.

Harm	Example
False accusation	Use of the AI system could result in exacerbating human bias, misattribution of suspicious behavior or criminal intent, wrongful arrest, or unreasonable searches and seizures based on historical records or incorrect inferences
Social control and homogeneity	Use of the AI system could induce conformity or compliance and affect rights to freedom of association, freedom of expression or practice of religion, or personal agency
Loss of effective remedy	The inability to follow, understand, and explain the rationale in decisions made by the AI system could lead to the lack of an ability to contest, question, or trust decisions the AI system makes
Assessment	Assign a "5" or "Very High" if the system could compel conformity or compliance, or otherwise result in loss of individual rights. Assign a "1" or "Very Low" if the system does not affect individual rights, and there is sufficient awareness of the capabilities and limitations of the system
Weighting	Depends on whether system functions include activities which have an effect on legal, judicial, or social systems

Table 2.5: Liberty Protection: How AI system recommendations and influences on legal, judicial, and social systems can reduce biases and detrimental consequences.

Benefit	Example
Criminal justice	Use of AI systems in predictive risk analysis could reduce human bias in law enforcement and sentencing systems[27]

[27] Foundations of Assessing Harm, Microsoft (2022); Darrell M. West & John. R. Allen, How Artificial Intelligence is Transforming the World, Brookings (2018).

Assessment	Assign a "5" or "Very High" if the system reduces bias and results in fairer legal, judicial, or social systems. Assign a "1" or "Very Low" if the system does not reduce biases, or otherwise results in loss of individual rights
Weighting	Depends on whether system functions include activities which have an effect on legal, judicial, or social systems

Privacy Loss / Privacy Protection

Table 1.6: Privacy Loss: The information generated by development or use of the AI system could be used to determine facts or make assumptions about someone without their knowledge.

Harm	Example
Privacy violation	Non-consensual data collection, or other operations could lead to loss of data privacy or inadequate protection of personally identifiable information (PII)
Dignity loss	Exposing, compelling or misleading users to share sensitive or socially inappropriate information, which could influence how people are perceived or viewed
Forced association	Requiring participation in the development or use of the AI system to participate in society or obtain organizational membership
Permanent record	Digital files or records of end-user activity could be retained and remain searchable indefinitely
Loss of anonymity	Data and activity monitoring by the AI system could limit the end-user's ability to navigate the physical or virtual world with desired anonymity

Assessment	Assign a "5" or "Very High" if conditions of data privacy and security are not met, or relevant data is not stored in a safe and secure way. Assign a "1" or "Very Low" if relevant data is stored or managed in a safe and secure way
Weighting	Depends on whether personal or private data is stored or managed by the system

Table 2.6: Privacy Protection: How the AI system can be used to detect or manage sensitive information.

Benefit	Example
Fraud detection	Use of the AI system could provide the ability to precisely identify possible fraudulent activities (e.g., abnormalities, outliers, or deviant cases) that might require additional investigation related to the manipulation, release, or access to sensitive data[28]
Anonymity	Use of the AI system could enhance the end-user's ability to navigate the physical or virtual world with desired anonymity[29]
Sensitive data management	Use of the AI system can provide protection for sensitive data that might accidentally be exposed to humans (e.g., routing requests for healthcare records between providers)[30]
Data tracking	AI-driven data and privacy protection platforms could help organizations identify sensitive data and track and control all data movement within and outside their enterprise[31]
Assessment	Assign a "5" or "Very High" if conditions of data privacy and security are met, or relevant data is stored in a safe and secure way. Assign a "1" or "Very Low" if relevant data is not stored or managed in a safe and secure way
Weighting	Depends on whether personal or private data is stored or managed by the system

Negative Environmental Impact / Positive Environmental Impact

Table 1.7: Negative Environmental Impact: How the environment and populations or groups could be negatively impacted by the AI system life cycle.

[28] Artificial Intelligence, Automation, and the Economy, Executive Office of the President at 27-28 (2016); Foundations of Assessing Harm, Microsoft (2022).

[29] Foundations of Assessing Harm, Microsoft (2022).

[30] David Roe, The Role of AI in Ensuring Data Privacy, CMSWIRE (2020).

[31] Remesh Rachendran, How Artificial Intelligence Is Countering Data Protection Challenges Facing Organizations, Entrepreneur (2019).

Harm	Example
Adverse environmental impacts	Development or use of the AI system could lead to damage of the natural environment, damage to the built environment or property, exploitation or depletion of environmental resources, or displacement of inhabitants where resources are located
Chemical exposure	Development or use of the AI system could expose the environment, populations, or groups to toxic chemicals
Climate change	Development or use of the AI system could lead to unnecessary carbon emissions, or cause other climate harm
Assessment	Assign a "5" or "Very High" if there is risk of long-term impact on the natural or built environment and its inhabitants that cannot be mitigated or prevented. Assign a "1" or "Very Low" if the impact on the natural or built environment and its inhabitants is very low, and short-term environmental policies and regulations have been taken into account
Weighting	Depends on whether there are relevant characteristics that can reasonably influence an ecosystem

Table 2.7: Positive Environmental Impact: How the environment and populations or groups could be positively impacted by the AI system life cycle.

Benefit	Example
Environmental impacts	Use of the AI system could improve conservation and environmental efforts, including improving recycling systems, managing renewable energy for maximum efficiency, forecasting energy demand in large cities, making agricultural practices more efficient and environmentally friendly, and protecting endangered habitats[32]
Weather and environmental forecasting	Use of the AI system could increase the accuracy of weather and environmental condition forecasts, which would be important for

[32] Foundations of Assessing Harm, Microsoft (2022).

Benefit	Example
	agriculture, utility, transportation, and shipping / logistics industries[33]
Natural disaster prediction	AI-driven systems could help experts predict when and where disasters may strike with more accuracy, allowing people more time to keep themselves and their homes safe in the case of a natural disaster, and improve emergency relief response times[34]
Assessment	Assign a "5" or "Very High" if the system provides a positive impact on the natural or built environment and its inhabitants, and short-term environmental policies and regulations have been taken into account. Assign a "1" or "Very Low" if there is minimal impact, or the risk of long-term negative impact(s) that cannot be mitigated or prevented
Weighting	Depends on whether there are relevant characteristics that can reasonably influence an ecosystem

4. Social and Democratic Structures

The following section describes example harms related to the erosion of social and democratic structures, and example benefits related to the improvement of social and democratic structures.

Manipulation / Incentivization

Table 1.8: Manipulation: How the AI system's ability to create highly personalized and manipulative experiences can undermine an informed citizenry and trust in societal structures.

Harm	Example
Misinformation	Use of the AI system could result in the unintentional release of false or incorrect information

[33] Archer Charles, Top Benefits of Artificial Intelligence, Koenig (2023).
[34] Archer Charles, Top Benefits of Artificial Intelligence, Koenig (2023).

Harm	Example
Disinformation	The AI system could be exploited to deliberately release false or incorrect information or disguise it as legitimate or credible in order to deceive people
Malinformation	The AI system could be used to maliciously share genuine information that is designed to stay private to the public sphere
Behavioral exploitation, Coercion	Use of the AI system could result in exploitation of personal preferences or patterns of behavior beyond that of typical marketing or advertising to induce a desired reaction
Fraudulent behavior	Use of the AI system to intentionally conduct a deceptive action for unlawful gain
Assessment	Assign a "5" or "Very High" if there are clear risks that end-users can be harmed by the system due to the absence of safeguards against exploitation or manipulation (e.g., guidelines for data and consumer protection). Assign a "1" or "Very Low" if safeguards are provided that are adequate for the functional properties of the system
Weighting	Depends on whether the system has functionality that could result in exploitation or manipulation

Table 2.8: Incentivization: How the AI system can encourage a decision or performance of a specific individual or societal beneficial action.

Benefit	Example
Beneficial default actions	Use of the AI system could increase the chances of a specific beneficial outcome (e.g., automatic enrollment or selection of default options)
Increased/personalized knowledge	AI system could increase informed citizenry. Use of AI systems could improve educational quality by providing personalized instruction (e.g., development of instructional strategies, resources, tutoring, and evaluations tailored for each student's capabilities and limitations), real-time feedback to student replies, or freeing up additional instructional time by expediting administrative tasks (grading, scheduling, record-keeping, etc.)

Assessment	Assign a "5" or "Very High" if use of the system increases the chances of a good or positive outcome. Assign a "1" or "Very Low" if system operations have limited impact on outcome selection
Weighting	Depends on whether the system has functionality to encourage specific outcomes

Social Detriment / Social Improvement

Table 1.9: Social Detriment: At scale, the way AI systems can negatively impact people and shape social and economic structures within communities.

Harm	Example
Loss of freedom of thought, movement, or assembly	Use of AI system could impact freedom of movement, freedom of thought, rights to association, peaceful assembly, or democratic participation in government
Erosion of democracy	Use of the AI system could result in election interference, censorship, and harm to civil liberties
Stereotype reinforcement	Use of the AI system could reinforce or amplify existing harmful social norms, cultural stereotypes, or undesirable representations about historically or statistically underrepresented demographics of people
False perception	Use of the AI system could result in the proliferation of false perceptions about individuals or groups
Loss of representation/ individuality	The AI system could make use of broad categories of generalization for individuals or groups, which can constrain, obscure, suppress unique forms of expression, or diminish individuality, identities, or designations
Social erasure	Use of the AI system could result in unequal visibility of certain social groups
Social alienation	Use of the AI system could result in a failure to acknowledge an individual or group's membership in a culturally significant social group

Harm	Example
Loss of individuality	Use of the AI system could suppress unique forms of expression and amplify majority opinions or "groupthink"
Denial of self-identity	Use of the AI system could result in non-consensual classifications or representations of a person or groups of people
Assessment	Assign a “5” or “Very High” if the system can be used to influence or erode existing democratic or socioeconomic structures for a given population, or forcefully impede the ability to improve their lives. Assign a “1” or “Very Low” if system operations have limited impact on existing democratic or socioeconomic structures for members of a given population or group
Weighting	Depends on whether the system has relevant characteristics that can influence the democratic or socioeconomic structures

Table 2.9: Social Improvement: At scale, the way AI systems can positively impact people and shape social and economic structures within communities.

Benefit	Example
Transparency and accountability	The AI system could help streamline the ability to collect and analyze large amounts of publicly available material which can be used to keep organizations and governments accountable[35]
Bias detection	Use of the AI system to process data at scale could be used to detect biases in policing and legislative actions[36]
Fact checking	Use of the AI system could automate fact-checking for identifying deepfakes and misleading information if used in combination with detection algorithms and AI classifiers.[37] AI-enabled fact-checking could also provide information to end-users to inform content engagement

[35] Khari Johnson, How AI Can Empower Communities and Strengthen Democracy, Venture Beat (2020).
[36] Darrell M. West & John. R. Allen, How Artificial Intelligence is Transforming the World, Brookings (2018).
[37] Artificial Intelligence, Automation, and the Economy, Executive Office of the President at 27-28 (2016).

Assessment	Assign a "5" or "Very High" if the system can be used to influence or improve existing democratic or socioeconomic structures for a given population, or assist in the ability to improve their lives. Assign a "1" or "Very Low" if system operations have limited impact on existing democratic or socioeconomic structures for members of a given population or group
Weighting	Depends on whether the system has relevant characteristics that can influence the democratic or socioeconomic structures

5. Performance

The following section describes example harms related to the reduction of operational performance, and example benefits related to the improvement of processes, operations, and productivity.

Operational Degradation / Operational Improvement

Table 1.10: Operational Degradation: How the AI system might worsen processes, performance, output, or the work environment.

Harm	Example
Skills atrophy	Over reliance on the AI system could lead to degradation of skills necessary for fulfilling life, complacency, and reduced accessibility and ability to use manual controls
Temporal degradation	Temporal data drifts or lack of model retraining and evaluation could result in performance degradation of the AI system over time[38]
Reduced efficiency	The AI-assisted system could provide a reduction in efficiency or workflow over the current system / state[39]
Job simplification	The adoption of AI could simplify the tasks performed by employees, and potentially result in lower wages, particularly for those who are already in a lower income bracket
Work pace	Implementation of AI to reduce tedious or dangerous tasks could increase stress to workers completing more tasks of greater intensity at a higher pace

[38] Daniel Vela, et al., Temporal Quality Degradation in AI Models, Scientific Reports (2022).

[39] Andrew Green, et al., Artificial Intelligence, Job Quality and Inclusiveness, OECD Employment Outlook 2023 (2023).

Assessment	Assign a "5" or "Very High" if the system can be used to worsen the operational performance or output of a given organization, group, or team. Assign a "1" or "Very Low" if system operations have limited impact on performance or output
Weighting	Depends on whether the system has relevant characteristics that can influence operational performance or output

Table 2.10: Operational Improvement: How the AI system might improve processes, performance, and output.[40]

Benefit	Example
Enhanced productivity	Use of the AI system could improve productivity and cost savings (time and labor), and promote the human workforce to higher-value tasks through the replacement of manual or repetitive and routine processes with automation
Customer personalization	Use of the AI system could provide personalized recommendations based on pattern recognition in customer data, which could in turn improve marketing return on investment (ROI) and boost sales
Increased revenue	Use of the AI system could aid in identifying and maximizing sales opportunities
Constant availability	The AI system can run constantly and consistently with 24/7 availability, and can theoretically work endlessly to the same standard without breaks
Faster data management, decision-making	The AI system has the ability to analyze and manage massive amounts of data and recognize patterns that aren't apparent to humans, which could reduce the time associated with making decisions and performing subsequent action(s)
Value above replacement	The AI-assisted system provides an improvement in efficiency or workflow over the current system / state

[40] Dimitri Antonenko, Business Benefits of Artificial Intelligence, Business Tech Weekly (2020).

Assessment	Assign a “5” or “Very High” if the system can be used to improve the operational performance or output of a given organization, group, or team. Assign a “1” or “Very Low” if system operations have limited impact on performance or output
Weighting	Depends on whether the system has relevant characteristics that can influence operational performance or output

Appendix 2: Calculating Magnitude of Each Specific Harm/Benefit

A. Calculating Magnitude for Each Specific Harm

For each specific harm, the framework user reviews each harm magnitude factor, assigning a score using rank order categories or using a Likert scale.[41]

For the Likert scale option, the framework user would then calculate an overall magnitude for each harm by:

1. Calculating a proportional severity score,

$$Proportional\ Harm\ Severity = \frac{\Sigma(severity\ factor\ scores)}{\Sigma(max\ possible\ severity\ scores)}$$

2. Calculating a proportional likelihood score, and

$$Proportional\ Harm\ Likelihood = \frac{\Sigma(likelihood\ factor\ scores)}{\Sigma(max\ possible\ likelihood\ scores)}$$

3. Multiplying these two scores together.

$$Harm\ Magnitude = Proportional\ Harm\ Severity \times Proportional\ Harm\ Likelihood$$

The user can then use this magnitude to identify specific aspects of the system that create harm above a specific threshold and might require regulation, provide good awareness for areas which might necessitate risk reduction or mitigation, and use it as a numerical basis of comparison for corresponding benefits of the system.

B. Calculating Magnitude for Each Specific Benefit

For each specific benefit, the framework user reviews each benefit magnitude factor, assigning a score using rank order categories or using a Likert scale.[42]

[41] See assessment and weighting guidance for each harm category in Appendix 1.

[42] See assessment and weighting guidance for each benefit category in Appendix 1.

For the Likert scale option, the framework user would then calculate an overall magnitude for each benefit by:

1. Calculating a proportional impact score,

$$Proportional\ Benefit\ Impact = \frac{\Sigma(impact\ factor\ scores)}{\Sigma(max\ possible\ impact\ scores)}$$

2. Calculating a proportional likelihood score, and

$$Proportional\ Benefit\ Likelihood = \frac{\Sigma(likelihood\ factor\ scores)}{\Sigma(max\ possible\ likelihood\ scores)}$$

3. Multiplying these two scores together.

$$Benefit\ Magnitude = Proportional\ Benefit\ Impact \times Proportional\ Benefit\ Likelihood$$

These benefit magnitudes can then be used to compare to corresponding harms of the system, and identify aspects of the system that could help allow or incentivize development.

C. Calculating magnitudes for harm/benefit categories:

Under the Likert scale approach, one way to calculate aggregate magnitudes for each harm/benefit category is to average together all the specific harm/benefit magnitudes belonging to that category; thus, arriving at a maximum of 10 magnitudes for harm categories and 10 magnitudes for benefit categories.

For example, calculation of the aggregate magnitude for the physical injury category would include the following:

$$Aggregate\ Harm\ Magnitude_{PI} = \left(\frac{\Sigma(Harm\ Magnitudes)}{total\ number\ of\ harms}\right)_{PI}$$

where *PI* = the physical injury category.

Similarly, calculation of the aggregate magnitude for the physical health category would include the following:

$$Aggregate\ Benefit\ Magnitude_{PH} = \left(\frac{\Sigma(Benefit\ Magnitudes)}{total\ number\ of\ benefits}\right)_{PH}$$

where *PH* = the physical health category.

Alternatively, the framework user can apply a weighted sum or weighted average of the harm or benefit magnitudes to obtain the aggregate magnitudes for a more accurate reflection of the level of harm or benefit imparted by each category. This would allow for flexibility in the harm/benefit analysis, and better reflect differing sector priorities.

Framework for Identifying Highly Consequential AI Use Cases

The Special Competitive Studies Project in collaboration with John Hopkins University Applied Physics Lab (JHUAPL) developed a framework for identifying AI use cases or classes of use that may be highly consequential for society— whether harmful or beneficial—to help regulators determine on which AI uses to focus their regulatory efforts.

4 Principles for American AI Governance

1. Govern AI use cases by outcome and sector.
2. Empower and modernize existing regulators.
3. Focus governance on high-consequence use cases.
4. Strengthen non-regulatory AI governance.

The Need for a High Consequence Framework

- We must balance innovation with regulation.
- The U.S. government must focus their efforts on AI that has the most significant beneficial and harmful impacts on society.
- While the U.S. must mitigate the risks that AI presents, it is critical also to harness the tremendous benefits AI offers for our society.
- This risk-based approach aligns with the EU's AI Act, the NIST AI Risk Management Framework, the Blueprint for an AI Bill of Rights, and the Executive Order on Safe, Secure, and Trustworthy Artificial Intelligence.

When to Apply the Framework

- Regulators foresee a new application for AI;
- New applications for AI is under development or proposed to a regulatory body; or
- An existing AI system has created a highly consequential beneficial or harmful impact that triggers an ex-post facto regulatory review.

Implementation

1 Preliminary Analysis

Determine whether the AI use has foreseeable harms or benefits as an initial filter to determine whether a fuller assessment is needed.

2 Parallel Analysis of Harms and Benefits

Conduct a more comprehensive parallel analysis of categorical and specific harms and benefits.

3 Final Decision on High Consequence

Using an assessment of the magnitude of benefits and harms, determine if the AI use case is of high consequence and necessitates next steps to regulate the AI development.

4 Periodic Reassessment

Periodically monitor sectoral AI use to determine if the list of AI systems identified as highly consequential remains appropriate for that sector.

The framework provides ten corresponding categories of harms and benefits and specific harms and benefits for each category (see Appendix 1 of framework), as examples, with the recognition that specific harms/benefits will be unique to sectors. It also provides factors to calculate the magnitude (e.g., probability and scope) of identified harm(s) and benefit(s). Lastly, the framework offers ways to make high consequence determinations based on quantitative and qualitative analyses.

Harm Categories	Benefit Categories
Physical Injury	Physical Health
Emotional or Psychological Injury	Emotional or Psychological Health
Opportunity Loss	Opportunity Access
Economic Loss	Economic Access
Liberty Loss	Liberty Protection
Privacy Loss	Privacy Protection
Negative Environmental Impact	Positive Environmental Impact
Manipulation	Incentivization
Social Detriment	Social Improvement
Operational Degradation	Operational Improvement

Response for Request for comment on AI M-Memorandum

General Comments

> While generative AI is worthy of special attention, OMB should be addressing the broader issue of how the Federal government will adopt and govern the use of any disruptive technology. This is not the first (think web browser) nor the last (think general use quantum computing enabling expanded generative AI capabilities) that will disrupt operations and require rethinking of workflows for mission delivery. As an example, at the very least, we will surely begin to engage in "inhuman centered design" whereby we optimize our digital delivery to include cognizance that most of our customers will use generative AI enhanced search to find our services?
>
> Secondly, additional layers of bureaucracy rarely solve a problem, but just make decisions more time consuming; generally injecting political considerations and rewards without added value. Concentrate on leveraging the professional IT management structures and governance processes to do what they were intended to do, with Executive management review of their recommendations.
>
> Finally, establish by law, the position of Chief Technology Officer. This position is uniquely able to examine emerging technologies, evaluate their business value in consultation with business unit leaders, and create plans to develop innovative solutions for their use through proof-of-concept and proof-of-value pilot projects.

1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?

> By law (Clinger-Cohen Act), each CFO Act Agency and by this time most if not all smaller independent bureaus, commissions, and regulatory bodies have a CIO. The CAIO should be a role assigned to the CIO, the one senior executive who will have the expertise to responsibly adopt the new disruptive generative AI technology. Proposals, generative AI enabled product project review, approval, instantiation, and governance should be located in the Enterprise Architecture practice of each CFO Act Agency.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

> The Enterprise Architecture (EA) practice is the one governing body within each agency that has the breadth of cognizance to provide overarching AI Governance. EA encompasses business process models, solutions architecture, data inventory, and participation in periodic investment performance reviews in concert with Capital Planning and Investment Control. Adding additional layers of bureaucracy only invites redundancy, the accompanying monetary waste and confusion of responsibility and authority.

3. How can OMB best advance responsible AI innovation?

a. Encourage anticipation and response to industry changes as a key to innovation success. Establishing a Chief Technology Officer position to keep abreast of industry trends and changes is essential to the identification of new opportunities.

b. Leverage the Federal CIO Council Innovation committee. It can lead to innovative solutions by fostering collaboration among Federal organizations. Networking with other businesses and industry experts fosters a culture of shared learning.

c. Rewards for process automation should align with employee "wifm" goals. Encouraging continuous learning and providing opportunities for skill development contribute to innovation success. Monetary awards for innovative solutions should be made quickly and be substantial.

d. Pursue change management with discipline and foresight. Being adaptable to change and open to new ideas is crucial for successful innovation. Flexibility allows you to pivot when needed and capitalize on emerging opportunities.

e. Include Customer Experience Management and Human Centered Design as a key component of every project. Regular feedback from key stakeholders helps in refining and improving innovations.

f. Engage in Investment Performance Reviews that are thorough and exhaustive. Establishing KPIs and regularly evaluating the success of innovation helps in continuous improvement. Learning from both successes and failures is important for future innovation efforts.

g. Ensure product development projects are scoped, documented, and acquisition strategies prepared to take advantage of funding opportunities when they arise. Efficient time management is crucial for bringing innovations to life in a timely manner. Balancing speed with thoroughness is essential.

Organizational Structure:

a. The Office of the CTO, in consultation with business unit leaders, identifies priority risks to be addressed through technological solutions.

b. Projects are reviewed and funded through a consultive process which includes the CIO, business unit, and CFO organizations.

c. Open Innovation: For specific areas of technological interest (e.g., Gen AI) executive management may instantiate a "Tiger Team" to discuss ways the new technology can be adopted to best advantage by the organization and pilot project funded to prove efficacy.

    i. Look beyond internal resources and tap into external expertise.

    ii. Open innovation involves collaborating with external partners, citizens, or the broader community to leverage diverse ideas and insights.

d. Experimentation and prototyping: Testing ideas early and often, even with minimal viable products (MVPs), helps identify strengths and weaknesses before significant resources are invested.

e. Risk Management: Innovation inherently involves uncertainty, and a proactive approach to identifying, assessing, monitoring, and mitigating risks is crucial for innovation success.

f. Data driven decision making.

    i. Leverage data to inform decision making.

    ii. Analyzing insights into user behavior, trends, and the performance of innovative solutions, allowing for informed adjustments.

g. Design solutions with scalability in mind.

    i. Successful innovation projects are often those that grow to meet increasing demands or adapt to changing circumstances without compromising performance of user experience.

h. Invest in innovation in a way that aligns better with private sector practices.

    i. Provide funds to an established team in the CTO office that runs the process by which pilot projects are assessed, decided on and run.
    ii. The overall investment (budget provided to CTO) can be made in accordance with potential multi-year returns based on scalability of those ideas that turn out to be winners, but with the realistic expectation that not every 'innovation' will pay off. In other words, a chunk of money assigned to a responsible and capable group that aggressively stimulates controlled innovation with transparency.
    iii. Innovation will always be limited by some amount of funding but creating an 'open fund' that is managed & replenished on a year-by-year basis in accordance with appropriations would significantly increase velocity and open new doors to scalability, which is the only way innovation ever really pays off.

Creating a culture of innovation:

a. Leadership plays a critical role in setting the tone for innovation.

    i. Leaders should communicate a clear vision of innovation, express a commitment to experimentation, and support risk-taking.

    ii. Minimize organizational roadblocks to projects by identifying promising projects and creating project frameworks (project charter, project scope definition, risk analysis and mitigation plans, funding proposals, and acquisition plans) to be ready when funding becomes available.

b. Encourage open and transparent communication.

    i. Employees should feel empowered to share their ideas, provide feedback, and voice concerns without fear of reprisal.

    ii. Open communication fosters a collaborative environment conducive to innovation.

c. Provide employees with the autonomy to explore new ideas and take risks.

i. Empowerment allows individuals to feel a sense of ownership over their work and encourages creative thinking.

ii. Do not punish failure. Fail quickly, analyze thoroughly, identify lessons learned, move to the next project.

d. Recognize and reward innovative efforts.

i. This can be done through formal recognition programs, incentives, or simply acknowledging and celebrating small wins.

ii. Positive reinforcement reinforces the value of innovation.

e. Allocate time specifically for innovation.

i. This could involve dedicating a percentage of work hours or organizing regular innovation workshops and hackathons.

ii. Providing time and resources signals the importance of innovation within the organization.

f. Foster collaboration across different departments and teams.

i. Cross-functional teams bring diverse perspectives and expertise, leading to more comprehensive and innovative solutions.

g. Invest in continuous learning.

i. Providing training and development opportunities in areas such as design thinking, problem-solving, and emerging technologies can enhance employees' innovation capabilities.

h. Define key performance indicators (KPIs) for innovation.

i. Create a clear roadmap for organizational innovation priorities (Technical Statement of Direction)

ii. Establish metrics to track the progress of innovation initiatives and use data to inform decision-making and continuous improvement.

i. Instill a customer-centric mindset.

i. Encourage employees to understand customer needs, seek feedback, and actively involve end-users in the design and improvement of products and services.

4. With adequate safeguards in place, how should agencies take advantage of generative AI to improve agency missions or business operations?

Criteria to qualify a pilot project for consideration:

a. Resolves a risk to a mission service delivery problem identified in an unfunded liability.

b. Resolves a risk related to a mission delivery problem that is due to staff shortages.

c. Provides a direct enhancement to mission delivery addressing a customer service shortfall with respect to diversity, inclusion, equity, etc.

d. Provides a direct enhancement to mission delivery addressing a customer experience issue.

Projects we consider address the following:

a. Clear Objectives: Define specific and measurable objectives for the pilot project. Identify the problem you want to solve or the opportunity you want to explore using AI.

b. Feasibility: Ensure that the pilot project is technically feasible within the resources and expertise available in your organization.

c. Data Availability: Make sure you have access to quality data relevant to the project. Assess data availability, quality, and compatibility.

d. Impact and Value: Choose a pilot project that has the potential to deliver significant value to the organization.

e. Short Timeframe: opt for a project with a relatively short timeframe for completion.

    i. Embracing agile methodologies and being open to iterative development helps in adapting quickly to changing circumstances and refining solutions based on real-world feedback.

f. Low-Risk and Low-Cost: As it's a pilot project, aim for initiatives that have a relatively low risk and cost. This reduces the potential impact of failure while still providing valuable insights.

g. Alignment with Business Strategy: The pilot project should align with the overall business strategy and address the most critical challenges or opportunities faced by the organization.

h. Cross-Departmental Collaboration: Choose a project that involves collaboration between different departments or teams.

    i. This promotes a broader understanding of AI's capabilities and fosters a culture of innovation.

    ii. Successful innovation often comes from collaboration between individuals with diverse skills and backgrounds.

    iii. Cross-disciplinary teams can bring unique perspectives to problem solving.

i. Scalability and Transferability: Consider whether the insights and solutions from the pilot project can be scaled and applied to other areas within the organization.

j. Ethical Considerations: Ensure that the pilot project adheres to ethical principles and legal requirements. AI projects should respect user privacy, avoid bias, and be transparent.

k. Measurable Metrics: Define key performance indicators (KPIs) to evaluate the success of the pilot project. This allows for objective assessment of the project's outcomes.

l. Privacy and Data Security: As technology advances, ensuring robust data security and privacy measures is crucial.

    i. Building trust among users and stakeholders requires a commitment to protecting sensitive information.

m. Adaptability to Technology Changes: Technologies are dynamic, and successful solutions often demonstrate an ability to adapt to evolving trends and needs.

    i. Flexibility is key to long-term relevance.

n. Executive Support: Obtain support from top-level executives within the organization.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

No

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

Yes. Given the fast-evolving generative AI capabilities, baselines will have to be reviewed regularly. It is particularly important to identify what roles are essentially human and cannot be ceded to AI, much like there are inherently Federal roles within the contracting process that cannot be filled by a contractor. This will be pivotal in ensuring that AI continues to consider humanity's interests as paramount.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

In addition to Federal wide governance structures, standard documentary artifacts that prove conformance with the responsible AI guidelines are essential. It is completely wasteful to have all the CFO act agencies developing their own artifacts such as Model Cards, Data Cards, Monitoring Plan templates, etc.

8. What kind of information should be made public about agencies' use of AI in their annual use case inventory?

The use case inventory should include all AI projects including one's under consideration for development. It is better for the public to understand where their money is being spent before large expenditures are made on projects that will ultimately be cancelled due to public outcry.

RE: Request for Comments: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum (OMB-2023-0020)

Dear Director Young:

On behalf of the National Association of Federally-Insured Credit Unions (NAFCU), I am writing in response to the Office of Management and Budget's draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* (the Memorandum). NAFCU advocates for all federally-insured not-for-profit credit unions that, in turn, serve 138 million consumers with personal and small business financial services products.

As community financial institutions, credit unions recognize that responsible AI deployment can help achieve important benefits for consumers. While federal banking regulators, such as the National Credit Union Administration (NCUA) and Consumer Financial Protection Bureau (CFPB), are independent agencies, they would be "covered agencies" as defined in the Memorandum.[1] AI used by federal financial regulatory agencies would therefore be subject to the Memorandum's substantive provisions addressing risk management practices, governance, and transparency.

NAFCU has generally supported non-regulatory approaches for encouraging the use of AI within the financial services sector.[2] As with other technologies, consumer financial protections and antidiscrimination rules continue to have broad applicability and are not diminished by credit union deployment of AI. Existing regulation requires credit unions to adopt robust risk

[1] OMB, Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence [Memorandum], 3 (November 2023), *available at* https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf; *see also* 44 U.S.C. § 3502(1).
[2] *See* NAFCU, Letter to NCUA re: Financial Institutions' Use of Artificial Intelligence, Including Machine Learning (RIN: 3064-ZA24), July 1, 2021, *available at* https://www.nafcu.org/comment-letter-ncua-digital-assets-and-related-technologies-rfi-File

management practices and compliance systems to ensure that the use of new technology does not jeopardize safety and soundness or the rights of individual members.

By contrast, the use of AI by federal banking regulators, such as the CFPB, is subject to fewer explicit guardrails, particular in the domain of transparency. Accordingly, NAFCU supports the Memorandum's directive to agencies to "annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency's website."[3] The Memorandum also notes that additional guidance regarding the agency inventory process will be forthcoming. Because the scope and detail of reporting will depend significantly upon OMB's future guidance, NAFCU recommends soliciting public comment on any supplemental instructions for preparing an agency's AI use-case inventory. When developing future guidance, NAFCU recommends OMB clarify what it means for an agency to report use cases "to the extent practicable," and how that standard might apply to financial regulatory agencies.

NAFCU also recommends that OMB specify an additional category of presumptively "rights-impacting" AI usage under section 5(b)(i) of the Memorandum. This category should cover the use of AI by a financial regulatory agency for the purpose of making any material decision related to the supervision of a financial institution. A material supervisory decision could encompass a risk assessment, an examination rating, an exam-related finding, or the initial scoping of an exam—among other things. While it remains unclear whether AI is being deployed in this way by the functional banking regulators, it is likely the CFPB is one covered agency using AI as part of its supervisory prioritization process, which determines the scope and targets of future examinations of financial institutions subject to its jurisdiction.[4]

The CFPB's FY 2023 Annual Performance Report states that the CFPB continues "to assess sources and capabilities that will provide an enhanced data-driven approach to its areas of supervisory focus."[5] The report provides the specific insight that the CFPB is now "[l]everaging additional data sources as well as artificial intelligence within the supervisory prioritization process."[6] To date, the CFPB has shared very little information about its use of AI to perform supervisory prioritization.

Some important information regarding AI projects comes not from the CFPB itself, but from vendors selected to perform data analysis contracts. For example, a press release from one company describes a "Data Analytics Blank Purchase Agreement" covering "machine learning,

[3] The Memorandum, 4 (November 2023)
[4] See NAFCU, Letter to CFPB Director Rohit Chopra, "Re: Supervisory Use of Artificial Intelligence," (October 3, 2023), *available at* https://www.nafcu.org/system/files/files/10.3.2023%20Letter%20to%20CFPB%20re%20Supervisory%20Use%20of%20AI.pdf.
[5] CFPB, FY 2023 Annual Performance Report, 85 (February 2023)
[6] *Id*.

and natural language processing support."[7] However, the CFPB has never disclosed where ML or natural language processing support may be applied. One potential domain is the CFPB's consumer complaint database, where it is unlikely that manual analysis is feasible.[8]

As a matter of fairness, institutions regulated by the federal government should be aware of the inputs and processes that determine supervisory decisions and outcomes. Examinations of credit unions by the CFPB and the NCUA can be expensive in terms of time and resources. Furthermore, as member-owned institutions, credit unions must consider the costs of supervision before determining the share of profits that may be distributed to members as a dividend. Individual members and the credit union itself deserve to know whether AI-driven regulatory processes will influence the scope and length of credit union exams, since unfair or arbitrary supervisory decisions can negatively impact the performance of the credit union and the financial health of its members.

More generally, NAFCU encourages OMB to consider how it can tailor the Memorandum to promote AI transparency within the CFPB and other financial regulatory agencies. To the extent the CFPB has access to institution-specific early warning information, the agency should be willing to share that data with regulated entities. Institutions should also be afforded the opportunity to independently assess data that might inform future exam scope as early as possible. This would allow credit unions and other financial institutions to course correct prior to an examination and would afford an opportunity to explain data trends that might be perceived as problematic.

NAFCU appreciates the opportunity to comment on OMB's draft Memorandum. Where the use of AI is present, the CFPB and other financial regulatory agencies should commit to the same standards of explainability, accountability and transparency that are expected from credit unions and other regulated financial institutions. If you have any questions or concerns, please do not hesitate to contact me at amorris@nafcu.org or (703) 842-2266.

Sincerely,

Andrew Morris

Re: OMB-2023-0020, Draft Memorandum titled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"

Dear Director Young,

The National Health Law Program (NHeLP) is a public interest law firm that fights for equitable access to quality health care for people with low incomes and underserved populations and for health equity for all. For over fifty years, we have litigated to enforce health care and civil rights laws, advocated for better federal and state health laws and policies, and trained, supported, and partnered with health and civil rights advocates across the country. We believe that all people should have access to the health care they need, regardless of geography, race, ethnicity, language, income, disability, sex, gender identity, sexual orientation, immigration status, or other factors.

NHeLP welcomes the opportunity to use our experience regarding automated systems to comment on the Office of Management and Budget's (OMB) guidance on the federal use of artificial intelligence ("Proposed AI Memo").[1] NHeLP has a long history of fighting against faulty and harmful computer systems and processes that rely on automated decision making systems (ADS), including Artificial Intelligence (AI), such as assessment tools, eligibility systems, and prior authorization mechanisms that unlawfully deny people benefits to which they are entitled.[2] We have also partnered with Upturn and Legal Aid of Arkansas to form the Benefits Tech Advocacy Hub to give advocates tools to fight harmful benefits technology and force greater transparency so that harm to individuals can be

identified, prevented, or reduced earlier in the technology's lifecycle. NHeLP has also released our Principles for Fairer, More Responsive Automated Decision-Making Systems, which reflect our years of work regarding ADS, including AI, and what features and protections are needed in responsible ADS. We have real-world experience fighting the harm caused by technology in public benefits, knowledge about the how and why such harms occur, and practical ideas about policies necessary to protect against such harms.

NHeLP's decades of experience fighting to protect the rights of low-income and underserved people impacted by AI gives us a different and needed perspective on policy efforts to protect against harmful AI. We understand what the systems look like on the ground and how they impact people's rights. We also consistently see proposals to mitigate the harms of AI that fail to recognize the impact on public benefits, for which it is well-recognized that people have a "brutal need."[3] Protections of notice, transparency, and explainability already exist, are constitutionally required, and must be fully recognized in any AI policies that impact public

benefits.[4] We welcome executive action and OMB guidance on the federal use of AI, including mitigating harm. This Proposed AI Memo is an important step in protecting rights and equity, but clarification and more detail are needed to assure that individuals' rights are not violated.

I. The definition of AI and technical context need to be broader and consistent with the Executive Order.

Policies addressing AI fairness and accountability frequently use different definitions of what types of systems are included as AI, which is confusing and causes uneven developments in protective policies. Unfortunately, the definition of AI in the Proposed AI Memo is also inconsistent with the definition in the Executive Order that the Memo is intended to implement.[5] Continuity of the executive branch's definition of AI is necessary for clarity to federal agencies. The Executive Order definition of AI is broader than that used in the Memo and will therefore apply to more of the technology that agencies already use and will use in the future. The definition of AI in the Propose AI Memo is too narrow and will exclude many systems that impact people's rights, particularly in the context of public benefits. This includes systems that determine eligibility, automate notices, and decide levels of benefits. The guidance is meant to implement the Executive Order and therefore must reflect the Executive Order's definition.

Further, the technical context of the Proposed AI Memo definition is too limiting and would exclude current automated systems that are harmful and need to be addressed by this Proposed AI Memo. While the technical context rightly notes that the level of technical complexity and autonomous functioning are not relevant to the definition of AI, the exclusions in this section are overly narrow.[6] The final guidance should not exclude robotic process automation or systems that operate only by human-defined rules. We have seen automated systems that rely solely on human-defined rules be improperly programmed, use data incorrectly, and result in improper denials and reductions of public benefits.[7] By considering AI

[5] *Compare* Exec. Order No. 14,110, 88 Fed. Reg. 75, 191 (Nov. 1, 2023) (defining AI in alignment with 15 U.S.C. § 9401(3)) *with* Proposed AI Memo, *supra* note 1, at 22-23 (defining AI by citing to § 238(g) of the John S. McCain National Defense Authorization Act for Fiscal Year 2019).

[6] Proposed AI Memo, *supra* note 1, at 23.

[7] *See, e.g., A.M.C. v. Smith,* 2023 WL 6881785; Benefits Tech Advocacy Hub, Case Study: Wisconsin Medicaid Home and Community Based Services Terminations, https://www.btah.org/case-study/wisconsin-medicaid-home-and-community-based-services-terminations.html (describing automated eligibility system that repeatedly wrongfully terminated eligible individuals due to a system that failed to properly implement the eligibility policies); *see*

in a narrow context, ADS that regularly impact people's rights will continue to be used without the important oversight and mitigation strategies outlined in the Proposed AI Memo.

II. Requirements for Chief AI Officers and responsible AI innovation provide an important blueprint for agency AI management but need clarification.

We commend the thought put into agency AI oversight through Chief AI Officers (CAIOs) and responsible innovation measures. The inclusion of agency CAIOs and their responsibilities signifies the importance of AI oversight and how specialized knowledge and leadership are a crucial part of enacting the rest of the Proposed AI Memo. While we appreciate that much attention is paid to the authority and responsibilities of the CAIO, an assessment of whether the CAIO has the capacity to take on the duties outlined is never mentioned.[8] Simply giving an employee with the necessary level of authority these additional responsibilities without assessing whether they have the time or resources to carry them out is setting up the responsibilities to get minimal attention and time. In reality this work will need significant attention. The capacity of the CAIO to perform the task must also be part of the evaluation of the appointment and what other steps an agency may need to take to effectuate the memorandum.

We are concerned that many of the activities called for, such as conducting risk assessments and overseeing agency lists of safety- or rights-impacting AI, are softened by language such as the terms "necessary."[9] It is unclear from the Proposed AI Memo what OMB considers necessary for the purpose of AI oversight and innovation. For clarity and continuity across the federal government, we encourage OMB to define these terms and provide clear parameters to agency officials. Any such parameters should be written to result in as much oversight of risk assessment as possible, especially in the context of rights-impacting AI. The CAIO role should not be as discretionary as it is described in the Proposed AI Memo and OMB should have more criteria it can use to review and counter decisions made by the CAIOs. For example, as discussed in Section III.a *infra* the waiver authority of the CAIO is too unfettered. The CAIOs play a critical role in identifying risks in automated systems and they must have sufficient authority, capacity, and accountability to perform their important functions, including

[8] *See, e.g.,* Proposed AI Memo, at 4 (discussing an evaluation of authority of the designated CAIO); *id.* at 5-8 (discussing the necessary, skills, knowledge, training, expertise, responsibility, seniority, and reporting structure of the CAIO).

[9] *See, e.g.*, Proposed AI Memo at 4.

risk assessments. The more checks and balances there are on an automated system, both before and during use, the lower the risk will be of harming underserved individuals.

III. Clearer guidelines and authority are needed to adequately manage the risks of rights-impacting AI.

A critically important part of the Proposed AI Memo is that minimum practices to manage risks from rights- and safety-impacting AI must be implemented by August 1, 2024 or agencies must stop using non-compliant AI. We believe that the best response to AI that is biased, discriminatory, or at all inappropriately reduces access to public benefits like Medicaid is to not use it.[10] As discussed earlier, public benefits are only provided to those in our country who are most in need of the services provided and are often not in positions where an error or harm has a negligible impact on their lives.[11]

We also appreciate the requirement that agencies review each AI in development or use to determine if it is rights- or safety-impacting. In many of the areas that are identified as safety- and rights-impacting, the likelihood of bias is high given the pervasiveness of institutional bias in those areas, such as health care, housing, the criminal legal system, child welfare, employment, and policing. As recognized by numerous studies regarding bias in algorithmic decision-making, there are often issues with bias in the underlying data or research assumptions due to institutional biases.[12] Without thorough review, many AI uses would slip

J. 4 (2021), https://scholarlycommons.law.emory.edu/cgi/viewcontent.cgi?article=1418&context=elj (identifying harmful impacts in public benefits and the need to ensure tools enhance rather than undermine agency authority).

[11] *See, e.g.,* Leighton Ku et al., Health Affairs, *Florida's Medicaid Unwinding Lacks Fundamental Safeguards and Can Harm Population Health* (Dec. 1, 2023), https://www.healthaffairs.org/content/forefront/florida-s-medicaid-unwinding-lacks-fundamental-safeguards-and-can-harm-population (finding that disproportionate harm from Medicaid unwinding problems in Florida will deepen racial inequities in health care access and likely have serious health consequences).

[12] *See, e.g.,* Ziad Obermeyer, *Dissecting Racial Bias in an Algorithm Used to Manage the Health of Populations*, 366 SCIENCE 447 (Oct. 25, 2019), https://science.sciencemag.org/content/366/6464/447; Hannah E Knight et al., *Challenging Racism in the Use of Health Data*, 3 THE LANCET E144 (Mar. 1, 2021), https://www.thelancet.com/journals/landig/article/PIIS2589-7500(21)00019-4/fulltext; Mikella Hurley & Julius Adebayo, *Credit Scoring in the Era of Big Data*, 18 YALE J. L. TECH. 148 (2016). Relatedly, in the additional minimum practices for Rights Impacting AI, the Proposed AI Memo says that systems "should ensure that data used…is adequately representative of the communities who will be affected by the AI, and has been review for improper bias." Proposed

through the cracks and cause preventable harm. We agree that individual agencies are typically the experts in their own work and thus it makes sense to have each agency define their own additional AI uses that are presumed to be safety- or rights-impacting. However, because defining additional AI uses means additional analysis or potentially limitations on using AI tools that have decreased human workload, and thus incentivizes not finding issues, there must be oversight of this authority as well.

While we support AI use-case review and agency-specific lists, these two parts of the Proposed AI Memo would benefit from further detail. All agency activities related to mitigating the risks of rights-impacting AI as outlined in the Proposed AI Memo should have detailed oversight and accountability mechanisms. OMB should include a process for review of agency rights-impacting use cases and agency-specific lists. OMB and public comment feedback should be required on what additional use-cases the agency may have failed to include. There should also be consequences for when agencies are non-compliant with the agency review and list requirements that will be sufficiently significant to act as a deterrent. OMB must also include a mechanism to stop agencies from using non-compliant AI.

a. Needed protections are undermined by agency authority to determine that AI is not rights-impacting and allow waivers of minimum requirements.

The proposed policy to allow CAIOs to determine that AI presumed to be rights-impacting is not rights-impacting in practice creates a dangerous exception that could undermine all the critical protections in the Proposed AI Memo. If this portion of the guidance remains in the final document, further oversight of the CAIO waivers by OMB will be necessary to ensure that agencies are not using this loophole inappropriately. The Proposed AI Memo on risk assessments lacks clarity and any limits on when risks or harms are too high. There should be clearer indicators of what type of harms should be heavily weighed or presumed impossible to mitigate through the benefits. OMB should provide templates for the risk assessments and maintain authority to override or maintain final approval of the assessments. Overall, more detail on such a review process is needed in the final guidance.

Similarly, allowing agencies to waive mitigation requirements and extend the deadline for compliance with the minimum requirements could allow agencies to evade compliance. In the context of waivers, the Proposed AI Memo fails to define or provide detail on what is

---

AI Memo, *supra* note 1, at 19. Given the evidence of the role of data in algorithmic bias, this evaluation of the data needs to be a requirement rather than simply a "should." Meredith Whittaker et al., AI Now, *Disability Bias & AI Report* 8-12 (Nov. 20, 2019), https://ainowinstitute.org/publication/disabilitybiasai-2019 (discussing bias in AI and data issues regarding disability); Rajiv Movva et al., *Coarse Race Data Conceals Disparities in Clinical Risk Score Model Performance* (Apr. 2023), https://arxiv.org/abs/2304.09270.

considered an unacceptable impediment. In the context of extensions, the Proposed AI Memo fails to provide detail on when an agency may find it cannot feasibly meet minimum requirements by August 1, 2024. Guidance for both must be included in such a way that maintains the highest level of mitigation requirements possible, or OMB risks agencies falling short of the goals of AI governance. Further, the ability to override or maintain final approval of such waivers and extensions is necessary. Waivers should also be time limited and require regular review to ensure they remain justified. There is also no clear guidance that would prohibit an agency from using a harmful AI. Without sufficient detail guiding agency authority and oversight by OMB, there is too much discretion instilled in the CAIO position that would allow agencies to evade the important protections in the Proposed AI Memo.

b. Agencies are not provided a roadmap for oversight of AI used by state and local governments in federally funded programs.

Many of the presumed rights-impacting AI uses occur at the state and local level rather than within the federal government, but federal agency oversight of such programs tied to funding should require the relevant agencies to apply the obligations of the Proposed AI Memo to the AI that they have a role in approving. In Medicaid, the primary context within which NHeLP works on AI, there is federal approval of the systems themselves or use of AI systems for eligibility, service approvals and denials, and other services-related systems.[13] ADS used in Medicaid frequently reduce or deny people benefits in ways that deny them Constitutional Due Process.[14]

Despite the breadth of state and local rights-impacting AI under the purview of federal agencies, such use-cases are not mentioned in the Proposed AI Memo. The final guidance must remedy this and provide a blueprint for federal agencies to work with the programs they oversee. This should include following the final AI Memo as a condition of federal funding as well as a process and timeline for federal agencies to develop their own specific guidance and best practices. Should OMB determine that it would exceed its authority to require state

[13] For example, the Centers for Medicare & Medicaid services certify Medicaid enterprise systems, including those used to determine eligibility. *See* Ctrs. for Medicare & Medicaid Servs., *Certification*, https://www.medicaid.gov/medicaid/data-systems/certification/index.html. CMS also approves the use of automated tool for services, including assessment tools used for determining services. *See* Elizabeth Edwards & Sarah Grusin, Nat'l Health L. Prog., *Opportunities for Public Comment on HCBS Assessment Tools* (Dec. 19, 2019), https://healthlaw.org/resource/opportunities-for-public-comment-on-hcbs-assessment-tools/.

[14] *See See* Miriam Delaney Heard et al., Nat'l Health L. Prog., *Medicaid Enrollees Challenge Florida's Failure to Provide Due Process During Unwinding* (Aug. 24, 2023), https://healthlaw.org/resource/medicaid-enrollees-challenge-floridas-failure-to-provide-due-process-during-unwinding/; Edwards, *supra* note 2; Perkins, *supra* note 3.

agencies to follow the guidance, the final AI Memo should still outline the responsibility of the federal agencies for their approval of any AI systems.

c. Rights-impacting AI notice minimum practices proposals lack necessary clarity and provide for dangerous loopholes that may lead to rights violations.

The Proposed AI Memo's risk management of rights-impacting AI is an important step toward realizing equity in the use of technology, particularly the requirements for human intervention and oversight. However, the notice minimum practices create significant risk that entities will follow the minimum requirements and not recognize that requirements of "applicable laws" like the Constitution require far greater notice and transparency for certain rights-impacting AI, including for public benefits.[15] The Proposed AI Memo appropriately requires notice be given to negatively impacted individuals with instructions on how to contact the agency, but only encourages agencies to provide explanation for such decisions.[16] In the context of public benefits, agencies are constitutionally required to provide adequate explanation for an individual to understand the decision being made and what the agency relied upon to reach such a decision.[17] Worryingly, footnote 37 states that explanations of AI decisions "are often not technically feasible."[18] However, if AI is used where constitutional protections require explainability, then AI that cannot explain its decisions must not be allowed to be used.

The final OMB guidance should also be clear that AI systems must be able to meet the requirements of the guidance, including notice and transparency, and not assert "protections" of intellectual property. Any AI system used should be able to explain itself publicly, but it must be able to explain the basis of its decision regardless of intellectual property protections when public benefits are in question.[19] It should be clear in the final OMB guidance that "applicable law" will require greater transparency and ascertainability for certain rights-impacting AI.

The President's Executive Order and the Proposed AI Memo are inclusive of public benefits programs, such as Medicaid, as a context in which AI is rights-impacting.[20] To the largest extent possible, OMB should include more oversight of agency action, require federal agencies to apply the guidance to AI they oversee and fund, and ensure that the minimum risk

SIIA Comments on OMB AI Memo

Submission of the Software & Information Industry Association in Response to the Office of Management and Budget's Request for Comments on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* Memorandum

Federal Register Docket 2023-24269

December 5, 2023

On behalf of the Software & Information Industry Association (SIIA), we appreciate the opportunity to provide input on the Office of Management and Budget's (OMB) draft memorandum, *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* (the "Draft AI Memo"). The Executive Order on Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence (the "AI Executive Order") will have a significant impact in promoting development and adoption of responsible AI in the United States and influence the direction of AI policy globally in a manner that supports democratic values. We are pleased to see the thorough approach OMB has taken in the Draft AI Memo and hope the comments we provide in this submission will prove helpful as OMB refines its guidance.

Introduction

SIIA is the principal trade association for the software and digital information industries. Our members include nearly 400 companies reflecting the broad and diverse landscape of digital content providers and users in academic publishing, education technology, and financial information, along with creators of software and platforms used by millions worldwide, and companies specializing in data analytics and information services. As the only association representing both those who develop and deploy these engines and those who create the information that feeds environments, SIIA is uniquely positioned to provide insight on measures for the government's responsible adoption of AI and procedures designed to advance a values-based approach to AI-related risks and opportunities.

SIIA has long supported efforts by the federal government to advance proactive AI policy efforts.[1] We have called for use-based guardrails and tailored requirements for those AI systems

[1] *See, e.g.,* SIIA, *Blueprint for Government Oversight and Regulation of AI* (July 2023) (https://www.siia.net/wp-content/uploads/2023/07/Blueprint-for-Government-Oversight-and-Regulation-of-AI.FINAL-1.pdf); SIIA, *Submission to NTIA on AI Accountability* (Jun. 12, 2023) (https://www.siia.net/wp-content/uploads/2023/06/SIIA-Response-to-NTIA-on-AI-Accountability-Policy.pdf); SIIA, *Comments on Artificial Intelligence Export Competitiveness Submitted to the International Trade Association* (Oct. 17, 2022) (https://www.siia.net/wp-content/uploads/2022/10/SIIA-Comments-to-ITA-2022-0007.pdf); SIIA, *Comments on Study to Advance a More Productive Tech Economy Submitted to NIST* (Feb. 14, 2022) (https://www.siia.net/wp-content/uploads/2022/02/SIIA-Submission-for-NIST-Emerging-Tech-Study.pdf); SIIA, *Comments on Public and Private Sector Uses of Biometric Technologies Submitted to OSTP* (Jan. 14, 2022) (https://www.siia.net/wp-content/uploads/2022/01/SIIA-Submission-on-OSTP-Biometrics-RFI.pdf); SIIA, "*Ethical Principles for Artificial Intelligence and Data Analytics* (Sept. 15, 2017) (https://history.siia.net/Portals/0/pdf/Policy/Ethical%20Principles%20for%20Artificial%20Intelligence%20and%20D

that are likely to carry the highest risk to safety and rights. Throughout, we have stressed the importance of viewing innovation and governance as complementary, rather than oppositional goals. Most recently, in October, SIIA released *The Education Technology Industry's Principles for the Future of AI in Education*.[2] These principles intend to specifically guide the education technology (ed tech) industry as the broader education community continues toward deploying these impactful technologies. Fostering trustworthy and responsible AI through measures that are tailored to the risks of AI systems will benefit U.S. innovation as a whole and raise the profile of the United States as a global leader.

SIIA is pleased that OMB recognizes the need for practical solutions that help improve outcomes and experiences of the advancement of AI. Many of SIIA's members at the forefront of AI have been leaders in advancing AI accountability and governance.[3] The reason is simple: AI that generates the most accurate information, limits unintentional bias, and builds on reliable data will be most useful to governments, businesses, and consumers. As the trade association dedicated to the information side of "information technology," SIIA applauds OMB's approach to removing barriers to AI adoption to advance government use of AI. For the U.S. to continue to lead in AI and tech more broadly, it is important for the public and private sectors to join in the shared goal of helping citizens develop the requisite skills, build and maintain the necessary physical and technological infrastructure, and continue to invest in research and development to position the United States at the forefront of responsible innovation.

The accountability measures called for by the Draft AI Memo will, overall, improve the performance of AI systems, empower their users, and help to establish trust in AI systems designed to address key needs across our society. Our recommendations are designed to help to focus government resources, advance responsible adoption of AI, and mitigate harm to individuals.

Responses to OMB Questions

> *1. The composition of Federal agencies varies significantly in ways that will shape the way they approach governance. An overarching Federal policy must account for differences in an agency's size, organization, budget, mission, organic AI talent, and more. Are the roles, responsibilities, seniority, position, and reporting structures outlined for Chief AI Officers sufficiently flexible and achievable for the breadth of covered agencies?*

SIIA commends OMB for developing detailed guidance for the new Chief AI Officer (CAIO) functions, including roles and responsibilities, and we believe the framework contained in the Draft AI Memo provides sufficient flexibility for covered agencies to implement AI practices required by the AI Executive Order. Building the infrastructure necessary to effectively scope, adopt, and implement AI tools to meet critical government needs is a herculean task and will require dedicated leadership and lines of effort.

That task must be borne not just by the public sector but the private sector as well. Accordingly, information about the CAIOs and their backgrounds should be part of the public profiles of agency leadership provided online, as it will help align hiring processes across public and private sector, similar to what the Workforce Framework for Cybersecurity (the NICE Framework) has done for cybersecurity. This will also help keep the public informed while ensuring agencies consider how other roles, such as their CDO, CIO, or CISO will interact with the CAIOs, especially as it is such a cross-cutting technology. As we discuss in response to question 2, we recommend further attention to interagency infrastructure that can be leveraged by multiple agencies to provide governance, technical guidance, and technical support to help agencies achieve their objectives.

We have some concern that the minimum practices for safety-impacting and rights-impacting AI along with the additional minimum practices for rights-impacting AI will impede effective and timely adoption of AI by all agencies. We discuss this in more detail in response to questions 5 and 6. Though the Draft AI Memo would permit CAIOs to seek waivers as needed, it begins with the presumption that the minimum and additional minimum practices should be undertaken.

Given funding and human resource constraints, we recommend that OMB consider an approach that is better tailored to the risk profiles of the categories of safety-impacting and rights-impacting AI set out in Section 5.b.i and Section 5.b.ii. Rather than treating all rights-impacting AI in the same way, for example, OMB could treat certain of the minimum or additional minimum practices as recommended but not required – flipping the presumption – depending on the level of risk attendant to the use. As noted below, we recommend following the NIST AI Risk Management Framework for making such determinations.

It is critical that the government balances AI safety and the protection of rights against the governmental interests in adopting AI to achieve significant government objectives. Recognizing this balance, and incorporating it into the agency guidance, we believe will help to achieve a framework that fulfills the vision of the AI Executive Order.

2. What types of coordination mechanisms, either in the public or private sector, would be particularly effective for agencies to model in their establishment of an AI Governance Body? What are the benefits or drawbacks to having agencies establishing a new body to perform AI governance versus updating the scope of an existing group (for example, agency bodies focused on privacy, IT, or data)?

SIIA has been a leading proponent of strong interagency coordination on AI governance and accountability.[4] This is critical to leverage limited resources and advance consistency on common issues. OMB or another entity within EOP – such as the Office of Science and Technology Policy or the National AI Initiatives Office – seems best situated to handle functions around coordinating AI governance across agencies. We further recommend additional funding to NIST to undertake the necessary steps to build consistency around the NIST AI Risk Management Framework and related standards for impact assessments and other requirements – those set out in the minimum and additional minimum practices.

In addition, we recommend OMB consider centralized processes to undertake additional functions. First, it should build technical expertise to assist in the many pre-deployment and ongoing monitoring obligations, ideally in a manner that can be leveraged by multiple agencies to avoid duplication of effort and benefit from economies of scale. To do this, OMB may look to the 18F and United States Digital Service as models for creating technological expertise to provides services across the government. Second, it should coordinate the necessary outreach with non-governmental actors, including the private sector and civil society, will be necessary. We can envision situations in which the necessary coordination becomes overwhelming for some agencies; a streamlined, coordinated approach will help to conserve resources.

Within agencies themselves, there may be existing governance bodies or boards that can be leveraged, especially if they are resourced appropriately. Where a 1:1 fit does not exist, gaps should account for those existing bodies to ensure optimal coordination mechanisms are put in place. Among those coordination mechanisms, the importance of transparency via public meetings, opportunities to provide feedback, and comment periods for significant policy updates or changes will not only maintain the critical trust-building approach to integrating AI

[4] SIIA, *Blueprint for Government Oversight and Regulation of AI* (July 2023) (https://www.siia.net/wp-content/uploads/2023/07/Blueprint-for-Government-Oversight-and-Regulation-of-AI.FINAL-1.pdf).

into the public sector but also allow the government to obtain the benefits that come from such public-private partnerships.

The cybersecurity domain provides a good model of effective interagency and intra-agency coordination and coordination with non-governmental actors. We recommend that OMB consider modeling this effort on the mechanisms and programs that the Cybersecurity and Infrastructure Security Agency (CISA) has spearheaded.

3. How can OMB best advance responsible AI innovation?

OMB has a critical role in advancing responsible AI innovation both as a coordinator of administration and interagency priorities and as a liaison with Congress. In this response, we provide a handful of suggestions.

First, OMB can advocate for necessary resources for agencies to undertake new and augmented responsibilities required under the AI Executive Order and OMB's own guidance. While in some cases agencies may have necessary authorities and funding, in other cases appropriations from Congress may be required. Devising ways to create economies of scale across the interagency and build technical expertise will require OMB's leadership.

Second, OMB can prioritize efforts to fund research and development programs, including those authorized (but not funded) under the CHIPS and Science Act, and ensure that NIST, the National Science Foundation, and the Department of Energy's Science Division have requisite funds to advance responsible AI innovation. We also encourage OMB to pursue establishment and funding of programs set out in the National AI Research Resource (NAIRR) Task Force report issued earlier this year, including supporting passage of the CREATE AI Act.

Third, OMB has an important role in advancing responsible AI innovation in the education space. This is a priority for SIIA's membership given our significant work with companies across the ed tech ecosystem and involvement in a range of projects to advance responsible adoption of AI in education. Due to rapid advancements in AI models and data labeling, the diversity of populations that this technology can assist is expected to increase by the day. AI has the potential to create numerous opportunities for marginalized populations, specifically with education, health, and the workforce.

The education community is optimistic about the positive impact AI can have in the learning journeys of all students and, in particular, students with disabilities, English learners, and underserved populations. The U.S. Department of Education's (ED) recent report explains "[m]any educators are actively exploring AI tools as they are newly released to the public. AI tools should treat each person fairly and actively work to prevent unintended bias and unjust impacts on people. Educators see opportunities to use AI-powered capabilities like speech

recognition to increase the support available to students with disabilities, multilingual learners, and others who could benefit from greater."[5] From tutoring and test preparation to assessing learner performance to relatively simple tasks like checking the spelling and grammar of a document, AI technologies are and can have a great impact on teaching and learning. [6] Because of this and in order to realize AI's promise, stakeholders must address and embrace ways to encourage the safe innovation of these technologies.

SIIA believes that the successful deployment of AI technologies in education must be done in a way that supports those who use it, protects innovation in the field, and addresses the risks associated with the development and use of these new tools. AI should replace neither the educator nor the learning experience. As mentioned before, SIIA released The *Education Technology Industry's Principles for the Future of AI in Education*, which builds on experiences with and successes in using AI technologies to advance educational objectives. These principles provide a framework for how we can look to the future of implementing AI technologies in a purpose-driven, transparent, and equitable manner. These principles intend to guide the ed tech industry as the broader education community continues toward deploying these impactful technologies.

Fourth, OMB should promote, where appropriate, sector-specific guidelines developed with expert stakeholders. For example, currently, the leadership and staff at ED have taken on the important task of directly engaging with a large number of stakeholders to build out useful resources for practitioners and the broader education community like ed tech vendors, teachers, school leadership, parents, and students.

Fifth, OMB should encourage agencies to highlight the importance of using and moving to an interoperable and open public commercial cloud architecture that can support a multi-cloud environment that leverages existing investments in on-premises and government clouds to achieve the promise and security of AI.

If America wants to be the leader in AI innovation, then we believe that we must commit to develop responsible and trustworthy technologies focused on ensuring all products are purpose-driven, privacy-focused, explainable, equitable, reliable, and accountable.

---

[5] U.S. Department of Education, Office of Educational Technology, *Artificial Intelligence and the Future of Teaching and Learning* (May 2023) (https://www2.ed.gov/documents/ai-report/ai-report.pdf).

[6] AI in education refers to the tools used in teaching and learning inside and outside the four walls of a classroom. AI technologies may be used in the development or deployment of software used in an educational setting but are not part of the teaching and learning experience.

5. Are there use cases for presumed safety-impacting and rights-impacting AI (Section 5 (b)) that should be included, removed, or revised? If so, why?

We recommend that OMB focus the use cases for safety-impacting and rights-impacting AI and provide agencies with further guidance that will promote consistency across the federal government, avoid overbreadth, and promote continuity across future administrations.

Focus Definitions of Safety-Impacting and Rights-Impacting AI on High-Risk AI.

As an initial matter, we strongly agree with the risk-based approach that OMB has endorsed in the Draft AI Memo. However, we recommend refinement to the definitions of safety-impacting and rights-impacting to promote certainty and avoid inadvertently capturing a variety of low risk activities. For example, while the use cases for rights-impacting AI[7] align with categories where high-risk applications of AI are likely to be found, there are use cases within each category that will not present the same risk profile with regard to individual rights and privileges, including equitable access, access to services, and so on.

To better approximate a risk-based approach, we recommend refining the definitions of safety-impacting and rights-impacting AI. We recommend limiting safety-impacting AI systems to those that pose a risk of loss of human life or serious physical injury. We recommend focusing rights-impacting AI systems to exclude circumstances where an AI system is incidental or accessory to making the consequential decision. Rights-impacting AI should be scoped to decisions that are already regulated by existing laws, such as non-discrimination or consumer protection, to ensure clarity around the type of activity regulated in this circumstance.

Ensure Consistency between Rights-Impacting AI Definition and Use Cases.

The Draft AI Memo defines "rights-impacting AI" as "AI whose output serves as a basis for decision or action that has a legal, material, or similarly significant effect" on a variety of rights and privileges.[8] We appreciate the effort to enumerate AI applications that are presumptively rights-impacting in Section 5.b.ii. Section 5.b.ii, however, contains language different than that used in the definition of rights-impacting AI to guide agencies in their classification of AI. There, AI is deemed to be rights-impacting "if it is used to control or meaningfully influence the outcomes of any of the [enumerated] activities or decisions."[9] It is not clear from this whether the standard in Section 5.b.ii is meant to augment or limit the standard contained in the

[7] Office of Management and Budget, Draft AI Mem. Section 5.b.ii.

[8] Office of Management and Budget, Draft AI Mem. Section 6 (at page 24).

[9] Office of Management and Budget, Draft AI Mem. Section 5.b.ii.

definition of rights-impacting AI. Read by itself, the Section 5.b.ii standard is broader than the definitional standard, but read conjunctively would function to refine the definition.

We recommend that OMB refine this language to provide further consistency to agencies and to providers of AI used by the government and to more tightly scope the definitions associated with safety- and rights-impacting AI. Effectively, as it currently stands, OMB is defining virtually all applications as high-risk in ways that will make it difficult or impossible for federal agencies to adopt AI tools. Notably, the EU's AI Act, while generally embracing a category-based approach, does define "high risk" applications subject to heightened review more narrowly than the Draft AI Memo. This is important because the classification of an AI system as rights-impacting triggers the additional minimum requirements set forth in the Draft AI Memo. We also note a similar disjunction is present in the definition of safety-impacting AI and the list of use cases in Section 5.b.i.

Narrow Rights-Impacting AI Use Cases on High-Risk Examples.

We appreciate the thoughtful approach taken in the Draft AI Memo to identify categories of AI use cases that are presumptively rights-impacting. As a general matter, we would recommend that OMB require agencies to conduct a risk assessment to determine whether particular use cases should adhere to the additional minimum requirements of rights-impacting AI. To achieve this, we recommend that OMB explicitly require agencies to apply a risk-assessment that follows the NIST AI Risk Management Framework when determining which AI applications within the different use case categories should be treated as rights-impacting AI under the definition of that term.[10]

Additionally, it is worth reiterating that the definitions of both safety- and rights-impacting AI are broad enough that they could disincentivize the government from adopting AI in positive instances. This chilling effect could discourage the adoption of new technologies that serve diverse users, including those that would spread benefits to overburdened and underserved communities.

In addition to this overarching comment, we provide the following suggestions for refinement of the use cases of rights-impacting AI set out in Section 5.b.ii to assist OMB in providing more precise guidance to agencies.

- *Section 5.b.ii.A. Decisions to block, remove, hide, or limit the reach of protected speech;*

Online content moderation outside of the government domain has for years relied on a combination of human and machine learning processes to make determinations about user-generated content that comports with content policies. While the First Amendment provides

[10] NIST, *Artificial Intelligence Risk Management Framework (AI RMF 1.0)*, NIST Publication AI 100-1 (Jan. 2023) (https://nvlpubs.nist.gov/nistpubs/ai/NIST.AI.100-1.pdf).

robust protection for these practices in the private sector, the First Amendment limits the federal government's discretion to block, remove, hide, or limit the reach of protected speech. We support the inclusion of this set of use cases as presumptively risk-impacting insofar as the intent is to limit its scope to government-run websites or platforms.

- *Section 5.b.ii.B. Law enforcement or surveillance-related risk assessments about individuals, criminal recidivism prediction, offender prediction, predicting perpetrators' identities, victim prediction, crime forecasting, license plate readers, iris matching, facial matching, facial sketching, genetic facial reconstruction, social media monitoring, prison monitoring, forensic analysis, forensic genetics, the conduct of cyber intrusions, physical location-monitoring devices, or decisions related to sentencing, parole, supervised release, probation, bail, pretrial release, or pretrial detention;*

We agree with OMB that the use of AI tools for law enforcement or surveillance-related risk assessments represents an area that is presumptively high-risk and rights-impacting. However, the description of this category captures a wide variety of potential government actions. It is not clear what is and is not included, and there is a good chance that this language will be interpreted to cover a number of otherwise low-risk AI applications. Given that, adhering to the additional minimum practices in Section 5.c.v would have the effect of impeding effective and responsible adoption of AI systems for critical governmental purposes without meaningfully adding to the protection of individuals' rights and privileges. Moreover, these seem to go beyond the scope of the AI Executive Order, which calls for the identification of "areas where AI can enhance law enforcement efficiency and accuracy, consistent with protections for privacy, civil rights, and civil liberties."[11]

We suggest the following clarifications to this category: First, disambiguate between law enforcement and surveillance-related risk assessments. While law enforcement has a well understood meaning, "surveillance-related risk assessments" could apply to anything from law enforcement to FDA inspections. The scope of surveillance-related risk assessments is not clear outside the law enforcement context and could be interpreted in different ways. Second, focus the category on those law enforcement purposes that have a direct impact on individuals' rights. Third, limit the recourse mechanisms - notification to negatively affected individuals and opt-out rights – when doing so would jeopardize important government ends such as the need to maintain confidentiality in an open investigation and is not required by the Constitution or applicable law. Fourth, consider clarification about the use case involving "the conduct of cyber intrusions."

[11] White House AI Exec. Order Section 7.1(b)(ii)(A).

- *Section 5.b.ii.C. Deciding immigration, asylum, or detention status; providing risk assessments about individuals who intend to travel to, or have already entered, the U.S. or its territories; determining border access or access to Federal immigration related services through biometrics (e.g., facial matching) or other means (e.g., monitoring of social media or protected online speech); translating official communication to an individual in an immigration, asylum, detention, or border context; or immigration, asylum, or detention-related physical location monitoring devices.*

Similar to the law enforcement context, the use of AI tools in immigration is presumptively high-risk and rights-impacting but also presents a variety of use cases where some of the additional minimum steps could unreasonably impede governmental objectives. Facial matching–which we read to mean authentication and/or verification using facial recognition technology–presents significantly less risk than do other uses of facial recognition technology - or than many of the other uses contained in this category. While safeguards are required to ensure the AI tools deliver as promised, some of the additional minimum steps could impede responsible adoption. In general, we recommend this set of use cases be further delineated in accordance with a risk-based assessment.

- *Section 5.b.ii.D. Detecting or measuring emotions, thought, or deception in humans;*

This category stands out from the others in that it is not tied to a particular field of activity. We suggest clarifying the areas in which this may arise to give agencies and the public additional guidance.

- *Section 5.b.ii.E. In education, detecting student cheating or plagiarism, influencing admissions processes, monitoring students online or in virtual-reality, projecting student progress or outcomes, recommending disciplinary interventions, determining access to educational resources or programs, determining eligibility for student aid, or facilitating surveillance (whether online or in-person);*

SIIA and the ed tech industry recognize the need to manage the risk of AI used in the field of education. The Draft AI Memo defines "safety-impacting AI" as AI that has the potential to meaningfully impact, among other things "human life or well-being, including loss of life, serious injuries, bodily harm, biological or chemical harms, occupational hazards, harassment or abuse, or mental health, including both individual and community aspects of these harms." Further, OMB's definition for "rights-impacting AI" includes impacts on an individual's "civil rights, civil liberties, or privacy, including but not limited to freedom of speech, voting, human autonomy, and protections from discrimination, excessive punishment, and unlawful surveillance."

We recognize the sensitivity around the use of AI systems in the educational context. We concur with the spirit of OMB's guidance thereto about the importance of ensuring that AI systems used in the educational context are properly designed, do not foster discrimination, and contain

safeguards to protect citizens' rights at all levels. We believe, however, that subjecting all AI systems used in the educational context to the additional minimum requirements for "rights-impacting AI" could impair the ability to use these tools to advance learning objectives, if not defined clearly.

Based on the proposed guidance, it seems that OMB has virtually captured many different uses of AI in the education context within the scope of rights-impacting AI. We believe that the deployment of AI in education must be done in a way that addresses specific risks associated with the development and use of these tools and is appropriately tailored to cover high-risk applications. However, we must point out that in the field of education, the AI tools and their reach/impact in education can have completely different effects. With the diversity of AI-based platforms, as shown above, the draft guidance will need to provide more clarity into what "rights" are impacted in education, as many different types of rights may be affected within different scenarios. For example, plagiarism might impact a "right to intellectual property," where surveillance might impact "right to privacy." Are the rights equivalent? Could they be treated the same? Designating all AI systems used in the educational context as "riskier" will subject the field of ed tech to a plethora of rules and regulations, which allows the agency to "prove" that their AI-based system is trustworthy and meets the mandatory requirements.

Furthermore, in education, we encourage OMB to consider the evolving policy landscape of existing regulations, in addition to new policy developments on the horizon, when it comes to AI in education. Ed tech vendors and educational institutions already have legal and ethical obligations to protect students online through a range of data privacy laws, including CIPA, FERPA and COPPA. OMB should consider the additional compliance methods already set in place in these areas, and consider exempting from the list of presumptively "high-risk" use cases those which education agencies are undertaking specifically to comply with statutory obligations. Our members believe that it is important that OMB's guidance on responsibly integrating AI into federal agencies' work compliments, rather than complicates current education industry requirements.

AI presents an opportunity for schools to fulfill their obligation to better implement content filtering and to deploy technology in a way that, with the right guardrails in place, improves student safety. As mentioned above, CIPA already imposes certain requirements on schools or libraries that receive discounts for internet access or internal connections through the Federal Communications Commission's (FCC) E-Rate program. To receive E-Rate funding, schools are required to certify that they have internet safety policies in place that include technology protection measures against content that is obscene, pornographic, or harmful to minors. There are also certification requirements under CIPA that require schools to have internet safety policies that monitor the online activity of minors.

Furthermore, survey research confirms that parents and educators worry deeply about children's online activity and overwhelmingly support technology protections on school-issued devices to keep kids from accessing harmful content. For example, in a July 2022 survey of more

than 2,400 public school educators and parents, 80 percent of parents and 88 percent of teachers agreed that unrestricted access to the internet on school-issued devices can be detrimental to student mental health.[12] In the same survey, 89 percent of parents and 93 percent of teachers agreed that if there were an online tool that could detect signs that a student may be at risk of harming themselves, then this technology should be deployed on a school-issued device. When implemented properly, AI can help schools achieve these broadly supported safety objectives.

Although we all agree on the importance of the safety and efficacy of AI systems in the education market, we still believe the approach of "grouping" different types of AI tools in ed tech will offer some challenges to the field the field of education, if OMB does not review the complexity of what constitutes a "right" and how differently the rights can impact AI tools within the field of education.

- *Section 5.b.ii.J. Decisions regarding access to, eligibility for, or revocation of government benefits or services; allowing or denying access—through biometrics or other means (e.g., signature matching)—to IT systems for accessing services for benefits; detecting fraud; assigning penalties in the context of government benefits;*

The government interest in detecting fraud is significant and is one where certain of the additional minimum requirements around redress – notification to negatively affected individuals and opt-out rights – would undermine governmental objectives. In addition, we recommend limiting this category to those decisions to deny access rather than decisions that also allow access to programs and systems.

6. Do the minimum practices identified for safety-impacting and rights-impacting AI set an appropriate baseline that is applicable across all agencies and all such uses of AI? How can the minimum practices be improved, recognizing that agencies will need to apply context-specific risk mitigations in addition to what is listed?

As a general matter, SIIA recommends that responsibility for impact assessment performance evaluation and ongoing monitoring lie with the system deployer rather than developer because the deployer is closer to the intended use cases. In addition, we note that several of the practices would require agencies to conduct assessments and undertake monitoring in areas where traditionally they have not had the kind of expertise or access that the Draft AI Memo

[12] Morning Consult, *EdTech in Schools: Creating Safer Digital Learning Environments* (July 2022) (https://uploadsssl.webflow.com/60db82d1be38ad3341c2ff23/6324e2698b87f308a5085bc3_Edtech%20in%20Schools%20-%20Creating%20Safer%20Digital%20Learning%20Environments.pdf)

contemplates. Agencies, with OMB's leadership, should focus on up-skilling their existing workforce in order to meet the needs of enhanced AI procedures.

Furthermore, with the existing definitions being even broader than those present in the EU's AI Act, a large swath of AI use cases will be subject to these minimum practices, many of which are not the type to cause the risk of harm the memo is concerned with. In fact, this is likely to create enough complexity and red tape to harm the speed and breadth of adoption that would help the government fulfill the promise of this technology.

Comments on Minimum Practices for Safety- and Rights-Impacting AI.

The minimum practices will require a significant amount of government resources, given the breadth of the safety-impacting and rights-impacting AI enumerated in Section 5.b. We caution that the resource requirements – specifically, the requirement to test the AI for performance in a real-world context and the requirement to independently evaluate the AI – may impede effective adoption of responsible AI to advance significant government objectives. To that end, we would encourage OMB to incorporate a risk-based assessment within both categories and identify those requirements that are required of only the highest-risk AI systems within each.

In addition to a risk-based approach, we recommend tailoring requirements for rights-impacting AI to reflect the existing legal frameworks that already provide important risk mitigation to AI tools. Education provides an excellent case study in this. As AI technologies continue to advance, it is imperative that the implementation takes into account product variability and purposes and that a specific product in education aligns with existing frameworks established by state and federal laws - including privacy, accessibility, and other important civil rights laws. Furthermore, it is important to recognize that AI tools must be designed to perform in an equitable manner, ensuring that bias and discrimination is eliminated as algorithms progress.

When considering "minimum practices" for education, one must ensure that the recommendations are practical and create a complimentary impact instead of a disparate impact. Given the growing awareness and attention to the dangers children might encounter online, SIIA encourages the federal government to consider the evolving policy landscape of existing regulations, in addition to new policy developments on the horizon, when it comes to AI in education and the practices it must follow.

In addition, as noted above in our discussion of the categories of rights-impacting AI, we believe some of the additional minimum practices will on balance impede the responsible adoption of AI without adding meaningful safeguards to affected individuals. SIIA would like OMB to reassess the possible burdens of the specific practices required of the two types of AI systems:

- *Independently evaluate the AI:* We believe that this practice will be extremely burdensome on the agencies. For most AI systems, SIIA believes self-assessments and

increased transparency measures will provide the necessary accountability while avoiding undue burden on innovation and small and midsize agencies.

- *Mitigate emerging risks to rights and safety:* We believe that this is key, however, we have a concern that this requirement is too broad when defining the word "risk." We implore OMB to further define the word "risk," specifically "emerging risks" that are related to security, privacy, and data protection.

We also encourage OMB to reexamine the requirements regarding the quality and appropriateness of the relevant data that is part of the pre-deployment AI impact assessment. In many cases, assessment of training data will be unhelpful to assess AI system performance and, likely, prove a poor investment of resources that could be spent focusing on how an AI system performs in real-world testing environments. In addition, agencies are unlikely to have access to the training data in a way that would allow for the contemplated analyses - in part for practical reasons, and in part because of the need to protect IP and proprietary data.

Related to the latter point, we encourage OMB to include provisions that would permit agencies not to disclose to the public information that is protected by IP or is otherwise sensitive or proprietary to government vendors. Indeed, the compilation of training data is a confidential commercial secret with significant competitive value. We have concerns about vendors' ability to claim trade secret protection under federal or state law if disclosure is permitted, and to that end, would encourage revision of the documentation requirements in Section 5.c.iv.a.3. We recommend relying as much as possible on testing – such as the methods contained in Section 5.c.iv.c – rather than on scrutiny of training data to provide best indications of anticipated performance by the AI model. To the extent documentation of information regarding training data is required, we suggest limiting this to summary information about the data the model was trained on and/or that demonstrates how training data is appropriate to the agency's intended use. For example, documentation could show that a model was trained on industry-specific content, such as medical literature without disclosing the specifics around the articles themselves.

Lastly, we encourage OMB to provide agencies with additional flexibility to create and evolve processes around adopting AI tools. Commercially available technologies such as privacy-enhancing technologies should be considered as a means of preserving model and AI security during the training, evaluation, and verification processes as outlined in the AI Executive Order and the recent *Guidelines for Secure AI System Development* issued by the CISA and the UK's National Cyber Security Centre (UKNCSC).[13] This would build on President's directive that "Agencies shall use available policy and technical tools, including [PETs] where appropriate, to

[13] CISA, UKNCSC, et al., *Guidelines for Secure AI System Development* (Nov. 2023) (https://www.ncsc.gov.uk/files/Guidelines-for-secure-AI-system-development.pdf).

protect privacy and to combat the broader legal and societal risks — including the chilling of First Amendment rights — that result from the improper collection and use of people's data."[14]

Comments on Additional Minimum Practices for Rights-Impacting AI.

SIIA recommends requiring the additional minimum practices apply (a) only to high-risk rights-impacting systems rather than to all rights-impacting systems and (b) only where impact assessments suggest negative impacts that require further assessment and mitigation. Government resources will be strained by requiring these steps of all rights-impacting systems and the measures contained in the minimum practices provide sufficient guardrails.

In addition, we support measures to advance equity, dignity, and fairness, and to incorporate feedback from affected groups – this is essential to build trust and public confidence in the government's use of AI – we are concerned that this requirement may prove impractical in the design and development stages. This is because much of the AI tools will be developed by non-governmental entities and the federal procurement process and budgeting deadlines present challenges. We recommend revising this language, consistent with Section 7.2 of the AI Executive Order, to avoid creating new barriers to adoption.

7. What types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum into relevant contracts?

SIIA appreciates the thoughtful approach to federal procurement taken in the Draft AI Memo. We provide two comments on the proposed text.

First, SIIA recommends that OMB remove the reference to "copyright" in "Aligning to National Values and Law" and replace it with the umbrella term "intellectual property."[15] The use of commercial AI by the government will raise issues around trade secret and patent law. In addition, the question of copyright and AI is exceedingly complex and raises a multitude of questions that are now being considered by all three branches of the federal government. Developing a position in all of these areas will require additional time to get right.

Second, we caution OMB to amend its requirement for generative AI models to have labeling and provenance capabilities to create flexibility as the technology develops.[16] These technologies remain in their infancy and we recommend that the government avoid aligning to

[14] White House AI Exec. Order Section 2(f).

[15] Office of Management and Budget, Draft AI Mem. Section 5.d.i.

[16] Office of Management and Budget, Draft AI Mem. Section 5.d.v.B.

a single standard for achieving the goals of authentication and provenance as the technology continues to develop and different approaches may prove more effective for different use cases.

Third, OMB should ensure agencies are able to protect the data of companies and their intellectual property insofar as it has to be exposed, collected, or provided to the government.[17] This includes using contractual clauses based in the FAR and DFARS along with any agency-specific deviations or internal policy to provide an assurance of confidentiality and exemption from FOIA disclosure with all requisite authorities to hold those who intentionally, accidentally, or otherwise disclose such information accountable.

* * *

The AI Executive Order marks perhaps the most significant measure to date reflecting the United States' approach to AI governance, and we appreciate the opportunity to comment on OMB's efforts to implement responsible AI across the federal government. We look forward to continuing to work with OMB and the Administration as this effort continues. Please direct inquiries to Paul Lekas, SIIA's Senior Vice President and Head of Global Public Policy & Government Affairs, at plekas@siia.net.

Subject: Comment on Draft Memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI)* (OMB-2023-0020)

References: 88 FR 75625 (November 3, 2023); FR Document # 2023-24269

Dear Madam Director:

Microsoft appreciates the opportunity to provide comments on the draft memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI). We commend the Office of Management and Budget (OMB) for its rapid progress on promoting responsible AI innovation across the federal government and furthering the U.S. government's efforts to ensure that agencies' use of AI is safe, secure, and trustworthy.

We share the Administration's vision of AI as a strategic enabler for advancing the public interest and enhancing the efficiency and effectiveness of government operations. This year, Governor Newsom in California, Governor Burgum in North Dakota, and Governor Youngkin in Virginia released executive orders to ensure state and local governments can fully harness the capabilities of AI technology while also ensuring proper guardrails are in place. New York City released MyCity Chatbot, which uses information published by the NYC Department of Small Business Services to respond to constituents in a timely manner. NY Power Authority digitized infrastructure blueprints from 1900 to present day, allowing staff to easily ask generative AI questions about their infrastructure plans instead of having to manually search through 65,000 pdf files. Governments across the globe are leveraging AI to address urgent issues of water stress and public access to legal records as well as to open up broad opportunities with municipal services.[1] While these

[1] Microsoft Customer Story-The Société du Canal de Provence relies on data to optimize the management of water supply networks and the use of this resource in the face of climate change; Microsoft Customer Story-The City of Kelowna increases and speeds access to its services with Azure AI; Microsoft Customer Story-Mexico's Supreme Court of Justice of the Nation provides the public with digital access to the court's historical documents with the help of Azure (Microsoft Customer Story-Mexico's SCJN).

immediate public sector use cases provide enormous value, innovation potential will only expand over time as technology is deployed.

We also acknowledge that innovation and risk management must move forward together. Developing and implementing an AI policy framework that establishes clear roles and responsibilities, governance mechanisms, and best practices for AI procurement and deployment is critical to ensuring agencies use AI responsibly in support of their missions.

In summary, we recognize the enormity and importance of the U.S. government's efforts to responsibly leverage what the draft memorandum describes as "one of the most powerful technologies of our time," and we aim to be a partner to OMB and agencies on both strategy and implementation. Strengthening AI governance, advancing responsible AI innovation, and managing risks from the use of AI are the right priorities, but each is complex, even in isolation – and they must work in concert. At a high level, providing both clarity and flexibility will be critical, allowing agencies to move quickly, learn, and iterate. Consistency and integration will also be key; for example, investments in centralized guidance and processes to enable exchange across the federal community will help drive a high common baseline and rapid, applied learning.

Building from these high-level principles, we offer the following recommendations on the draft memorandum and a broader OMB strategy based on our experience and insights:

1) Enable efficient, effective, and consistent implementation of AI requirements;
2) Ensure minimum practices and procurement guidelines are clear, adaptable, and calibrated to the technology architecture;
3) Foster AI innovation through infrastructure, policy, and process investments;
4) Design multi-tiered and multi-disciplinary AI governance;
5) Facilitate iterative improvement, including through small-scale pilots.

Recommendations 1 and 2 relate to managing risks from the use of AI, focusing on ways to improve the draft memorandum's minimum practices and procurement guidelines as well as anticipating implementation needs. Recommendation 3 relates to advancing responsible AI innovation, encouraging a focus on cultural readiness as well as the draft memorandum's emphasis on enabling infrastructure. Recommendation 4 relates to strengthening AI governance, describing Microsoft's experience building out our AI governance bodies and our takeaways on the importance of multi-layered accountability structures and multi-disciplinary coordination. Recommendation 5 is applicable across each of the areas in focus in the draft memorandum, recognizing the value of more agile experimentation alongside formal policy development. Context and more detailed recommendations are also included further below.

1: Enable efficient, effective, and consistent implementation of AI guidance and requirements.

OMB's minimum practices for managing risks with rights- and safety-impacting AI, along with its recommendations for responsible federal procurement of any AI technology, will apply across many covered federal agencies, AI systems, and AI use scenarios – some of which may vary

significantly. Given this scope, defining a roadmap for how AI practices and procurement guidelines will be implemented is critical during the policy design process that's in focus in the draft memorandum. Anticipating potential challenges and opportunities with implementation at scale and with diversity can impact policy design choices, helping to ensure that requirements can be implemented efficiently, effectively, and consistently.

Lessons can be carried forward from previous waves of widely used technology, including cloud computing and software, and others' experiences with implementing AI practice requirements at scale. The federal government has established FedRAMP[2] requiring that cloud services meet or exceed security requirements and a "Common Form" for software vendor attestation of secure development practices,[3] recognizing the value of standardized and "do once, use many" approaches. Microsoft is also implementing our Responsible AI Standard[4] across many diverse use cases in partnership with engineering and product groups across the Company, defining policies and guidance that are clear and adaptable and integrating learnings across communities of practice to support iterative advancement.

Maximizing standardized and "do once, use many" approaches to facilitating or verifying conformance with agency-wide guidance and requirements strengthens efficiency, effectiveness, and consistency at scale, especially where there are variations or limitations in expertise and resources. For agencies, standardized implementation guidance can define a consistent and robust process while allowing for sufficient flexibility; for example, to support implementation of Microsoft's Responsible AI Standard across product groups, we have developed the Microsoft Responsible AI Impact Assessment Guide.[5] With vendors, "do once, use many" conformity assessments allow expertise to be concentrated, resulting in more rigorous and impactful evaluations as well as less burden on organizations with fewer resources to conduct meaningful assessments themselves. The risk of inconsistent evaluations and compliance findings can also be minimized, simplifying governance for agencies and increasing predictability for vendors.

Driving toward a standardized and consistent cross-agency approach to identifying rights- and safety-impacting AI in the draft memorandum or follow-on guidance would allow both vendors and agencies to have greater clarity as they provide and adopt AI technologies. While agencies will need some flexibility to interpret risk levels in their use scenarios, OMB could build on its definitions and set of purposes that should be presumed to be safety- or rights-impacting by developing guidance to help agencies assess whether their systems should trigger minimum practice requirements. For example, the Microsoft Responsible AI Impact Assessment Guide supports our teams through a process of determining whether any intended uses, unsupported uses, or foreseeable misuses of AI systems could trigger any "Sensitive Uses,"[6] which require additional internal oversight.[7]

[2] How to Become FedRAMP Authorized | FedRAMP.gov

[4] Microsoft-Responsible-AI-Standard-v2-General-Requirements-3.pdf
[5] Microsoft-RAI-Impact-Assessment-Guide.pdf
[6] Microsoft-RAI-Impact-Assessment-Guide.pdf; products or systems trigger our Sensitive Uses processes if they could have a consequential impact on a legal position or life opportunity; could involve a risk of physical or psychological injury; or could threaten an individual's human rights.
[7] The building blocks of Microsoft's responsible AI program - Microsoft On the Issues

Ultimately, greater clarity will be critical to enabling AI innovation by empowering agencies to move forward more quickly with lower-risk AI systems that are clearly not rights- or safety-impacting and by helping to focus agency attention on implementing minimum practices where warranted.

As currently configured in the draft memorandum, minimum practices and procurement guidelines could allow for consistent approaches to facilitating or verifying conformance, including agencies and AI vendors; however, further action is needed to ensure final requirements continue to allow for such an outcome and to define steps toward realizing it. In many cases today, federal contractors will need to provide documentation, not only to enable sufficient transparency into AI provider practices that may be required for agencies to meet relevant minimum practices but also to enable AI vendors to comply with federal procurement provisions. Common forms could allow for consistency and re-use of documentation and conformance verification across agencies. More broadly, common artifacts that demonstrate implementation of process-based frameworks – like the National Institute of Standards and Technology (NIST) AI Risk Management Framework (RMF), in alignment with defined benchmarks or other evaluation metrics – could support scalable and consistent measurement of impactful AI risk management practices.

In addition, flexibility to take advantage of future developments should be embedded in OMB's approach. For example, efforts to finalize standards and establish certification processes, such as for ISO/IEC 42001,[8] may offer a path to streamline some agency reviews of federal contractor practices by accepting certifications as sufficient to establish conformance with all or with a subset of required practices. Likewise, efforts to define benchmarks – for example, to evaluate AI safety across different use cases[9] – are ongoing and may offer alternative, more accessible mechanisms to achieve customer assurance of supplier practices consistent with desired processes. Developing an open standard for how to write AI benchmarks, and then allowing stakeholders to develop various benchmarks and converge on the most useful and important ones, could likewise provide a clear and efficient path toward measurement where appropriate. The U.S. AI Safety Institute and a related Consortium are specifically focused on establishing a new "measurement science" to identify metrics for safe and trustworthy AI, including benchmarks to evaluate AI capabilities.[10]

Integration with existing federal policies and assessment and authorization processes, including FedRAMP, should also be pursued. We are encouraged that OMB is seeking to update FedRAMP, modernizing it to allow AI technologies to help with automating FedRAMP processes and including AI products in the FedRAMP marketplace. However, cybersecurity-related and other appropriate provisions of the draft AI guidance memorandum should be rolled into FedRAMP and Executive Order (EO) 14028 software supply chain security self-attestation rather than risking redundancies or inconsistencies in a parallel compliance regime. Moreover, as necessary as part of updating

[8] ISO/IEC FDIS 42001 - Information technology — Artificial intelligence — Management system
[9] https://mlcommons.org/working-groups/ai-safety/ai-safety/
[10] U.S. Artificial Intelligence Safety Institute | NIST

FedRAMP, NIST's Secure Software Development Framework (SSDF) and companion resource to the SSDF (as tasked by EO 14110 Section 4.1(i)(B)) should be leveraged.

Recommendations:

- Provide additional guidance to help standardize processes for interpreting whether AI meets safety- and rights-impacting criteria, supporting AI innovation by allowing both agencies and AI vendors to have greater clarity and predictability.

- Design minimum practices in anticipation of the need to support consistent agency implementation. Likewise, design minimum practices and procurement guidelines in anticipation of the need to leverage to the maximum extent possible "do once, use many" approaches to assessing AI vendor implementation.

- Define a roadmap for supporting efficient, effective, and consistent implementation approaches, including through the use of common forms, common artifacts, or other cross-agency tools and processes where appropriate. For example, consider partnering with NIST to develop more detailed guidance on and common forms for impact assessments to support cross-agency consistency, providing additional opportunities for AI vendors that will likewise develop and share impact assessment documentation to comment on their approaches and lessons learned. In addition, leverage NIST's broader work as part of EO 14110 implementation and the AI Safety Institute to define safety evaluation benchmarks, ideally based on an open standard for how to write AI benchmarks as well as process-based frameworks like the NIST AI RMF, that could be used in a manner that's repeatable at scale across a representative set of use cases. Common artifacts could potentially also then be defined to demonstrate implementation of practices consistent with defined benchmarks or other evaluation metrics.

- Ensure sufficient flexibility to allow for use of more efficient, in-development processes to verify that minimum practices are implemented, both by agencies and their federal contractors, recognizing dynamism in AI safety evaluation methodologies, transparency capabilities, benchmarking research, and standards and certifications. As certifications are available for comprehensive standards like ISO/IEC 42001, agencies may also be able to leverage them to help demonstrate the conformance of some of their AI providers' practices with minimum practice or procurement requirements.

- Integrate AI requirements into existing agency and vendor requirements and conformance verification processes, including FedRAMP for cybersecurity-related provisions, wherever feasible, and avoid creating parallel or potentially redundant compliance schemes.

2: Ensure minimum practices and procurement guidelines are clear, adaptable, and calibrated to the technology architecture.

Establishing AI risk management processes and practices can help realize AI innovation when they are clear, adaptable, and calibrated to the technology architecture. One way that clarity can be achieved is by defining which processes and practices are necessary to enable responsible use of different AI systems in different scenarios, helping focus resources on durable adoption of trusted, higher-risk technology without impeding lower-risk use cases. In the draft memorandum, OMB takes this foundational risk management step, distinguishing between safety-impacting and rights-impacting AI that is subject to elevated minimum practice requirements and all AI systems that are subject to procurement guidelines.

However, there are opportunities to refine minimum practices and recommended procurement requirements to strengthen clarity, adaptability, and calibration to the technology architecture, and OMB's approach to aligning with existing and in-development guidance also requires consideration. There is ambiguity regarding how existing guidance, including NIST's AI RMF, should apply, and how implementation of its processes and practices might support broader agency and vendor compliance efforts. Section 5(c) of the draft memorandum acknowledges that agencies are encouraged to implement best practices for AI risk management from the NIST AI RMF and other resources; in addition, specific minimum practices, such as the requirement to complete an AI impact assessment, overlap with practices described in the NIST AI RMF. Likewise, Section 5(d)(v) encourages agencies to consider the NIST AI RMF for contracts for all generative AI while specific procurement recommendations, such as for transparency, overlap with NIST AI RMF practices.

For rights- and safety-impacting AI, many of the minimum practices identified are consistent with those required by Microsoft's Responsible AI Standard. For instance, the completion of a Responsible AI Impact Assessment is required by our Standard, as is ongoing monitoring, feedback, and evaluation of AI systems so that we can identify and review new uses, identify and troubleshoot issues, manage and maintain the systems, and improve them over time.[11] Consistent with our principles of transparency, reliability and safety, and accountability, the Standard also requires preparation of documentation for customers and other stakeholders, including to describe a system's intended uses and its capabilities and limitations.[12]

We also implement additional practices that we consider important to include for safety-impacting AI applications and use scenarios in particular. For such applications, incident response systems should be documented and tested. In addition, recognizing that not all use scenarios will have the same risks and needs, there is value in ensuring the ability to access a configurable safety layer for AI systems that will be used in safety-impacting scenarios.

[11] See Reliability and Safety Goals – RS3: Ongoing monitoring, feedback, and evaluation, Microsoft-Responsible-AI-Standard-v2-General-Requirements-3.pdf

[12] See Transparency Goals – T2: Communication to stakeholders; Accountability Goals – A3: Fit for purpose; and Reliability and Safety Goals – RS1: Reliability and safety guidance, Microsoft-Responsible-AI-Standard-v2-General-Requirements-3.pdf

Our experience implementing Microsoft's Responsible AI Standard across diverse product and engineering groups, and as technology and the broader ecosystem are rapidly evolving, has demonstrated the importance of adaptability along with strong governance and accountability. Minimum practices are most effective and durable when designed in a way that allows for a focus on desired processes – and when governance then holds stakeholders accountable for demonstrating that they've robustly implemented such processes. Practitioners should be required to focus on understanding the sociotechnical risks of specific AI systems – including the model and software and ways in which individuals interact with or are impacted by both – and ensure that proper mapping, measurement, and management plans are in place for each risk. Such a process helps avoid a "checklist-of-risks" mindset, where many risks are not relevant to all systems and risks unique to the system's sociotechnical context are missed.

While many of the draft memorandum's minimum practices take this process-based approach allowing for flexibility and multiple approaches to defining impactful processes consistent with desired interests or outcomes can help define a broadly applicable and agile baseline.

As with the minimum practices, many of the recommendations for responsible federal procurement of AI provide a useful starting place, though they also require further specificity to understand how they might be applied. At Microsoft, we've invested significantly in layered transparency measures, recognizing that different stakeholders have different needs and goals when it comes to transparency for different types of AI technologies, including models, platform services, and applications.[13] While maintaining visibility as needed to support product performance and enable implementation of responsible AI commitments, we've also invested significantly in policies and practices to ensure that customers maintain both control over their data and exclusive rights to use fine-tuned AI models that are based on their training data.

We also appreciate that the draft memorandum seeks to have agencies promote interoperability as one means of ensuring opportunities for competition among contractors. Interoperability is important as it allows disparate information systems from multiple vendors to readily work together and exchange data. It enables valuable business connections, whether across processes, between people and information, or among companies in a value chain. Providing interoperability helps agency customers decrease complexity and better manage heterogeneous environments while enhancing choice and innovation in the market.

Microsoft has made – and continues to make – technology and business practice investments that promote greater interoperability. Our approach includes delivering interoperability in our products and technologies; collaborating with customers, partners, and competitors; supporting the development of and using industry standards; and providing developer resources. For example, we've supported the development and use of C2PA for provenance and authenticity of AI-

[13] For example, we provide documentation like Transparency Notes for AI platform services and whitepapers for Bing Chat. E.g., Transparency Note for Azure OpenAI - Azure AI services | Microsoft Learn; Transparency Note and use cases for AI Content Safety - Azure AI services | Microsoft Learn; Transparency Note for Azure AI Language - Azure AI services | Microsoft Learn; The new Bing - Our approach to Responsible AI (microsoft.com)

generated audio-visual content.[14] In addition, we use our Azure AI Content Safety Service[15] for our own first-party Copilots as well as on Llama-2 and some of the third-party models made available on the Azure Machine Learning Model catalog.

Recommendations:

- Design minimum practices and recommended procurement requirements in a way that's risk based and process focused, accounting for how technology will evolve and the need for adaptability in implementation. Consider questions to ask about each system that help guide brainstorming about the set of risks (i.e., mapping risk), and then for each system, leveraging a set of understood risks that are applicable to it to measure and manage risk (and structuring common forms or artifacts to align with this process).
    - External AI red teaming should be required for frontier AI models but not for all generative AI. While the role of AI red teaming is a critical part of a comprehensive process of mapping risks of high-risk AI systems, flexibility in leveraging external AI red teaming, internal red teaming, and broader practices also driving toward accountability in processes for mapping risk should be allowed more broadly. In addition, the role of systematic evaluation should be emphasized, recognizing its role in complementing red teaming and other risk mapping practices as part of a holistic risk management approach.
    - Minimum practices for ongoing monitoring should recognize the role of automated processes that can be operated consistently with privacy expectations alongside periodic human review. Testing and confidence in such processes can be an input into monitoring architecture, recognizing that the role of appropriately scoped periodic human review will remain critical.
    - Processes for scaling the gathering and incorporation of feedback on fairness and inclusion metrics should be considered alongside direct engagement with groups that may be affected by AI systems. In the absence of clarity about a discrete set of affected groups, such an approach risks overemphasizing interests of certain groups or missing out on more comprehensive feedback through scaled processes. Minimum practices should also evolve as the definition of process- and outcome-oriented metrics progress.

- Ensure minimum practices are sufficiently clear, either in the draft memorandum or in follow-on guidance that OMB will develop to support consistent agency implementation.
    - Clarification of terms like "proxies" and their role in enabling agencies to meeting minimum practices for rights-impacting AI may help agencies with less familiarity working with factors contributing to algorithmic discrimination or bias.
    - Clarification that humans must oversee and have the ability to override consequential, rights-impacting decisions by AI systems, and that such ability

[14] Overview - C2PA
[15] What is Azure AI Content Safety? - Azure AI services | Microsoft Learn

should be subject to ordinary review guidelines as for agencies. This clarification may likewise be useful context for rights-impacting AI systems to maintain human oversight and remedy processes for consequential decisions.

- Consider adding minimum practices for safety-impacting AI, including requirements that incident response systems should be documented and tested and that a configurable safety layer should be made available to agencies deploying those systems.

- Provide greater clarity on recommendations for responsible federal procurement of AI as an interim step in advance of a means to ensure that AI contracts align with OMB guidance, helping strengthen AI provider readiness to meet interoperability and other requirements.
    - Requirements regarding data for AI should distinguish between rights to training data used to create an AI model or fine tune it, and rights to the AI model itself that likely also includes AI provider intellectual property. In addition, requirements regarding data for AI should allow for providers to maintain visibility needed to support product performance and implementation of responsible AI practices.

- Ensure that requirements are applied to the appropriate part of the technology architecture and in a way that reflects risk management priorities and capabilities.
    - Requirements to reliably label or establish provenance for content generated or modified by AI are more appropriately applied to platform services or generative AI applications than to AI models themselves. Where feasible, platform services can help scale practices across downstream applications, though in some cases, user interface interventions could be more impactful, enabling end users to understand capabilities and limitations in real time and allowing for feedback. Focusing labeling and provenance requirements on audio-visual content also prioritizes use cases where practices can more meaningfully be applied today.
    - Requirements for ensuring sufficient transparency and obtaining documentation should correspond with the type of AI technology (i.e., model, platform/API service, or application) being procured.

- Consider how the NIST AI RMF can be leveraged to the maximum extent possible, acting as a foundation for a consistent, impactful, and process-based approach to mapping, measuring, and managing AI risk as applicable across rights- and safety-impacting and other AI systems. NIST's ongoing work in implementing EO 14110 deliverables and developing and operating the AI Safety Institute will also be critical to leverage, ensuring ongoing alignment and best practice utilization. Defining more specific controls that support operationalization of the NIST AI RMF, as well as common artifacts that demonstrate implementation of NIST AI RMF and controls-based practices in alignment with defined benchmarks or other evaluation metrics, may especially support its application to safety- and rights-impacting AI, where more prescriptive guardrails may be

needed. Minimum practices included in the draft memorandum could also be described in relationship to the NIST AI RMF to enable greater clarity regarding how to use the NIST AI RMF in concert with efforts to meet draft memorandum obligations and to prepare for ongoing alignment as NIST's EO-related and broader efforts continue.

3. Foster AI innovation through infrastructure, policy, and process investments.

Fostering AI innovation and responsible use should be key components of an agency's AI governance functions. The development, implementation, and evolution of a clear and coherent AI innovation strategy can provide a useful starting point, considering both how to establish an enabling environment and how to concretely measure progress against identified challenges.

There are both technology-based and cultural aspects of an enabling environment. Regarding technology, AI systems rely heavily on digital data for training, learning, and making predictions; the more diverse and extensive the available datasets, the better an AI model can often perform. In addition, they rely on cloud computing infrastructure, enabling organizations to access not only the computational power needed for training and running AI models but also AI safety layers, such as Azure AI Content Safety.[16] We appreciate the draft memorandum's inclusion of data governance and cybersecurity provisions, recognizing the importance of ensuring agencies maximize appropriate access to datasets managed through sound data governance as well as to adequate, authorized infrastructure.

Cultural readiness is equally critical. Many customers have shared that AI use is uneven across their organizations, reflecting a variety of challenges, including comfort with, and understanding of how to benefit from new technology. A skilled, multi-disciplinary workforce, including AI experts, social scientists, and domain specialists, as well as AI literacy and awareness among all staff and leaders, can have compounding effects, ensuring that AI investments are well leveraged and that all resources direct attention toward innovative potential. A culture of continuous learning and effective training can also establish organizational norms of asking questions and experimenting with new technology.

The AI innovation strategy should also provide a process for identifying barriers to AI adoption and use and addressing them in turn. While many agencies may experience consistent technical, organizational, and cultural challenges, there may also be variation and opportunities to build on different existing investments to accelerate progress. Moreover, a process to identify and address barriers can be regularly re-used as agencies and their policies, leadership, enabling environments, and state of AI use continue to evolve and offer opportunities for refinement or major shifts.

In addition to strategies that require regular assessment of AI readiness and progress against metrics, teams responsible for using repositories of ideas and best practices are critical. Multiple data repositories may be relevant, including to collect and incubate AI use case ideas and to

[16] https://learn.microsoft.com/en-us/azure/ai-services/content-safety/overview

catalogue use cases in practice and their benefits. Moreover, such repositories are best leveraged not just as standing inventories but as actively managed databases, with teams responsible for leveraging them to help identify and raise awareness of high-value AI use cases.

Within Microsoft, teams are encouraged to raise ideas about AI tools or functionality they might benefit from in their work, and centralized groups prioritize what to build first. Visibility into the ideas and projects is provided within divisions so they can understand trends, make connections, and reduce duplication. Such visibility also prompts more ideation as teams can conceptually apply how one group is benefiting from AI to their distinct areas and needs. Through events like Hackathons, AI projects compete for visibility across the entire company.

Recommendations:

- Direct agencies to develop comprehensive strategies that create a culture and environment that foster AI innovation, including by incorporating investments to strengthen enabling technology, cultural readiness, and processes for regularly assessing and responding to challenges.

- Clarify how agencies should proceed when AI systems and use cases fall outside of rights- and safety- impacting scenarios, ensuring they understand how to move forward in the immediate term and with forthcoming procurement guidelines. Absent an affirmative position, agencies may default toward a posture of slow adoption, even for low-risk systems and use cases.

- Reference the role of commercial cloud services, including how agencies may benefit from OMB's policies around data center optimization and guidance regarding use of pooled, shared services, including for "sandbox" opportunities. The draft memorandum seeks to remove barriers to the responsible use of AI by ensuring agencies have the right environments; however, the memorandum focuses on agency "internal environments" without reference to commercial cloud services.

- Update, as necessary, cybersecurity authorization processes to better address the needs of AI applications, including to advance the use of continuous authorizations for AI. Consistent with Section 10.1(f) of EO 14110, agency authorizing officials should also prioritize generative AI and other critical emerging technologies in Authorizations to Operate and any other applicable release or oversight processes.

- Include both technical roles, such as data scientists and engineers, and non-technical roles, such as designers, social scientists, contracting officials, managers, and attorneys, whose contribution and competence with AI are important for successful and responsible AI outcomes, when identifying and filling workforce needs for AI.

    - Agencies should provide resources and training to develop such AI talent internally and should also increase AI training offerings for federal employees.
    - Cybersecurity professionals should be added to the draft memorandum's list, consistent with cybersecurity intersections recognized elsewhere.

- Encourage agencies to build tools and teams to collect and apply AI project ideas and use case information, providing visibility across the AI governance body and its stakeholders to prompt broad, contextualized idea generation and strong feedback loops. Consider processes to facilitate ongoing awareness of and interaction with information about cross-sector generative AI use cases and their evolving benefits within agencies or across a federal CAIO community (along with point-in-time use case guidance).

4. Design multi-tiered and multi-disciplinary AI governance.

Strengthening AI governance is appropriately in focus in OMB's memo, and requirements for agencies to designate a Chief AI Officer (CAIO), convene an AI governance body, and provide AI inventories are appropriate foundational steps. Given differences across agencies in missions, resources, and capabilities, how these structures are implemented may vary, but their roles, expectations, functions, and authorities should be consistently defined.

At Microsoft, we operate multi-layered and multi-disciplinary hub-and-spoke models to ensure clarity of policy and to facilitate both top-down and bottom-up implementation of responsible AI practices. Our Office of Responsible AI (ORA), established in 2019 and led by our Chief Responsible AI Officer, defines our Responsible AI Standard, a set of goals and requirements applicable to product and engineering groups across the company. Across product divisions and teams, ORA coordinates with Responsible AI Champions to support implementation of our Standard, bringing together engineering, product, policy, and operational expertise to provide enabling resources, manage communities of practices, and measure progress. Our Responsible AI Council, led by our Vice Chair and President Brad Smith and our Chief Technology Officer Kevin Scott, oversee responsible AI efforts across the company, regularly convening research, policy, and engineering experts along with business leaders to ensure accountability in implementing practices.

Structurally, CAIOs and agency AI governance bodies can create hub-and-spoke models at both the policy definition and implementation layers, and establishing a feedback loop across those layers will also help to ensure appropriate calibration and consistency rigor. CAIOs should be accountable for setting policies to promote AI innovation and to manage risk; they should also be accountable for driving and maintaining visibility into implementation, leveraging that context to measure progress and evolve policies and processes as needed. Within an agency governance body, operational partners should lead implementation of policies within their domains, integrating

with other policies and processes that may be established or developed and surfacing overlaps or inconsistencies to be resolved by CAIOs and partners responsible for other agency-wide policies.

CAIOs should also have a role within broader agency decision-making and resourcing forums and processes to ensure they have the necessary visibility and can appropriately reinforce implementation of their policies. While the AI governance body officials and their teams can serve to scale bottom-up implementation efforts, CAIO participation in a broader agency oversight forum can help CAIOs leverage opportunities for top-down mandates and make decisions with impacts on broader agency operations or outcomes.

Beyond individual agencies, convening CAIOs through organizations or efforts akin to the Federal CIO Council can also help to ensure that lessons learned are shared and built upon by agencies seeking to rapidly advance responsible AI innovation. Policies and processes to create and maintain inventories, define innovation strategies, and measure implementation of safeguards may be transferable – or offer a starting point or knowledge about approaches to avoid.

Recommendations:

- Define baseline governance roles, responsibilities, and desired outcomes but allow for adaptability based on differences across agencies and evolving needs in practice. While some agencies may opt to assign the CAIO role to an existing senior official, others may create a new position; likewise, some agencies may establish a new AI Governance Body whereas others may expand the remit of an existing governance body. However, minimum expectations, authorities, and accountabilities of the CAIO and an agency body focused on AI governance should be consistent. Moreover, whereas new roles and bodies may signal the importance of AI governance and benefit from being focused on AI, updating the scope of an existing role or body may enable it to leverage existing relationships and processes and help avoid fragmentation of existing functions. Thus, OMB could provide guidance to help agencies determine the appropriate path forward and mitigate risks with either route.

- Establish ongoing training on AI and its responsible deployment for any officials, advisory committees, and governance bodies, leveraging NIST expertise. Also consider leveraging private sector experts to help share their knowledge the technology, the evolving practice of responsible AI, and examples of AI governance. One example we recommend is the AI Federal Leadership Program developed by the Partnership for Public Service and supported by the private sector, including Microsoft. The program runs cohorts of SES and GS-15 employees and to date has graduated over 200 participants from dozens of agencies. We also suggest looking to the AI and responsible AI training that Microsoft, LinkedIn, and others offer as examples and resources.

- Empower CAIOs with the authority to develop, manage implementation of, and evolve agency policies for AI innovation and risk management, including by establishing baselines

and metrics, measuring internal compliance, and creating a culture of responsible innovation.

- Establish an operating model whereby CAIOs regularly convene a cross-agency AI governance body responsible for driving implementation of AI innovation and risk management policies and provide feedback that could inform policy adjustments. The AI governance body should enable meaningful coordination on policy implementation, including by reviewing AI use cases, monitoring, and assessing performance against risk management metrics, providing guidance and support on policy interpretation, and sharing best practices. It should also help scale efforts to establish a culture of AI awareness and literacy, as well as a commitment to accountable AI practices, across the agency.

- Consider sequencing the creation of a cross-agency CAIO forum for sharing best practices and resources as CAIOs and their teams are established and provided some runway to operate. While too much structure too early could overburden efforts to build governance grounded in agencies' existing operations and needs, over time, each CAIO will have learnings that are transferable and for which there's greater readiness to process and implement as relevant.

5. Facilitate iterative improvement, including through small-scale pilots.

Establishing effective AI governance, enabling AI innovation, and ensuring accountability for AI risk are each critical endeavors. And they are the appropriate tasks for federal agencies to pursue *in parallel* to deploy AI responsibly, gaining enormous benefits for agencies themselves and their constituents. Moreover, there are use cases that are ripe for safe and rights-respecting deployment today, and the U.S. government cannot wait for more clarity to arrive in a space in which early users will gain competitive advantages. The technology and risk management practices will continue to evolve, and early adopters will gain critical context for future iterations of technology and safety techniques and evaluations.

In this environment, establishing approaches and processes that facilitate iterative improvement are as important as – or perhaps even more important than – establishing any single starting point. Along with more durable, process-focused policies, pilots and ongoing public-private partnerships and best practice communities can help realize such an approach. Pilots can offer a chance for forward-leaning agencies and partners to help surface and work through challenges in advance of attempting to implement policies across the federal ecosystem. For example, in the context of EO 14028, pilots may have also helped surface agency and software providers with uncertainties about how to deliver, manage, and use software bill of materials (SBOM) information, driving greater clarity and ultimately accelerating meaningful implementation.

Recommendations:

- Incentivize and support pilots that can provide valuable insights into how to implement and verify conformance with minimum AI risk management practices, including for agencies and with their federal contractors. Provide continuous visibility into learnings and potential needs for policy adjustments across the federal ecosystem and partner communities.

- Encourage agencies to conduct pilot projects on how to surface use cases for AI, how to share learnings across the federal community, and other open questions, recognizing that such efforts can proceed alongside the more formal development and implementation of innovation strategies and governance structures that allow for flexibility in incorporating their learnings.

Conclusion

We thank OMB for the opportunity to provide feedback on the draft memorandum for federal agencies regarding their use of AI products and services. We welcome further opportunities to engage on the development and improvement of a robust and comprehensive AI policy framework that empowers agencies to leverage AI as a strategic asset for advancing the public interest and enhancing government services. We look forward to working with OMB and other agencies to implement and operationalize responsible AI across the federal government.

Sincerely yours,

Gerry Petrella

Scale AI Comments in Response to the Office of Management and Budget Request for Comments on Advancing Governance, Innovation and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum Docket ID: OMB-2023-0020-0001

Scale AI (Scale) appreciates the opportunity to respond to the Office of Management and Budget's (OMB) request for comments on the Proposed Memorandum for the Heads of Executive Departments and Agencies (OMB Memo)[1] on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence". Scale looks forward to continuing work with the OMB and the rest of the Biden-Harris Administration to ensure the United States continues to be the global leader in the efficient adoption of safe, secure, and trustworthy AI.

INTRODUCTION

Scale was founded in 2016 with the mission of accelerating the development of AI. Today, our Data Engine powers every leading large language model (LLM), including OpenAI, Meta, Microsoft and Anthropic, through data fine-tuning, red-teaming, or test and evaluation. Beyond our work with LLM developers, Scale labels data for the leading autonomous vehicle programs at companies like GM and Toyota and works closely with the U.S. government. Based on Scale's role in the AI ecosystem, we have helped to pioneer nearly every major recent AI development.

As the United States leads the world in the adoption of AI, it is critical that we establish a regulatory framework that is flexible enough to enable innovation, while putting in place the proper safety guardrails. President Biden, Vice President Harris and other Administration officials echoed this sentiment, most recently when the President signed the "Executive Order on the Safe, Secure, and Trustworthy Development and Use of

[1] See, https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf

Artificial Intelligence" on October 30, 2023[2] and OMB released its accompanying memo.[3]

Scale applauds the Biden-Harris Administration for their AI approach to date and echoes Vice President Harris' sentiment and belief that "[w]hen it comes to AI, America is a global leader."

RAPID IMPLEMENTATION IS CRITICAL FOR U.S. LEADERSHIP

The OMB Memo and Executive Order put in place over 100 new requirements for agencies to implement over the course of the next 18 months, which are all critical pieces of U.S. leadership. These build on two previous Executive Orders and two pieces of bipartisan legislation, which are currently being implemented by those same agencies. Once this work begins, it is important that these new policies and regulations position the United States for success. The OMB memo starts to do this but can be improved to fully position our nation for global leadership.

The newly established Chief AI Officers[4] are a great starting point to centrally coordinate an agency's AI efforts, and they must be empowered and resourced to carry out the functions of their job effectively. The previously submitted AI use case inventories[5] were vital to understand both how each agency intends to leverage AI and show the status of its AI implementation.

Beyond empowering and resourcing, they will have no shortage of day one tasks that must be carried out by the Chief AI Officers to best set up their own Agency for future success. It will be critical for them to prioritize establishing an AI foundation that can be built on, instead of starting at the end of the journey. Scale appreciates the OMB Memo's approach to this by starting with the basics, but believes that the Chief AI Officer should also answer in their report questions related to the resources that they will need to better set long-term budgets.

---

[2] See, https://www.whitehouse.gov/briefing-room/presidential-actions/2023/10/30/executive-order-on-the-safe-secure-and-trustworthy-development-and-use-of-artificial-intelligence/

[4] iBid.

[5] See, https://ai.gov/ai-use-cases/

It is clear that AI is advancing faster than the government budget cycles. For example, ChatGPT launched on November 30, 2022,[6] which was after the agencies set their FY2024 budget requests, making it impossible to have included funding requests for generative AI, despite the OMB Memo's statements related to support for Agency use of the technology. Likewise, it is imperative that agencies include funding for the Chief AI Officer position and the implementation priorities, despite being close to finalizing their FY2025 budget requests. If the Chief AI Officers do not work on day one to understand their funding needs, and those needs are not adequately responded to, it is unrealistic to think that they will be properly resourced to do their jobs. We can not wait until at least FY2026 to begin to embrace AI; the rest of the world is not slowing down.

Additionally, it will be critical for NIST to expedite its work as soon as possible and that agencies support it. NIST has been a critical partner to industry and the government with their release of the AI Risk Management Framework,[7] launch of their GenAI Working Groups,[8] and the newly established AI Safety Consortium.[9] All of this work is critical to the development of safe, secure and trustworthy AI, but it is clear that it is not a small task.

Research gaps still exist related to evaluation benchmarks, determining risk classification of AI use, and more. To assist with this, Scale recently launched its Safety, Evaluation, and Analysis Lab (SEAL) that will develop methodologies, benchmark datasets, and fill the research gaps that exist today. SEAL intends to collaborate with NIST's AI Safety Consortium and standards development organizations to help build robust safety standards.

Scale is fully committed to doing our part to assist in the implementation of these new provisions. It is critical that federal agencies prioritize the early work and that Congress adequately funds these new requirements to position the United States for global leadership.

AI-READY DATA IS CRITICAL TO U.S. LEADERSHIP

For the United States to lead the world in the implementation of safe, secure and trustworthy AI, we must lead the world in AI-ready data. The output of an AI system is

---

[6] See, https://www.forbes.com/sites/bernardmarr/2023/05/19/a-short-history-of-chatgpt-how-we-got-to-where-we-are-today/?sh=1ab8b38f674f

[7] See, https://www.nist.gov/itl/ai-risk-management-framework

[9] See, https://www.nist.gov/artificial-intelligence/artificial-intelligence-safety-institute

only as good as the data that it is trained on, which means that to have high quality outputs, it must have high quality, AI-ready data that has been tagged, annotated, labeled and is able to be read by the algorithm.

The DoD has long recognized the importance of AI-ready data, and its own data strategy states that “Data sets for A.I. training and algorithmic models will increasingly become the DoD’s most valuable digital assets and we must create a framework for managing them across the data lifecycle that provides protected visibility and responsible brokerage.”[10] To convert raw data to AI-ready data, the DoD set up the Chief Digital and AI Office (CDAO)[11] that has been tasked with leading the DoD’s work on “AI Scaffolding” or building out its AI infrastructure.

Relatively, the DoD is a few years ahead of the rest of the federal government because of the aforementioned efforts, and its work can serve as a blueprint for the other agencies to build out their own AI Scaffolding. The OMB Memo correctly points out the value of AI training data calling it “...a critical asset for their AI maturity[12]”and tasks the Chief AI Officers (CAIO) of each agency to craft a plan to maximize each agency’s AI infrastructure.

This work will be critical to ensuring that federal agencies are set up to harness the power of AI. Within this strategy, Scale believes that the CAIO should work to better understand what has worked well from industry and the DoD and how they can best set their own agency up to leverage the AI Scaffolding concept.

Creating AI-ready data is necessary to position the United States to leverage AI and further cement our role as the global leader in AI.

A RISK-BASED TEST AND EVALUATION REGIME IS THE RIGHT APPROACH TO AI SAFETY

One of the most pressing topics facing governments around the world is related to ensuring that AI is safe to deploy. The OMB memo addresses this topic in Section IV “Minimum Practices for Either Safety-Impacting or Rights-Impacting AI” that beginning on August 1, 2024 requires test and evaluation “before using new or existing covered safety-impacting or rights-impacting AI” and “on an ongoing basis while using new or

[10] See, https://media.defense.gov/2020/Oct/08/2002514180/-1/-1/0/DOD-DATA-STRATEGY.PDF
[11] See, https://www.ai.mil/
[12] See, See, https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf

existing covered safety-impacting or rights-impacting AI, agencies must ensure these practices are followed for the AI."[13]

Scale strongly supports this approach and believes that test and evaluation is the best way to ensure that AI is safe to deploy. Test and evaluation is a standard process for bringing any product to market or getting it procured by the government, but this does not yet exist for AI. The OMB memo rightly puts this process in place for AI, though as the draft OMB memo becomes final, Scale would recommend the following to make this approach truly comprehensive.

First, the OMB memo does not specify whether or not the test and evaluation should be one size fits all or a risk-based approach. While it specifies certain use cases within Section b. "Determining Which Artificial Intelligence Is Presumed to Be Safety-Impacting or Rights-Impacting"[14] that will serve as the basis for which AI use cases will require test and evaluation prior to deployment, the memo does not provide guidance to agencies on determining the specific benchmarks to test and evaluate against.

Test and evaluation will rely, as rightly noted in the OMB Memo, heavily on industry best practices and standards. However, these best practices and standards will not identify the specific metrics that each use case will require. A risk-based approach will build on these standards to ensure that AI is safe for its intended use, and the risk associated with the use will determine the rigor of the evaluation.

Scale fully agrees that all AI, regardless of its intended use, should undergo an independent test and evaluation process, but the standards for test and evaluation should be based on the intended use and not one-size-fits-all. For example, AI being used for "Decisions to block, remove, hide, or limit the reach of protected speech"[15] or "Decisions regarding medical devices, medical diagnostic tools, clinical diagnosis and determination of treatment, medical or insurance health-risk assessments, drug-addiction risk assessments and associated access systems, suicide or other violence risk assessment, mental-health status detection or prevention, systems that flag patients for interventions, public insurance care-allocation systems, or health-insurance cost and underwriting processes"[16] can and should require different metrics to be evaluated against given their intended use.

---

[13] See, https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf
[14] iBid.
[15] iBid.
[16] iBid.

Both of the above examples will require test and evaluation, but the specific use case may require different metrics to be prioritized to ensure that it is safe for its intended use. It is critical that the agencies responsible for those use cases publish the specific metrics that they intend to evaluate against to provide the necessary long-term regulatory certainty.

Second, as agencies implement Section IV, it will be important to clarify how they can comply with the requirements. Section IV (c) correctly requires independent test and evaluation, but the OMB memo should clarify how this should be carried out. While it is critical that the developers and deployers do their own internal assessments throughout the AI development process, it is clear that an independent group should also test and evaluate the AI prior to deployment. However, the OMB memo does not provide guidance related to how this independent test and evaluation should be carried out.

Scale believes that independent test and evaluation can be a role that industry plays to stay current with the rapid pace of innovation and enable a shift towards a more performance-based approach that would see the government approve industry's work, while the government sets the safety objective or requirement.

Industry and governments around the world have heralded performance-based approaches[17] as the right approach to promote innovation and ensure a high safety bar. AI test and evaluation can and should also adopt this approach, which relies heavily on industry consensus standards, as it is best suited to meet the Administration's goals of creating a governance framework that is flexible to enable innovation and put in place the right safety guardrails.

Agencies should rely on existing best practices, standards, and documents like the NIST AI Risk Management Framework and AI Bill of Rights[18] when performing test and evaluation, as the OMB memo notes. Industry is also working to develop test and evaluation platforms that will take these guidelines and standards into account and adapt them, as needed, to new standards or best practices. Once the government sets the metrics that it intends to evaluate against, industry can incorporate those into our platforms and continuously update them to be current.

This will be required by the rapid pace of innovation. Multiple new frontier models have been released in 2023 alone, and in the next 18 months, it is anticipated that many

[17] See, https://www.ainonline.com/aviation-news/business-aviation/2017-09-05/new-faa-part-23-becomes-reality
[18] See, https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf

more will be released, as well as innovations that are not public or captured in the scope of OMB memo. A performance-based regulatory framework would ensure that test and evaluations would be current for new innovations quickly after their release, instead of requiring new rulemakings and updates to the procurement guidelines every time industry releases a new technology.

Scale believes that Section IV of the final OMB memo should be updated to reflect the above recommendations to establish a comprehensive test and evaluation regime.

CONCLUSION

Scale looks forward to continuing to work with OMB and the entirety of the federal government to ensure that the United States leads the world in the adoption of safe, secure and trustworthy AI.

Please direct any questions to the undersigned.

Re: OMB–2023–0020; Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum

Dear Administrator Martorana,

The American Council on Education (ACE) submits these comments in response to the "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum." This draft memorandum lays out the responsibilities of the federal agencies under recent legislation and the October 30, 2023, "Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence" Executive Order in advancing "AI governance and innovation while managing risks from the use of AI, particularly those affecting the safety and rights of the public."

ACE is the major coordinating body for the nation's colleges and universities, representing over 1,600 colleges and universities, related associations, and other organizations in America and abroad. ACE is the only major higher education association to represent all types of U.S. accredited, degree-granting colleges and universities, public and private. Our members educate two out of every three postsecondary students attending accredited, degree-granting U.S. institutions. Given the diversity of our membership and the education mission of our members, our comments focus on the education-specific implications with an emphasis on the implementation of this memorandum at the U.S. Department of Education. We have also submitted comments to the United States Committee on Health, Education, Labor, and Pensions regarding the actions the committee and Congress may take regarding federal policy on AI in education.[1]

Regarding this draft memorandum, OMB is requesting feedback on several specific questions. Below please find our responses.

Question #1 focuses on the creation and role of a Chief Artificial Intelligence Officer (CAIO). The draft memorandum states that the primary responsibility for a CAIO will be "coordinating

[1] https://www.acenet.edu/Documents/Letter-Senate-AI-092023.pdf

their agency's use of AI, promoting AI innovation, managing risks from the use of AI, and carrying out the agency responsibilities." For the U.S. Department of Education (ED), the CAIO will need to coordinate and work across the various offices within ED, including the office of Federal Student Aid (FSA), as well as the Office of Postsecondary Education (OPE). Therefore, the CAIO should be specifically charged with working across the various divisions at agencies, which at ED cover K-12, postsecondary, and vocational and technical education. This can be accomplished through the proposed Agency AI Governance Boards but will need to include representation across ED's diverse divisions, as well as the relevant stakeholder communities. It will be important for the AI Governance Board at ED and other agencies to incorporate feedback and input from stakeholders as they move forward in creating and implementing AI policies and programs.

In regard to Question #4, about how agencies should take advantage of generative AI to improve agency missions or business operations, there are numerous ways AI could be used to improve customer service for federal student aid. These include identifying and granting public service loan forgiveness for qualified borrowers; identifying and working with qualifying individuals to apply for federal student aid (even before a Free Application for Federal Student Aid form is completed); and speeding up responses to inquiries for institutions and individuals at FSA. The development of a process in which a student, guided by an AI chatbot, is provided personalized information, directed to relevant resources, has questions answered, and receives prompts to initiate or complete various stages of their application process could have enormous benefits for low-income students, especially those with other external demands such as jobs or family responsibilities.

Question #5 asks if there are "use cases for presumed safety-impacting and rights-impacting AI" that should be included in the final memorandum. We are pleased that Section b (ii) "Purposes that are Presumed to be Right-Impacting" includes:

- E. In education, detecting student cheating or plagiarism, influencing admissions processes, monitoring students online or in virtual-reality, projecting student progress or outcomes, recommending disciplinary interventions, determining access to educational resources or programs, determining eligibility for student aid, or facilitating surveillance (whether online or in-person).

ED should work with the higher education community to provide guidance to institutions of higher education regarding these important issues, especially as it relates to eligibility for Title IV and other federal requirements on colleges and universities. It will be important for the ED Office for Civil Rights (OCR) to be involved in those conversations. In addition, institutions are exploring using AI to streamline, and in some cases remove, bias from some institutional processes, including the use of AI in the admissions process. In the admissions process, AI can perform initial screens of application materials to ensure that minimum requirements for admission are met before admissions personnel review them, saving countless hours of staff time. AI can also review large data sets, such as transcripts, that could reduce time and burden for institutions as part of complicated admissions decisions in areas such as transfer of credit. It will be important that any guidance coming from ED, or other agencies, does not limit or stifle innovation in these areas, which could result in discouraging first-generation and other under-represented students from pursuing postsecondary education.

To Question #7, what types of materials or resources would be most valuable to help agencies, as appropriate, incorporate the requirements and recommendations of this memorandum…", the final memorandum from OMB should include directions, or at the very least encouragement, that agencies engage with the stakeholder community in developing and implementing policies and actions with AI. Specifically for ED, the higher education stakeholder community can share effective practices and institutional policies from a campus perspective, as well as providing input into how AI can be used to improve services at ED.

For question #8, "what kind of information should be made public about agencies' use of AI in their annual use case inventory," we believe it would be helpful to include information regarding whether AI had a substantial impact on speeding up responses to individual or institutional questions to ED, as well as how AI may be being applied beyond the Office of Federal Student Aid. For instance, if it is being used in the grant making process within OPE, or how it is being applied at FSA to support applications and disbursement of federal student aid.

We appreciate the proactive actions of OMB and the administration in encouraging the federal agencies to develop effective policies around AI. We look forward to continuing to engage with the administration on these important issues.

Sincerely,

Ted Mitchell
President

ITI Promoting Innovation Worldwide

Director Shalanda Young
Office of Management and Budget
725 17th Street NW
Washington, DC 20503

Re: Comments from the Information Technology Industry Council (ITI) on the Draft Memorandum entitled "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence"

Submitted via regulations.gov
Docket ID: OMB-2023-0020-0001

December 5, 2023

Dear Director Young,

The Information Technology Industry Council (ITI) greatly appreciates the opportunity to comment on the draft memorandum on advancing governance, innovation, and risk management for agency use of artificial intelligence (AI). We recognize that the Office of Management and Budget (OMB) is under no obligation to release pre-decisional drafts of its M-series memoranda for public consumption. We welcome the opportunity to provide the below comments and thank you for prioritizing public-private collaboration on this effort.

ITI is the premier global advocate for technology, representing the world's most innovative companies. Founded in 1916, ITI is an international trade association with a team of professionals on four continents. We promote public policies and industry standards that advance competition and innovation worldwide. Our diverse membership and expert staff provide policymakers the broadest perspective and thought leadership from technology, hardware, software, services, and related industries.

ITI and our member companies support the government's vision of safely and responsibly developing and deploying AI and we commend President Biden for his leadership in launching the Administration's new whole-of-government approach to AI. Technology has always played an essential role in shaping the economy and AI is already revolutionizing many sectors. We appreciate the careful consideration given by the government for responsibly adopting and integrating AI in ways that can significantly enhance agency operations, and services, and cybersecurity while appropriately managing risks. We support OMB's efforts to advance trustworthy AI, which will be imperative to fostering public trust in this emerging technology. At the same time, it is important that OMB's guidance strikes a balance that fosters accountability without hindering innovation. To ensure U.S. competitiveness, the federal government must rely on the cutting-edge commercial AI technologies developed by the private sector pursuant

to commercial best practices, including widely accepted approaches for managing risk. We believe that the risk-based approach outlined in this memorandum is an important step in realizing this vision, but we urge OMB to consider our suggestions for how to fully realize a risk-based approach. To that end, our comments seek to preserve the goal of building trustworthy federal AI systems, while navigating the increasingly complex procurement environment and ensuring that the federal government can access best-in-class commercial AI solutions.

Below, we touch on a number of issues including minimum risk management practices, government access to and management of data, aligning federal contracts with AI guidance, cybersecurity governance processes and resourcing.

Our comments focus on the following recommendations:

I. Adopt Standards-Based Approaches

A. Evaluate AI models' capabilities and risks through testing and by focusing on outputs, rather than through inputs such as training data.

B. Adopt the National Institute of Standards and Technology (NIST) AI Risk Management Framework (RMF) as a common standard for evaluating and mitigating AI risk, including the RMF's focus on "high-risk" solutions and the creation of use-case profiles.

II. Leverage Innovative Commercial Solutions and Promote Competition

A. Promote innovation by prioritizing the use of commercial AI solutions to the maximum extent practicable, rather than developing government-unique requirements and solutions.

B. Promote competition by ensuring government requirements prioritize interoperable commercial AI solutions, including related technologies, in line with existing best practices and commitments.

C. Protect vendors' intellectual property and proprietary data by ensuring that government-required reporting focuses on the minimum amount of information required to address risk.

III. Clarify Public/Private Shared Accountability for Harm Prevention

IV. Improve Government Processes and Resources to Support AI Adoption

A. Ensure the U.S. Government prioritizes automation and modernizing its internal systems and practices to appropriately facilitate risk assessments and continuous monitoring of AI solutions.

B. Ensure the U.S. Government uses all available avenues and authorities to attract, retain, and develop the skilled, diverse AI workforce needed to accomplish the responsibilities described in the memo.

These recommendations are discussed in detail below.

I. Adopt Standards-Based Approaches

A. Evaluate AI models' capabilities and risks through testing and by focusing on outputs, rather than requesting inputs such as training data.

Section 5(c) of the OMB memo recommends methods based on superseded approaches that focus on the data inputs for an AI model instead of the outputs. Advances in technology are allowing us to extract greater insight from smaller and imperfect data sets. We urge OMB to consider refining the memorandum's approach away from direct inspections of data toward verifications of dataset validity and evaluations of outcomes as the vehicles for mitigating risks that impact rights and safety.

Requiring agencies to sift through and review volumes of data to ensure it is reflective of the communities the AI tool is designed to serve is an inefficient use of resources nor is it technologically feasible. We support OMB's goal of reducing bias in AI models used in government service delivery and offer a few suggestions below to both strengthen this approach and ensure the federal government can continue to access innovative commercial AI solutions that further this goal.

Additionally, Section 5(c)(iv)(A)(3) states that agencies need to fully evaluate the sufficiency of the data that underpins the development, training, testing and operation of the AI system before deployment to minimize risks from low quality or inappropriate data. However, pretrained foundation models (defined in the U.S. AI Advisory Council FAQs) have been created with massive volumes of diverse text data collated over many years.[1] For commercial companies who offer these models, documenting complete provenance and reliably assessing errors is infeasible across web-scale data sets measuring in the hundreds of gigabytes. For Foundational models, ITI urges OMB to instead require agencies to focus analysis expectations on model outputs rather than exhaustively documenting training inputs, allowing standard techniques like safety benchmarks to count toward compliance with the memo's goals. If specific requirements for data inputs are imposed, they should pertain to the agency's use of the data (e.g., for agency fine-tuning of vendor models).

B. Adopt the National Institute of Standards and Technology (NIST) AI Risk Management Framework (RMF) as a common standard for evaluating and mitigating AI risk, including the RMF's focus on "high-risk" solutions and the creation of use-case profiles.

ITI appreciates that OMB encourages agencies to fill gaps by aligning risk management best practices with the NIST AI RMF. However, we urge OMB to fully adopt the NIST AI RMF's flexible approach to evaluating and mitigating risk, rather than the current, more prescriptive approach outlined in the memorandum with its broad categories of "rights-impacting" and "safety-

[1] See https://ai.gov/wp-content/uploads/2023/09/FAQs-on-Foundation-Models-and-Generative-AI.pdf

impacting" AI and the expansive list of use cases and/or sectors that are *presumed* to impact one's rights or safety. We recognize that AI is a powerful tool that can "meaningfully influence the outcomes of [many] activities or decisions" but have concerns that these categories, as they are currently scoped, would inadvertently capture uses of AI that would not impact rights or safety and instead serve as a barrier to the government harnessing AI technologies with diverse societal benefits.[2]

Moreover, Section 6 of the memorandum defines "safety-impacting" AI as including any AI that has the "potential to meaningfully impact…safety" and it is not evident what the distinction is between AI that is presumed to impact safety compared to AI that has the "potential" to impact safety. We are concerned that the term "potential" could serve as a catch-all for any AI use case as this technology continues to mature and strongly urge OMB to clarify if and how these two terms are distinct.

We are similarly concerned that the memorandum's definition of "rights-impacting AI" may inadvertently discourage the adoption of AI tools that promote the interest of marginalized communities as it makes it hard to anticipate the breadth of potential agency actions that could be covered by the memorandum. To address this, OMB should focus on anticipating what civil and human rights risks may surface from AI products rather than presuming from the outset that they are such.

We urge OMB to consider scoping guidance on "high-risk" applications, as opposed to "rights-impacting" or "safety-impacting" applications. As it currently stands, OMB is defining virtually all applications as high-risk and therefore making it difficult or impossible for federal agencies to adopt AI tools. In our view, an AI system is considered high-risk when an outcome could materially and negatively impact fundamental human rights or safety—especially as it pertains to health, safety, freedom, discrimination, or human rights.

ITI strongly supports how NIST has used the Cybersecurity Framework (CSF) for establishing an overarching cybersecurity risk management strategy for developing standards, guidelines, and best practices within organizations to manage cybersecurity risk and believes the NIST AI RMF has the potential to achieve a similar outcome. The NIST AI RMF outlines in great detail the core functions that organizations designing, developing, deploying, or using AI should follow to manage risks and is intended to be a practical way for organizations to operationalize these strategies as AI technologies continue to mature and evolve. OMB should avoid deviating too far from the principles within the NIST AI RMF as these were developed in close coordination with industry stakeholders and reflect existing best practices for managing and documenting the risk management process for AI.

[2] See: 5(b)(ii) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=16

To better align these two risk-based approaches, we encourage OMB to consider implementing the use-case profiles presented in Section 6 of the NIST AI RMF. Incorporating use-case profiles (e.g., hiring profile, fair housing profile) would offer a more nuanced approach for understanding how to manage risks at various stages of the AI lifecycle for an agency specific use case of AI rather than defining extensive categories that may capture most possible uses of AI. We recommend that OMB leverage these use-case profiles presented by the NIST AI RMF to operationalize the goal of managing risks to rights and safety from agency use of AI without impeding the government's ability to utilize best-in-class commercial technologies for service delivery.

In developing those profiles, it is important to recognize that not all applications of AI pose equivalent risks nor do all applications of AI inflict harm on the public and warrant regulation. Additionally, if using an AI system in a high-risk context produces a more desirable result than alternative tools and/or processes, using the AI system may actually reduce safety risks. A decision based on outputs from a well-described and documented AI system has the potential to be more transparent than one made based on the personal judgment of an individual or group. It is critical that OMB works with federal agencies to ensure any required AI governance actions do not disincentivize the adoption of AI technologies that have the potential to reduce risks in high-stakes contexts.

Below, we have provided a non-exhaustive list of use cases that demonstrate how AI tools and solutions developed by industry are positively impacting the proposed risk categories in Section 5(b) of the OMB memorandum:

- **Medical Devices**: Section 5 (b) presumes that medical equipment including "medical devices, medical diagnostic tools, clinical diagnoses and determination of treatment" among other applications would potentially be safety-impacting and/or rights-impacting, but it is also important to recognize that AI applications are poised to revolutionize everything from the back office to the doctor's office, and from the emergency room to the living room in patient care. AI technologies are being used to develop insights on large patient populations to help predict, pre-empt, and prevent diseases and in early results are already more effective in delivering precision patient care.[3] As an example, AI is currently being used to "study digitized images of biopsies to detect subtle differences between tumors" and to ""sift through [volumes of data] to [identify] patterns and speed up the drug development process."[4] Consequently, it will be critical for OMB to help federal agencies develop more nuanced criteria for determining which AI medical use cases are safety-impacting or rights-impacting.

[4] Loftus, P. (2023, November 30). J&J hired thousands of data scientists. will the strategy pay off? The Wall Street Journal. https://www.wsj.com/tech/biotech/johnson-johnson-hiring-data-scientists-ai-ccbf2c07?st=mnsc2q5tdd7fsub&reflink=desktopwebshare_permalink.

- **Financial Services**: Section 5 (b) also calls attention to the impact that AI could have on the financial services sector including "mortgage underwriting…loan-allocation processes, credit scoring…[audits] and financial system penalties" but AI tools can help to expand access to capital, allowing individuals and small businesses to take out loans that they otherwise might not qualify for. OMB should work with financial regulatory agencies to ensure that regulations and other policy actions do not discourage the use of AI systems in mortgage underwriting and loan allocations. Instead, federal agencies should encourage the use of trustworthy AI systems that support civil rights and improve equity in lending. To encourage responsible AI adoption, OMB should work with federal agencies to ensure regulatory frameworks empower regulated entities to integrate AI governance safeguards into their existing data privacy, cybersecurity, and model risk management programs. Moreover, AI can also distill complex tax laws into a personalized decision system enabling individuals to quickly and accurately file taxes. AI systems help combat fraudulent transactions, secure payments, and enhance cybersecurity throughout the financial sector. Federal AI governance requirements should enable public-sector and private-sector entities to continue deploying AI technologies for these important, beneficial purposes.

- **Law-Enforcement**: Section 5 (b) references the impact to law enforcement or surveillance-related assessments, including license plate readers and technologies that analyze biometric information. But these technologies, enhanced by AI including facial recognition technology (FRT), have transformed safety and security operations. For example, widely used biometric identity verification capabilities such as fingerprint or facial recognition support a tremendous volume of secure online commerce on a daily basis. Such tools help prevent identity theft and fraud, as well as aid in authentication and verification solutions for account access and financial transactions. These AI-powered capabilities are also used for physical security such as access control and facility security screening, and even support rapid and contactless travel experiences such as clearing customs and aviation security screening.

- **Movement of Vehicles**: Not all movement of vehicles present a risk to safety. AI has been critical in assisted driving technologies to improve driver safety and reduce the prevalence of traffic accidents. Many vehicles deploy AI technologies to assist with automatic emergency braking or to analyze complex traffic scenarios to help drivers make more informed decisions. AI allows workers to remotely operate vehicles, thereby reducing or eliminating threats to personal safety that occur in physically dangerous work environments.

- **Climate Technology**: AI also has the potential to contribute solutions to the growing climate crisis. Studies show that impacts from our changing climate fall disproportionately on underserved communities that do not have adequate resources to prepare for and recover from heat waves, poor air quality, flooding, and other impacts.[5] AI is helping to restore balance by combing through enormous volumes of data to enhance the accuracy of weather forecasts and prepare communities to reduce the impact of climate disasters through better preparation. With nearly half of the world lacking adequate warning systems for climate events like floods and wildfires, AI is an important tool in notifying vulnerable populations and saving lives in the process.[6]

- **Cybersecurity**: Defensive cyber operations is another beneficial use case where AI is already leveraged to protect networks and information systems from nation-state or other cyber threat actors that could undermine the confidentiality, integrity, and availability of the systems the government uses to protect health, safety, and fundamental rights. Network defenders need tools to monitor large amounts of security data, vulnerability information, and other telemetry, spot malign activity in real-time and launch automated response and remediation measures. Maximizing AI for this critical cyber defense use case will inevitably support both the security of those systems and the privacy of the data within which ultimately helps federal agencies protect fundamental rights.

- **Human Resources**: AI in HR has the ability to improve every aspect of the modern workforce, from recruiting and training to increasing employee engagement and retention. The OMB memorandum highlights employment as rights-impacting, but new recruiting AI software can remove unconscious biases in job descriptions. Further, specialized AI for training is interactive, continuously learning and adapting to each worker's learning style and interests. Virtual reality training, natural language bots, and self-directed apps are available at the worker's convenience, thus increasing engagement and material retention. The government should make it easier for workers to upskill and have access to trainings.

These examples of AI's ability to positively impact rights and safety demonstrate why OMB should continue dialogue with stakeholders across the AI value chain. The goal of that dialogue should be how to best characterize and scope use cases so that the government can fully leverage this transformative technology and deliver for its constituents, with the Chief Artificial Intelligence Officer (CAIO) leading the way in making these decisions and considering multiple factors that balance use case-specific considerations. Through those use cases, federal agencies

[5] U.S. Environmental Protection Agency, "Climate Change and Social Vulnerability in the United States: A Focus on Six Impacts" (2021), EPA 430-R-21-003.
[6] UNDRR and WMO (2022) "Global status of multi-hazard early warning systems: Target G", United Nations Office for Disaster Risk Reduction.

will have the flexibility to utilize the best technologies that make sense for their intended purposes, while ensuring they have robust processes to advance public trust and safety.

II. Leverage Innovative Commercial Solutions and Promote Competition

A. Promote innovation by prioritizing the use of commercial AI solutions to the maximum extent practicable, rather than developing government-unique solutions.

The federal acquisition process generally prioritizes the use of commercial products and services, rather than government-unique or custom solutions. This makes sense in the context of AI, which has largely been developed and deployed by the private sector. As OMB develops its guidance for aligning federal contracts with the guidance in this memorandum, we urge OMB to ensure agencies have the authority and direction to fully leverage commercial acquisition procedures to procure AI. To make the most of this approach, agencies will need to procure private-sector AI under commercial terms that balance the government's interest in licensing AI with the commercial firms' interests in making broader commercial use of their products and services. As discussed above, when procuring AI, the government should focus requirements around AI outcomes (e.g., optimization of air traffic or management of fraud, waste, and abuse in tax filings) as doing so will promote a collaborative engagement with industry to identify solutions that achieve those outcomes, with the broadest possible group of market participants.

It is also important to note that AI capability is not generally procured independently. Rather, it is most often a function of code that enhances the usefulness of other software that was written for a specific purpose. For example, travel and expense software may be delivered with AI capabilities to reduce the opportunity for improper payments, financial management software uses AI to enhance user experience, and generative AI to improve business operations. Indeed, many commercial software programs come standard with AI capabilities, and have for some time. The government must also prioritize the use of commercial products and services that leverage AI, to ensure a full range of access to private sector innovation.

Especially in the context of commercial providers, we are concerned that Section 5(d) of the OMB memorandum lacks guidance on how broadly these requirements will apply throughout federal contractor supply chains. For example:

- Will the requirements apply only at the prime contractor level, or will the government require prime contractors to flow requirements down to subcontractors and/or lower tier suppliers?
- Will these subcontractors and/or lower-tier suppliers potentially be required to provide reporting information directly to the federal government, even if there is no contractual privity?

We urge OMB to limit contractual requirements to the companies with which the government has a direct contractual relationship. Furthermore, we suggest that the U.S. Government consider excluding common commercial products in which AI is embedded from the scope of future rulemaking to ensure regulators are focused solely on the AI systems that present the highest levels of risk.

Additionally, we recognize that implementing new reporting and other minimum practices requirements in federal contracts represents an increased burden and cost for both the federal acquisition workforce and the vendor community—especially for small businesses that may be new to considering these requirements and commercial companies that do not factor in the cost of these additional requirements into their standard pricing. We strongly support additional training and technical assistance for both the acquisition workforce and federal suppliers to understand new minimum practices requirements and how to successfully implement them within federal contracts. This is especially needed for AI red teaming, which does not yet have a standard meaning, and may be a new concept and practice for many suppliers. It would be beneficial for OMB to consider opportunities to implement Application Programming Interfaces (API) and other assistive developer resources to help scale and automate this work.

Finally, we have questions about OMB's planned approach for developing an "initial means to ensure that AI contracts align with the guidance" in the OMB memorandum and AI EO.[7] Specifically:

- Will this be completed as a government wide mass modification or class deviation?
- Will guidance be issued to individual contracting officers to modify contracts in line with OMB guidance?
- Absent a Federal Acquisition Regulation (FAR) rulemaking process, how will OMB and/or federal agencies seek public input on the new contract language?
- Will contracts be modified unilaterally or bilaterally?
- Will existing contractors taking on new minimum practices be entitled to seek compensation through an equitable adjustment or other means?
- Will this guidance apply only when AI is delivered in a procurement, or does it also apply if AI is used by a contractor or subcontractor?

These are just some of the questions that surround the implementation of these requirements in federal contracts. To further understand the range of concerns and perspectives, we encourage OMB and/or individual agencies to seek public comments on any proposed contractual modification or other directive, ideally through the rulemaking process.

[7] See: 5(d) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=21

B. Promote competition by ensuring government requirements prioritize interoperable commercial AI solutions, including related technologies, in line with existing best practices and commitments.

Section 5(d)(iii) of the OMB memorandum requires agencies to "take appropriate steps to ensure that Federal AI procurement practices promote opportunities for competition among contractors and do not improperly entrench incumbents."[8] While ITI strongly supports government efforts to ensure a competitive environment, we are concerned about how this will be accomplished given how AI models and associated technology are sold and used. For example, if the government enters a five-year contract to procure an AI model, and then exposes that model to government data for the life of the contract, the AI model will be trained significantly over a five-year span to cater to the government's unique data needs and requirements. When the five-year contract is over, how will the government possibly ensure a level playing field for a new contract competition for the AI model? The evolving nature and trainability of AI models raise unique challenges for achieving full and open competition for a subsequent contract award.

To support robust competition and innovation, agencies should prioritize interoperability and commercially available infrastructure as they adopt AI technologies. Doing so will support a vendor-agnostic environment, permitting new or competitive technologies to be slotted in seamlessly as they become available.

Exceptions from this approach should be rare, with well-documented justification. If an agency is unable to integrate technology from new vendors, it will miss opportunities to adopt superior technologies as they become available. This risks impeding the agency's mission and exposing the agency to security risks if the incumbent technology becomes compromised. It also excludes other vendors from competing fairly to serve agencies, thus distorting the innovation ecosystem and potentially undermining the country's competitive edge.

Among other measures, OMB should clarify the meaning of Section 5(d)(v)(a) regarding responsibly procuring generative AI to ensure that the contracting process does not favor incumbents who are able to shape the "testing and safeguards" requirements to meet their existing processes (e.g., setting specific requirements that would be costly or difficult for others to achieve).

OMB should also clarify the meaning of Section 5(d)(ii)(A) on transparency and performance improvement to ensure that it is not used to advantage incumbent providers. It is critical for new entrants and competitors to be informed about the documentation that agencies require under this provision. Otherwise, incumbents will have a competitive advantage in designing technology that can meet the agency's standards.

[8] See 5(d)(iii) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=21

Finally, we note that much of the government's ability to create a competitive environment for AI technology depends on how the government chooses to define requirements for purchasing AI. For example, additional clarity is needed regarding the following points:

- How is the government thinking about procuring AI? Will the government primarily procure AI models? Or, alternatively, outputs from an AI model or tool?
- Does the government intend to pursue enterprise license agreements for AI solutions?
- What government use/data rights will be required for the AI technology procured?
- Will future government contract solicitations clearly specify when the technology to be procured is considered to be rights impacting and/or safety impacting such that minimum practices will be contractually required?
- Regarding fair competition in the contracting process, what does fair competition look like for an AI product or service? Are there specific criteria that agencies will use when evaluating AI models as part of the procurement process?

As discussed above, we strongly encourage the government to conduct robust stakeholder outreach—particularly to commercial providers—to understand how AI models and outputs are sold commercially and to ensure government acquisition processes incorporate these best practices.

C. Protect vendors' intellectual property and proprietary data by ensuring that government-required reporting focuses on the minimum amount of information required to address risk.

ITI recommends the removal of documentation requirements related to data used in AI's design, development, and training contained in Section 5(a)(ii) of the OMB memorandum. Compilation of training data is a confidential commercial secret with significant competitive value. If OMB/agency procurement officials require vendors to disclose information about such data to agencies, it may foreclose the vendor's ability to claim trade secret protection under federal or state law. These concerns are only amplified if agencies seek to use fewer but larger models, like foundation models, which are trained on a central corpus of internet scale data and are intended to be used by many customers across many use cases. The training data disclosure requirements are therefore impractical and not well suited to evaluating appropriateness for use across federal agencies.

ITI is supportive of OMB's goal in requiring agencies to assess the quality and appropriateness of data used in model development to help determine a model's performance for a particular use case, including ensuring it works with appropriate levels of accuracy and performs fairly across relevant demographic groups. However, visibility into training and evaluation datasets will not meaningfully help an agency make that determination. Training datasets vary based on many factors, including size, demographic makeup (the number and type of groups), quality (amount

of confounding variation, fit for purpose), the types and quality of labeling, and other factors. Simply because a model has been trained on certain data does not mean it will perform as needed in a specific use case. Instead, testing is the scientifically appropriate and industry-standard mechanism that provides the best indication of performance and is already required in Section 4 (b). For example, even if an agency has access to information that a model was trained on data across a variety of languages, including English, Mandarin, Hindi, Spanish, French, in order to assess how well the model performs in transcribing Mandarin in a particular application, the agency must test the model, and evaluate the outcomes.

If OMB seeks to require vendors to provide information to agencies related to model development, rather than focusing on training data, ITI recommends that OMB and agencies limit these requests for information to submissions describing: (A) the capabilities of the AI system; (B) known material limitations at the time of development of the AI intelligence system; (C) guidelines for intended use; and (D) example performance results. This will provide agencies with the most relevant information for AI system assessment and selection before they commence their own testing for their intended use case. To the extent documentation of information regarding training data is required, we suggest limiting this to summary information about the data the model was trained on and/or that demonstrates how training data is appropriate to the agency's intended use. For example, documentation could show that a model was trained on industry-specific content, such as medical records.

While we understand the government's requirement for industry to provide reports on AI technology development and security, including the results of AI red teaming, we note that there is a substantial risk of unintended consequences associated with the unauthorized disclosure of companies' proprietary or sensitive information, including capabilities that support privacy-enhancing technologies (PETs), confidential computing, or information that could jeopardize the security of network and information systems. We recommend implementing security measures and access controls that balance information sharing with protecting contractor information. Additionally, we recommend the government limit the information required to the bare minimum necessary to achieve the government's goals for this process.

III. Clarify Public/Private Shared Accountability for Harm Prevention

ITI urges OMB to modify the memorandum to clarify the extent to which the U.S. Government and the private sector will share accountability for harm prevention in the government's use of private sector-developed AI solutions.

For example, Section 5 (b) requires agencies to bring selected vendors under compliance with the minimum risk management practices or cease the agency use of that covered AI. However, additional clarification is necessary to better understand the impact on various stakeholders. OMB should clarify the extent to which vendors will be expected to perform some or all of the

minimum practices. This is particularly important in the pre-deployment phase as industry awaits agencies to build out their capacity to "independently evaluate AI."[9]

As just one example, the recent Infrastructure Investment and Jobs Act (IIJA) includes significant investment in upgrading our physical and digital infrastructure by expanding federal financial assistance for infrastructure projects, particularly to deliver broadband access to unserved and underserved communities, clean drinking water, and safe and reliable transportation. Importantly, commercial information technology (IT) is an essential component of the products and services that deliver on these objectives, and the application of technology in those projects may substantially benefit from the use of AI. It is currently unclear how the minimum risk management practices would apply to federal grants and other contracting vehicles.

While we understand that details on aligning federal contracts with the guidance in this memorandum are forthcoming, we encourage OMB to expand on Section 5 (c) that describes the set of exclusions and waivers from the minimum practices to avoid significant project delays, increased costs, and uncertainty for both the government and industry. It is important to note that the memorandum does offer agency CAIOs the option to waive one or more of the minimum requirements for specific use cases that would "create an unacceptable impediment to critical agency operations," although clarification is needed on what constitutes an "unacceptable impediment".[10] Additional questions include:

- Would a significant delay to an infrastructure project designed to repair deteriorating roads and bridges qualify, especially if the road or bridge is a detriment to public safety?
- How would an agency treat recipients of a grant simply using AI to assist in streamlining routine tasks like forecasting, routing, and other operational processes?
- If federal grant recipients are subject to these minimum risk management practices, how would that be implemented?

Finally, it is important for OMB to consider that during the post-deployment phase, security and privacy considerations differ from that of development. This means that vendors typically do not have the ability to monitor the use of their AI tools by external customers, and in fact, the government may not want vendor monitoring in order to protect sensitive data and uses. We urge OMB to be clear on what documentation will be required to perform evaluations on outputs from a model, if this will be an ongoing requirement over the lifetime of the model, and to what extent this will be a shared responsibility between the government and the AI vendor.

[9] See: 5(c)(iv)(C) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=16
[10]See: 5(c)(iii)(C) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=14

IV. Improve Government Processes and Resources to Support AI Adoption

A. Ensure the U.S. Government prioritizes automation and modernizing its internal systems and practices to appropriately facilitate risk assessments and continuous monitoring of AI solutions.

To fully leverage the benefits of innovative AI solutions, the government must prioritize the modernization of the existing systems, technologies, and processes that will interact with AI. For example, Section 4 (b) of the OMB memorandum directs agencies to prioritize critical and emerging technologies in FedRAMP's authorization process, particularly generative AI. However, FedRAMP does not have the infrastructure to handle the current scale of authorization applications. The FedRAMP marketplace lists just over 300 authorized CSOs in a commercial marketplace with multiples of 10,000 CSOs. According to the Federal Secure Cloud Advisory Committee (FSCAC), roughly 80 percent of FedRAMP resources are dedicated to continuous monitoring rather than the authorization process. As the FedRAMP process is itself being updated, we encourage OMB and GSA to work closely with industry stakeholders, and to ensure that the FSCAC is able to provide AI specific guidance.

ITI shares OMB's desire to update the agency authorization process and recognizes the potential of AI solutions to support automation goals. We recommend OMB expand on Section 4 (b) (ii) and provide additional context on how OMB envisions balancing the current backlog in the Authorization to Operate (ATO) process with the directive to prioritize critical and emerging technologies. For example, this section directs agencies to "update, as necessary, cybersecurity authorization processes to better address the needs of AI applications" but does not provide explicit details on how agencies should achieve this objective. Additional clarification is needed regarding the unique authorization requirements for AI applications. Absent that clarification, this section risks exacerbating the existing problem of agencies adopting their own approaches and therefore not leveraging the work of other agencies. Considering that FedRAMP's ability to automate certification processes that span across the whole of government will be the ultimate determinant of its long-term success, we encourage the continuation of public-private engagements to identify and tailor the authorization process for AI as necessary.

Separately, we note that Section 5 (d) of the OMB memo encourages, but does not require, agencies to conduct "adequate" testing, including external AI red teaming as part of the tailored risk management requirements for procuring generative AI. It is important to note that these AI red teaming standards that agencies are encouraged to incorporate into federal contracts do not yet exist and that the Executive Order directs NIST to develop such standards within the next 270 days. We recommend that OMB require agencies to follow NIST's standards once developed and provide a clear timeline for agencies to implement them only after the standards are published.

Additionally, the definition of "artificial intelligence red teaming" established in Section 3 (d) of the Executive Order is more broad than the traditional use of red teaming in the security

context. Traditional red teaming is already a time-consuming, costly, and specialized process, which will become even more so with the addition of large-scale data requirements. Alternately, OMB can encourage agencies to embed secure-by-design principles within the federal acquisition and ATO process, through including cybersecurity as a factor in vendor selection. Doing so would allow red teaming capabilities to focus on the most important systems and uses. It would also be beneficial for the forthcoming OMB guidance aligning federal contracts with the memorandum to clarify a few points further as there is significant ambiguity around this provision. Additionally, as mentioned above, consideration should be given to how these red teaming requirements may impact small businesses and their ability to comply. To give you a sense of the type of information that would be helpful, we would welcome input on the following questions:

- What would be considered adequate testing?
- How often are companies expected to test and how extensively?
- If the testing identifies a model is found to produce "discriminatory, misleading, inflammatory, unsafe, or deceptive outputs," what actions will be required of vendors?[11]

We urge OMB to expand the provision in Section 5(d) that encourages agencies to require external red teaming for generative AI to include both internal and external red teaming, which would align with AI companies' voluntary commitments to the White House. External red teaming should be required only where appropriate and technologically feasible.

B. Ensure the U.S. Government devotes adequate resources and uses all available avenues and authorities to attract, retain, and develop the skilled, diverse AI workforce needed to accomplish the responsibilities described in the memo.

In general, this OMB memo is broad in scope and proposes an ambitious timeline for agencies to comply with the issued guidance. While we appreciate that OMB recognizes the urgent need to build capacity and fill gaps in federal AI talent, we are concerned that the lack of additional resources will undermine the stated goals of the memorandum to develop and deploy safe and responsible federal AI systems.

Implementing minimum risk management practices throughout agency operations and within the complex federal procurement process will require agencies to elevate technology training and regulatory awareness throughout the federal workforce. The requirement for agency authorizing officials to prioritize ATOs for critical and emerging technologies like generative AI may increase the number of authorization requests in the near term and exacerbate the need to expand the federal workforce to meet the scale of these requests, before the workforce is adequately prepared. Moreover, the very technical nature of AI itself will require agencies to quickly upskill the workforce to boost awareness of key concepts and terminology and create a greater pool of knowledgeable personnel.

[11] See: 5(d)(v) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=22

ITI is encouraged OMB recognizes that to meet these workforce challenges agencies need to foster an AI-ready workforce by expanding the pool of applicants with diverse perspectives and backgrounds. Many ITI members have made commitments to increase access to educational opportunities, adapt training to enable a diverse AI-ready workforce, and assist with building pathways to careers in AI. These efforts include partnerships with government, academia, civil society, and industry stakeholders to develop programs that encompass skills, trust, and responsible use of AI technology. For example, many ITI members offer tailored learning paths and professional certification programs on artificial intelligence and machine learning that prepare the workforce with the skills and knowledge necessary to understand how these technologies work and how to successfully implement them to into their careers. We encourage OMB to leverage these commercial training programs as one of many tools to address workforce challenges.

We appreciate that OMB directs agencies to take "full advantage of available special hiring and retention authorities" to address these workforce challenges, and we encourage the federal government to continue to improve these hiring processes to attract and retain the best and brightest AI talent.[12] However, we do not believe that existing resources alone will be sufficient to meet the scope and scale of the memorandum. Therefore, to adequately prepare the federal workforce, we urge OMB to integrate this into the federal budget planning cycle and work with Congressional counterparts to secure appropriate levels of funding.

As noted in Section 3 (b), the designated CAIO within each agency has a broad set of defined roles and responsibilities for accelerating the adoption of AI tools and ensuring compliance with established risk management practices. We appreciate that OMB recognizes that AI is "deeply interconnected with other technical and policy areas including data, IT, security, [and] privacy," but clarification is necessary regarding how CAIO responsibilities will align with existing Senior Executives within the agency reporting structure where jurisdictional overlap may exist, such as the Chief Information Officer, Chief Data Officer, Chief Technology Officer, Chief Privacy Officer and Chief Information Security Officer to name a few.[13] Where possible, we recommend that OMB direct agencies to delineate and deduplicate responsibilities in order to bolster operational efficiency and support OMB's goal of reducing barriers to responsibly advancing enterprise-wide AI maturity.

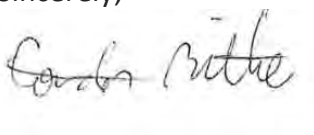
OMB should also encourage agencies to make sure the operations and outcomes of their AI applications are sufficiently understandable by subject matter experts and users, support voluntary consensus standards, encourage agency AI officers to review the NIST AI RMF, review existing applicable laws, document noteworthy AI implementation challenges and opportunities including barriers to the adoption of commercial AI applications, and consider trust and ethics in the procurement and use of AI.

[12] See: 4(b)(iv) https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=9
[13] See: Section 1 https://www.whitehouse.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-draft-for-public-review.pdf#page=1

Finally, we note that industry remains concerned existing resources are not sufficient to accomplish the numerous agency functions established by the memorandum, which would directly impact the ability of the federal government to procure best-in-class commercial technology solutions safely and securely. To that end, we encourage OMB to continue to open dialogue with industry and explore areas for public-private collaboration to understand how to best position an agency's organizational structure to succeed with existing resources. As one example, OMB should make interagency coordination efforts public as much as possible. Section 3(c) requires agencies to establish and convene an AI Governance Body. It would be beneficial for this body to hold open meetings, publish meeting minutes, and host listening sessions that allow the public to share ideas and concerns. Such transparency will help the public understand how agencies adopt AI and enable industry and academia to lend their expertise to support consistent government practices.

We thank you again for the opportunity to engage on this issue. To discuss any of these points in greater detail, please contact Zack Royster, Manager of Public Sector Policy, at zroyster@itic.org.

Sincerely,



Gordon Bitko
Executive Vice President of Policy, Public Sector
Information Technology Industry Council (ITI)

RE: Proposed Memorandum on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

The Data Foundation is a non-profit organization that seeks to improve government, business and society through open data and evidence-informed public policy. Our Data Coalition community is America's premier voice on data policy, advocating for responsible policies to make government data high-quality, accessible, and usable. The Data Foundation appreciates the opportunity to provide comments on behalf of our community on the Office of Management and Budget's draft guidance on responsible artificial intelligence (AI) governance, innovation, and risk management.

A cohesive national AI implementation plan must incorporate sound data management as a central component. Chief Data Officers (CDOs) within federal agencies offer invaluable expertise for facilitating ethical and responsible AI development and deployment. As data serve as the fuel for AI systems, CDO insights can strengthen processes around data quality, bias mitigation, governance, and responsible access and use. By fully integrating CDOs into unified efforts to establish national AI priorities and implementation guidance, the government can proactively address AI risks and harms through robust data oversight. Rather than treating AI implementation and data considerations in isolation, formal establishment of CDO duties will enable agencies to unify plans through reliable data stewardship. With CDOs serving as the connective tissue between data and AI, national implementation efforts can holistically account for and govern these intrinsically linked components in tandem. Failing to empower this data governance perspective risks inconsistent, siloed agency plans that lack cohesive data guardrails to prevent irresponsible AI outcomes. The unique capabilities CDOs offer must directly shape our country's AI future.

We respectfully recommend:

- **A mandate that agency CDOs co-chair new AI governance boards alongside agency Chief Information Officers. This gives CDOs an explicit role in high-level AI oversight**. Mandating CDOs co-chair agency AI boards properly elevates data considerations to be on par with technical ones. CDO insights would likely be underrepresented otherwise.
- **Codifying required data governance checklists that agency CDOs, or a CDO designee, must certify systems meet before deployment around lineage, standards, monitoring, etc.** Requiring CDO approval of data checklists

DATA FOUNDATION
data coalition

Data Coalition

Washington, DC 20005

202.964.1120
@DataCoalition
info@datacoalition.org
datacoalition.org

pre-deployment establishes accountability for governance and mitigates data risks proactively rather than reactively.

- **Requiring the agency CDO, or a CDO designee, review of systems using sensitive, personal, or civil rights-related data with privacy officers before those systems can be operationalized.** Enforcing CDO review of data with civil liberties impacts brings an ethics perspective focused on potential societal harms early in the process.
- **Inclusion of the agency CDO, or a CDO designee, on AI procurement source selection teams to evaluate vendor data governance capabilities**. Having CDOs assist in AI vendor selection utilizes their expertise in evaluating long-term governance capabilities -- a key procurement consideration.

Elevating the role of CDOs in the guidance will enable more responsible and trustworthy AI by accounting for data ethics, quality, and sound governance from the start. The Data Foundation and our community urges OMB to formalize CDO responsibilities in AI policy guidance.

We applaud the Administration's collaborative approach and focus on responsible AI innovation. Incorporating robust data governance and oversight into the national AI strategy will help guarantee government AI use aligns with American values while achieving mission objectives. Please feel free to contact me if we can provide any additional perspective about these comments or provide assistance as OMB finalizes guidance to federal agencies on AI.

Sincerely,
Corinna Turbes
Policy Director

Re: OMB-2023-0020, AFGE Comments on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* Draft Memorandum

Dear Chief Information Officer Martorana:

The American Federation of Government Employees, AFL-CIO, (AFGE) hereby submits its comments to the draft memorandum on *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence* prepared by the Office of Management and Budget (AI Memo). *See* Request for Comments on Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence Draft Memorandum, 88 Fed. Reg. 75625 (Nov. 3, 2023). AFGE is the largest labor organization representing federal employees. On its own and in conjunction with its affiliated councils and locals, AFGE represents over 750,000 employees in agencies and departments across the federal government and the District of Columbia.

The responsible regulation and safe use of artificial intelligence (AI) by the federal government presents a defining public policy challenge. The Government must balance the need to control and develop outward-facing use cases with its internal administrative and workforce commitments and obligations, while ensuring that necessary safeguards in both areas are able to keep pace with a rapidly changing cyber environment. And it must simultaneously ensure that agency use of AI does not result in discrimination or bias against members of protected classes, including within the federal workforce. It is therefore of the utmost importance that the AI Memo acknowledge that federal employees and the labor organizations that represent them are key stakeholders in the governance, innovation, and risk management of agency use of AI. It is federal workers who are responsible for day-to-day agency operations, and it is these same rank-and-file federal workers who will be chiefly responsible for the implementation and application of agency AI initiatives and programs and who will also, in many instances, feel their effects. The successful rollout of agency AI initiatives thus hinges on consequential employee and union engagement. *See* Brian DeWyngaert Sr., *Want successful integration of AI at federal agencies? Engage employees through the unions*, GovExec.com (July 19, 2023), https://www.govexec.com/workforce/2023/07/want-successful-integration-ai-federal-agencies-engage-employees-through-unions/388574/.

The fact that federal worker engagement is a critical component of the effective and efficient delivery of high-quality government services is a seminal reason why the Federal Service Labor-Management Relations Statute (Statute) requires that agencies bargain in good faith with those labor organizations certified as their employees' exclusive representatives on any condition of employment. *See* 5 U.S.C. § 7114; *see also* 5 U.S.C. §§ 7102(2), 7103(a)(12), 7116(a)(5). It is also why the President has directed agency heads to bargain with their associated labor organizations over the numbers, types, and grades of employees assigned to any organizational subdivision, work project, or tour of duty, as well as over the technology, methods, and means of performing work. *See* Exec. Order 14003, § 4, 86 Fed. Reg. 7231 (Jan. 27, 2021); *see also* 5 U.S.C. § 7106(b)(1). It is, after all, the policy of the United States to protect, empower and rebuild the career Federal workforce, and to encourage union organizing and collective bargaining. Exec. Order 14003, § 1; *see also* Exec. Order 14025, § 1, 86 Fed. Reg. 22829 (April 26, 2021); 5 U.S.C. § 7101(a) ("[L]abor organizations and collective bargaining in the civil service are in the public interest.").

Consequently, the AI Memo should elevate the role of federal employee labor organizations with respect to agency use of AI. The AI Memo should, for example, expressly and specifically state that agencies must meet their obligation to bargain with the relevant labor organizations over changes to federal employees' conditions of employment arising from or related to agency use of AI before such changes may go into effect. The Statute requires more than mere consultation or feedback with respect to federal employees' conditions of employment. It requires collective bargaining. The same is true with respect to agencies' compliance with existing collective bargaining agreements. While it may be that AI will, in some ways, pose new and novel challenges for the federal workplace, such challenges do not relieve agencies from complying with their legal and contractual obligations. The obligation to bargain and to abide by agreements reached through collective bargaining is a statutory duty that may not be waived or diminished by an agency merely because a matter is complex or is one of first impression.

The potential novelty of future AI challenges, in fact, only reinforces the need for robust labor-management partnership because joint agency, employee, and union, problem-solving will promote a more durable AI governance framework. For this reason, the AI Memo should include a demonstrated commitment to and understanding of labor-management partnership among the skills, knowledge, training, and expertise, necessary to perform the role of Chief AI Officer (CAIO), and should include coordination and the sharing of workforce-related information (e.g., potential workforce impacts identified by agency AI impact assessments) with employees' exclusive representatives, i.e., labor organizations, as part of the CAIO's responsibilities. The AI Memo also should require that agencies provide labor organizations the opportunity for meaningful representation on agency AI Governance Boards. Plans made in the dark are unlikely to bear fruit. Active union participation in AI Governance Boards, however, will bring agencies the benefit of frontline workers' experience and knowledge when addressing the substantive and logistical issues that may arise from agency regulation and use of AI.

The AI Memo should, moreover, seize the opportunity to promote worker empowerment by directing agencies to prioritize the preservation and/or expansion of federal positions within existing bargaining units or, when necessary, to reorganize in a fashion that provides for

continued representation by existing exclusive representatives. In this same vein, the AI Memo should strengthen its direction to agencies that they provide training offerings for federal employees, including opportunities that provide pathways to AI occupations and assist and cultivate employees affected by the application of AI to their work. The AI Memo should direct agencies to develop, and negotiate with the pertinent labor organizations, concrete plans that, at a minimum, offer federal employees appropriate re-skilling or up-skilling opportunities any time it is foreseeable that their positions may be affected by the agency use of AI, and which provide attainable, clear, and equitable, pathways for federal employee advancement.

Lastly, the AI Memo should establish a presumption that work related to the Government's continued design, development, testing, and operation of AI will be insourced whenever doing so is feasible. The Government should, for example, eschew reliance on AI contracts for the creation, regulation, or maintenance of controls over artificial general intelligence or generative AI because these subjects raise issues that are inherently governmental in nature. The growth and retention of a deep, internal federal employee talent pool thus will help ensure the long-term sustainability and success of federal agencies' AI governance, innovation, and risk management.

AFGE thanks OMB for providing it the opportunity to submit these comments. AFGE notes that by submitting these comments, AFGE does not waive any arguments, claims, challenges, or rights that it may have, now or in the future, concerning any aspect of the AI Memo or its application.

Sincerely,
/s/ Andres M. Grajales

EDSAFE AI Alliance Response to OMB Guidance on AI - 12.5.23

December 5, 2023,

On behalf of EDSAFE AI Alliance, thank you for the opportunity to respond to the Office of Management and Budget's (OMB) draft memorandum titled *Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (AI).* We appreciate the Administration's forward-looking approach to advancing AI governance and innovation while managing the risks of AI, specifically the safety and rights of the public. We are pleased that this expansive effort requires each federal agency to designate a chief AI officer, develop an agency plan for responsible AI use, and publicly share an inventory of AI use cases. We have provided recommendations for each question included in the request for information below.

Question 1

Regarding the roles, responsibilities, and structure of the Chief AI Officer (CAIO) role, we recommend the following:

- **Public Communication:** The CAIO must implement a dedicated communication strategy to better inform the public of the safety and efficacy of AI use. Specific to the U.S. Department of Education (ED), the communications focus will help ensure that states and school districts are informed about any ED guidance, support, and resources for AI use in education.

- **Equity-focused:** Particularly in education, the CAIO must prioritize the equitable implementation of technologies to decrease historical and systemic inequalities in the education system, including for communities and students who have been historically marginalized. Special attention must be paid to issues of digital access, accessibility, and inclusivity with specific strategies to address safe and ethical AI use for and with English Learners, students with disabilities, and other historically marginalized groups.

- **Education Policy Leadership**: The CAIO role at ED should be part of the department's leadership structure and report directly to the Secretary. Additionally, the CAIO must help determine AI policy and serve as a bridge between two ED entities with different but important responsibilities regarding AI use: the Office of Education Technology (OET) and the Institute of Education Sciences (IES).

- **Dual Staffing Requirements:** The CAIO must develop and promulgate two distinct sets of policies - one governing student-facing education issues and the second guiding data analytics unique to internal requirements within ED.

Interagency Collaboration and Sharing of Best Practices: The CAIO should establish mechanisms for interagency collaboration to share best practices, successes, and challenges in AI implementation. These mechanisms could lead to more cohesive and efficient AI strategies across federal agencies. The CAIO should continue collaborating with other agencies, including the National Science Foundation (NSF), building on the success of early interagency collaboration with AI, including the two co-founded AI Institutes with IES and NSF.

- **Engage Broad Coalitions of Expertise Outside Government:** CAIO should engage and partner with experts from industry, nonprofits, philanthropies, universities, and other relevant groups to stay current on existing and emerging technologies and applications to inform future policy and funding decisions.

- **Establish AI education and training for department personnel:** The CAIO should be responsible for creating workshops and training opportunities for staff to better understand the latest AI technologies, their ethical implications, and effective safeguards for department staff and contractors.

Question 2

Regarding effective coordination mechanisms and benefits or drawbacks in establishing an AI Governance Body, OMB should consider a few major requirements:

- **Consult top multi-disciplinary experts:** As reflected in the Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence and the call to build capacity within the Administration, we believe that issues related to implementing effective AI strategies may be beyond the expertise of many existing agencies or boards/groups within those agencies. The policies will require education expertise in data analytics, machine learning, learning engineering, AI foundation models, security and privacy, and equity. ED should recruit the best talent from outside the government to ensure the latest expertise on AI foundation models and the specific challenges they bring for privacy, security, and potential bias for underrepresented populations through fellowships or direct hire authority. Additionally, several nonprofit groups are currently working on these issues, including the EDSAFE AI Alliance, the International Society for Technology in Education (ISTE), the Consortium for School Networking (CoSN), and Digital Promise. ED should leverage and, where possible, partner with these groups.

- **Effective multi-agency practices**: A review of previous successful governing bodies in government and their relationship to the statutory agencies can provide models for establishing both process and jurisdiction governance so that effective domain expertise can be considered. This would enable the CAIO to have areas of deep expertise in AI that other agencies can leverage to define and evaluate policy options.

- **Require full participation:** To ensure that the OMB directive is being implemented uniformly and consistently across the federal government, all agencies must be fully included and expected to produce and share, both externally and internally.

- **Proactive response to technology advances:** Much of the current efforts by the Federal government have been in response to recent developments in generative AI systems. We urge agencies to develop these governing bodies with an eye toward proactive engagement regarding

future AI systems and capabilities, including future systems that meet the Artificial Generalized Intelligence (AGI) threshold. The field of AI is advancing rapidly, and it is important for policy to keep pace rather than continually reacting to change.

Question 3

On the question of how OMB can best advance responsible AI innovation, we recommend several considerations:

- **Use of the SAFE Framework**: First, we strongly support the effort by a coalition of leading organizations from educators, solution providers (or technologists), and policy experts to develop the S.A.F.E. (Safety, Accountability, Fairness, Efficacy) Framework for AI, a set of fundamental principles guiding the ethical and effective deployment of AI in educational settings. This framework aims to prioritize the security and privacy of data and focus on a "Do No Harm" approach, ensuring accountability by clearly defining the responsibilities of all stakeholders and promoting equity and ethics while mitigating bias, including working to ensure that AI technology helps close—not widen—existing disparities in access and use, and prioritizing technologies that demonstrably improve learning outcomes. We encourage OMB to consider these guidelines to determine how federal agencies should advance AI responsibly.

- **Standards:** Additionally, OMB should work with the National Institute of Science & Technology (NIST) to ensure the continuous development of standards for data quality and interoperability, accessibility, and transparency.

- **Continuous Improvement:** OMB should commit to continuous improvement (CI) in AI implementation. It should be a critical principle to maximize opportunities and minimize risk and, as a potential model, shift to that mindset more broadly, given the potential penetration of AI in education. Any CI efforts should be conducted by collaborating with educators and other affected stakeholders.

- **Investing in Research and Development:** We strongly recommend increased support for advanced research and development activities such as the Seedlings to Scale grant program, research that prioritizes rapid cycle development, and establishing an NCADE center as currently advocated by the Institute for Education Sciences, which could help research, fund and guide groundbreaking innovations in AI in education under the S.A.F.E. framework. Responsible development for effective and safe uses of AI will require increased support for government educational research and development activities.

Question 4

Regarding how agencies should take advantage of generative AI to improve agency missions or business operations, we strongly recommend incorporating research and analysis of a variety of education data received from educational institutions. This would include using AI to analyze academic data to identify trends, predict educational outcomes, and provide insights into effective teaching strategies and outcomes. This research should be undertaken in partnership with educators, drawn on other quantitative and qualitative data sources when appropriate, and done with sensitivity to potential implications for school and educator accountability systems. AI can also help synthesize research findings, generate reports to inform policy-making and educational

practices, and analyze education data to efficiently allocate funding for the most significant impacts.

Question 5

Regarding use cases for presumed safety-impacting and rights-impacting AI that should be included, removed, or revised, we believe ED should consider use cases for AI that promote innovation while maximizing safety, privacy, security, and equity and minimizing bias. Moreover, ED should develop use cases for the effective and safe use of AI in the classroom, including personalized learning, real-time formative assessments, automated grading and feedback aligned to learning objectives and standards, professional learning and development for teachers, and improving accessibility for a wide variety of learning and physical disabilities and neurodivergence.

Regarding the examples of "rights-impacting" applications included in the guidance, we recommend that these be carefully considered specifically with education to maximize impact on learning while addressing privacy, security, accessibility, equity, and bias issues.

Question 6

Regarding "rights-impacting AI," we believe that the baselines across each agency will differ significantly depending on the intent and goals of the agency. For instance, several examples outlined in the proposed use cases for "rights-impacting AI" may be critical in developing effective online and personalized learning platform implementations and more effective real-time assessments. As proof, measures of learning outcomes may depend on the assessment of attention, engagement, and perhaps other indirect comprehension measures. Also, learning activities in virtual environments will require some forms of monitoring and evaluation.

We recognize that these implementations require safeguards against AI bias privacy and security. We recommend calibrating the required safeguards to the risk profile of the AI tool at issue. The additional minimum practices, for example, may impose burdens on limited government resourcing that are not commensurate with particular use cases within the education context. A risk-based analysis to distinguish between higher- and lower-risk AI applications will help focus resources while protecting rights.

We recommend that these implementations require safeguards against AI bias privacy and security. They should also undergo assessment through multi-agency collaboration offering expertise and guiding principles to the agency of jurisdiction. This provides oversight and consistency while remaining flexible to newer technological developments and unforeseen use cases. Leveraging the forthcoming U.S. Department of Education toolkit for developers and ensuring there is deference to the relevant agency to provide guidance in their respective sectors.

Question 7

We suggest a number of other materials and resources such as the U.S. Department of Education's *Artificial Intelligence and the Future of Teaching and Learning* report, the UNESCO recommendations for policymakers, principles for AI from the OECD (Organization for Economic Co-operation and Development), and reports from the American Enterprise Institute and All4Ed, among others. We have included these resources in the appendix that follows this letter.

Question 8

Transparency with the public is required regarding the information that should be made public about agencies' use of AI in their annual use case inventory, especially in K-12 education. A communications strategy should be developed with the help of experts to communicate privacy and security issues and to educate the public on the positive impacts AI can have on student success. The October 30th Executive Order highlights this effort's importance by requiring ED to develop an "AI toolkit for education leaders implementing recommendations from the Department of Education's AI and the Future of Teaching and Learning report…"

We are deeply committed to working individually and collectively with close, overlapping partners in technology, civil rights, and other communities to learn and inform AI policies to maximize opportunities and minimize risks. We look forward to the opportunity to engage and contribute to developing an AI strategy and ensure that the voices of the education community are represented.

Sincerely,
EDSAFE AI Alliance

SIA Comment on Draft AI Memorandum OMB-2023-0020 Final

Dec. 5, 2023

The Honorable Shalanda Young
Director, Office of Management and Budget
725 7th Street NW
Washington, DC 20503

Re: Notice of Public Comment Period, Office of Management and Budget; Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence (88 FR 75625, OMB-2023-0020), Nov. 3, 2023

Dear Director Young:

The Security Industry Association (SIA) appreciates the opportunity to provide comments to the Office of Management and Budget (OMB) on its draft memorandum, "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence" ("draft memorandum").[1] The draft memorandum, among other things, would require agencies to apply a "minimum baseline" of practices to manage risks of "rights-impacting AI" and "safety-impacting AI." OMB also includes a series of recommendations to apply risk management approaches to federal procurement and intends to develop a system for ensuring federal contracts align with the Oct. 30, 2023, Executive Order for Safe Secure and Trustworthy Artificial Intelligence ("AI EO").

About SIA

SIA represents more than 1,400 safety and security solutions providers, ranging from large global technology firms to locally owned and operated small businesses. Our members include manufacturers, software developers and systems integrators providing solutions that help protect people, property and sensitive data across a wide variety of public- and private-sector applications.

We believe advanced technologies must only be used in a lawful, ethical, nondiscriminatory and effective manner. SIA and our members support the development and use of artificial intelligence (AI) technologies in ways that are human-centric, ethical and trustworthy and that mitigate potential risks. In part to help communicate and guide effective technology implementations that harness these innovations, SIA has formed its AI Advisory Board[2] and Identity and Biometric Technology Advisory

[1] See - https://ai.gov/wp-content/uploads/2023/11/AI-in-Government-Memo-Public-Comment.pdf
[2] See - https://www.securityindustry.org/committee/ai-advisory-board/

Board.[3] SIA is also pleased to have a representative serving on the National AI Advisory Committee Subcommittee on Law Enforcement.[4]

AI-Driven Safety and Security Technologies Are Critical to Agency Missions

AI stands to provide enormous individual, societal and economic benefits in almost every sector. Within the safety and security space, AI helps to power advanced tools, enabling technology users to analyze and respond to information in a substantially quicker and more accurate manner than traditional, non-automated methods. For example, AI tools and technologies can streamline 911 call center responses, better transcribe incident reports, and analyze video feeds for high-risk safety and security situations at faster speeds. Associated techniques like machine learning, computer vision, deep learning and neural networks can dramatically improve the capabilities of security solutions and have been the primary areas of recent technological innovation in our industry, which contributes over $150 billion to the economy and employs more than a million people across the United States.

Deploying these technologies results in more preventative, as opposed to reactionary, capabilities for the security of government facilities and greater effectiveness in the performance of critical agency missions related to homeland security, law enforcement, public safety, emergency response, identity management, cybersecurity, program integrity measures and many more. Importantly, AI can also help protect against some of the broader potential risks that OMB's proposed policies are intended to prevent. For example, there is a growing body of research that shows how AI can identify and mitigate against bias in human decision making, thereby moving towards the goal of preventing unlawful bias.[5] And effective AI deployment can also help improve safety and security.

Comment on the Draft Memorandum

The draft memorandum follows and specifically responds to Section 10.1(b) of the AI EO, requiring OMB to, within 150 days, "issue guidance to agencies to strengthen the effective and appropriate use of AI, advance AI innovation, and manage risks from AI in the Federal Government."

We fully support the aims of the draft memorandum, as well as the eight principles the AI EO directs federal agencies to adhere to in the development and use of AI: 1) ensuring AI safety and security, 2)

While some companies have embraced these new technologies, others fear that AI may actually cause discriminatory outcomes. As discussed, the phenomena of 'garbage in, garbage out' is real, but can be addressed paying attention to the data sets by using known sources and making sure the sets are balanced and representative of all groups."); Jon Kleinberg et al., *Discrimination in the Age of Algorithms*, 10 J. of Legal Analysis 113, 120 (Apr. 22, 2019), https://academic.oup.com/jla/article/doi/10.1093/jla/laz001/5476086 ("Our central claim, stated in simple form, is that safeguards against the biases of the people who build algorithms, rather than against algorithms per se, could play a key role in ensuring that algorithms are not being built in a way that discriminates (recognizing the complexity and contested character of that term). If we do that, then algorithms go beyond merely being a threat to be regulated; they can also be a positive force for social justice.").

promoting responsible innovation, competition and collaboration, 3) supporting American workers, 4) advancing equity and civil rights, 5) standing up for consumers, patients and students, 6) protecting Americans' privacy and civil liberties, 7) ensuring responsible and effective government use of AI and 8) advancing American leadership abroad.

That said, we are concerned that, without changes, there are ***significant issues in the draft memorandum that could lead to results that undermine these goals and a true risk-based approach***. Most notably, we are concerned that the draft memorandum's broad definitions of "rights-impacting AI" and "safety-impacting AI" combined with a broad and rigid checklist of "minimum practices" associated with their use will result in discouraging the use of AI in the federal government. Further, given the limited resources of federal agencies, these broad definitions and one-size-fits-all requirements could foster an environment in which truly high-risk uses of AI do not receive proportional attention compared to lower-risk AI uses that happen to fall under the definitions of "rights-impacting" and "safety-impacting" AI. We offer the following recommendations in three key areas to address these issues in finalizing the memorandum.

1. **AI use cases subject to "minimum requirements" must be narrowed and clarified to ensure the framework appropriately focuses on applications that are truly high-risk.**

The draft memorandum is framed as suggesting a targeted approach to AI use by agencies, in that it only proposes to impose minimum requirements on "rights-impacting AI" and "safety-impacting AI." However, it broadly defines "rights-impacting AI"[6] and "safety-impacting AI,"[7] and additionally lists broad categories of use cases that are automatically presumed to fall under these definitions. This overly broad approach risks categorizing nearly *all* AI use cases with any connection to the listed categories as high-risk, which would undermine the goals of the AI EO and the OMB memorandum, and stifle AI use and development to support federal agency missions.

In particular, the draft memorandum's sweeping definitions do not adequately differentiate between different levels of risk. The definition of "rights-impacting AI" includes, for example, "AI whose output serves as a basis for a decision or action that has a legal, material, or similarly significant effect" on individuals' or communities' privacy and access to critical resources or services, among other things.[8] Without adequate tailoring or guidance, these concepts can be construed broadly and sweep in a vast

[6] "AI whose output serves as a basis for decision or action that has a legal, material, or similarly significant effect on an individual's or community's: 1. Civil rights, civil liberties, or privacy, including but not limited to freedom of speech, voting, human autonomy, and protections from discrimination, excessive punishment, and unlawful surveillance; 2. Equal opportunities, including equitable access to education, housing, credit, employment, and other programs where civil rights and equal opportunity protections apply; or 3. Access to critical resources or services, including healthcare, financial services, social services, transportation, non-deceptive information about goods and services, and government benefits or privileges." Draft memorandum at 24.

[7] "AI that has the potential to meaningfully impact the safety of: 1. Human life or well-being, including loss of life, serious injury, bodily harm, biological or chemical harms, occupational hazards, harassment or abuse, or mental health, including both individual and community aspects of these harms; 2. Climate or environment, including irreversible or significant environmental damage; 3. Critical infrastructure, including the critical infrastructure sectors defined in Presidential Policy Directive 2143 and the infrastructure for voting and protecting the integrity of elections; or, 4. Strategic assets or resources, including high-value property, information marked as sensitive or classified by the Federal Government, and intellectual property." Draft memorandum at 25.

[8] Draft memorandum at 24.

array of AI use cases – for example, AI outputs that are just one factor in a decision made by an individual, and/or that have a potential effect on "privacy" generally even if there is no directly applicable privacy law.

The definition of "safety-impacting AI" is similarly broad. This category includes AI that "has the potential to meaningfully impact the safety" of a range of things, from "human life or well-being" to "critical infrastructure" and "[s]trategic assets or resources." The inclusion of the word "potential", as well as the broad and vague range of impacts – for example, "well-being" – does not provide meaningful parameters to help federal agencies draw lines between high-risk applications and other applications. This approach is likely to result in a set of policies and practices that may ultimately fall short of accomplishing the intended risk-based approach to regulation because it does not sufficiently differentiate, at a practical level, between that which may actually cause harm and that which is much less likely to cause harm.

Additionally, the lists of specific technologies and use cases that the draft memorandum "presume[s] to be rights-impacting" or "presume[s] to be safety-impacting" are overly broad and do not fully account for the wide variety of use cases of AI applications within the established categories. For instance, the list for "rights-impacting" AI includes broad categories such as "facial matching," "physical location-monitoring devices," and "license plate readers."[9] While such technologies – already utilized for two decades in some cases – could be high-risk under certain contexts, grouping all instances of these AI use cases together without differentiation between different risk levels is counter to a risk-based approach and could result in agencies being discouraged from using these applications for beneficial purposes even when the agency might be able to do so in a sufficiently narrow and low-risk manner.

For example, license-plate readers and plate data can be used to provide a number of services beneficial to the public that would be difficult to construe as "high-risk" such as traffic analysis and management, toll automation and smart cities applications, such as intelligent parking. Moreover, the specific AI utilized in such applications is limited to a narrow portion of the application workflow – utilizing computer vision for the purpose of character recognition. Due to the nature of this use case and the narrow capabilities of the supporting AI, it is difficult to conceive a path for the AI in this use case to provide any substantial social or security risk. The draft approach to regulating AI set forth in the memorandum, however, does not provide a sufficient framework to differentiate such a lower-risk use case from a higher-risk use case. Blanketly categorizing technologies as high-risk would undermine OMB's goals to advance AI innovation and "seize the opportunities AI presents,"[10] including to improve safety and security across the federal government.

The technologies laid out as presumptively "safety-impacting" in the draft memorandum also cover broad categories of applications that – depending on the context of deployment – may or may not be high-risk. For example, the list includes "[r]esponses to insider threats," "[a]ccess to and security of government facilities," and "movements of vehicles."[11] Again, including these blanket examples as presumptively "safety-impacting" could negatively impact the federal government's effective use of AI for beneficial purposes, including to assist it with cybersecurity and defense activities.

[9] *Id.* at 12.
[10] *Id.* at 1.
[11] *Id.* at 11.

Additionally, the draft memorandum establishes an overly broad and vague standard for when these categories trigger the presumption, explaining that a specific use case is presumptively rights- or safety-impacting when AI "is used to control or meaningfully influence the outcomes of the [listed categories of activities]." The standard of "meaningfully influenc[ing] the outcome" is vague and difficult to operationalize and risks being construed broadly to potentially include any operation that includes AI – which would be in direct tension with a risk management approach. Instead, the final OMB memorandum should, 1) strike "the outcomes of" language for clarity (so the standard would be if "it is used to control or meaningfully influence the following activities") and 2) provide clear guidance on the parameters or outer limits of what it means to "meaningfully influence." At a minimum, the memorandum should make clear that the following activities would not meet the "meaningfully influence" standard, consistent with recent proposals for high-risk categorization under consideration in the European Union's AI Act, which exclude when: 1) "the AI system is intended to perform a narrow procedural task of low complexity," 2) "the use of the AI system does not replace a human assessment relevant for the purpose of the use case [at issue], but is intended to confirm or improve an accessory factor of such assessment;" or 3) "the AI system is intended to perform a preparatory task to an assessment relevant for the purpose of the use case [at issue]."[12]

In short, we recommend that definitions for "rights-impacting" and "safety-impacting" in the draft memorandum should be narrowed to focus on truly high-risk applications, rather than listing broad categories of technologies *presumptively* falling into its high-risk framework. In addition, guidance should be provided to agencies to help assess the unique set of benefits and risks to a specific AI application, through objective and not subjective standards,[13] before classifying it as either "rights-impacting" or "safety-impacting."

2. **Agencies should be provided with more flexibility regarding "minimum practices" to tailor risk mitigation strategies to specific AI applications in greater alignment with the National Institute of Standards and Technology (NIST) Risk Management Framework (RMF).**

AI encompasses a wide range of emerging technologies with countless iterations and applications. There is no "one-size-fits-all" approach that can be used to mitigate risks across all AI applications as the technology evolves. As currently written, the draft memorandum creates a rigid checklist applicable to "rights-impacting AI" or "safety-impacting AI" that is too prescriptive. Flexibility is a longstanding and important risk management principle that addresses this issue: approaches to AI should be flexible enough to account for the wide range of ways that AI can be deployed for beneficial uses and a range of methods to appropriately address risks.

[12] See https://www.notizie.ai/pathal/uploads/2023/10/20231003-ai-act-article-6_new-filter.pdf

[13] As an analogy, the U.K. Information Commissioner's Office provides objective guidance on when an activity is presumed "high risk" (see - https://ico.org.uk/for-organisations/uk-gdpr-guidance-and-resources/accountability-and-governance/data-protection-impact-assessments-dpias/when-do-we-need-to-do-a-dpia/). For instance: not generically presuming the processing of sensitive data is high risk, but rather the processing of sensitive data on a large scale. Creating objective standards need not undermine each Agency's autonomy to assess (within their scope of practice and each specific use case) whether certain AI applications fall within the categories of safety-impacting or risk-impacting. By curtailing agencies autonomy to do so through generic pre-formulated categories, the draft memorandum undermines its own stated goal of allowing each Agency to conduct their own review, as the same use of a certain AI application by one agency might be different than that same use by another agency.

Unfortunately, as currently written, the draft memorandum does not afford such flexibility. Instead, it creates a rigid checklist applicable to "rights-impacting AI" or "safety-impacting AI" that is too prescriptive, particularly in light of the unsettled and rapidly evolving landscape of AI safety.

This approach stands in stark contrast to the risk-based and flexible AI RMF, which establishes governance principles and goals for AI risk management but does not include specific methods for implementation.[14] Published in January 2023, the AI RMF, together with its accompanying AI RMF Playbook,[15] is a tool for organizations of varying types and sizes to identify and manage benefits and risks when developing and deploying AI technologies. During its development, NIST collaborated with a broad range of stakeholders, so the AI RMF is aligned with existing best practices and industry standards.[16] Importantly, it is meant to be applied flexibly to a variety of use cases. Since the second draft of the AI RMF, NIST has specifically noted that the "AI RMF is not a checklist."[17]

As it finalizes its memorandum, OMB should align its "minimum practices" requirements with NIST's AI RMF to ensure that federal agencies balance AI benefits and risks. Already, the AI EO[18] and the draft memorandum[19] point to and rely on the AI RMF as a standard for proper AI risk management. In fact, the AI EO explicitly instructs OMB to specify in its guidance "required minimum risk-management practices for government uses of AI that impact people's rights or safety, including, where appropriate, the following practices derived from…the NIST AI Risk Management Framework."[20] Building from the AI EO, OMB should make targeted updates to the draft memorandum to ensure that NIST's AI RMF is touchstone for OMB in crafting its AI risk mitigation requirements for federal agencies.

Specifically, to better align with the NIST RMF, OMB's guidance should provide a menu of options[21] for federal agencies to select from to mitigate risks. Agencies should perform a risk assessment and select appropriate controls – tailored to the context of the AI deployment – to best address specific risks; they should not have to apply a pre-determined checklist of detailed steps, no matter the context. By applying a more flexible, risk-based approach, consistent with the AI RMF, OMB can more effectively mitigate risks by allowing federal agencies to tailor their risk mitigation strategies to the actual risks their

[14] *See e.g.,* NIST AI RMF Playbook § Govern 1.2, https://airc.nist.gov/docs/AI_RMF_Playbook.pdf (NIST includes governance standards such as inclusion of "characteristics of trustworthy AI" in "organizational policies, processes, and procedures," but does not dictate how that is accomplished. Instead, the NIST AI RMF Playbook suggests actions such as defining and scoping key AI terms and concepts, conducting model testing and validation processes, and outlining change management requirements."

[18] *See e.g.*, AI Executive Order at 75199.

[19] Draft memorandum at 13 ("To fill potential risk management gaps, agencies are encouraged to promote and to incorporate, as appropriate, additional best practices for AI risk management, such as from the National Institute of Standards and Technology (NIST) AI Risk Management Framework . . .").

[20] AI Executive Order at 75218.

[21] *See e.g.,* NIST AI RMF Playbook § Govern 1.3, https://airc.nist.gov/docs/AI_RMF_Playbook.pdf (The governance principle requires, "[p]rocesses and procedures are in place to determine the needed level of risk management activities based on the organization's risk tolerance," but the section subsequently lists five examples, "suggested actions," of types of policies that could be implemented to execute those types of risk management activities."); s*ee also supra* note 31 (providing options for implementation of a governing principle).

unique deployments face. This approach will also allow agencies to continue to adapt their approaches to prevailing best practices in AI safety as the field continues to evolve in the months and years ahead.

3. **Key adjustments are needed to "minimum practices" related to testing and disclosure of data quality and use in design, development and training.**

The draft memorandum's AI impact assessment requirements include data documentation and training data disclosures that either apply directly or flow down to technology providers.[22] We are supportive of ensuring the quality and appropriateness of data used in model development to help determine a model's performance for a particular use case; however, visibility into training and evaluation datasets will not meaningfully help an agency make that determination. The fact that a model has been trained on certain data does not directly indicate how it will perform in a specific use case. Performance testing, already required under the draft memorandum's "Minimum Practices," is the scientifically appropriate and relevant way to assess this.

Rather than focusing on training data, ensuring greater visibility into how a model works, in addition to its performance, would be a more effective approach. This could include requiring documentation regarding the capabilities of the AI system, known limitations, guidelines for use and demonstrative performance results.

The collection of training data used to develop an AI system or software is often intellectual property (IP) with significant competitive value, and disclosure could affect a provider's claim to trade secret protection, compromise proprietary information and data security (where disclosure could expose it to bad actors and possibly lead to data breaches), or lead to bias and misinterpretation (where disclosing the source of data might lead to erroneous conclusions about the performance of the AI application based on only its origin from a particular group, population or data set, potentially giving one technology provider an advantage over another based not on the performance of the AI application, but on the pre-judgement of its training data). This makes training data disclosure impractical and ill suited for agency evaluation. Therefore, any information requirement regarding training data should be limited to summary information about the data the model was trained on or that demonstrates how the training data is appropriate for the agency's intended use.

Additionally, we encourage OMB to provide direction to agencies, as they implement the Minimum Practices, that they should, to the extent possible, limit administrative duplication and potential unnecessary disruptions or delays in needed AI technology implementations, by incorporating existing relevant agency polices and documentation into the AI impact assessment. For example, many "safety-impacting" and "rights-impacting" AI systems will already be accompanied by extensive privacy impact assessments (PIAs) that include required elements. Also, some AI-driven technologies are already independently and robustly tested through government evaluation programs.[23]

[22] Draft memorandum at 15-16

[23] For example, face recognition and related technologies are evaluated by National Institute of Standards and Technology (NIST), https://www.nist.gov/programs-projects/face-recognition-vendor-test-frvt, and Department of Homeland Security, https://www.dhs.gov/science-and-technology/BI-TC.

Finally, regarding the practice outlined to "Consult and incorporate feedback from affected groups," we strongly encourage OMB to provide additional direction to agencies to engage with all relevant stakeholders – including technology providers and other subject matter experts – regarding "negative feedback" regarding specific AI systems, to help ensure such feedback has merit.

Conclusion

Agency requirements under the memorandum need to balance promoting beneficial uses of AI while managing risks. The Request for Comment asks how "OMB [can] best advance responsible AI innovation."[24] The draft memorandum recognizes that AI can "improve operations and deliver efficiencies across the Federal Government"[25] and encourages agencies to identify the opportunities and benefits AI can provide to the agencies mission and "improve their ability to use AI in ways that benefit the public and increase mission effectiveness."[26]

We are concerned that, without changes, the broad scope and overly prescriptive nature of certain requirements in the draft memorandum could put up roadblocks to the federal government using AI and potentially discourage companies with AI-powered tools and solutions from engaging with federal government.

Additionally, as polices are developed to ensure federal contract alignment with the AI EO, we urge OMB to facilitate informed decision making in the federal procurement process with clear and specific requirements for procuring AI products and services. OMB should also consider creating additional guidance or tools that would help current and potential suppliers assess compliance requirements in relations to their offerings ahead of time, which could create efficiencies in procurement processes and throughout contract life cycles.

Again, we appreciate the opportunity to provide initial feedback on the draft memorandum. SIA and its members stand ready to work with OMB to ensure that government can continue to leverage AI technologies in a safe, secure and effective manner.

Sincerely,

Don Erickson

AI-in-Government-Memo-Public-Comment-CWC20231205

5 December 2023

Hon. Shalanda D. Young
Director, Office of Management and Budget

Dear Ms. Young -

I am much appreciative of the opportunity to offer public comment on the proposed memorandum on "Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence."

The draft makes frequent reference to "responsible artificial intelligence", "responsible AI", "responsible use of AI", etc. I have marked many such instances in red; those can be found via the Bookmarks pane in this document.

There are uses of "responsible" in this document that are interpretable in plain language, e.g. "CAIOs must work in close coordination with existing responsible officials and organizations within their agencies."

"Responsible artificial intelligence" is not like "responsible officials". It is the name associated with an object of which there are various descriptions. Indeed some of these are now contained in Section 6, Definitions.

I suggest that Section 6 include a specific definition of "responsible artificial intelligence". It will make the memorandum more clear and definitive.

Respectfully submitted -

Charles W. Clark
Chief Research Scientist, Aspen Quantum Consulting

EXECUTIVE OFFICE OF THE PRESIDENT
OFFICE OF MANAGEMENT AND BUDGET
WASHINGTON, D.C. 20503

THE DIRECTOR

PROPOSED MEMORANDUM FOR THE HEADS OF EXECUTIVE DEPARTMENTS AND AGENCIES

FROM: Shalanda D. Young

SUBJECT: Advancing Governance, Innovation, and Risk Management for Agency Use of Artificial Intelligence

Artificial intelligence (AI) is one of the most powerful technologies of our time, and the President has been clear that we must seize the opportunities AI presents while managing its risks. Consistent with the Artificial Intelligence in Government Act of 2020,[1] the Advancing American AI Act,[2] and President Biden's Executive Order of October 30, 2023 (Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence), this memorandum directs agencies to advance AI governance and innovation while managing risks from the use of AI, particularly those affecting the safety and rights of the public.

As set forth in the accompanying Federal Register notice, the Office of Management and Budget is requesting public comment on this proposed memorandum.

1. OVERVIEW

While AI is improving operations and efficiency across the Federal Government, agencies must effectively manage its use. As such, this memorandum establishes new agency requirements and guidance for AI governance, innovation, and risk management, including through specific minimum risk management practices for uses of AI that impact the rights and safety of the public.

Strengthening AI Governance. Managing AI risk and promoting AI innovation requires effective AI governance. As required by President Biden's October 30, 2023 Executive Order (the "AI Executive Order"), each agency must designate a Chief AI Officer (CAIO) within 60 days of the date of the issuance of this memorandum. This memorandum describes the roles, responsibilities, seniority, position, and reporting structures for agency CAIOs. Because AI is deeply interconnected with other technical and policy areas including data, information

[1] Pub. L. No. 116-260, div. U, title 1, § 104 (codified at 40 U.S.C. § 11301 note), https://www.congress.gov/116/plaws/publ260/PLAW-116publ260.pdf.
[2] Pub. L. No. 117-263, div. G, title LXXII, subtitle B, §§ 7224(a), 7224(d)(1)(B), and 7225 (codified at 40 U.S.C. 11301 note), https://www.congress.gov/117/plaws/publ263/PLAW-117publ263.pdf.

technology (IT), security, privacy, civil rights and civil liberties, customer experience, and workforce management, CAIOs must work in close coordination with existing responsible officials and organizations within their agencies.

Advancing Responsible AI Innovation. When implemented responsibly, AI can improve operations across the Federal Government. Agencies must increase their capacity to successfully and responsibly adopt AI, including generative AI, into their operations. To that end, this memorandum requires each agency identified in the Chief Financial Officer (CFO) Act[3] to develop an enterprise AI strategy. This memorandum also provides recommendations for how agencies should reduce barriers to the responsible use of AI, including barriers related to IT infrastructure, data, cybersecurity, workforce, and the particular challenges of generative AI.

Managing Risks from the Use of AI. While agencies will realize significant benefits from AI, they must also manage a range of risks from the use of AI. Agencies are subject to existing risk management requirements relevant to AI, and this memorandum does not replace or supersede these requirements. Instead, it creates new requirements focused specifically on the risks from relying on AI to inform or carry out agency decisions and actions, particularly when such reliance impacts the rights and safety of the public.[4] To address these risks, this memorandum requires agencies to follow minimum practices when using rights-impacting and safety-impacting AI, and enumerates specific categories of AI that are presumed to impact rights and safety. Finally, this memorandum also establishes a series of recommendations for managing AI risks in the context of Federal procurement.

2. SCOPE

Agency adoption of AI poses many challenges, some novel and specific to AI and some well-known. While agencies must give due attention to all aspects of AI, this memorandum is scoped to address risks specifically arising from the use of AI, as well as governance and innovation issues that are directly tied to agencies' use of AI. This memorandum does not address issues that are present regardless of the use of AI, for instance with respect to Federal information and systems in general. In addition, this memorandum does not supersede other, more general Federal policies that apply to AI but are not focused specifically on AI, such as policies that relate to enterprise risk management, information resources management, privacy, Federal statistical activities, IT, or cybersecurity. Agencies must continue to comply with applicable OMB policies in other domains relevant to AI, and to coordinate compliance across the agency with all appropriate officials. All agency responsible officials retain their existing authorities and responsibilities established in other laws and policies.

[3] 31 U.S.C. § 901(b).
[4] A full definition for "risks from the use of AI" is provided in Section 6.

a. Covered Agencies. Except as specifically noted, this memorandum applies to all agencies defined in 44 U.S.C. § 3502(1).[5] As noted in the relevant sections, some requirements in this memorandum only apply to CFO Act agencies, as identified in 31 U.S.C. § 901(b), and other requirements do not apply to elements of the Intelligence Community, as defined in 50 U.S.C. § 3003.

b. Covered AI. This memorandum provides requirements and recommendations that, as described in more detail below, apply to new and existing AI that is developed, used, or procured by or on behalf of covered agencies. The principles of this memorandum do not, by contrast, govern agencies' regulatory actions designed to prescribe law or policy regarding non-agency uses of AI.

The requirements of this memorandum apply to system functionality that implements or is reliant on AI, rather than to the entirety of an information system that incorporates AI. As noted in the relevant sections, some requirements in this memorandum apply only in specific circumstances in which agencies use AI, such as when the AI may impact rights or safety.

c. Applicability to National Security Systems. This memorandum does not cover AI when it is used as a component of a national security system.[6]

3. STRENGTHENING ARTIFICIAL INTELLIGENCE GOVERNANCE

The head of each covered agency is responsible for pursuing AI innovation and ensuring that their agency complies with AI requirements in relevant law and policy, including that risks from the agency's use of AI are adequately managed. The head of each covered agency must also consider the necessary financial, human, information, and infrastructural resources to carry out these responsibilities effectively, including providing or requesting resources via the budget process to support the responsibilities identified in this memorandum.

To improve accountability for AI issues, agencies must designate a Chief AI Officer, consistent with Section 10.1(b) of the AI Executive Order. CAIOs bear primary responsibility on

[5] The term "agency" is defined as "any executive department, military department, Government corporation, Government controlled corporation, or other establishment in the executive branch of the Government (including the Executive Office of the President), or any independent regulatory agency," but does not include the Government Accountability Office; the Federal Election Commission; the governments of the District of Columbia and of the territories and possessions of the United States, and their various subdivisions; or Government-owned contractor-operated facilities, including laboratories engaged in national defense research and production activities. As a result, agencies defined in 44 U.S.C. § 3502(5) (independent regulatory agencies) that were not covered by Executive Order 13960 of December 8, 2020 *are* covered by this memorandum.

[6] AI innovation and risk for national security systems must be managed appropriately, but these systems are governed through other policy. For example, Section 4.8 of the AI Executive Order requires the development of a National Security Memorandum to govern the use of AI as a component of a National Security System, and agencies have existing guidelines in place such as the Department of Defense's (DoD) *Responsible Artificial Intelligence Strategy and Implementation Pathway* and the Office of the Director of National Intelligence's *Principles of Artificial Intelligence Ethics for the Intelligence Community*, as well as policies governing specific high-risk national security applications of AI, such as DoD Directive 3000.09, *Autonomy in Weapon Systems*.

behalf of the head of their agency for implementing this memorandum and coordinating implementation with other agencies. This section defines CAIOs' roles, responsibilities, seniority, position, and reporting structure.

a. Actions

i. **Designating Chief AI Officers**. Within 60 days of the issuance of this memorandum, the head of each agency must designate a CAIO. To ensure the CAIO can fulfill the responsibilities laid out in this memorandum, agencies that have already designated a CAIO must evaluate whether they need to provide that individual with additional authority or appoint a new CAIO. Agencies must identify these officers to OMB through OMB's Integrated Data Collection process or an OMB-designated successor process, and they must update OMB within 30 days when the designated individual changes.

ii. **Convening Agency AI Governance Bodies**. Within 60 days of the issuance of this memorandum, each CFO Act agency must convene its relevant senior officials to coordinate and govern AI issues, consistent with Section 10.1(b) of the AI Executive Order and the detailed guidance in Section 3(c) of this memorandum.

iii. **Compliance Plans**. Consistent with Section 104(c)-(d) of the AI in Government Act, within 180 days of the issuance of this memorandum or any update to this memorandum and every two years thereafter until 2036, each agency must submit to OMB and post publicly on the agency's website either a plan to achieve consistency with this memorandum, or a written determination that the agency does not use and does not anticipate using covered AI. Agencies must also include plans to update any existing internal AI principles and guidelines to ensure consistency with this memorandum.[7] OMB will provide full templates for these compliance plans.

iv. **AI Use Case Inventories**. Pursuant to Section 7225 of the Advancing American AI Act, and subject to the exclusions in that Act and Section 10.1(e) of the AI Executive Order, each agency (except for the Department of Defense and the Intelligence Community) must annually submit an inventory of its AI use cases to OMB and subsequently post a public version on the agency's website.[8] OMB will issue detailed instructions for the inventory through its Integrated Data Collection process or an OMB-designated successor process. Beginning with the use case inventory for 2024, agencies will be required, as applicable, to identify and report additional detail on how they are using safety-impacting and rights-impacting AI, the risks—including risks to equity—that such use poses, how they are managing those risks, and any related extensions and waivers granted under

[7] Given the importance of context-specific guidance on AI, agencies are encouraged to continue implementing their agency's AI principles and guidelines, so long as they do not conflict with the guidance in this memorandum.
[8] Agencies must only publicly report use cases to the extent practicable and consistent with applicable law and governmentwide guidance, including those concerning the protection of privacy and of sensitive law enforcement, national security, and other protected information.

Section 5 of this memorandum.

v. **Reporting on AI Use Cases Not Subject to Inventory**. Some AI use cases are exempt from the Advancing American AI Act's inventory requirement. Of those use cases, those within the Department of Defense are otherwise within the scope of this memorandum unless they concern AI used as a component of a national security system. The Department of Defense must annually provide OMB with information on those in-scope AI use cases, including aggregate metrics about those in-scope AI uses cases, the number of such cases that impact rights and safety, their compliance with the practices of Section 5(c) of this memorandum, and any waivers granted under Section 5 of this memorandum. OMB will issue detailed instructions for this reporting through its Integrated Data Collection process or an OMB-designated successor process.

b. Roles, Responsibilities, Seniority, Position, and Reporting Structure of Chief Artificial Intelligence Officers

Consistent with Section 10.1(b)(ii) of the AI Executive Order, this memorandum defines agency CAIOs' roles, responsibilities, seniority, position, and reporting structures as follows:

i. **Roles.** CAIOs must have the necessary skills, knowledge, training, and expertise to perform the responsibilities described in this section. At CFO Act agencies, the CAIO's primary role must be coordination, innovation, and risk management for their agency's use of AI. Agencies may choose to designate an existing official, such as a Chief Technology Officer, Chief Data Officer, or similar official with relevant or complementary authorities and responsibilities, provided they have significant expertise in AI and meet the other requirements in this section.

ii. **Responsibilities.** The AI Executive Order tasks CAIOs with primary responsibility in their agencies, in coordination with other responsible officials, for coordinating their agency's use of AI, promoting AI innovation, managing risks from the use of AI, and carrying out the agency responsibilities defined in Section 8(c) of Executive Order 13960[9] and Section 4(b) of Executive Order 14091.[10] In addition, CAIOs, in coordination with other responsible officials and appropriate stakeholders, are responsible for:

Coordinating Agency Use of AI

A. serving as the senior advisor for AI to the head of the agency and other senior agency leadership and within their agency's senior decision-making forums;
B. maintaining awareness of agency AI activities, including through creating and maintaining the annual AI use case inventory;

[9] Executive Order 13960, *Promoting the Use of Trustworthy Artificial Intelligence in the Federal Government,* https://www.govinfo.gov/content/pkg/FR-2020-12-08/pdf/2020-27065.pdf.
[10] Executive Order 14091, *Further Advancing Racial Equity and Support for Underserved Communities Through the Federal Government*, https://www.govinfo.gov/content/pkg/FR-2023-02-22/pdf/2023-03779.pdf.

C. developing a plan for compliance with this memorandum, as detailed in Section 3(a)(iii) of this memorandum, and an agency AI strategy, as detailed in Section 4(a) of this memorandum;
D. advising the agency CFO and Chief Human Capital Officer (CHCO) on the resourcing requirements and workforce skillsets necessary for applying AI to the agency's mission and adequately managing its risks;
E. supporting agency involvement with appropriate interagency coordination bodies related to their agency's AI activities, including representing the agency to the council described in Section 10.1(a) of the AI Executive Order;
F. supporting and coordinating their agency's involvement in AI standards-setting bodies, as appropriate, and encouraging agency adoption of voluntary consensus standards for AI, as appropriate and consistent with OMB Circular No. A-119;[11]

Promoting AI Innovation

G. working with their agency to identify and prioritize appropriate uses of AI that will improve their agency's mission and advance equity;
H. identifying and removing barriers to the responsible use of AI in the agency, including through the advancement of AI-enabling enterprise infrastructure, workforce development measures, policy, and other resources for AI innovation;
I. advocating within their agency and to the public on the opportunities and benefits of AI to the agency's mission;

Managing Risks from the Use of AI

J. managing an agency program that supports the enterprise in identifying and managing risks from the use of AI, especially for safety-impacting and rights-impacting AI;
K. working with relevant senior agency officials to establish or update processes to measure, monitor, and evaluate the ongoing performance of AI applications and whether they are achieving their intended objectives;
L. overseeing agency compliance with requirements to manage risks from the use of AI, including those established in this memorandum and in relevant law and policy;
M. conducting risk assessments, as necessary, of agency AI applications to ensure compliance with this memorandum;
N. overseeing development of agency-specific lists, as necessary, of purposes for which AI is presumed to be safety-impacting or rights-impacting;[12]
O. waiving individual applications of AI from elements of Section 5 of this memorandum through the processes detailed in that section; and

[11] OMB Circular A-119, *Federal Participation in the Development and Use of Voluntary Consensus Standards and in Conformity Assessment Activities* (Feb. 10, 1998), https://www.whitehouse.gov/wp-content/uploads/2017/11/Circular-119-1.pdf.
[12] See Section 5(b) of this memorandum for the OMB-defined lists to which agency-specific lists would add. Any agency-specific lists will be governed by the same processes defined in Section 5(b) for the OMB-defined lists.

P. in partnership with relevant agency officials (e.g., authorizing, procurement, legal, human capital, and oversight officials), ensuring that their agency does not use AI that is not in compliance with this memorandum, including by assisting these relevant agency officials in evaluating Authorizations to Operate based on risks from the use of AI.

iii. **Seniority.** For CFO Act agencies, the CAIO must be a position at the Senior Executive Service, Scientific and Professional, or Senior Leader level, or equivalent. In other agencies, the CAIO must be at least a GS-15 or equivalent.

iv. **Position and Reporting Structure.** CAIOs must have the necessary authority to perform the responsibilities in this section and must be positioned highly enough to engage regularly with other agency leadership, to include the Deputy Secretary or equivalent. Further, CAIOs must coordinate with other responsible officials at their agency to ensure that the agency's use of AI complies with and is appropriate in light of applicable law and governmentwide guidance.

c. Internal Agency AI Coordination

Agencies must ensure that AI issues receive adequate attention from the agency's senior leadership. Consistent with Section 10.1(b) of the AI Executive Order, agencies must take appropriate steps, such as through the convening of an AI governance body, to coordinate internally among officials responsible for aspects of AI adoption and risk management. Likewise, the CAIO must be involved, at appropriate times, in broader agency-wide risk management bodies and processes,[13] including in the development of the agency risk management strategy.[14] The agency's AI coordination mechanisms should be aligned to the needs of the agency based on, for example, the degree to which the agency currently uses AI, the degree to which AI could improve the agency's mission, and the risks posed by the agency's current and potential uses of AI.

CFO Act agencies are required specifically to establish AI Governance Boards to convene relevant senior officials no less than quarterly to govern the agency's use of AI, including to remove barriers to the use of AI and to manage its associated risks. Those agencies are permitted to rely on existing governance bodies[15] to fulfill this requirement as long as they currently satisfy or are made to satisfy both of the following:

[13] *See, e.g.,* OMB Circular No. A-123, *Management's Responsibility for Enterprise Risk Management and Internal Control* (July 15, 2016), https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/memoranda/2016/m-16-17.pdf.
[14] *See* OMB Circular No. A-130, *Managing Information as a Strategic Resource*, Appx. I, sec. 5(b) (July 28, 2016), https://www.whitehouse.gov/wp-content/uploads/legacy_drupal_files/omb/circulars/A130/a130revised.pdf.
[15] An example of a qualifying body includes agency Data Governance Bodies, established by OMB Memorandum M-19-23, *Phase 1 Implementation of the Foundations for Evidence-Based Policymaking Act of 2018: Learning Agendas, Personnel, and Planning Guidance*, https://www.whitehouse.gov/wp-content/uploads/2019/07/m-19-23.pdf.

i. Agency AI Governance Boards must be chaired by the Deputy Secretary of the agency or equivalent and vice-chaired by the agency CAIO, and these responsibilities should not be assigned to other officials. Working through this Board, CAIOs will support their respective Deputy Secretaries in coordinating AI activities across the agency and implementing relevant sections of the AI Executive Order.

ii. Agency AI Governance Boards must include appropriate representation from senior agency officials responsible for key enablers of AI adoption and risk management, including at least IT, cybersecurity, data, human capital, procurement, budget, agency management, customer experience, performance evaluation, statistics, risk management, equity, privacy, civil rights and civil liberties, and officials responsible for implementing AI within an agency's program office(s). Agencies should also consider including representation from their respective Office of the Inspector General.

4. ADVANCING RESPONSIBLE ARTIFICIAL INTELLIGENCE INNOVATION

If implemented responsibly, AI can improve operations and deliver efficiencies across the Federal Government. Agencies must improve their ability to use AI in ways that benefit the public and increase mission effectiveness, while recognizing the limitations of AI and when it is not suited for a given task. To achieve this, agencies should build internal enterprise capacity to support responsible AI innovation and take actions to improve their procurement of AI.

a. AI Strategies

Within 365 days of the issuance of this memorandum, each CFO Act agency must develop and release publicly on the agency's website a strategy for identifying and removing barriers to the responsible use of AI and achieving enterprise-wide advances in AI maturity, including:

i. the agency's current and planned top use cases of AI[16];

ii. a current assessment of the agency's AI maturity and the agency's AI maturity goals based on the method established under Section 10.1(c) of the AI Executive Order;

iii. the agency's plans to effectively govern its use of AI, including through its Chief AI Officer, AI Governance Boards, and improvements to their AI use case inventory;

iv. a plan for developing sufficient enterprise capacity for AI innovation, including mature AI-enabling infrastructure for the data, computing, development, testing, cybersecurity compliance, deployment, and continuous-monitoring infrastructure necessary to build, test, and maintain AI;

v. a plan for building sufficient enterprise capacity to manage risks from the use of AI;

vi. a current assessment of the agency's AI workforce capacity and projected AI workforce needs, as well as a plan to recruit, hire, train, retain and empower AI practitioners and achieve AI literacy for non-practitioners involved in AI to meet those needs; and

[16] Consistent with Sections 7225(d) and 7228 of the Advancing American AI Act, this requirement applies to CFO Act agencies except for the Department of Defense and the Intelligence Community, as defined in 5 U.S.C. § 3003(4).

vii. specific, prioritized areas and planning for future AI investment.

b. Removing Barriers to the Responsible Use of Artificial Intelligence

Embracing innovation requires removing unnecessary and unhelpful barriers to the use of AI while retaining and strengthening the guardrails that ensure its responsible use. Agencies should create internal environments where those developing and deploying AI have flexibility and do not face hindrances that divert limited resources and expertise away from the AI innovation and risk management. Agencies should take steps to remove such barriers, paying special attention to the following recommendations:

i. **IT Infrastructure.** Agencies should ensure that their AI projects have access to adequate IT infrastructure, including high-performance computing infrastructure specialized for AI training and inference, where necessary. Agencies should also ensure adequate access for AI developers to the software tools, open-source libraries, and deployment and monitoring capabilities necessary to rapidly develop, test, and maintain AI applications.

ii. **Data.** Agencies should develop adequate infrastructure and capacity to sufficiently curate agency datasets for use in training, testing, and operating AI. This includes an agency's capacity to maximize appropriate access to internal data and share such data within the agency. Agencies should also explore the utility of public access datasets and encourage their use, where appropriate and consistent with the data practices outlined in this memorandum, to help develop, test, and maintain AI applications. These activities should be supported by resources to enable sound data governance and management practices, particularly as it relates to data curation, labeling, and stewardship.

iii. **Cybersecurity.** Agencies should update, as necessary, cybersecurity authorization processes to better address the needs of AI applications, including to advance the use of continuous authorizations for AI. Consistent with Section 10.1(f) of the AI Executive Order, agency authorizing officials should also prioritize generative AI and other critical emerging technologies in Authorizations to Operate and any other applicable release or oversight processes.

iv. **Workforce.** Consistent with Sections 5.1 and 10.2 of the AI Executive Order, agencies should take full advantage of available special hiring and retention authorities to fill gaps in AI talent, encouraging applications from individuals with diverse perspectives and experiences, and ensure the use of recruitment best practices for AI positions, such as descriptive job titles and skills-based assessments. When identifying and filling workforce needs for AI, agencies should include both technical roles, such as data scientists and engineers, and non-technical roles, such as designers, behavioral scientists, contracting officials, managers, and attorneys, whose contribution and competence with AI are important for successful and responsible AI outcomes. Agencies should provide resources and training to develop such AI talent internally and should also increase AI training offerings for Federal employees, including opportunities that provide Federal

employees pathways to AI occupations and that assist employees affected by the application of AI to their work.

v. **Generative AI.** In addition to heeding the guidance provided in Section 10.1(f) of the AI Executive Order, agencies should assess potential beneficial use cases of generative AI in their missions and establish adequate safeguards and oversight mechanisms that allow generative AI to be used in the agency without posing undue risk.

5. MANAGING RISKS FROM THE USE OF ARTIFICIAL INTELLIGENCE

Agencies have a range of policies, procedures, and officials in place to manage risks related to agency information and systems. To better address risks from the use of AI, and particularly risks to the rights and safety of the public, all agencies that are not elements of the Intelligence Community are required to implement minimum practices, detailed below, to manage risks from rights-impacting and safety-impacting AI.[17]

a. Actions

i. **Implementation of Risk Management Practices and Termination of Non-Compliant AI**. By August 1, 2024, agencies must implement the minimum practices in Section 5(c) of this memorandum for safety-impacting or rights-impacting AI, or else stop using any AI that is not compliant with the minimum practices, consistent with the details and caveats in that section.

ii. **Recommendation on AI Documentation.** Within 180 days of the issuance of this memorandum, the council described in Section 10.1(a) of the AI Executive Order will provide the Director of OMB with a list of recommended documentation that should be required from a selected vendor in the fulfillment of a Federal AI contract. As part of their recommendation, the council must consider the minimum risk management practices in Section 5(c) and the associated materials that may be required of vendors to demonstrate that they have completed such tasks.

b. Determining Which Artificial Intelligence Is Presumed to Be Safety-Impacting or Rights-Impacting

All AI within the scope of this section that matches the definitions of "safety-impacting AI" or "rights-impacting AI" as defined in Section 6 must follow the minimum practices in Section 5(c) by the appropriate deadline. Agencies must review each use of AI that they are developing or using to determine whether it matches the definition of safety-impacting or rights-impacting.

The categories in this subsection only identify a subset of specific purposes for which AI is automatically *presumed* to be safety-impacting or rights-impacting, and they do not represent an exhaustive list of purposes for which AI is safety-impacting or rights-impacting. Agencies are

[17] Although elements of the Intelligence Community are not required to implement these practices, they are encouraged to do so.

also encouraged to define specific purposes that, within their agency, are presumed to be safety-impacting or rights-impacting and so must follow the practices in Section 5(c). Agencies are required to report any such agency-specific lists to OMB on an annual basis.

Where an agency currently uses or plans to use AI for a purpose described below, the CAIO, in coordination with other relevant officials as specified by the agency, may make a determination (or reverse a prior determination) that the AI application or component[18] does not match the definitions of "safety-impacting AI" or "rights-impacting AI" and is therefore not subject to the minimum practices. The agency CAIO may make or reverse this determination only with a documented context-specific and system-specific risk assessment. Any such determination or reversal must be reported to OMB within 30 days.

i. **Purposes That Are Presumed to Be Safety-Impacting.** Unless the CAIO determines otherwise, covered AI within the scope of this memorandum is presumed to be safety-impacting and must follow the minimum practices for safety-impacting AI if it is used to control or meaningfully influence the outcomes of the following activities:
   A. The functioning of dams, emergency services, electrical grids or the generation or movement of energy, fire safety systems, food safety mechanisms, integrity of elections and voting infrastructure, traffic control systems and other systems controlling physical transit, water and wastewater systems, and nuclear reactors, materials, and waste;
   B. Physical movements, including in human-robot teaming, such as the movements of a robotic appendage or body, within a workplace, school, housing, transportation, medical, or law enforcement setting;
   C. The application of kinetic force, delivery of biological or chemical agents, or delivery of potentially damaging electromagnetic impulses;
   D. The movements of vehicles, whether on land, underground, at sea, in the air, or in space;
   E. The transport, safety, design, or development of hazardous chemicals or biological entities or pathways;
   F. Industrial emissions and environmental impact control processes;
   G. The transportation or management of industrial waste or other controlled pollutants;
   H. The design, construction, or testing of industrial equipment, systems, or structures that, if they failed, would pose a meaningful risk to safety;
   I. Responses to insider threats;
   J. Access to or security of government facilities; or
   K. Enforcement actions pursuant to sanctions, trade restrictions, or other controls on exports, investments, or shipping.

[18] CAIOs may also make these determinations across groups of closely related AI applications or components, provided that: (1) those systems have undergone a risk assessment that adequately considers the risks from each individual system; and (2) the systems are substantially identical in their risk profiles.

ii. **Purposes That Are Presumed to Be Rights-Impacting.** Unless the CAIO determines otherwise, covered AI is presumed to be rights-impacting (and potentially also safety-impacting) and agencies must follow the minimum practices for rights-impacting AI and safety-impacting AI if it is used to control or meaningfully influence the outcomes of any of the following activities or decisions:

A. Decisions to block, remove, hide, or limit the reach of protected speech;
B. Law enforcement or surveillance-related risk assessments about individuals, criminal recidivism prediction, offender prediction, predicting perpetrators' identities, victim prediction, crime forecasting, license plate readers, iris matching, facial matching, facial sketching, genetic facial reconstruction, social media monitoring, prison monitoring, forensic analysis, forensic genetics, the conduct of cyber intrusions, physical location-monitoring devices, or decisions related to sentencing, parole, supervised release, probation, bail, pretrial release, or pretrial detention;
C. Deciding immigration, asylum, or detention status; providing risk assessments about individuals who intend to travel to, or have already entered, the U.S. or its territories; determining border access or access to Federal immigration related services through biometrics (e.g., facial matching) or other means (e.g., monitoring of social media or protected online speech); translating official communication to an individual in an immigration, asylum, detention, or border context; or immigration, asylum, or detention-related physical location-monitoring devices.
D. Detecting or measuring emotions, thought, or deception in humans;
E. In education, detecting student cheating or plagiarism, influencing admissions processes, monitoring students online or in virtual-reality, projecting student progress or outcomes, recommending disciplinary interventions, determining access to educational resources or programs, determining eligibility for student aid, or facilitating surveillance (whether online or in-person);
F. Tenant screening or controls, home valuation, mortgage underwriting, or determining access to or terms of home insurance;
G. Determining the terms and conditions of employment, including pre-employment screening, pay or promotion, performance management, hiring or termination, time-on-task tracking, virtual or augmented reality workplace training programs, or electronic workplace surveillance and management systems;
H. Decisions regarding medical devices, medical diagnostic tools, clinical diagnosis and determination of treatment, medical or insurance health-risk assessments, drug-addiction risk assessments and associated access systems, suicide or other violence risk assessment, mental-health status detection or prevention, systems that flag patients for interventions, public insurance care-allocation systems, or health-insurance cost and underwriting processes;
I. Loan-allocation processes, financial-system access determinations, credit scoring, determining who is subject to a financial audit, insurance processes including risk

assessments, interest rate determinations, or financial systems that apply penalties (e.g., that can garnish wages or withhold tax returns);

J. Decisions regarding access to, eligibility for, or revocation of government benefits or services; allowing or denying access—through biometrics or other means (e.g., signature matching)—to IT systems for accessing services for benefits; detecting fraud; assigning penalties in the context of government benefits; or

K. Recommendations or decisions about child welfare, child custody, or whether a parent or guardian is suitable to gain or retain custody of a child.

c. Minimum Practices for Safety-Impacting and Rights-Impacting Artificial Intelligence

Except as prevented by applicable law and governmentwide guidance, agencies must apply the minimum practices in this section to safety-impacting and rights-impacting AI by August 1, 2024, or else stop using the AI until it becomes compliant. Prior to August 1, 2024, agency CAIOs should work with their agencies' relevant officials to bring potentially non-compliant AI into conformity, which may include voluntary requests to third-party vendors to take appropriate action (e.g., via updated documentation or testing measures). To ensure compliance with this requirement, relevant agency officials must use existing mechanisms wherever possible, for example, the Authorization to Operate process. An agency may also request an extension or grant a waiver to this requirement through its CAIO using the processes detailed below.

Agencies must document their implementation of these practices and be prepared to report them to OMB, either as a component of the annual AI use case inventory, periodic accountability reviews such as a TechStat process,[19] or on request as determined by OMB.

The practices in this section represent a minimum baseline for managing risk from the use of AI. Agencies must identify additional context-specific risks that are associated with their determined use cases and address them as appropriate. Such risk considerations may include impacts to safety, security, civil rights, civil liberties, privacy, democratic values, human rights, equal opportunities, potential harms to worker wellbeing, access to critical resources and services, and effects on market competition. To fill potential risk management gaps, agencies are encouraged to promote and to incorporate, as appropriate, additional best practices for AI risk management, such as from the National Institute of Standards and Technology (NIST) AI Risk Management Framework,[20] the Blueprint for an AI Bill of Rights,[21] applicable international standards,[22] and the workforce principles established pursuant to Section 6 of the AI Executive

[21] *Blueprint for an AI Bill of Rights*, White House Office of Science and Technology Policy, https://www.whitehouse.gov/wp-content/uploads/2022/10/Blueprint-for-an-AI-Bill-of-Rights.pdf.
[22] For example, ISO/IEC 23894:2023 Information technology — Artificial intelligence — Guidance on risk management, https://www.iso.org/standard/77304.html.

Order. Agencies are also encouraged to continue developing their own agency-specific practices, as appropriate and consistent with this memorandum and the principles in Executive Order 13960, Executive Order 14091, and the October 30, 2023 AI Executive Order. The practices in this section also do not supersede, modify, or direct an interpretation of existing requirements mandated by law or governmentwide policy, and agency responsible officials must coordinate to ensure that the performance of these practices does not conflict with other applicable law or governmentwide guidance.

i. **Exclusions from Minimum Practices.** Agencies are not required to follow the minimum practices outlined in this section when using AI solely for one or more of the following purposes:
   A. Evaluation of a potential vendor, commercial capability, or freely available AI capability that is not otherwise used in agency operations, solely for the purpose of making a procurement or acquisition decision;
   B. Evaluation of a particular AI application because the AI provider is the target or potential target of a regulatory enforcement, law enforcement, or national security action;[23] and
   C. Research and development.[24]

ii. **Extensions for Minimum Practices.** Until August 1, 2024, agencies may request from OMB an extension of limited and defined duration for a particular use of AI that cannot feasibly meet the minimum requirements in this section by that date. The request must be accompanied by a detailed justification for why the agency cannot achieve compliance for the use case in question and what practices the agency has in place to mitigate the risks from noncompliance, as well as a plan for how the agency will come to implement the full set of required minimum practices from this section.

iii. **Waivers from Minimum Practices.** In coordination with other relevant officials, an agency CAIO may waive one or more of the requirements in this section for a specific covered AI application or component[25] after making a written determination, based upon a system-specific risk assessment, that fulfilling the requirement would increase risks to safety or rights overall or would create an unacceptable impediment to critical agency operations. Such waivers are applicable for the duration of the AI's use, but must be reassessed by the CAIO if there are significant changes to the conditions or context in which the AI is used. An agency CAIO may also revoke a previously issued waiver at

[23] Agencies are not required to follow these minimum practices when examining AI as the target or potential target of such an action, but they are required to follow these practices when *carrying out* an enforcement or national security action. For example, when evaluating an AI tool to determine whether it violates the law, agencies need not follow the minimum practices; if agencies were using that same tool to assess a different target, they would have to follow the minimum practices.

[24] AI research and development is not excluded if it is used in agency operations other than for the purposes of research and development, such as to make agency recommendations or decisions about real people.

[25] CAIOs may also grant waivers applicable to groups of closely related AI applications or components, provided that: (1) those systems have undergone a risk assessment that adequately considers the risks from each individual system; and (2) the systems are substantially identical in their risk profiles.

any time. Agencies must report to OMB within 30 days of granting such a waiver, detailing the scope, justifications, and supporting evidence.

iv. **Minimum Practices for Either Safety-Impacting or Rights-Impacting AI.**

Starting on August 1, 2024, agencies must follow these practices *before* using new or existing covered safety-impacting or rights-impacting AI:

A. **Complete an AI impact assessment**. Impact assessments must document the following:

1. *The intended purpose for the AI and its expected benefit*, supported by specific metrics or qualitative analysis. Metrics should be quantifiable measures of positive outcomes for an agency's mission, for example to reduce costs, wait time for customers, or risk to human life, that can be measured after the AI is deployed to confirm or disprove the value of using AI.[26] Where quantification is not feasible, qualitative analysis should demonstrate an expected positive outcome, such as for improvements to customer experience or human interactions—and demonstrate that AI is a good fit to accomplish the relevant task.

2. *The potential risks of using AI*, as well as what, if any, additional mitigation measures, beyond these minimum practices, the agency will take to help reduce these risks. Agencies should document the stakeholders[27] that will be most impacted by the use of the system and assess the possible failure modes of the AI and of the broader system, both in isolation and as a result of human users and other likely variables outside the scope of the system itself. Agencies should be especially attentive to the potential risks to underserved communities. The expected benefits of the AI functionality should be considered against its potential risks, and if the benefits do not meaningfully outweigh the risks, agencies should not use the AI.

3. *The quality and appropriateness of the relevant data*. Agencies must assess the quality of the data used in the AI's design, development, training, testing, and operation and its fitness to the AI's intended purpose. If the agency cannot access such data after a reasonable effort to do so, it must obtain sufficient descriptive information from the AI or data provider to satisfy the

[26] For supervised and semi-supervised AI, agencies should use a target variable which can be reliably measured and adequately represents the desired real-world outcomes.
[27] Stakeholders will vary by use case. For example, if an agency is using AI to control a water treatment process, stakeholders may include (1) local residents; (2) state, local, tribal, and territorial government representatives; and (3) environmental experts.

reporting requirements in this paragraph. At a minimum, agencies must document:

a. the provenance and quality of the data for its intended purpose;[28]
b. how the data is relevant to the task being automated and has a reasonable expectation of being useful for the AI's development, testing, and operation;
c. whether the data contains sufficient breadth to address the range of real-world inputs the AI might encounter;
d. whether the data comes from an adequately reliable source; and
e. how errors from data entry, machine processing, or other sources are adequately measured and limited, to include errors from relying on AI-generated data as training data or model inputs.

B. **Test the AI for performance in a real-world context**. Agencies must conduct adequate testing to ensure the AI, as well as components that rely on it, will work in its intended real-world context. Such testing should follow domain-specific best practices, when available, and should take into account both the specific technology used and feedback from human operators, reviewers, employees, and customers that use the service who impact the system's outcomes. Testing conditions should mirror as closely as possible the conditions in which the AI will be deployed. Through test results, agencies should demonstrate, to the extent practicable, that the AI will achieve its expected benefits while sufficiently mitigating risks associated with the AI, or else the agency should not use the AI. Agencies are also encouraged to leverage pilots and limited releases, with strong monitoring, evaluation, and safeguards in place, to carry out the final stages of testing before a wider release.

C. **Independently evaluate the AI**. Agencies, through the CAIO, an agency AI oversight board, or other appropriate agency office with existing test and evaluation responsibilities, must review relevant AI documentation to ensure that the system works appropriately and as intended, and that its expected benefits outweigh its potential risks. At a minimum, this documentation must include the completed impact assessment and results from testing AI performance in a real-world context, both referenced in Section 5(c)(iv). Agencies must incorporate this independent evaluation into an applicable release or oversight process, or the Authorization to Operate process. The independent reviewing authority must not have been directly involved in the system's development.

[28] Consistent with OMB Memorandum M-19-15, *Improving Implementation of the Information Quality Act*, https://www.whitehouse.gov/wp-content/uploads/2019/04/M-19-15.pdf, and the National Science and Technology Council's report *Protecting the Integrity of Government Science*, https://www.whitehouse.gov/wp-content/uploads/2022/01/01-22-Protecting_the_Integrity_of_Government_Science.pdf.

Starting on August 1, 2024 and on an ongoing basis *while* using new or existing covered safety-impacting or rights-impacting AI, agencies must ensure these practices are followed for the AI:

D. **Conduct ongoing monitoring and establish thresholds for periodic human review.** In addition to pre-deployment testing, agencies must institute ongoing procedures to monitor degradation to the AI's functionality and to detect changes in the AI's impact on rights or safety. Part of this monitoring process must include periodic human reviews to determine whether the existing implementation of the minimum practices in this section adequately mitigates any new risk. Such human review, including renewed testing for performance of the AI in a real-world context, must be conducted at least annually[29], and after significant modifications to the AI or to the conditions or context in which the AI is used. Reviews must include oversight and consideration by an appropriate internal agency authority not directly involved in the system's development or operation. Agencies should also scale up the use of new or updated AI features incrementally where possible, to provide adequate time to monitor for adverse performance or outcomes. Agencies should also monitor and defend the AI from AI-specific exploits,[30] particularly those that would adversely impact rights or safety.

E. **Mitigate emerging risks to rights and safety.** Upon identifying new or significantly altered risks to rights or safety through continuous monitoring, periodic review, or other mechanisms, agencies must take steps to mitigate those risks, including, as appropriate, through updating the AI to reduce its risks or implementing non-technical mitigations, such as greater human oversight. As significant modifications make the existing implementation of the other minimum practices in this section less effective, such as by making training or documentation inaccurate, agencies must update or repeat those practices, as appropriate. Where the AI's risks to rights or safety exceed an acceptable level and where mitigation is not practicable, agencies must stop using the affected AI as soon as is practicable.[31]

F. **Ensure adequate human training and assessment.** Agencies must ensure there is sufficient training, assessment, and oversight for operators of the AI to interpret and act on the AI's output, combat any human-machine teaming issues (such as automation bias), and ensure the human-based components of the system effectively manage risks from the use of AI. Training should be conducted on a periodic basis, determined by the agency, and should be specific to the AI use case, product, or service being operated.

[29] For customer-facing services, agencies should consider customer feedback.
[30] For example, the AI-specific exploits outlined in the MITRE ATLAS framework. *See* https://atlas.mitre.org/.
[31] Agencies are responsible for determining how to safely decommission AI that was already in use at the time of this memorandum's release without significant disruptions to essential government functions.
